This capstone course provides students with the understanding of the fashion industry. This course provides students with an understanding of fashion, textiles and design. The emphasis of instruction is placed on Fashion merchandising, fashion illustration, and fashion designers. Students will apply the skills for a career in the area of fashion design by learning how to draw, design and restyle clothing. This course also studies fashion trends throughout history and includes an understanding of cultural, social, political and economic influences on fashion design. Students learn and then use the principles and elements of design to analyze other designers' work and create their own original designs. Students will understand the visual impact of marketing, displays, sales, visual merchandising and product development. Students will design a fashion show, and create a professional portfolio of their work. Throughout the year, students learn how fashion design and merchandising is connected to other academic disciplines and the career opportunities that are contained in the world of fashion.

This class is designed for students with a career goal in the field of fashion design, merchandising, marketing and management. Students will learn about fashion design, merchandising, textiles, history of fashion and retail. Instruction in the concepts of advertising, communications, display and visual merchandising, operations and product technology will also be discussed. Students will work on individual research projects, reflect and respond in journals, and develop fashion portfolios that will prepare them for careers and post-secondary training.

urse content:

Unit: Introduction to Fashion

- This unit covers basic fashion terms, the "why" of clothes, and the influences on fashion (social, religious, economic, etc.). Students will be introduced to key fashion terms used throughout the fashion industry. They will learn the reasons for clothing throughout the world and the key influences on clothing choices. After receiving a foundation of knowledge students are introduced to the various world fashion centers. This includes a basic knowledge about each fashion center, what the area is known for in the fashion industry and key fashion designers from the areas. Students will communicate and express their ideas in the language of fashion.

Unit Assignment(s):

Fashion Terms Assignment

- Students will create mini wall posters for each fashion term plus portfolio pages-illustrating fashion terms. Both assignments will require students to demonstrate an understanding of the terms and use critical thinking and writing skills. They will identify the terms through fashion pictures then write how the pictures are an appropriate illustration of the term.

- **Why We Wear Assignment**
- Students will create a collage of magazine pictures illustrating the clothes worn for a variety of occasions and write a description of each picture including the social, religious, political, economic and technological influences. Students will use key fashion terms when describing the fashions.

Unit: Elements & Principles of Design

- We will cover the elements of design (line, shape, color and texture) and principles of design (proportion, rhythm, balance, emphasis, variety and harmony). Each element and principle will be thoroughly discussed individually and how they all relate to one another. Students will learn about textiles and be able to identify basic fibers, the characteristics, use and care of each textile. They will participate in a textile lab that includes burning and dyeing textiles to help identify the basic fibers. Students will learn about the basic weaves, how to identify them and the elements & principles of design related to the weaves. Lastly they will design their own printed fabric sample created by painting or color medium of their choice. Students will make a "fabric sample" on drawing paper and one on muslin. They will sketch a design that incorporates their textile design and identify how the elements & principles were used.
- Make informed critical judgments about fashion design based on artistic elements, design principles, expressive characteristics and technical merit.
- Create original design drawings for fashions using sound design principles.
- Students will learn how to use technical writing when describing the style of a particular garment.

Unit Assignment(s):

- **Color Scheme Portfolio Pages and Design Board**
- Students will create portfolio pages to demonstrate their knowledge of color. They will mix primary colors to create all of the colors on the color wheel, illustrate value, intensity and complementary colors.
- They will draw 3 original designs on fashion figures representing 3 different color schemes. They will label their designs with the color scheme and individual colors used to create the color scheme. In addition, they will write a one page analysis using color terminology of how color schemes were used in each drawing. They will describe each garment using key fashion terms and garment style names. This will be presented on a design board. There will be a peer evaluation of the color project design board using a rubric to critically assess their peers' color schemes and proper use of terms.
- **Art as Fashion Assignment**
- Individual students will research a piece of art to use as their personal influence for a fashion garment. They will find the art piece, print it out and write about the artist and what elements within the piece provided inspiration. Students will create a full color garment on a fashion figure that was inspired by the art. They will write a description of their garment, target market, and elements & principles of design. This will be added to the student's portfolio. Students will analyze and interpret other students' work through critiques and rubrics

---

Unit: History of Fashion

- This unit will cover the history of fashion with a focus on the 20th and 21st We will cover fashion styles, influences and decorative elements including social, cultural, political, economic, religious, architectural and artistic influences on fashion. During class we will watch the DVD "Fashion though the Ages", have a speaker from the Fashion Institute of Design and Merchandising and review as a class the history of fashion. This foundation will allow students to dig deeper into a specific time period in the past.
- Demonstrate knowledge of cultural origins, historical significance and influence of specific fashions
- Identify periods, styles of fashion and works of individual designers who have national prominence and have been influential in their work.
- Analyze and discuss issues of period and style in terms of art and design elements and principles utilizing appropriate terminology.

Unit Assignment(s):

- **Fashion History Multi-Media Project**
- In partners, students will research an assigned period of history. A multi-media presentation will be created to include influences of politics, economics, social customs and practices, fabrics, garment names and parts, jewelry, footwear, headdresses and special occasion clothing (weddings, royalty, uniforms). Include a collection of 7-10 pictures or illustrations of the fashions for that period of time.

- **Paper Doll Assignment**
- Students will create/construct an original design using the 9-heads croquis; draw an original paper doll wearing time period undergarments, mount on foam board, and draw 5 time period garments worn for different purposes. Label (wedding, sports wear, religious).

- **Portfolio Pages & Oral Report**
- A collaborative effort will be used to create a fashion history summary to be included in their portfolio. Students will develop a summary and 2-3 pictures of their time period. Before oral presentations these will be copied and distributed to each student. During the oral presentations they will add key information. Class presentation and oral report of the fashion history and paper dolls.

Unit: Fashion Designers

- Students will learn in detail about key fashion designers throughout history and the world. Students will be assessed on prior knowledge, referring back to the world fashion centers and the designers presented earlier in the year. We will discuss additional designers as a class and have a presentation by the Fashion Institute of Design and Merchandising. As a class we will watch biographies on key designers, i.e., Calvin Klein and Coco Chanel. Students will learn about the background, education, motivation and successes of the designers.

Unit Assignment(s):

Fashion Designer Research Paper

- Students will choose a iconic designer to research. They will discover the designer's life history, education, motivation, notoriety, contributions to fashion and their fashion capitol. Students will create a digital presentation, plus a 2-3 page written report on their fashion designer. Through their research, students will learn more about the fashion industry, the requirements of the profession, the education and training needed, and the skills most needed to be successful in the field.
- During the presentations, students in the audience will take notes on each fashion designer presentation.

- **Fashion Designer Time Line , Presentation Board**
  - Students will create a time line detailing the historical events of their fashion designer.
  - Students will create a fashion presentation board of the a fashion designers work, with flats, color schemes and fabric samples, including a copycat design of their own.

Unit: Reuse & Recycle Fashion Show

- Students will learn about up-cycling, recycling and re-purposing as it relates to fashion. We will cover how this concept has been used throughout history, referring back to their history of fashion projects, and how the concept has changed. They will also discover what it takes to put on a fashion show. They will receive a foundation of knowledge about the elements that go into organizing and running a fashion show, including their target market, purpose of the show, location, music, etc. For the target customer we will cover demographics, marketing techniques, meeting the customer needs, and clothing modifications.
- Demonstrate the ability to solve design problems. They will learn to work as a team and the importance of communication and conflict resolution and time management.
- Make sound, informed judgments about the quality of their own designs.
- Design a fashion show to display their own work and demonstrate interpretation of designers' artistic expression.

Unit Assignment(s):

- **Market Research Survey Assignment**
- Students will conduct a survey on school campus regarding fashion trends and cultural influences on fashion decisions. Students will use Excel for data analysis and Word for a one page written analysis. Skills used will be discussed in terms of applicability to careers in fashion design, writing, merchandising, and market analysis. We will also discuss how to relate market research to creating a fashion show.
- **Recycled & Re-Purpose Fashions Assignment**
- Students will work collaboratively to take everyday items and recycle into multiple fashion items (clothing and accessories) or re-purpose clothing. Students will sketch each item in detail. Collaboration teams will physically

create one of their items into a 3-D item to be worn in the class produced fashion show.

- Students will bring in a project from home that they want to alter. They will first sketch the garment and then write a detailed list of steps required to change this garment into a new usable version.
- Students will write a paper that includes the original item's purpose, a description of each up-cycled or re-purposed design stating the garment style, elements & principles of design, influences on design and target customer. Students will orally present their design to the class and the class will evaluate the designs. Teams will also put their design in the fashion show.
- Fashion Show
- Students will work collaborative as a whole class to plan and execute a fashion show. Students will create committees with specific responsibilities and deadlines. We will have regular check-ins with each committee and discuss concerns, changes and progress as a class. Students will wear their recycled fashion item during the show.

Unit: Retail Management and Marketing

- This unit will cover the retail industry. We will cover types of retail stores, store structure, careers, types of shopping centers, advertising, marketing and special events. Retail buying will discussed in detail by explaining all of the different departments that work together to get a product from concept to consumer. Students will participate in a retail role play activity that takes a new item from the trend department through the retail chain to eventually reach the consumer. Students will write a PO for a specific manufacturer, based on their assigned OTB, store and target customer.

Unit Assignment(s):

- Retail Advertising Assignment
- Students will find magazine examples of specific advertising approaches used in fashion. They will then create ads for other advertising approaches. They will use the computer to develop, design and revise their advertisements. They will create a portfolio page for each with a write up about the target customer, advertising approach, how the approach is represented in the ad, the merchandise featured and the store selling the merchandise.
- Design a Virtual Fashion Business Assignment
- In collaborative teams students will design their own virtual business. Using a the Virtual Business Fashion program students will create their own business. They will include a write up about the type of business, target audience, location, name of the business, and elements & principles of design used. Students will describe an event that will draw customers to their store.

Unit: Visual Merchandising

- We will discuss all of the elements of visual merchandising specific to the fashion industry and retail stores. The purpose, elements & principles of design, classifications, themes and types will be covered in detail. Through a field

trip students will have the opportunity to see various visual merchandising types and styles in person. The students will take what they learned in class and apply it to what is currently taking place in retail stores.

Unit Assignment(s):

- **Visual Merchandising Assignment**
- In teams students will develop an in-store visual merchandising plan. They will create a campaign for a new merchandise group. They will design an in-store poster, a door sign, and merchandise floor layout that cohesively promotes the new merchandise. They will write a 1-2 page paper describing their campaign elements and how they work together to successfully promote the merchandise.

- **Window Display**
- Students will create a 3-D window display for a specific retail store and merchandise. They will use the computer to digitally create an element of their display, background, props, etc. They will write a one page paper describing the store, target customer, and display in addition to the use of the elements and principles of design. Oral presentation and peer evaluation of display.

- **Design a Retail Store**
- In small collaborative teams students will design their own retail store. They will design their store logo, shopping bag, in store poster, merchandise display and window display. They will need to determine the merchandise carried and what size assortment they will offer. Students will include a write up about their store, target customer, marketing campaign, and merchandise plan. Students will orally present their store concept to the class.

Unit: Fashion in the Real World, Planning For the Future

- In this unit, students will delve deeper into researching the wide variety of careers (many of them extremely lucrative) available within the fashion industry. In addition to researching various career pathways they haven't considered in previous courses, students identify the breadth and depth of
education required for various positions and roles. New guest speakers and professionals in the fashion industry act as industry experts, delivering valuable presentations to students, both on the actual discipline of fashion as well as the realities of careers in fashion. For example, Fashion
Blogging and Social Media are growing fields in the fashion industry. Students engage in question and answer sessions with these experts, receiving important mentoring and professional advice. Students refine their interests in career pathways and in addition to updating their professional art/design portfolio (or website), students will create a branding suite for their potential careers (including brand logo, business card, and resume). Wherever possible, students are eligible to "shadow" professionals to get a better sense of the day-to-day operations of a fashion career. As a result of

these experiences and research, students will evaluate and revise their Career and Education Plan that articulates their goals and strategies for pursuing a career of their choice in the fashion industry.
- Students will learn about creating a job portfolio including a job application, cover letter, resume and interview questions. We will have various guest speakers from the Fashion Institute of Design and Merchandising and other industry professionals.

Unit Assignment(s):

- Career Research
- Students will research a wide variety of professional paths and fields within the contemporary fashion industry, for the primary purpose of identifying future careers within the industry. They should include careers that they have not previously explored in prior fashion courses. Students will refine & present a “Personal Career Plan,” that includes: (1) education requirements needed for selected career, (2) salary scale/earning potential, (3) career mapping (indicating transferability of knowledge/skills), and (4) A five year plan including personal/career goals.Students will utilize a career website like Xello to assist in this project.
- Career Portfolio
- Students will learn about creating a job portfolio including a job application, cover letter, resume and interview questions. We will have various guest speakers from the Fashion Institute of Design and Merchandising and other industry professionals.
- Students will find a classified ad for a fashion career. They will then write a cover letter directed to the classified ad and write a resume based on their skills and experiences. Students will practice answering the twelve common interview questions.
- Students will prepare and participate in a mock job interview.

Unit: Portfolio Development and Review

- Students will develop professional portfolio. Each semester they will participate in a portfolio review. Students will present their own portfolio and then critique their peers' portfolios based on a rubric.

Unit Assignment(s):

Develop a Professional Portfolio

- Students will develop a professional portfolio that showcases their work. It will include a resume, job applications, a cover letter, fashion drawings,and projects that students have worked on and development throughout the year.
- Students will be able to take this portfolio with them when the complete the course and use it in the future career in the fashion industry.
- Students will present their own portfolios to their peers. Students will learn the process of developing a professional portfolio that they will be able to use in their career.

9. Subject Area

- ☐ History/Social Science
- ☐ English
- ☐ Mathematics
- ☐ Laboratory Science
- ☐ Language other than English
- ☐ Visual & Performing Arts (for 2003)
- ☒ College Prep Elective

10. Grade Level(s)
10-12

11. Seeking "Honors" Distinction?
☐ Yes ☒ No

12. Unit Value

- ☐ 0.5 (half year or semester equivalent)
- ☒ 1.0 (one year equivalent)
- ☐ 2.0 (two year equivalent)
- ☐ Other: _____

13. Date of School Board Approval

14. Was this course previously approved by UC? ☐ Yes ☒ No If so, year removed from list? _____

Under what course title? _____

15. Is this course modeled after an UC-approved course from another school? ☒ Yes ☐ No

If so, which school(s)? Arroyo Grande High School

16. Pre-Requisites
Clothing & Fashion A/B

17. Co-Requisites
none

18. Brief Course Description
This is a yearlong course that will focus all aspects on the fashion industry. Students enrolled in this course will explore and demonstrate knowledge of the historical and cultural influences on the fashion industry. Students will learn principles and elements of two and three dimensional design, be introduced to fashion merchandizing, learn terminology used in the fashion industry, become familiar with prominent designers (past and present), and recognize the impact of historical influences on the fashion industry. Students will create a portfolio of sketches, figures drawings and create their own fabric designs using a variety of different materials and techniques, as well as creative projects throughout the school year. Students will be required to research educational and career requirements and opportunities in the field of fashion design.

B. COURSE CONTENT

19. Course Goals and/or Major Student Outcomes (CAVPA Standards are noted in Blue)

By the end of the year the students will:

1. Understand and articulate the principles and elements of design as they apply to fashion design.
2. Demonstrate problem solving and critical thinking skills through group and individual assignments and projects.
3. Use observation techniques to study designers, trends, techniques, and marketing of fashion in the fashion industry. ***(CAVPA: Artistic Perception 1.0; 1.6, 1.8)***
4. Connect the application of diverse social, economic, and political developments in the contemporary fashions created. ***(CAVPA: Historical and Cultural Context 3.0; 3.1, 3.4)***
5. Analyze the relationship between the designer, manufacturer, and the product in the fashion industry and the influence society has on the interpretation and success of a design. ***(CAVPA: Aesthetic Valuing 4.0; 4.1, 4.3)***
6. Compare and discuss universal design concepts expressed in fashion design from diverse cultures. ***(CAVPA: Historical and Cultural Context 3.0; 3.3)***
7. Assess the role history and culture have played in the evolution of fashion throughout time.
8. Develop and demonstrate skills, knowledge, and education necessary to attain jobs and careers related to fashion design.

20. Course Objectives (CCATE Pathway Standards are noted in blue)

1. Demonstrate an understanding of the principles and elements of design as they apply to the fashion industry. (A 4.0)
2. Identify theories of historical, economical and political that impacts the fashion industry. (A 5.0)
3. Identify artistic and technological skills used in creating fashions.
4. Explain the relationship between history and fashion as influenced by culture and trends. (A 5.0)
5. Understand the stages of fashion from the creation of a design to marketing a finished product.
6. Analyze how fashion trends develop and evolve throughout history.
7. Understand the ways in which economies, mass production, labor unions, and technology have an affect on the fashion industry. (A 5.4)
8. Analyze textile design. (A 6.0)
9. Identify the characteristics of standard types of print design and the construction of fabric.
10. Identify how trends and color forecasting are used in the development of new clothing lines. (A 7.0)
11. Describe the principles of pattern making and draping techniques to produce a pattern for apparel design. (A 8.2)
12. Compare and contrast manufacturing and production of garments as it related to specifications and costs throughout the world. (A 1.0)
13. Develop designs that express individuality and creativity while utilizing principles and elements of form and function.
14. Identify the skills and procedures necessary for sales and marketing in the fashion industry. (A 10.0)
15. Research and present the effects that current laws and worksite policies have on the fashion industry. (A 12.0)
16. Research skills and knowledge of key concepts used in the workforce and organizational management, including the roles and responsibilities of management and employees. (A 3.0)
17. Research skills and knowledge necessary to attain a job or career in the fashion design industry. (3.0 Foundation Standards)

21. Course Outline

I. Principles and Elements of Design
- A. Principles and Elements of Design
  - 1. Principles of Design
    - a. Balance
    - b. Proportion
    - c. Emphasis
    - d. Rhythm
  - 2. Elements of Design
    - a. Shape
    - b. Line
    - c. Texture
- B. Color Theory
  - 1. Color terms
  - 2. Color wheel
  - 3. Color schemes
  - 4. Symbolism
  - 5. Color as a design element
  - 6. Color in apparel

Students will create a portfolio inclusive of:
1. Definition of principles and elements terms.
2. Draw two dimensional examples of each principle and element.
3. Define color theory terms, create a color wheel, and identify different color schemes.
4. Write a 1-2 page essay on the symbolism of the historical use of color.
5. Create a visual component using pictures of apparel that represent each principle, element and color scheme discussed in class.

II. Historical, Economical, and Political Impacts
- A. Historical Impacts
  - 1. European influences
    - a. France
    - b. Italy
    - c. Great Britain
  - 2. Asian influences
    - a. Japan
    - b. China
  - 3. United States influences
    - a. 1800 – 1900's influence
    - b. 1900's influence
    - c. 1910's influence
    - d. 1920's influence
    - e. 1930's influence
    - f. 1940's influence
    - g. 1950's influence
    - h. 1960's influence
    - i. 1970's influence
    - j. 1980's influence
    - k. 1990 – present day
- B. Economical Impacts
  - 1. Good economic conditions
  - 2. Bad economic conditions
- C. Political Impacts
  - 1. Laws or government regulations
  - 2. Disruptive world events
  - 3. Religion

Group project:
Students will locate specific works of art from different countries. They will identify evidence of the historical impact on fashion seen in each work of art.

Web quest internet research:
Students will visit websites from various decades of United States history. Choose one decade, select a fashion designer and create a 4-5 page research paper and visual presentation, using the principles and elements of design, of the designer and their works.

III. Artistic and Technological Skills
- A. Artistic
  - 1. Sketching Two-Dimensional
    - a. Sources of Inspirations
    - b. Adapting Designs
  - 2. Draping Three-Dimensional
    - a. Sources of Inspirations
    - b. Adapting Designs
- B. Technology
  - 1. Computer Aided Design
  - 2. Current technology used in the fashion industry.

Students will create two-dimensional sketches applying the correct formula (i.e. the nine head) to demonstrate an understanding of the human form, and then create a design that accentuates the form.

Students will create a portfolio of their design sketches.

Using the design sketch students will work in groups to create a three dement ional drape using one of their designs.

IV. History and Fashion
- A. Culture
  1. Values
  2. Attitudes
  3. Conformity
  4. Individuality
  5. Needs and Wants
- B. Trends
  1. Trend setters
  2. Trend cycles

V. Stages of Fashion
- A. Design Concepts
  1. Sketches
  2. Formal Drawings
- B. Pattern Development
  1. Design manipulations
  2. Prototype
- C. Fabric Selection
- D. Merchandising
  1. Sample Garments
  2. Focus Groups
- E. Production
- F. Marketing

1. Students will create a mood board, as the basis for their formal drawings.
2. Students will also create a color board consisting the three sketches, fabrics samples, three-dimensional design details, and textures used.
3. Students will make an oral presentation of their project to the class.
4. Students will research and evaluate the development and evolution of fashion trends seen in a particular period of time.
5. Students will design two fabrics and different art mediums to implement the design on material.

VI. Industrial Influences on the Fashion Industry
- A. Economy
  1. World Economies
  2. Imports/Exports
  3. Global Competition
- B. Production
  1. Automation
  2. Ergonomics
  3. Benchmarking
- C. Labor
  1. Unions
  2. Traditional Tailor System
  3. Piecework System
  4. Progressive Bundle system
  5. Modular Manufacturing
- D. Technology
  1. Microelectronics
  2. Robotics
  3. CAD Programs

Students will complete a mass production project.

Students will observe the technology used at the various stages of clothing construction.

VII. Characteristics and Maintenance of Textile Products
- A. Characteristics of Natural Fibers
  1. Cotton
  2. Wool
  3. Silk
  4. Flax (Linen)
  5. Other natural fibers used
- B. Characteristics of Non-Fiber Animal Products
  1. Leather
  2. Fur
- C. Characteristics of Manufactured Fibers
- D. Maintenance of Textiles
  1. Care of natural fibers
  2. Care of leather and fur
  3. Care of manufactured fibers
- E. Production and Manufacturing of Fibers

Textiles Lab:
Students will identify fibers and their characteristics.
Students will collect samples, descriptions, and care/maintenance guidelines.
Students will identify the historical and geographical significance of the use of fibers.

VIII. Types of Print and Weaving Construction
- A. Print Application Techniques
- B. Types of Weaves
  1. Plain
  2. Twill
  3. Satin

Students will create samples of different print application techniques using various materials. Samples will be incorporated into the portfolio.

Students will use construction paper to create/ demonstrate different types of weave patterns in fabric.

IX. Pattern Making and Draping
- A. Pattern Making
  1. Proportions
  2. Measurements
  3. Transferring sketch into pattern
  4. Drafting a basic block pattern
- B. Draping
  1. Fabric selection appropriate to garment design
  2. Fitting issues

X. Developing, Manufacturing and Producing New Lines
- A. Trends and Color Forecasting
  1. Sources of Inspiration
  2. Adapting Designs
- B. Manufacturing
  1. Manual
  2. Automated
  3. Modular
- C. Production
  1. Tailor System
  2. Progressive Bundle System
  3. Unit Production System

XI. Sales and Marketing
- A. Sales Procedures
  1. Promotion
  2. Ordering
  3. Shipping
  4. Merchandise Layout/Display
- B. Marketing
  1. Demographics
  2. Types of Retail Stores
  3. Purchasing Trends
  4. Promotion

Group project:
Students will visit a retail operation and evaluate its sales procedures, marketing and merchandising techniques to develop their own retail operation.

XIII. Education and Careers
- A. Education
  1. Four Year Universities
     a. Bachelors Degree
     b. Masters Degree
  2. Two Year Community College
     a. Associate Degree
  3. Vocational School
     a. Technical Certificate
- B. Careers
  1. Textile Industry
     a. Textile Research Scientist
     b. Textile Laboratory Technician
     c. Fabric Designer
     d. Fabric Stylist
     e. Fashion Director
     f. Department Manager
     g. Market Analyst
  2. Fashion Industry
     a. Fashion Designer
     b. Sketchers
     c. Sample Cutter
     d. Pattern Maker
     e. Assemblers
     f. Product Managers
     g. Buyers
     h. Retail Sales

Students may go on field trips to the Fashion Institute of Design and Merchandising (FIDM) or local community colleges.

Students will create an informational brochure, using the principles and elements of design, outlining a specific fashion related career, including educational requirements and employment opportunities.

22. Texts & Supplemental Instructional Materials

Fashion!; Mary Wolfe, Goodheart-Wilcox

The World of Fashion Merchandising; Mary Wolfe, Goodheart-Wilcox

23. Key Assignments

Tests/Quizzes
Multiple choice, matching and short essay
In Class Assignments
Lectures
Study guides
Book work
Discussions
Videos/DVD
Projects-individual and group
Packet of principles and elements of design explained and represented in photos.
Research a period of fashion or article of clothing.
Create two-dimensional sketches to create an original design.
Design fabrics.
Clothing construction techniques.
Evaluate clothing designs for a variety of body types.
Create samples of different types of weaving patterns.
Research a fashion designer and create a visual presentation.
Research education programs pertaining to the field of fashion and design.
Observations
Possible field trips to fashion schools, museums, and clothing stores.
Presentation Boards
Student Portfolio
Students will create a collection of work that represent a variety textiles, fashion reflecting elements and principles of design, fashion influence and trends. This will be an accumulation of various assignments and projects completed throughout the year.

25. Assessment Methods and/or Tools

Tests/Quizzes
In class assignments
Projects – individual and group
Observations
Presentation Boards
Student Portfolio

SMJUHSD Course Description

(Must be accompanied by a Course Adoption Form)

Course Purpose: *What is the purpose of this course?*

Leadership, communication skills, and work ethics are major contributing factors in today's successful work force. This course is designed to instruct and train students to meet the necessary leadership and communication skills needed for a career in the Family & Consumer Sciences industry. This course will provide instruction and meaningful experiences in personal development, career awareness and planning, management, and presentation of FCCLA leadership activities and Community Service Projects. Students will also be required to compile an individual career plan and portfolio. This course is designed to give students the opportunity to become a part of a Career and Technical Student Organization (CTSO) and compete at regional, state and national competitions in the Family & Consumer Sciences.

B. COURSE CONTENT

Course Outline: A *detailed descriptive summary of all topics covered. All historical knowledge is expected to be empirically based, give examples. (i.e. California State Standards).*

Course Goals and/or Major Student Outcomes

Upon completion of this course students will be able to:

1. Be a fair and effective leader.
2. Make logical decisions.
3. Work effectively with groups and committees.
4. Be able to speak effectively and communicate with others.
5. Manage, prioritize, and plan time efficiently.
6. Identify conflict and use conflict management.
7. Be able to conduct a meeting using parliamentary procedure.
8. Prepare a personal career portfolio.
9. Select and plan for a career.
10. Apply for a job and go through an interview process.
11. Perform 20 hours of community or school service.

Course Objectives

1.) To develop personal leadership qualities. a. Leadership: Who and what is a Leader? b. Developing Personal Responsibility c. Ethics d. Social Behavior e. Developing standards of personal dress f. Developing a sense of vision g. Developing self-discipline and goals h. Taking risks

2.) Growing interpersonal relationships a. Effective one-on-one communication b. Non-verbal communication c. Developing people skills d. Keeping commitments e. Loyalty and openness f. Encouraging others g. Conflict resolution h. Service to others

3.) Nurturing group leadership a. Leading in constantly changing times b. Systems thinking c. Encouraging personal mastery d. Understanding mental models e. Building shared vision. f. Shared decision making g. Presiding over meetings h. Speaking in public

4.) To create an awareness of the importance of agricultural leadership.

5.) To prepare students for college level entry in the various disciplines of agriculture science.

Unit 1 personal Leadership Development

Interpersonal Development

1. Demonstrate good manners and positive behaviors 2. Identify elements of positive self-concept 3. Demonstrate positive professional image and behaviors

Leadership Development

1. Knowledge of the history, aims, purposes, constitution, Organization of Family, Career, and Community Leaders of America. 2. Working knowledge of Parliamentary Procedure. 3. Demonstrate communication skills.

Unit 2 Effective Leadership Types and Traits of Good Leadership

1. Define and identify leadership styles. 2. Define technical, conceptual and human. relations skills. 3. Identify leadership potential 4. Understand Maslow's Hierarchy of needs. 5. Demonstrate methods of motivation and influence.

Unit 3 Career Planning / Career options

1. Explain the importance of work to the individual and society 2. Identify potential and local Family & Consumer Sciences careers. 3. Describe economic and technological trends of the work environment.

Career Planning

1. Identify, research, and describe and a Family & Consumer Sciences career. 2. Identify and list skills abilities, and education required for career choice. 3. Develop a career plan.

Individual Personal Portfolio

1. Develop personal; resume and letter introduction. 2. Complete a basic job application. 3. Acquire two letters of reference. 4. Demonstrate job interview skills. 5. Complete five Family & Consumer Sciences work samples. 6. Understand employee/employer responsibilities.

Unit 4 Communication Processes / Importance of Speaking and Listening

1. List and describe the importance of public speaking skills. 2. Demonstrate the ability to lead a group discussion. 3. Demonstrate the ability of being a good listener.

FCS Leadership

Unit 1 personal Leadership Development

Interpersonal Development

1. Demonstrate good manners and positive behaviors 2. Identify elements of positive self-concept 3. Demonstrate positive professional image and behaviors

Leadership Development

1. Knowledge of the history, aims, purposes, constitution, Organization of Family, Career, and Community Leaders of America. 2. Working knowledge of Parliamentary Procedure. 3. Demonstrate communication skills.

Unit 2 Effective Leadership Types and Traits of Good Leadership

1. Define and identify leadership styles. 2. Define technical, conceptual and human. relations skills. 3. Identify leadership potential 4. Understand Maslow's Hierarchy of needs. 5. Demonstrate methods of motivation and influence.

Unit 3 Career Planning / Career options

1. Explain the importance of work to the individual and society 2. Identify potential and local agriculture careers. 3. Describe economic and technological trends of the work environment.

Career Planning

1. Identify, research, and describe and a agriculture career. 2. Identify and list skills abilities, and education required for career choice. 3. Develop a career plan.

Individual Personal Portfolio

1. Develop personal; resume and letter introduction. 2. Complete a basic job application. 3. Acquire two letters of reference. 4. Demonstrate job interview skills. 5. Complete five agriculture work samples. 6. Understand employee/employer responsibilities.

Unit 4 Communication Processes / Importance of Speaking and Listening

1. List and describe the importance of public speaking skills. 2. Demonstrate the ability to lead a group discussion. 3. Demonstrate the ability of being a good listener.

Communication Technology

1. Identify and demonstrate ability to communicate effectively using telephone written memo and letters, verbally, and e-mail.

Public Speaking Skills

1. Select, research, develop, and deliver an 8-10 minute presentation to a local agriculture service group or education group.

Unit 5 Time Management / Importance of Time Management

1. Explain the process of time management 2. Develop a system for grouping and planning activities. 3. Develop and utilize a personal daily activity list.

Prioritizing

1. Understand and prioritize activities according to urgent, short term, immediate, or long term. 2. Develop and unitize a personal daily activity list.

Unit 6 Team Building/Group Dynamics

Student Outcomes, Group Definition, and Functions

1. Identify and define group norms

Group Cohesiveness and Teamwork

1. Identify and demonstrate group norms Teamwork and team work skills. 2. Identify roles within groups (dynamics). 3. Identify and understand role conflicts. 4. Identify and demonstrate group communication skills.

Group Pressure

1. Identify and explain group pressure.

Role Playing in Small Groups

1. Identify and demonstrate different roles within a group.

Unit 7 Understanding Power in Organization

Unit 8 Goal Setting

Unit 9 Critical Thinking and Problem Solving

Unit 10 Conflict Management

Unit 11 Public Speaking

Unit 12 Parliamentary Procedure

Unit 13 Current Issues

2. PREVIOUSLY APPROVED COURSES

Complete outlines are not needed for courses that were previously approved by UC. Was this course previously approved? ___Yes X No

If yes, indicate category which applies.

A course reinstated after removal within 3 years.
Year removed from list? _____
Same course title? ___Yes ___No
If no, previous course title? _____

___An identical course approved at another school in same district.
Which school? _____
Same course title? ___Yes ___No
If no, course title at other school? _____

___Approved International Baccalaureate (IB) course

___Approved CDE Agricultural Education course

___Approved P.A.S.S./Cyber High course

___Approved ROP/C course. Name of ROP/C? _____

___Approved A.V.I.D. course

For preparation Only

___Approved C.A.R.T. course

___Approved Project Lead the Way course

___CSU Expository Reading and Writing course

___Other. Explain: _____

___Advanced Placement Course
If Advanced Placement, has it been authorized by the College Board through the AP Audit process?
___Yes ___No If not, please explain why._____

Is this course a resubmission?
___Yes ___No
If yes, date(s) of previous submission? _____
Title of previous submission? _____

Is this an Internet-based course?
___Yes ___No
If "Yes", who is the provider?
___PASS/Cyber High ___Other_____

Is this course modeled after an UC-approved course from another school outside your district?
X Yes ___No
If yes, which school(s)? Oxnard High School / Merced County Regional Occupational Program

Course title at other school Food and Nutritional Science / Food Science

Is this course classified as a Career Technical Education? Yes X No ____
If Yes:
Name of Industry Sector: Hospitality, Tourism, and Recreation Industry Sector
Name of Career Pathway: Food Science, Dietetics, and Nutrition

4. CATALOG DESCRIPTION

Brief Course Description (If school has a catalog, the description that is in the catalog. If not, a brief description of the course) (NOTE: DO NOT INCLUDE INFORMATION THAT COULD IDENTIFY YOUR SCHOOL OR DISTRICT.)

Food and Nutritional Science is designed to give students an understanding of food science and the science of human nutrition to promote optimal health. This applied, laboratory-based course will emphasize the chemical, physical, and microbiological properties of food and the relationship to nutrition. It is designed to educate students about the functional components of foods, food preparation, food safety, nutrition, sensory evaluation, quality assurance, new product development, food chemistry, food processing and careers in the industry.

GENERAL COLLEGE PREP ELECTIVE GUIDANCE
The intent of the college preparatory elective requirement is to encourage prospective UC students to fill out their high school programs with courses that will meet one or more of a number of objectives:

- To strengthen general study skills, particularly analytical reading, expository writing, and oral communications
- To provide an opportunity to begin work that could lead directly into a major program of study at the University, and
- To experience, in some depth, new areas of academic disciplines that might form the basis for future major or minor studies at the University

Quality. All courses selected to meet the "g" elective requirement are expected to meet standards of quality similar to those required for the "a-f" requirements. Courses acceptable for the "g" elective area should be advanced courses designed for the 11th and 12th grade level and/or have appropriate prerequisites. Elective courses should present material at a sufficient depth to allow students to achieve mastery of fundamental knowledge that prepares them for University work or a future career path.

COLLEGE PREP ELECTIVE: INTERDISCIPLINARY/OTHER GUIDANCE
- Courses must be rigorous in terms of academic content and student expectations.

COURSE CONTENT

A. Course Purpose. What is the purpose of this course? Please provide a brief description of the goals and expected outcomes. Note: More specificity than a simple recitation of the State Standards is needed.

- Students will build on the aspects of chemistry, using food to better understand chemistry and its relationship to personal and environmental issues.
- Students will demonstrate the ability to analyze situations and solve problems by applying the scientific inquiry process and to think critically by effectively completing challenging group and individual projects and assignment.
- Students will develop laboratory writing, reasoning and mathematic skills through measuring, recording data, Excel graphs and writing laboratory and research reports.
- Students will investigate current nutritional health issues and develop a better understanding of the long-term impact on themselves and society.
- Students will demonstrate knowledge and understanding of food science regarding meat, poultry, dairy products, fruits, vegetables, grain, and legumes.
- Students will investigate scientific issues by asking meaningful questions, researching literature and on the internet, conducting careful investigations, analyzing data, and formulating explanations by using logic and evidence.

For preparation only

B. Course Outline. Detailed description of topics covered. Show examples of how the text is incorporated into the topics covered.

See Chart in next section:

C. Key Assignments: Detailed descriptions of the Key Assignments including tests, and quizzes, which should incorporate not only short answers but essay questions also. How do assignments incorporate topics? Include all assignments that students will be required to complete.

Course Outline

Units of Instruction	Key Assignments
I. Introduction to the Course **A.** Safety 1. Safety Procedures 2. Accident Prevention 3. Emergency Procedures **B.** Use of equipment 1. Tools and layout **C.** Weights and measures 1. Conversions of measurements used 2. Measure liquids and solids 3. Scales and thermometers **D.** Lab Organization 1. Organizing work stations	• Safety Test • Bacteriological Examination of Food Equipment and Eating Utensils (Bacteria test on utensils and other environmental conditions) • Calibrating measuring/lab equipment • Properties of popping corn lab • Measuring mass and volume lab
II. Scientific Method **A.** Forming a hypothesis **B.** Experimentation **C.** Analyzing data **D.** Reporting Results	• Design your Own Experiment (How to setup an experiment) • Developing Data Tables (For use in lab analysis) • Using Data for Calculations and Graphs
III. Overview of Food Science **A.** Food Industry Organization **B.** Food Industry Trends	• Research Food Tariffs Internet Project (Understanding food tariffs) • Write a research paper of a historical milestone in food science or a person who has had a an impact on the advancement of food science using APA/MLA documentation
IV. Sensory Analysis A. Factors Influencing Senses	• Odor Recognition Lab • Taste Test Panel

For preparation only

1. Sensory Testing and Evaluation 2. Research Design 3. Validity 4. Reliability 5. Variables	Activity • Statistical Analysis • Psychological Study of sensory influence • Write a Personal Profile (based on the food choices you make)

V. Nutrition and Digestion **A.** Nutritional Values 1. Nutritional needs using RDA or DRI 2. Function of energy, carbohydrates, and fats 3. Calorie content of proteins, carbohydrates, and fats 4. Amino acids 5. Water and fat soluble vitamins 6. Minerals required by the body **B.** Digestion 1. Process of digestion 2. Organs involved in digestion	• Digestion of Starch Lab • Identifying Basic Components of Food (Nutrients) Lab (Measure the presence of major nutrients such as complex carbohydrates, protein, fat, etc.) • Effects of Changing to a Low Fat Milk (Calculate the number of calories and grams of fat that would be saved by changing to lower fat milk)
VI. Chemistry of Foods **A.** Chemical properties 1. Chemical properties of an element 2. Covalent, hydrogen, and ionic bonds 3. Molecules 4. Oxidation-reduction reactions 5. Metabolism **B.** Carbohydrates 1. Sugars 2. Carbohydrates in food **C.** Proteins 1. Chemical makeup and functions	• Boiling Points of Sugar and Salt Solutions Lab (Understanding different boiling points of liquid solutions) • Potato Chip Lab (Oxidative rancidity)

For preparation Only

	D. Fats 1. Lipids 2. Saturated and unsaturated fats 3. Fats and water soluble vitamins **E.** Minerals 1. Essential nutritional minerals **F.** Water essentials 1. Function of water in the body	
VII.	Food Processing and Technology **A.** Material handling **B.** Food Preservation 1. Mixing 2. Heat transfer 3. Chemicals 4. Irradiation 5. Separating 6. Drying 7. Packaging **C.** Biotechnology and Genetic Engineering 1. Process 2. Future trends **D.** Water 1. Structure and properties	• Biotechnology in Food Safety Lab (Design a bioengineered food product) • A Bioengineered Food Product Lab (The enzyme rennin and its impact on hard cheese production) • Binding Water in Meat Products (Importance of water in meat products) • Boiling Point of Water Lab (Understanding boiling points of water) • Heat Transfer on Cooking Rate Lab (Understanding how heat transfer effects food) • Dehydration Lab (Dehydrate fruit and measuring water content)

VIII.	Packaging **A.** Packing Concepts 1. Packing materials 2. Properties of packaging 3. Environmental concerns	• Affects of Light on Food Flavor Lab (Affect of lights has on the flavor of corn chips stored under varying conditions) • Popcorn Packaging Lab (How laminated microwave popcorn package and its influence on popping rate)
IX.	Dairy Processing **A.** Dairy Processes 1. Quality control 2. Pasteurization and homogenization 3. Composition of milk **B.** Butter	• Butter Lab (Steps and process to create butter) • Ice Cream Lab (Create and process a new type of ice cream) • Cheese Lab (Steps to

For preparation only

	1. Separating butterfat **C.** Dairy Products 1. Bacteria used to produce dairy products 2. Fermented dairy products 3. Physical changes 4. Sensory testing and analysis **D.** Ice Cream 1. Heat transfer in processing ice cream	processing cheese) • Bacteria in Milk-A Chemical Analysis Lab (Perform analysis to detect the presence of bacteria in milk) • Fat in Milk Lab (Measure fat content in a variety of milk brands)
X.	Meat, Poultry, and Eggs **A.** Meat and Poultry 1. Composition of meat and meat products 2. Fat content of ground beef 3. Quality and yield grading 4. Sensory testing and analysis **B.** Eggs 1. Grading Egg	• Exam Nitrites and Nitrates in Meat (How a substance which can be toxic is used in minute proportions) • Fat content of Skinned and Skinless Chicken Lab (Measure amount of fat after cooking) • Exam the Process of Grading Eggs
XI.	Cereal Grains, Legumes, and Oilseeds **A.** Grains 1. Structure and composition of a grain **B.** Starches 1. Properties of starch **C.** Flour 1. Classes and grades of flour **D.** Corn 1. Corn refining **E.** Oilseeds 1. Compositions of oilseeds 2. Uses of products **F.** Legumes 1. Composition of legumes **G.** Soybeans 1. Soybean extraction	• Subsurface Mold Growth in Food Control of Molds in Breads Lab (Morphological characteristics of mold and spores)

For preparation Only

XII.	Fruits and Vegetables **A.** Structure and Physiology 1. Nutrient composition 2. Structure of a plant cell 3. Plant tissues and their functions 4. Climatic and non-climatic 5. Responses to heat or Ph 6. Factors affecting textures **B.** Grading 1. Quality grading 2. Sensory testing and analysis **C.** Processing 1. Processing of fruits 2. Processing of vegetables	• Examine the testing process of pesticide residues found on fruits and vegetables • Organic Foods Lab (Taste test difference) • Comparing Canned and Frozen Food Lab • Pigment Extraction Lab (Remove pigment from fruit and vegetables)
XIII.	Food Safety **A.** Sanitation 1. Microorganisms that provide an index of food sanitation **B.** Food-Borne Illness 1. Types of microorganisms that can cause food borne illness 2. Microbial growth **C.** Regulations 1. HAACP in food safety 2. Food security and food defense	• Microbial Growth in Foods-Spoilage Lab (Conditions that promote bacterial growth) • Bacteria are Found Everywhere Lab (Bacteria Test) • Food and Sanitation Activity by the Food and Drug Administration (Test for cleaning)
XIV.	Fats and Oils **A.** Composition and Processes 1. Saturated and unsaturated, cis, tarns, and fatty acids 2. Melting point and structure of fatty acids 3. Monoglycerides and diglycerides 4. Fat substitutes	• Examining a Variety of Oils Lab (Measure the fat content)
XV.	Candy and Confectionery **A.** Types of Candies 1. Crystalline and non-crystalline candies **B.** Components **C.** Candy Making Processes 1. Sugar concentration and boiling	• Affects of Temperature on Butter Lab • Invert Sugar and Sucrose Lab (How sugar and sucrose are inverted)

For preparation Only

point 2. Inverting sugar 3. Caramelizing techniques	

D. Instructional Methods and/or Strategies

Instructional methods and strategies may include, but is not limited to:

1. Textbooks
2. Direct instruction and discussion
3. Lecture
4. Write and deliver persuasive essays and reflective compositions
5. Reading assigned materials
6. Internet research
7. Self-directed/independent, cooperative and collaborative learning
8. Independent and group laboratory experiments
9. Written, oral, and multimedia/power point presentations
10. Curriculum based field trips
11. Industry experts
12. Supplemental books, articles, etc.
13. Career research , job applications, and resumes

E. Assessment Methods and/or Tools

Assessment of student performance will include, but is not limited to:

1. Individual or group project based learning assignments
2. Lab projects and reports
3. Teacher observation
4. Examinations and quizzes
5. Student demonstration
6. Research projects
7. Homework
8. Presentations/Exhibitions
9. Rubrics
10. Peer evaluation
11. Portfolios
12. Calif. State ELA Standards-Writing Applications:WA2.1, WA 2.2, WA 2.3, WA 2.4, WA 2.5 and WA 2.6

F. Corresponding Non-Honors Course. Indicate the name of the regular non-honors course corresponding to this proposed honors course.

For preparation Only

G. Differences in Honors/Non-Honors Courses. Describe in detail how this honors course differs from the regular course offered in the same subject area. Be specific.

For preparation Only

Course Title

Foods for Special Occasions

Description of Target Group

This course is designed for all 10th, 11th, and 12th grade students who have successfully completed Foods and Nutrition A/B or instructor approval.

Purpose

This one-semester course is designed as an elective for students who have an interest in foods for special occasions.

The course will provide a combination of subject matter and activities designed to aid the student in preparation of foods for special occasions including such things as cake decorating, holidays, celebration types, and entertainment. The student will study consumer selection, storage, preparation, and service for special occasions to meet their individual needs and preferences. They will gain a knowledge of various styles of food and table service.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. To plan, budget, prepare, and serve foods for special occasions.
2. To coordinate invitations, decorations, and foods to a specific theme.
3. The ability to issue formal and informal invitations.
4. Analyze, select, prepare, and store food products which meet the nutritional, economic, and social needs and preferences consistent with their value systems.
5. Knowledge of various styles of food service by using efficiency in table service based upon customs compatible with the practices acceptable in his/hr contemporary society.
6. In basic cake decorating by completing a minimum of one decoration project.
7. In acceptable host/hostess skills through classroom entertainment.
8. To plan, select appropriate food and entertainment, and prepare a children's party.
9. Compare cost analysis of ready made products versus home made.
10. Develop a continuing awareness of career opportunities that are available in the areas of food preparation.

Students will acquire sufficient economic understanding and consumer competency to make wise decisions in the use of their resources.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District.

Course Title

Foods and Nutrition, Advanced

Description of Target Group

This course is designed for students who are interested in the study of advanced food preparation techniques. This course is highly recommended for 10th, 11th and 12th grade students who have successfully completed Foods and Nutrition A/B.

Purpose

This is a one-semester course, which will emphasize the buying and storing of foods, as well as advanced food preparation techniques and food preservation. There will be a strong emphasis on nutrition, meal management techniques, and consumer selection to meet individual needs and preferences. There will be an overview of world and American regional foods. Activities will include cake decorating, holiday decorations and planning, and various styles of food and table service. Students will explore opportunities in the food industry. This is an excellent preparation for an entry level job in the food industry.

Topics:

1. Controlling your weight and special food needs.
2. Buying and storing food.
3. Variety of food service style.
4. Coordinating formal and informal invitations, decorations and food for specific theme.
5. Planning, budgeting and serving food for special occasions.
6. Host/hostessing skills through classroom entertainment.
7. Preparing beverages, stocks, soups, sauces, pasta.
8. Awareness of career opportunities in food industry.
9. Meal management, etiquette, manners.
10. Comparison cost analysis of ready-made products versus homemade.
11. Understanding of the economic and consumer decisions necessary to make wise use of resources.

Instructional Materials

Text and supplementary materials.

Refer to: Secondary Adopted Texts and Approved Supplemental Books Used in the Santa Maria Joint Union High school District

Activities

Students will use educational materials which relate to the various phases of food service. These will include books, magazines, miscellaneous equipment, slides, filmstrips, films, demonstration materials, etc. Also, students will participate in laboratory work, field trips, and work with resource people and guest speakers. Practical experience in creation of projects will be included.

Course Title

Foods, Foreign

Description of Target Group

This course is designed as an elective for 10th, 11th, and 12th grade students who have an interest in foods from other countries. It is recommended that students enrolled in this course have successfully completed the requirements of Foods and Nutrition A/B or instructor approval.

Purpose

This one-semester course will provide a combination of subject matter and activities to gain an understanding of food customs, food habits, cultural background, and appreciation of a wide variety of foods from regions in the United States and other countries.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Evaluating information, which could be interpreted as food faddism and fallacies.
2. Developing an ability in applying management principles to meal preparation.
3. Ability to plan, prepare, and serve meals using recipes of foreign origin.
4. A willingness to accept foods of foreign origin.
5. Knowledge of familiarity with food habits and customs of different nationalities.
6. Developing a continuing awareness of career opportunities that are available in the areas of food preparation.
7. Acquiring sufficient economic understanding, and consumer competency to make wise decisions in the use of their resources.
8. Ability to evaluate the nutritional value of food prepared.
9. Be able to use substitution and equivalent charts in preparing market orders.
10. Be able to define and use foreign cookery terms in class.
11. To use specialty equipment as used in preparation of foreign foods.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

The student will study the socio-economic aspects of geographical food customs including world nutrition, food habits, food facts and fallacies. The student will study the national religious and cultural variations of specific food types, spices, cooking methods, and utensils as related to breads, pastries, cereals, gelatins, meats, soups, vegetables, and fruits.

Course Title

Foods Study, Advanced Gourmet Foods

Description of Target Group

This course is designed for students who are interested in the study of advanced food preparation techniques. The course is highly recommended for 10th, 11th and 12th grade students who have successfully completed Foods and Nutrition A/B.

Purpose

This is a one semester course, which will emphasize the buying and storing of foods, as well as advanced food preparation techniques including stocks, soups, sauces, beverages, and food preservation. There will be a strong emphasis on nutrition. Meal management techniques will also be covered. There will be an overview of foods of the world and American regional foods. Students will explore career opportunities in the food industry; including how to get and keep a job. This course will be excellent preparation for an entry level job in the food industry.

Topics:

1. Foods, Facts, and Fallacies
2. Controlling your weight and special foods needs.
3. Buying food.
4. Storing food.
5. Meal management etiquette, manners.
6. Healthy living-satisfying a sweet tooth the low fat way (confections, meringues).
7. Stocks, Soups, Sauces, Pasta.
8. Beverages.
9. Preserving Food at Home.
10. Foods of the World.
11. American Regional Food.
12. Careers in Food and Nut.
13. How to get and keep a job.

Instructional Materials

Text and Supplementary Materials
Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District.

Activities

Use of Supplementary periodicals, video, films, filmstrips, visual aids, and demonstrative materials. Practical experience in creation of projects will be included. Professional guest speakers to be invited.

Course Title

HEALTH EDUCATION (5 Units)

Description of Target Group

Ninth through Twelfth Grade Students

Prerequisites

None

Purpose

This one semester course (5 units) is a combination of Health 9/10 and Health 11/12. It will satisfy the District 4-unit Health requirement for graduation. It is designed to stress the skills which enables students to make healthy decisions throughout their lives. The curriculum stresses a holistic approach to health. The emphasis is on social, physical and mental health to create a strong foundation and enable students to make healthy decisions regarding the following: stress, nutrition, physical fitness, substance abuse, STD's, family planning issues, personal mission statements, decision making, core values, personal safety, mental illness, diet and diseases, and parenting.

Standards of Expected Students Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

Health Education

1. Use basic rules of general hygiene, good nutrition, proper exercise, and mental health.

2. Recognize and practice positive family health habits.

3. Recognize and avoid the harmful effects of alcohol, narcotics, tobacco, and restricted, dangerous drugs.

4. Recognize the physical, psychological, and behavioral effects of the most abused drugs in our society.

5. Describe the major STD's (including HIV/AIDS) and the necessary factors for the successful prevention and control of these diseases.

HEALTH EDUCATION (5 Units) continued

6. Understand reproductive health and the proper use of family planning methods.

7. Recognize the benefits of abstinence to the individual, family and society.

8. Understand the life cycle and crisis management techniques as it relates to an individual's health.

9. Decision making skills will be stressed throughout the curriculum.

10. Have developed a personal mission statement and understand the steps involved in successful decision making.

11. Ability to communicate the affects of alcohol on the human body and judgment.

12. The students will also have a basic understanding of first aid and be familiar with CPR and the Heimleich Maneuver.

13. Will study a variety of mental illnesses and be able to describe their symptoms and treatments.

14. Will study diet and disease specifically in the areas of: nutrition and fitness, breast and testicular cancer, osteoporosis, heart, diabetes, alcoholism.

Instructional Materials

Textbook and supplementary materials
Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in Santa Maria Joint Union High School District.

Activities

Health Education activities will include use of county and district films, lectures, discussions, demonstrations, student reports and committee work, guest speaker, role playing, quizzes, and test.

Assessment

Journal, demonstrations, group presentations/discussion, role playing, tests, quizzes, and authentic assessment.

Course Title

Home Economics, Independent Study

Description of Target Group

This course is designed for the student who has an interest in voluntarily participating in additional study or in developing a special activity in a particular area of Home Economics. This course is recommended for students who have completed all courses offered by the department in the area they wish to study and who wish additional study in that area.

Purpose

The purpose of Independent Study is to provide for flexibility in the amount of learning experiences to be completed by the student. Additionally, the opportunity to pursue individual interest in Home Economics area is provided to the student.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. The ability to prepare, with the aid of the instructor, a written proposal for planned study.
2. The ability to function adequately within the unstructured framework of independent study by establishing and meeting self-imposed deadlines and standards of expected student achievement.
3. Knowledge of chosen areas of study by completion of terms agreed upon in student/teacher contract.
4. Develop a continuing awareness of career opportunities pertaining to chosen areas of study.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District.

Activities

The student will use any educational materials which will enable him to achieve the goal established in the teacher/student contract.

Course Title

Home Living, Advanced

Description of Target Group

This course is designed for 10th, 11th, and 12th grade students interested in child growth and development, care and nurture of the family and its safety, learning skill and techniques in the care and selection of fabric, and constructing a project. Introduction to Home Living is not a prerequisite, but it is desirable.

Purpose

This course will provide the students with information concerning the differing food needs in a family, special diets, safety and health care of family members, a knowledge of and skill in the intellectual, social, and physical development of a child as well as to learn skills and techniques in the care and selection of fabric, and constructing of a lounging garment.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Demonstrate knowledge of differing food needs in a family.
2. Understand the different types of diets for various illnesses.
3. Plan, prepare, and serve the prescribed diet according to the physician's specifications.
4. Arrange tray service meals for the ill, home convalescent, and the bedridden.
5. Demonstrate feeding techniques for the ill, the home convalescent, and the bedridden person.
6. Plan, prepare, and serve nutritious, well-balanced meals.
7. Demonstrate correct sanitation practices.
8. Describe safety attitudes and practices.
9. Carry out the necessary first aid for the ill, the home convalescent, and the elderly until professional medical assistance is needed.
10. Explore career possibilities increasing their understanding of the options available to them in the world of work.
11. Develop a positive attitude toward work and appreciate its contribution to self-fulfillment and to the welfare and productivity of the family, community, nation, and the world.
12. Demonstrate a favorable attitude in looking his/her best at all times.
13. Describe how and where to apply for the desired job.
14. Describe the proper attire for the personal interview.
15. Carry out specific instructions given by one's employer.
16. Demonstrate proper telephone etiquette in receiving and giving messages.
17. Make an emergency phone call.

Home Living, Advanced (continued)

18. Demonstrate hygienically cleaning bed linens, medical supplies, eating utensils.
19. Show concern and respect for the property of others.
20. Describe use of special equipment needed for the ill or convalescent.
21. Entertain a child, an elderly, convalescent, or bedridden person.
22. Understand the physical, social, emotional, and intellectual development stages of a child.
23. List a variety of children's games, songs, and activities for specific age groups.
24. Know and be able to carry out disciplinary techniques for specific age groups.
25. Follow and carry out specific instructions given by one's employer.
26. Be familiar with and know the differences between the various child care schools –Head Start, day care centers, nursery schools (private and public), parent co-ops, and licensed baby sitters.
27. Select toys and games according to the appropriate age level.
28. Read a story to a young child, ill, elderly, and/or convalescent.
29. Choose a suitable fabric and pattern for a project.
30. Know the techniques required to complete a suitable and acceptable project.
31. Demonstrate correct care and use of equipment in the home.
32. Know safety techniques in the home.
33. Observe children in a nursery school situation.
34. Gain an economic understanding and consumer competency to make wise decisions in the use of resources as related to home living skill.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Students will use educational materials, which relate to the various areas of child growth and development, care and nurture of the family, personal and social relationships, and clothing and textiles. These will include books, magazines, miscellaneous equipment, slides, filmstrips, films, demonstration materials, etc. Also, students will participate in laboratory work, classroom discussions, field trips, and work with resource people.

Course Title

Home Physical Science A

Description of Target Group

Home Physical Science A is designed as a Home Economics course to fulfill the Physical Science requirement for the non-college student. The course is designed for students who have an interest in practical application of physical science in the home and in relation to food preparation. There is no prerequisite for this course.

Purpose

Home Physical Science A is the first of a two-semester course designed to develop basic scientific understanding of the areas of physical science as related to home studies of cleaners, energy use, food preparation, etc. This course will emphasize the following areas of physical science: atoms, elements, measurements, compounds, formulas, acids, bases, heat and density, etc. These areas of physical science will be studied in relation to application and use in the home. Areas such as measurement, equipment, effect of acids, bases and heat in preparing foods, food preservation, food additives, sugar cookery, starch cookery, fats, etc.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Ability to identify and give proper use of the kitchen equipment and scientific equipment used.
2. To identify and manipulate various methods of measurement.
3. Show the importance of accurate measurement and relevance to the scientific method.
4. To identify and manipulate a thermometer in the scientific preparation and testing of foods.
5. Ability to identify and define cooking and scientific terminology.
6. Use of the safety and sanitation rules for working in a foods and science lab.
7. Use the scientific methods in the preparation, storage, testing, and consumption of food.
8. Use of proper measuring techniques.
9. The correct use and care of kitchen hand tools as well as the use and care of large and small appliances.
10. Ability to write a usable time plan and follow it in a laboratory situation.
11. Demonstrate the effect of heat on cooking various food items.
12. The student will apply food chemistry by solving problems using scientific theories and concepts (chemical equations, temperatures, symbols, and chemical reaction).

13. Ability to prepare foods according to the preparation principles considered acceptable by those persons established as authorities in this area.
14. Ability to investigate the food prices at the local stores and plan meals to meet economic limitations and maintain nutritional requirements.
15. Ability to write a market order which is organized by food categories and which specifies quantities and any desired brands.
16. Develop a continuing awareness of career opportunities in foods and science.
17. Ability to consistently maintain a sanitary and orderly process of operation during the preparation of food items by keeping waste items gathered, by keeping soiled equipment cleaned up as work progresses, by returning equipment to designated storage areas, and by leaving the kitchen in a clean condition when work is completed.
18. Ability to use resource materials to locate desired information.
19. Recognize how material changes through different states.
20. Discuss the problems faced in conserving earth.
21. Recognize and know implications of acid-base and oxidation in relation to food preparation.
22. Follow instructions both oral and written, and run a laboratory exercise, collect data, and clean up after the lab.
23. Analyze lab data and write conclusions relating the data to the purpose for each lab.
24. Develop and use a notebook for this class. Record and graph experimental data.
25. To recognize the rapidly expanding scientific advances being made in related areas such as computers, nutrition, health, and space.
26. To give students opportunities to develop values, aspirations, and attitudes that promote their personal involvement with the environment and society through land use and physical resources management.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in Santa Maria Joint Union High School District.

Activities

Students will use educational materials, which relate to the various phases of food nutrition, consumer economics, and preparation principles. These will include books, magazines, miscellaneous equipment, slides, filmstrips, films, demonstration materials, etc. Also, students will participate in laboratory work, field trips, and work with resource people.

Home Physical Science A (continued

Resource Materials:

Project Wild
Physics Experiments for Children
Chemistry Experiments for Children
Electricity Experiments for Children
Biology Experiments for Children
Kitchen Science
AIMS Project - Fun with Foods
County and Department films and filmstrips
Energy 83
Mini-Scope Teacher Guide and Lesson Plans

Course Title

Home Physical Science B

Description of Target Group

Home Physical Science is designed as a Home Economics course to fulfill the Physical Science requirement for the non-college bound student. The course is designed for students who have an interest in practical application of physical science in the home and in relation to food preparation. Home Physical Science A skill is recommended.

Purpose

Home Physical Science B is the second semester of a two-semester course designed to develop basic scientific understanding of the areas of physical science as related to home studies of chemicals, energy use, food preparation, etc. This calculation of energy usage, chemical reactions, machines, density, measurements in addition to areas emphasized in the first semester. These areas of physical science will be studied in relation to application and use in the home. Areas such as measurement, equipment, microwave cookery, protein cookery, meal planning, home safety and sanitation, calker, textiles, food and fuel in the future, and nutrition.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Ability to prepare a plan of work for food preparation which delineates realistic time segments for the class time limitations, designates specific job tasks for organized completion of meal implementation, and describes tool and equipment items used throughout the food preparation and scientific techniques.
2. Can consistently demonstrate, in the laboratory situation, either an effort to practice the preparation principles relative to the food item under study or through an evaluation, recognition of the processes which could have provided success when the activity has experienced partial or complete failure.
3. Can consistently maintain a sanitary and orderly process of operation during the preparation of food items by keeping waste items gathered, keeping soiled equipment cleaned up as work progresses, returning equipment to designated storage areas, and leaving kitchen in a clean condition when work is completed.
4. Be able to recognize and demonstrate proper use of cleaning agents and other chemicals found in the home.
5. Be able to recognize and use solutions and compounds.

6. Ability to recognize and/or report correct responses to questions concerning food preparation principles or techniques.
7. Use large and small appliances and hand tools according to the manufacturer's instructions and according to the needs of the specific preparation task.
8. Operate large and small appliances and hand tools in a safe and sanitary manner designed to protect the health and safety of those participating in the activity and the "life" of the equipment.
9. Write a market order which is organized by food categories and which specifies quantities and any desired brands.
10. Analyze and describe techniques in selection and storage of food items in accordance with currently accepted nutrition and consumer practices.
11. Write an evaluation, which analyzes and judged the effectiveness of the student's written plan in relation to the reality of execution of the plan in the laboratory situation.
12. The ability to cook foods at a low temperature and in as short a cooking time as possible to obtain the desired format.
13. Develop a continuing awareness of career opportunities in foods.
14. Develop with teacher's guidance, a plan to complete a simple scientific project using foods.
15. Identify and use the materials and techniques of physical science as related to the study of foods.
16. The student will apply food chemistry by solving problems using scientific theories and concepts (chemical equations, temperature, symbols, chemical reactions, carbohydrates, and wavelengths).
17. Follow instructions, both oral and written, and run a laboratory exercise, collect data, and clean up after the lab.
18. Analyze lab data and write conclusions relating the data to the purpose for each lab.
19. Develop and use a notebook for this class. Record and graph experimental data.
20. Demonstrate the effect of heat on food preparation.
21. To study areas of food preparation by applying the scientific process.
22. Describe use and preservation of natural resources as related to food production and preparation.
23. To recognize and appreciate the rapidly expanding scientific advances being made in related areas such as computers, nutrition, health and space.
24. To give students opportunities to develop values, aspirations, and attitudes that promote their personal involvement with the environment and society through land use and physical resources management.

25. Demonstrate an understanding, rational and creative thinking processes of observing, communicating, comparing, organizing, relating and inferring, problem solving, and decision making.
26. The importance of basic facts and information in making career and consumer choices.
27. The importance and application of technology to everyday life.
28. To give students opportunities to develop values, aspirations, and attitudes that promote their personal well being through and understanding of themselves, other living organisms, and the importance of maintaining a balance in nature.
29. Ability to name the nutrients needed by the body and the foods that are good sources of these nutrients and to state reasons why the body needs nutrients.
30. Be able to explain sources and used of energy.
31. Be able to calculate energy consumption in the home.
32. Know and practice safe use of energy.
33. Be able to identify textiles and their proper care.
34. Recognize the components of energy and how it relates to our lives.
35. Demonstrate a basic understanding of electricity including principles of conduction and resistance. Electrical sources, conservation, and safety issues are included as well.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in Santa Maria Joint Union High School District.

Activities

Students will use educational materials, which relate to the various phases of food nutrition, consumer economics, and preparation principles. These will include books, magazines, miscellaneous equipment, slides, filmstrips, films, demonstration materials, etc. Also, students will participate in laboratory work, field trips, and work with resource people.

B. COURSE CONTENT

Please refer to instructions

19. Course Goals and/or Major Student Outcomes

This one semester course is designed to provide a combination of subject matter and activities to develop abilities necessary for assisting with and/or performing the common and important operations or processes concerned with:

1. Understanding the relationship between values, goals, and decision-making.
2. Awareness of the importance of Mental Health and recognizing symptoms of Mental Illness.
3. Assessment of risks and precautionary measures to stay safe in today's world.
4. Selection, purchase, and preparation of food, with emphasis on simple and inexpensive meals.
5. Housing selection and care.
6. Budgets and Finance
7. Clothing Care
8. Review of reproductive health issues including HIV and STI prevention and family planning methods.

20. Course Objectives

Standards of Expected Achievement

1. Students identify their own values and goals and learn to apply decision-making model to everyday life.
2. Students research a Mental Illness and present symptoms and prognosis to the class.
3. Students acquire knowledge to increase safety awareness at home and in the community.
4. Students apply practical knowledge of kitchen equipment, safety and sanitation, and cooking methods to basic recipe preparation.
5. Students use resources to select housing which meets financial and personal needs, to understand and accept the responsibilities of renting and to interpret information found in a lease.
6. Students explore the criteria for a realistic, workable budget.
7. Students apply the basic knowledge necessary to get the most from their clothing dollars.
8. Students assess risks of sexual activity and re-visit the benefits of an abstinent lifestyle.

21. Course Outline

22. Texts & Supplemental Instructional Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books used in the Santa Maria Joint Union High School District.

23. Key Assignments

24. Instructional Methods and/or Strategies

Activities:

Use of supplementary periodicals, films, filmstrips, visual aids, and demonstration materials. Guest Speakers may also be available to speak with students regarding a variety of applicable topics.

25. Assessment Methods and/or Tools

Students will be evaluated through a variety of assessment tools. Students will be evaluated on mastery of content and skills, class participation, and effort.

C. HONORS COURSES ONLY

Please refer to instructions

26. Indicate how this honors course is different from the standard course.

D. OPTIONAL BACKGROUND INFORMATION

27. Context for Course (optional)

28. History of Course Development (optional)

Course Title

Interior Design A

Description of Target Group

This course is designed for 10th, 11th and 12th grade students interested in interior decorating and housing.

Purpose

This course will provide the students with information concerning consumerism and the basic fundamentals in interior decorating, furniture, colors, the history of housing, interior design, etc.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Identify housing and furnishing needs according to life style.
2. Evaluate a home in terms of meeting the needs of children, the elderly, and physically handicapped.
3. Recognize the elements of design and how they relate to interior decorating.
4. Identify a satisfactory floor plan.
5. Be aware of the environmental impact of housing on an area to be developed.
6. Develop a satisfactory color scheme for a specific home.
7. Use of the knowledge of various types of floor covering and wall covering.
8. Identify styles of windows and window treatment.
9. Compare a home furnishings project at the discretion of the instructor.
10. Explore career possibilities to increase their understanding of the options available to them in the world of work.
11. Gain an economic understanding and consumer competency to make wise decisions in the use of their resources as related to their interior decorating and housing needs.
12. Describe and practice techniques for refinishing or restoring home furnishings.
13. Select and complete an appropriate home furnishings project.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Participation in classroom discussion, literature and other reading materials, lectures, speakers, field trips, films, filmstrips, overhead projector, tapes, classroom projects and/or individual projects and/or reports and individualized learning.

Interior Design B

Description of Target Group

This course is designed for 11th and 12th grade students who are interested in advanced interior design and consumer housing. This course is open to students who have completed Interior Design A.

Purpose

This one-semester course will provide students with a combination of subject matter and activities designed to develop abilities necessary for integrating design principles with today's living spaces and activities; conservation of energy and resources; future career opportunities; consumer buymanship related to housing and home furnishings; awareness of the special needs of some family members; and home management. This course will develop skills suitable for entry level jobs in the field of interior design and the housing industry.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. List and evaluate home improvements that a family could do to conserve energy.
2. Devise a plan for remodeling or redecorating a room to meet the special needs of certain family members.
3. Evaluate home furnishings such as floor coverings, window and wall treatments, etc. in terms of needs, wants, costs, intended use, and care.
4. Select appropriate and affordable home furnishings.
5. Plan a family budget for home furnishing purchases.
6. Identify different styles of housing design and discuss their influence on today's architectural design.
7. Identify by name, given several characteristics, difference styles of furniture.
8. Choose effective lighting for a given living area.
9. Select and complete an appropriate home furnishing project.
10. Develop a floor plan and design layout according to elements and principles of design.
11. Identify and explain financial aspects of renting and buying housing.
12. Examine advantages and disadvantages of renting versus home ownership.
13. Work to improve neighborhood and the community.
14. Choose suitable housing from the available alternatives.
15. Examine various career opportunities related to interior design and housing.

Instructional Materials

Activities

Participation in classroom discussions, laboratory situations, field trips, complete projects, view films, filmstrips and video tapes, use computer software, watch demonstrations, individual and/or group reports, and individualized learning.

Course

Introduction to FCS and Health

Description of Target Groups

This course is designed for students interested in a comprehensive course in Family and Consumer Sciences with a strong health emphasis. This is a year-long course. Completion of both semesters of this course with a grade of "D" or better fulfills the Santa Maria Joint Union High School District health requirement for graduation.

Purpose

This course helps develop a basic understanding of clothing and textiles, creative arts, foods and nutrition, child development, interior design, leadership skills, and career opportunities. Health topics such as sex education (including HIV/AIDS, STD's, reproduction, and family planning), drug and substance abuse, personal and relationship development, life cycle/crisis, and personal safety (bullying, first-aid, etc.).

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Identify the three elements of health: social, emotional, and physical.
2. Identify personal goals, values, and needs.
3. Actively participate in decision-making activities.
4. Demonstrate methods for stress and anger management
5. Understand factors affecting positive development of relationships (family, friends, and dating).
6. Develop an appreciation for the implementation of good physical fitness.
7. Demonstrate use of a sewing machine and be able to use and define terminology related to clothing.
8. Demonstrate suitable care and repair for fabric and clothing.
9. Understand the human reproductive system and the importance of good personal hygiene and preventative health care, including communicable diseases.
10. Discuss the impact of teen pregnancy/family planning on society with an emphasis on abstinence/refusal skills.
11. Examine the adverse effects of drugs and alcohol on individuals and society, family, pregnancy (prenatal substance abuse), goals/career, with an emphasis on prevention.

12. Demonstrate responsible behavior in order to avoid health-related risks, including STDs and HIV/AIDS education with an emphasis on abstinence/refusal skills.
13. Introduction to various career opportunities as related to the subject areas studied.
14. Develop personal creativity and respect for their own and others artistic projects.
15. Learn to apply the elements of design in developing projects.
16. Demonstrate a knowledge of differing food needs in a family.
17. Plan, prepare, and serve nutritious, well-balanced meals.
18. Describe good personal hygiene, safety attitudes, and sanitation practices used in preparing food.
19. Identify and share proper use of the kitchen equipment.
20. Be familiar with the rules needed for safety and sanitation when working in a food preparation situation.
21. Use of proper techniques for measuring food ingredients.
22. Identify a balanced menu based on the current FDA model for daily food choices.
23. Be familiar with emergency, first aid, and safety techniques.
24. Understand the meaning and consequences of bullying, cyberbullying, and reckless driving.
25. Understand the role of being a parent.
26. Prepare and present a developmentally appropriate activity or toy for a child.
27. Expose students to a variety of children's games, songs, and activities for specific age groups.
28. Know and be able to carry out disciplinary and safety techniques for specific age groups.
29. Understand the physical, social, emotional, and intellectual developmental stages of a child.
30. Learn management methods and elements of design in housing/interior designs.
31. Introduction to various career opportunities as related to subject areas studied.
32. Explore career possibilities increasing their understanding of options available to them in the world of work.

Instructional Materials

Text and Supplementary Materials
Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District.

Activities

Students will use education materials, which relate to the various areas of study. These will include books, magazines, miscellaneous equipment, media, computers and tablets, Software and apps, guest speakers, demonstration materials, etc. Students will participate in laboratory work, cooperative groups, field trips, and independent study, etc.

Assessments

Teacher observation of student actions, oral presentations, and speaking demonstrations.
Group or individual presentations/demonstrations/observations evaluated by teacher and/or students.
Written student work-projects, notebooks, worksheets, etc.
Self-analysis by individuals and groups.
Summative projects, quizzes, and exams with teacher general criteria.
Classwork/ homework completion and correction.
Performance in role plays, and other real life situations.

19. Brief Course Description

Life Management and Health A/B is a year long course designed to provide a combination of subject matter and activities to help develop the necessary skills to prepare students for life on their own. The curriculum will include but not be limited to career search and assessment, necessary skills in the workplace, economics as it applies to careers and managing resources, foods and nutrition, mental, physical and social health, reproductive health, consumer education, community involvement, housing selection and care, interior design techniques, clothing selection and care, leisure time activities and environmental concerns.

Requirements fulfilled: $11^{th}/12^{th}$ Health graduation requirement.

B. COURSE CONTENT

Please refer to instructions

20. Course Goals and/or Major Student Outcomes

- Students will research possible careers and write documents related to career development including resumes, job applications and cover letters. (ECDFS 2.5)
- Students will understand how to make effective decision, use career information and manage personal career plans. (ECDFS 3.0)
- Students will demonstrate knowledge of nutrition and correct food preparation.
- Students will investigate mental, physical and social health issues and their impact on relationships, career and maintaining a healthy lifestyle including reproductive health.
- Students will understand the roles and procedures of using the services of a variety of financial institutions as well as develop resource management skills.
- Students will demonstrate knowledge of the process of making consumer decisions, including the comparison of goods and services. (ECDFS 10.6)
- Students will understand the characteristics and benefits of teamwork, leadership and citizenship in the school, community and workplace settings.
- Students will be able to demonstrate their knowledge of housing choices, leases and consumer laws as they relate to housing.
- Students will learn how to apply garment construction skills to maintaining and caring for their wardrobe as well as select appropriate attire for the occasion or workplace. (FID A2.2)
- Students will understand the importance of developing and maintaining healthy leisure time activities.
- Students will demonstrate knowledge of conservation practices and their applications. (TI C1.1)

21. Course Objectives

- Provide clear and purposeful information addressing the intended audience appropriately following the conventional style for that type of document. (e.g., resumes, job applications, cover letters and portfolios.) (ECDFS 2.5 a, d)
- Demonstrate the ability to apply appropriate interviewing techniques. (ECDFS 2.3)
- Understand the importance of effective nonverbal, oral, and written communication skills in getting and keeping a job as well as how to respond appropriately. (ECDFS 2.5)
- Understand the scope of career opportunities and know the requirements for education, training, and licensure. (ECDFS 3.2)
- Understand the role and function of professional organizations, industry associations, and organized labor in a productive society. (ECDFS 3.4
- Know how to use contemporary and emerging technological resources in their chosen career pathway. (ECDFS 4.0, 4.4)
- Explain how to use technical writing and communication skills to work effectively with diverse groups of people. (ITI B4.3)
- Identify the personal qualifications, interests, aptitudes, knowledge and skills necessary to succeed in careers. (ECDFS (3.1)
- Research the policies, procedures, and regulations regarding health and safety in the workplace, including employers' and employees' responsibilities. (ECDFS 6.1)

- Understand the characteristics and benefits of teamwork, leadership, and citizenship in the school, community, and workplace settings. (ECDFS 9.1)
- Describe the functions of the financial markets and institutions. (ECDFS 12.2.9)
- Describe the current economy and labor market, including the types of goods and service produced, the types of skills workers need, the effects of rapid technological change, and the impact of international competition. (ECDFS 12.4.2)
- Apply knowledge of nutrition and healthy lifestyles when selecting recipes as well as prepared food (e.g., restaurant).
- Prepare food by using the correct techniques and procedures specified in recipes and formulas. (HTR B6.4)
- Understand the factors that affect the development of individuals and how to build positive relationships. (ECDFS 10.10)
- Understand the importance of wellness and safety to individual health and well being. (ECDFS 10.13)
- Understand the ways in which to enhance the emotional health of individuals. (ECDFS D5.4)
- Plan exercise activities that are enjoyable, safe, and appropriate for the individual. (ECDFS D6.4)
- Know the signs of emotional and physical abuse, emotional crises, and mental health issues, such as depression, isolation, substance abuse, and stress. (ECDFS D11.1)
- Know the correct procedures for dealing with emergencies and disasters. (ECDFS D7.4)
- Understand how to manage financial resources to achieve personal goals. (ECDFS 10.7)
- Understand consumer resources, rights, and responsibilities and their relationship to the various levels of the economy. (ECDFS 10.8)
- Know credit terminology, credit ratings and sources, costs of credit and risks and benefits of credit. (ECDFS B11.3)
- Know the services provided by various financial institutions and departments of government. (ECDFS B12.3)
- Understand the various advertising techniques that are used in marketing with respect to consumer rights. (ECDFS B5.1)
- Know effective strategies that consumers can use when exercising their rights and accepting their responsibilities. (ECDFS B5.4)
- Understand important consumer information, such as comparison shopping, disclosure on labels, warranties and guarantees, consumer fraud and identity theft, consumer redress, and consumer rights and responsibilities. (ECDFS D10.6)
- Use a variety of online services (e.g., purchasing, selling tracking, communicating, banking, investing. (IT C5.2)
- Understand the factors that influence housing decisions. (FID 10.7)
- Understand the factors influencing the selection and care of home furnishings, accessories and equipment. (FID 10.8)
- Understand the elements and principles of design and their interrelationships. (FID B3.1)

- Understand and apply important aspects of space planning and know the characteristics of interior systems. (FID B5.0)
- Know the principles of wardrobe planning and maintenance and the factors that influence a person's apparel budget. (FID 10.6)
- Demonstrate how to construct, alter, and repair fashion items and accessories through the use of basic construction techniques and equipment. (FID 10.5)
- Explain the value of social, recreational, and educational activities for all ages. (ECDFS D12.1)
- Recognize environmental conditions that are hazardous and identify actions to protect the environment.

22. Course Outline

I. Learning to Manage
   A. Decision making in your daily life
   B. Your values, goals, and standards
   C. Managing your resources
   D. Technology as a resource

II. Preparing for Your Career
   A. Career planning
   B. Finding a job

III. Understand Development and Relationships
   A. Your character and self-concept
   B. Successful relationships
   C. Effective communication

IV. Managing Health and Wellness
   A. Physical and mental wellness
   B. Healthful eating
   C. Coping with stress
   D. Environmental responsibility

V. Managing Finances
   A. Financial management
   B. Using credit wisely
   C. Planning for financial security

VI. Managing as a Consumer
   A. Consumer rights and responsibilities
   B. Consumer decision making

VII. Managing Food
   A. Meal management – planning and shopping
   B. Meal preparation

VIII. Managing Clothing
   A. Planning and shopping for clothes
   B. Caring for clothing

IX. Managing Housing
   A. Planning and selecting housing
   B. Furnishing and caring for the home

23. Texts & Supplemental Instructional Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

24. Key Assignments

Key assignments may include, but not limited to:

1. Create and present a multimedia presentation.
2. Complete a mental health research project using MLA formatting.
3. Develop a job-related portfolio including a resume and job application.
4. Develop a personal budget using software.
5. Use knowledge of nutrition to plan and prepare healthy, economical meals on a budget.
6. Research the advantages and disadvantages of buying vs. renting housing.
7. Complete portfolios of all assignments and projects.
8. Plan a wardrobe developing a care and maintenance plan.
9. Complete a clothing repair project.
10. Plan a community-based environmental awareness project. (Group Project)

25. Instructional Methods and/or Strategies

Instructional methods and strategies may include, but not limited to:

1. Textbooks
2. Direct instruction and discussion
3. Lecture
4. Reading assigned materials
5. Internet research
6. Self-directed/independent, cooperative and collaborative learning
7. Independent and group lab work
8. Written, oral, and multimedia/power point presentations
9. Supplemental books, articles, etc.
10. Career research, job applications, cover letter and resumes.

26. Assessment Methods and/or Tools

Assessment of student performance will include, but not limited to:

1. Content based tests and quizzes.
2. Oral presentations, using a rubric, both individually and in groups.
3. Peer review of demonstrations and presentations.
4. Journal entries.
5. Multimedia presentations using a rubric.
6. Written assignments using a rubric.
7. Portfolio of assignments and projects using grading checklists.
8. Teacher observation of oral presentations and speaking demonstrations.
9. Summative projects, quizzes, and exams with teacher general criteria.
10. Class work/homework completion and correction.
11. Student performance in role-plays and other real-life situations.

C. HONORS COURSES ONLY

Please refer to instructions

27. Indicate how this honors course is different from the standard course.

D. OPTIONAL BACKGROUND INFORMATION

Please refer to instructions

28. Context for Course (optional)

29. History of Course Development (optional)

Course Title

Marriage and Family Living A

Description of Target Group

This course is designed for 12th-grade students interested in marriage and the family. The spring semester will be open to second-semester juniors who will graduate in June or January.

Purpose

This one-semester course will provide students with knowledge of preparation for marriage, family roles and responsibilities, and marriage adjustments while becoming skillful in making decisions related to family living as well as beginning family needs which include money management, being a wise consumer and being able to promote and maintain individual and family health and safety.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to:

1. Develop goal selection and decision making skills and relate these principles to housing and home management choices, family living, and consumer choices.
2. Understand the significance and functions of family roles and responsibilities.
3. Assist individuals and the family to develop communication skills to help them cope with conflicts and disagreement.
4. Identify family members' needs as they assume their changing roles and responsibilities.
5. Identify factors to consider when choosing a marriage partner.
6. Understand the personal and socio-economic impact of marriage.
7. Identify factors, which predict success in marriage.
8. Identify roles of family members in America.
9. Evaluate choices and decisions regarding work, in terms of projected income, lifestyle, and family goals and needs during each stage of the family life cycle.
10. Understand the human reproductive systems and importance of preventative health care.
11. Understand the relationship of the health of an individual to the well being of the family.
12. Plan spending according to family values, needs, and income.
13. Use consumer resources (magazines, agencies, etc.) to aid them in making decisions in buying goods and services.

14. Explain and describe the local community's resources available to families.
15. Demonstrate knowledge of consumer rights and responsibilities.
16. Develop and evaluate a personal and/or family plan within own life style for the future.
17. Identify how consumer resources can be used to achieve a desired lifestyle.
18. Acquire sufficient economic understanding and consumer competency to make wise decisions in the use of their resources.
19. Develop an awareness of "personal space" needs of individuals and families.
20. Choose suitable housing from the available alternatives.
21. Select appropriate and affordable home furnishings.
22. Promote and maintain a clean, orderly, safe, and aesthetically desirable environment.
23. Determine employment opportunities in the family health and human services field.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Union High School District.

Activities

Participation in classroom discussions, literature and other reading materials, lectures, speakers, field trips, filmstrips, overhead projector, tapes, classroom projects, and/or individual projects and/or reports and individualized leanings.

Title: Relationship and Family Health

Length of course: Full Year

Subject area: College-Preparatory Elective (G) / Interdisciplinary

UC honors designation? No

Prerequisites: None

Co-requisites: None

Integrated (Academics / CTE)? Yes

Grade levels: 10th, 11th, 12th

ourse Description

urse overview:

The State Board of Education provides in pertinent part, that “good health and academic success go hand in hand. Healthy children make better students, and better students become healthy, successful adults who are productive members of their communities. Comprehensive health education that addresses the physical, mental, emotional, and social aspects of health teaches students how to maintain and improve their health; prevent disease; reduce health-related risk behaviors; and develop health knowledge, attitudes, and skills that foster academic achievement, increase attendance rates, and improve behavior at school.”
This year-long course includes the following topics: wellness, nutrition, mental and emotional health including depression and suicide prevention, media safety, technology awareness, substance abuse including alcohol, tobacco, and other drugs, first aid, CPR, and emergency preparedness. The Family Life units include pregnancy prevention including abstinence and contraceptives, pregnancy options, prenatal growth development, STI/HIV education, safe dating practices, and healthy relationships.

urse content:

Unit 1: Understanding Your Health and Wellness

Throughout this unit students will gain an understanding of the broad components of physical, mental, emotional, social, and environmental health. Areas of study will include influences on health, including genetics and family history, self-evaluation of health skills and decision making, goal setting and implementation of improvement plans, identifying health and safety risks, becoming a health literate consumer, and development of self-care and hygiene skills.

⮒ Unit Assignment(s):

1. Completion of a self-assessment questionnaire (approximately 50 questions assessing each broad component of health) with a 1-2 page written reflection that incorporates 2-3 SMART goals for improving health choices and longevity.

2. A life time line that begins at birth and continues for five decades. Students reflect of previous choices and outcomes, and plan for healthy choices incorporating skills taught during this unit. Students will present their time line to the class in a short 3-5 minute presentation. This project will help them reflect on the outcomes of events and choices that have already occurred, and also practice implementing health skills that will potentially improve their health and happiness in the future.

Unit 2: Nutrition

The in-depth areas of study in this unit include:

• The six components of nutrition defined and incorporated throughout the unit: protein, fats, carbohydrates, vitamins, minerals, and water
• Developing healthy eating and exercise habits for lifelong health and disease prevention
• Understanding and using nutrition labels and food safety skills
• Creating and implementing a healthy eating plan
• Body image, body dysmorphia, eating disorders, and risks of fad diets, diet aids, and performance enhancing drugs

⮒ Unit Assignment(s):

1. Students will work with a partner for a culminating "Eat This, Not That" activity. First, they will build a splurge meal of their choice and using the nutrition facts they will calculate the nutrient totals. Then, they will revise their meal making it healthier with the goal of reducing calories, sugar, saturated fats, and sodium. Once their meals are calculated, they will measure out the fat in both meals using a butter substitute onto plates. Then, they will measure out the sugar in both meals into cups. Last, they will present their meals and visual aides to the class and will discuss how they revised their meals to make them healthier and they will compare the nutrient amounts in the meals to the recommended daily allowances to show how high restaurant meals are compared to their nutrient needs.

2. Students will complete a nutrition assessment in which they apply the skills they have learned in scenario based short answer questions, using a nutrition facts label, and create a healthy nutrition plan.

Unit 3: Addiction, Alcohol, Tobacco, and Other Drugs

In this in-depth drug unit, students will learn the science of addiction and why their young brains are at a greater risk until their mid-20s. Then they will progress into learning the specifics of major drugs of abuse and potential life-long consequences.

This unit covers:

• Health risks of tobacco use including vape products, cigarettes, cigars, chewing tobacco, hookah, etc.
• Short and long term effects of alcohol on the brain and body
• Alcohol abuse including the dangers of binge drinking, alcohol poisoning, and combining alcohol and drugs
• Risks for alcoholism and resources for treatment
• Health risks of drug use including commonly abused drugs, both legal and illegal
• Marijuana effects on the adolescent brain
• Identifying community resources for substance abuse
• Refusal skills and resisting pressure to use drugs

⮒ Unit Assignment(s):

1. In groups of 3-4 students, they will create a video PSA about 1-2 minutes in length on a specific drug or the risk of addiction for young people. They will be required to include research and submit a written script as well as play the video for the class. Each class will vote on the most thorough PSA, and it will be forwarded to our video productions class to play

school-wide on the morning bulletin.

Unit 4: Mental and Emotional Health

In this unit, students will learn in-depth information about mental and emotional help that includes:

- Managing stress and developing healthy coping mechanisms
- Evaluating self-esteem and learning enhancement strategies
- Understanding and managing emotions including dealing with anger, guilt, and grief
- Understanding mental health disorders including depression, anxiety, and bipolar
- Recognizing bullying and importance of intervention and reporting
- Technology, social media, and online safety strategies
- Suicidal risk factors and strategies to prevent suicide
- Signs, symptoms, health risks, and treatment of disorders
- Identifying community resources for help as well as self-help strategies

⮒ Unit Assignment(s):

1. Students will collaborate in small groups to analyze case studies to identify suicide warning signs and develop prevention strategies. Students will brainstorm and evaluate intervention strategies.

2. Each student will write to a hypothetical friend they are concerned about. The letter will highlight what warning signs they have observed and suggest possible next steps and resources they can turn to.

Unit 5: First Aid, CPR, and Emergency Preparedness

Students will complete the ProTrainings CPR/First Aid certification on-line course. Students must complete the course curriculum and pass the final exam to receive their certification cards. In addition to the on-line certification course students will also learn the following:

- First steps in an emergency, and universal precautions
- First aid for cuts, burns, and other common injuries
- CPR and instruction, use, and importance of AEDs

⮒ Unit Assignment(s):

1. Students must participate in and pass the ProTrainings CPR/First Aid course to become CPR Certified.
2. Students create an evacuation plan with their family and identify where safety items are located in their home (fire extinguishers, first aid supplies, fire alarms, etc.)

Unit 6: Adolescent Growth, Development, and Reproduction - including STIs and HIV

In this unit of study, students will gain in-depth knowledge on the following topics:

- Understanding the male and female reproductive systems including diagrams
- Common reproductive problems and self-exams (breast and testicular)
- Time line of conception and fetal development
- Benefits of abstinence and abstinence strategies including refusal skills
- Contraceptive options and effectiveness: hormonal, barrier, behavioral
- Descriptions, transmission, symptoms, health risks, prevention, and treatment of STIs including HIV
- Identifying school and community resources related to reproductive health and STIs

⮒ Unit Assignment(s):

1. Students will complete an independent online research assignment that requires them to look up detailed information about STIs, contraception, and community resources available to them within a 10 mile radius.

2. In groups of 3-4 students, they will be given a list of common myths and stereotypes on family life topics and they will discuss why each statement is not true and what the actual facts and statistics are (they can conduct research). (Example: Most high school students have sex before they graduate - a myth popular in media marketed to teens. Statistically it is not true.)

Unit 7: Developing Health Relationships and Sexual Consent

- Life planning: exploring relationships, marriage, and family
- Identifying healthy and unhealthy behaviors in relationships
- Effective communication skills
- Signs of an abusive relationship and identifying various types of abuse in relationships (verbal, physical, emotional, manipulation)
- Laws related to sexual behavior and the involvement of minors, including sexting and revenge pornography

⮒ Unit Assignment(s):

1. Students will identify the qualities their ideal dating partner would have, firm deal breakers (drug use, lack of common values, etc.), and create a time line that includes their future goals and when a serious relationship (or marriage) would fit in. Then they will create some type of visual aide (such as a poster) to present in small groups of 4-6 students.

2. Students will practice effective communication and refusal skills in front of the class with a partner and scenarios written by their peers. Students should demonstrate the use of I-statements, show confidence in their body and speech, and be able to give realistic responses to the pressure imposed by their peer in each scenario.

Course Title

Relationships and Family

Description of Target Group

This course is designed for 11th and 12th grade students interested in relationships and family. When this semester course is taken in conjunction with Child and Family or Family Health, and passed with a grade of "D" or better, this fulfills the 5-unit health requirement for graduation.

Purpose

This one-semester course will provide students with knowledge of preparation for relationships, marriage, family roles and responsibilities and relationship/marriage adjustments while becoming skillful in making decisions related to family living, as well as beginning family needs, which include money management, being a wise consumer and being able to promote and maintain individual and family health and safety.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to:

1. Develop skills for personal success, including self-esteem, goal selection and decision making skills.
2. Understand the significance and functions of family roles and responsibilities.
3. Assist individuals and the family to develop communication skills to help them cope with conflicts and disagreements.
4. Identify family members' needs as they assume their changing roles and responsibilities.
5. Identify factors to consider when choosing a partner.
6. Understand the personal and socio-economic impact of marriage.
7. Identify factors, which predict success in relationships.
8. Identify roles of family members in America.
9. Evaluate choices and decisions regarding work, in terms of projected income, lifestyle and family goals and needs, during each stage of the family life cycle.
10. Understand the human reproductive systems and importance of preventative health care.
11. Understand the relationship of the health of an individual to the well-being of the family.
12. Plan spending accordingly to family values, needs and income.
13. Use a variety of consumer resources and technology to aid them in making decisions in buying goods and services.
14. Understanding finances for independent living including, but not limited to wages, taxes, withholding, savings and retirement, and budgeting.
15. Develop an awareness of "personal space" needs of individuals and families.
16. Determine employment options and opportunities.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District.

Activities

Participation in classroom discussions, literature and other reading materials, lectures, speakers, field trips, videos, power point presentations, classroom projects, and/or individual projects and/or reports and individualized learnings.

Course Title

Single Living

Description of Target Group

This course is designed for all 12th grade students who have an interest in becoming self-sufficient.

Purpose

This one semester course is designed to provide a combination of subject matter and activities designed to develop abilities necessary for assisting with and/or performing the common and important operations or processes concerned with:

1. Finding employment.
2. Selecting housing.
3. Keeping a checking account and other household records.
4. Selecting and maintaining clothing.
5. Housekeeping
6. Selection, purchase, and preparation of food, with emphasis on simple and expensive meals
7. Becoming aware of the importance of and relations between one's values, goals and the decision-making process.
8. Becoming a well informed, prepared consumer.

Standards of Expected Student Achievement

1. Identify their own values and goals.
2. Relate the decision-making process to everyday life.
3. Compile a job-related personal portfolio.
4. Use resources to select a job which meets the student's abilities and needs.
5. Recognize and understand the uses of various kinds of household equipment.
6. Correctly use a variety of household equipment.
7. Demonstrate knowledge of instructions on the labels of household cleaners.
8. Use resources to select housing which meets financial and personal needs, to understand and accept the responsibilities of renting and to interpret information found in a lease.
9. Judge the merits of advertisements.
10. Exercise their rights as consumers.
11. Know the criteria for a realistic, workable budget for living expenses.
12. Identify basic nutritional needs.
13. Plan nutritious menus for meals and special occasions within a stipulated budget.

14. Be able to select nutritious foods and plan balanced menus to maintain individual and family health.
15. Identify activities necessary for the mending, cleaning and caring of clothing.
16. Demonstrate responsible behavior in order to avoid health-related risks, including STD's and HIV/AIDS education.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District.

Activities

Use of supplementary periodicals, films, filmstrips, visual aids, and demonstration materials.

20. Course Goals and/or Major Student Outcomes

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Develop an appreciation for the implementation of good physical fitness.
2. Plan, prepare, and serve nutritious, well balanced meals.
3. Describe good personal hygiene, safety attitudes, and sanitation practices used in preparing food.
4. Identify and properly use kitchen equipment.
5. Be familiar with the rules for safety and sanitation when working with food.
6. Proper measuring techniques.
7. Identify a balanced menu based on the current FDA model.
8. Be familiar with emergency, first aid, and safety techniques.
9. Define terminology related to clothing.
10. Choose suitable care and repair for fabric and clothing.
11. Select appropriate styles to enhance personal appearance.
12. Develop personal creativity and respect for their own and others artistic projects.
13. Learn to apply the elements of design in developing projects
14. Learn elements of design in housing/interior design.

15. Prepare and present a developmentally appropriate activity or toy for child.
16. Prepare and present a developmentally appropriate activity or toy for a child.
17. Expose students to a variety of children's games, songs, and activities for specific age group.
18. Understand the role of being a parent.
19. Introduction to various career opportunities as related to subject areas studied.
20. Explore career possibilities increasing their understanding of options available to them in the work world.
21. Develop a positive attitude toward work and appreciate its contribution to self-fulfillment and to the welfare and productivity of the family, community, nation, and world.
22. Describe job search, acquisition, and retention skills.
23. Develop career portfolios, which could include job applications, resumes, etc.

21. Course Objectives

This course helps develop a basic understanding of clothing and textiles, creative arts, foods and nutrition, child development, interior design, and career exploration.
Recommended for ninth grade level students.

22. Course Outline

Genera Information

Course: Home Economics
Test: Creative Living

Course Description

This course helps to develop basic understanding of clothing and textiles, creative arts, child development, foods and nutrition, and career opportunities.
Recommended for ninth grade level students.

Grading Procedures

Grades will be determined by the point system. Grading scale for academic grades:

90% - 100%	A
80% - 89%	B
70% - 79%	C
60% - 69%	D
59% or below	F

Students will be graded on the activities and assignments listed below:

Written assignments from the textbook and handouts (in class and homework)
Tests given periodically on material covered in class and on homework assignments
Major Projects completed in class and at home
Final exam
Class participation, cooperation, and behavior on a daily basis.

Accuracy, completeness, promptness, and neatness will be considered in the grading process. Due dates will be set and assignments will not be accepted after the date.

Additional Procedures

Make-up procedure: After returning from an excused absence, the student is responsible for finding out the assignments missed and completing any homework, classwork, quizzes, or tests. All written missed work must be done and turned in within 3 days following the student's return to class. This must be done outside of regular class time. A cut results in a zero for the day.
Attendance Policy: A student may not make up any work for absences that result in a cut. The student is assigned on hour of dentition for every cut. If the student does not serve the detention within the time allowed it then gets doubled to two hours. If it is still not served then it will result in a referral and a request for doubling the detention again, resulting in four hours for every cut.
Tardy policy: I allow two tardies for the term; on the third tardy I assign 30 minutes of detention. If the tardy is not served within 48 hours it will be doubled and can result in a referral.

Regular attendance is essential at class lectures, guest speakers, movies, classroom group activates, etc. These cannot be duplicated at a later time.

Parental/Guardian cooperation is assisting the student with assignments and in providing materials he/she needs for class would be appreciated.

Classroom Expectations

1. Be on time to class
2. Come prepared
3. Respect yourself and others
4. Follow directions
5. Be honest
6. Stay on task
7. Follow school rules
8. Seated and ready to work when the bell rings

23. Texts & Supplemental Instructional Materials

Creative Leaving
(Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District.)

24. Key Assignments

- Scrapbook project
- Foods Labs
- Sew on a button
- Repair a tear
- Machine/hand hem stitch
- Career Exploration
- Design a room
- Color Wheel/Elements of Design
- Vocabulary
- Child's party

25. Instructional Methods and/or Strategies

Students will use education materials, which related to the various areas of study. These will include books, magazines, pamphlets, miscellaneous equipment, videos, computer based projects, guest speakers, demonstration materials, etc. Students will participate in laboratory work, cooperative groups, field trips, and independent study, etc.

26. Assessment Methods and/or Tools

- The observation of student actions, oral presentations, and speaking demonstrations.
- Group or individual presentations/demonstrations/observations evaluate by teacher and or students.
- Written student work-projects, notebooks, worksheets, etc.
- Self-analysis by individuals and groups\Summative projects, quizzes, and exams.
- Class work/homework completion and correction.
- Performance in role plays, and other real life situations.
- Laboratory activities.

C. HONORS COURSES ONLY

Please refer to instructions

27. Indicate how this honors course is different from the standard course.

D. OPTIONAL BACKBROUND INFORMATION

Please refer to instructions

28. Context for Course (optional)
29. History of Course Development (optional)

Course Title

Survey of Women in Society

Description of the Target Group

This course is for 10th- 12th grade students interested in a challenging elective course surveying women and society through research and investigation

Prerequisite: None, 9th grade with teacher and/or guidance recommendation

Purpose

This 5-unit course is designed for students interested in the field of Women's Studies. By putting women at the center of scholarly investigation, students will analyze how women and society interact and impact one another. Students will select topics-of inquiry from the list below with instructor's guidance and approval.

Note: Students interested in more in depth survey may repeat course-up to 10-units.

Standards of Expected Student Achievement

Topics of Investigation:

I. Women in History, Art. and Literature
II. Women and Careers
III. Women's Health
Students will demonstrate responsible behavior to avoid health-related risks, including S.T.D.'s and HIV/Aids education.
IV. Contemporary Global and Legal Issues for Women.
V. Family Structure and Women's Roles
VI. Conflict Resolution and Decision making
VII. Educational Opportunities for Women
VIII. Women and Economics

Instructional Materials

Refer to: Secondary adopted texts and approved supplementary books used in the S.M.J.U.H.S. District.

Activities

Lectures, class participation, demonstrations, research using technology and the internet, field trips, small group activities, outside resources and guest speakers.

Assessment

Student work and projects, teacher observation, teacher evaluation, verbal and written presentations by students, tests and quizzes.

Course Title

Women and Family Health

Description of Target Group

This course is designed for 11th and 12th grade students. 10th with instructors approval.

Prerequisite: none

Purpose

This is a 5-unit course meets the 1 lth/12th grade health requirement and is designed for students interested in the study of health as it relates specifically to women and the family. The curriculum is based primarily on the 11th/l2th grade Health Education course with a strong emphasis on women's and children's health issues as they pertain to the family.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Understand the relationship between proper nutrition and good health.
2. Examine physical fitness and its impact on the human body.
3. Identify and practice positive family health habits.
4. Recognize and avoid the harmful effects of alcohol, narcotics, tobacco, and restricted, dangerous drugs (including prenatal substance abuse).
5. Explain the physical, psychological, and behavioral effects of the most abused drugs in our society.
6. Describe the major STD's (including HIV/AIDS) and understand the necessary factors for the successful prevention and control of these diseases.
7. Understand reproductive health and the proper use of family planning methods.
8. Understand the benefits of abstinence to the individual, family and society.
9. Understand and apply life cycle and crisis management techniques as it relates to an individual and the family (including the elderly).
10. Decision making skills will be stressed throughout the curriculum.
11. Understand the specific health and nutritional needs of infants, toddlers, and young children.

12. Demonstrate knowledge of preventative health care for women and children within the family structure, such as regular exams, vaccinations, nutrition, etc.

Instructional materials

Text and supplementary materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District.

Activities

Health Education activities will include use of county and district media, lectures, discussions demonstrations, student reports and committee work, guest speakers, role playing, quizzes, and tests.

Assessment

Journal, demonstrations, group presentations/discussion, role playing, tests, quizzes, and authentic assessments.

Unit Value

- ☐ Semester (5 units)
- ☑ Year A/B (5 units per semester)
- ☐ Year A/B (two period course, 10 units per semester)

Comments:

Course Purpose: *What is the purpose of this course?*

Advanced Technology and Engineering provides a student experience that develops career ready practices in the context of project based learning. Students work in teams of 6-8 using a cloud-based content learning management system which allows students to access the content anytime, anywhere, and on any device providing immediate feedback to keep the student fully informed of their mastery of the content. All knowledge and skills are based on career clusters and pathway standards to promote college and career readiness. Areas of study include Architecture & Construction, Alternative Energy & Environment, Robotics, Manufacturing & Materials. The 4 main focus areas utilize the existing tools, stations, and materials that students have previously used in the Foundations course. Students will: work productively in teams, use technology to enhance productivity, plan education and career paths, utilize critical thinking, define problems and persevere in solving them, demonstrate creativity and innovation, employ valid and reliable research methods, and apply appropriate academic & technical skills. During this course, students will experience what it is like to work in careers within the STEM Career Cluster. They will actually do the work that professionals perform in the field. Students will do in-depth research into 2 careers within each unit and discover what knowledge, skills and abilities are required and where to get post-secondary education. Please see the following pages for specific details regarding each of the modules.

B. COURSE CONTENT

Course Outline: *A detailed descriptive summary of all topics covered. All historical knowledge is expected to be empirically based, give examples. (i.e. California State Standards).*

Introduction

Students in this course are already familiar with the Paxton Patterson online cloud-based learning management system, but will spend a few hours refreshing their skills from the previous year and investigating new features on the CareerPlus2 system. Students master the system utilizing digital fluency and information literacy. In this course, students take responsibility for their own learning. In the intro. section, students will be placed in groups of 6-8 students and work on team dynamics prior to formally beginning their actual modules.

Architecture and Construction

Architecture and Construction surround us in our everyday life. The following is taken directly from the student's design module.

The M2E consulting firm is competing for a contract to design and build an innovative portable shelter for a premiere entertainment company. They will combine all of the knowledge and skills learned from their foundational experience including teamwork and technical writing and combine it with their specific research on structural components to secure the contract. Students will then take their design and create a model to demonstrate compliance with the design criteria.

Cluster Objectives

This Architecture and Construction module is classified under the Architecture & Construction Career Cluster. Individuals that work in the Architecture & Construction Career Cluster demonstrate the following skills and knowledge:

1. Use vocabulary, symbols and formulas common to architecture and construction.
2. Use architecture and construction skills to create and manage a project.
3. Comply with regulations and applicable codes to establish and manage a legal and safe workplace.
4. Evaluate the nature and scope of the Architecture & Construction Career Cluster and the role of architecture and construction in society and the economy.
5. Describe the roles, responsibilities and relationships found in the architecture and construction trades and professions, including labor/management relationships.
6. Read, interpret and use technical drawings, documents and specifications to plan a project.
7. Describe career opportunities and means to achieve those opportunities in each of the Architecture & Construction Career Pathways.

Career Pathway

There are hundreds of related careers in the Architecture & Construction Career Cluster, some more similar than others. By classifying these similar careers into narrower categories called pathways, it helps individuals look at a range of options when it comes to employment in an area with similar skills and knowledge. Although this system of classifying careers into clusters and pathways is helpful in navigating career options, it is not the only way. This module is more specifically aligned with the Design/Pre-construction Career Pathway. Individuals in this pathway share a set of skills and knowledge that expands on the skills and knowledge needed in the Architecture & Construction Career Cluster. Individuals in the Design/Pre-construction Career Pathway demonstrate the following skills and knowledge:

1. Justify design solutions through the use of research documentation and analysis of data.
2. Use effective communication skills and strategies (listening, speaking, reading, writing and graphic communications) to work with clients and colleagues.
3. Describe the requirements of the integral systems that impact the design of buildings.
4. Apply building codes, laws and rules in the project design.
5. Identify the diversity of needs, values and social patterns in project design, including accessibility standards.
6. Apply the techniques and skills of modern drafting, design, engineering and construction to projects.
7. Employ appropriate representational media to communicate concepts and project design.
8. Apply standards, applications and restrictions pertaining to the selection and use of construction materials, components and assemblies in the project design.

Real World Activities: M2E Company

Designing and Testing a Truss - A popular band will be the musical headliner for this summer's FestCo events. As you already know, M2E has been asked to design the main lighting truss for the concert! Using the design and testing techniques that you have learned in the previous tutorial and using the new Truss Design Tutorial, design the band's new truss. They are counting on you, as this truss will be hanging 40 feet high, right over their heads!

Soil Sampling and Analysis – The FestCo design team at M2E needs to perform a soil evaluation for the sites of this summer's FestCo events. Lucky for you, one of the festival locations is near your school!

While earthquakes are rare in near all of the event sites, it is always necessary to do a soil evaluation before building. In this project, you and your team will prepare a soil evaluation presentation using the samples obtained from the soil near your school.

Water Slide Design

In addition to the festivities at this summer's FestCo events, the firm has decided to add a water slide attraction to the festival. David, the company's CEO, insists that the slide be a dramatic addition to the events.

Your team has already tested the soil composition to ensure safe slide construction conditions at every festival site. In this project, you will design a structurally sound, reconstructable body slide to meet David's design needs. Complete this assignment working in pairs. You and your partner have three class sessions to complete this task.

Designing a Portable Shelter

The portable shelter design process is now in your hands. David has entrusted you to design a shelter to replace the need for tent rentals at his traveling summer festivals. His shelter specifications are extremely specific and M2E is counting on your expertise to assist in their design process. Use what you've learned throughout the Foundations and Applications portions of the CAREERplus2 Program to develop the best possible portable shelter design.

Case Studies

A case study is a written account of an engineering activity as it was actually carried out. It's a true story, A narrative, with detailed backgrounds. Take a look at both the "Racing the Wind" case study and the "Hyatt Regency Walkway Collapse."

Students will select one of the case studies and submit their answers to these questions.

- Make a connection between the Architecture and Construction portion of the CAREERplus2: Application program and this case study. How did this story relate to this portion of the program? Utilize vocabulary you learned through the course of the program to explain your response.
- Did the engineer in this story showcase ethical actions? Why?
- How has this case study changed your ways of thinking about the Architecture and Construction portion of this program?

Career Planning

In this module you have now experienced many of the tasks associated with the Engineering and Technology Career Pathway. In addition, you have made connections to some of the related careers in the STEM Career Cluster. There are two goals that we want to help you achieve by completing this module. The first is to help you identify and develop your skills and knowledge in the career cluster. The second is to give you a better idea of careers that you can pursue and a means to achieve those opportunities.

Select two of the careers listed and follow the links to My Next Move to research the next steps in pursuing each.

- Soil Scientists
- Architects
- Civil Engineers
- Construction Manager
- Surveyors
- Materials Engineers
- Mechanical Engineers
- Geologists

Alternative Energy & Environment

Alternative Energy and Environment addresses some of the more compelling challenges of our global society. The M2E consulting firm is competing for a contract in Gambia (West Africa). Students must combine all of the knowledge and skills learned from their foundational experience and combine it with their specific research to design and build a solar cooker that meets the design criteria. Students will then collect data and report their findings to secure the contract.

Cluster Objectives

This Alternative Energy & Environment Module is classified under the STEM Career Cluster. Individuals that work in the STEM Career Cluster demonstrate the following skills and knowledge:

1. Apply engineering skills in a project that requires project management, process control and quality assurance.
2. Use technology to acquire, manipulate, analyze and report data.

3. Describe and follow safety, health and environmental standards related to science, technology, engineering and mathematics (STEM) workplaces.
4. Understand the nature and scope of the Science, Technology, Engineering & Mathematics Career Cluster and the role of STEM in society and the economy.
5. Demonstrate an understanding of the breadth of career opportunities and means to those opportunities in each of the Science, Technology, Engineering & Mathematics Career Pathways.
6. Demonstrate technical skills needed in a chosen STEM field.

Career Pathway

There are hundreds of related careers in the STEM Career Cluster, some more similar than others. By classifying these similar careers into narrower categories called pathways, it helps individuals look at a range of options when it comes to employment in an area with similar skills and knowledge. Although this system of classifying careers into clusters and pathways is helpful in navigating career options, it is not the only way. This module is more specifically aligned with the Engineering and Technology Career Pathway. Individuals in this pathway share a set of skills and knowledge that expands on the skills and knowledge needed in the STEM Career Cluster. Individuals in the Engineering and Technology Career Pathway demonstrate the following skills and knowledge:

1. Use STEM concepts and processes to solve problems involving design and/or production.
2. Display and communicate STEM information.
3. Apply processes and concepts for the use of technological tools in STEM.
4. Apply the elements of the design process.
5. Apply the knowledge learned in STEM to solve problems.
6. Apply the knowledge learned in the study of STEM to provide solutions to human and societal problems in an ethical and legal manner.

Real World Activities: M2E Company

Parabola Focal Point

This is M2E's first solar oven design project. The team recognizes that a parabolic shape will serve as the heat collecting element in their solar oven design.

To begin the project, you and your M2E team members will experiment with various parabolic shapes. This lesson will further your understanding of the various shape options for your solar oven design.

Design a Parabolic Dish

Engineers sometimes use complex tools to design very accurate products and tools for industry. However, all engineers look for ways to do the same job that "elegantly simple."

In this project, you and your M2E team members will design your parabolic dish using two methods, one simple and one complex. Your team will experiment with a variety of parabolas in order to best decide which one will meet the design criteria in the next project. Create two or three viable design options using both programs.

Solar Oven Construction

You and your team members will continue designing a solar oven for people to use in a remote village where there is no electricity or easily available resources for building a fire. Remember to keep their overall intentions in mind: they hope to produce enough heat to boil water with the oven.

During this project you will further devise a plan for building your solar oven. Your teams should have two or three viable designs from your Excel and SolidWorks designs. Your testing should have given you some further insights into which design was the best.

Solar Oven Completion, Testing and Presentation

The day has finally come! Your hard work is paying off and it's time to construct the solar oven you and your team at M2E have been working on! The Gambian Consulate is counting on you to deliver an effective solar oven for the people of their country.

In this project, your team will complete work on building the solar oven. You have four days to complete this part of the project. Once you have the dish shape built you will line the dish with heavy cardstock and reflective mylar sticky-back paper.

Case Studies

A case study is documentation of an engineering activity or process where information and background are given in great detail about the research and development of a project over time. In this activity, you and your partner will choose from one of the two case studies provided to read and reflect on and then answer critical-thinking questions.

Ivanpah Solar Project - How Solar Ovens are Changing Lives in the Dominican Republic

Select one of the case studies and submit your answers to these questions.

- If solar parabolic troughs can provide so many benefits, why aren't they more prevalent through the United States?
- Aside from the benefits mentioned in the article, what are some other advantages of these solar power projects to both humans and the environment?
- Do you feel the government is doing enough to promote solar energy?

Career Planning

In this module you have now experienced many of the tasks associated with the Engineering and Technology Career Pathway. In addition, you have made connections to some of the related careers in the STEM Career Cluster. There are two goals that we want to help you achieve by completing this module. The first is to help you identify and develop your skills and knowledge in the career cluster. The second is to give you a better idea of careers that you can pursue and a means to achieve those opportunities.

Select two of the careers listed and follow the links to My Next Move to research the next steps in pursuing each.

- Computer Engineers
- Industrial Engineers
- Civil Engineers

- Electrical Engineers
- Environmental Engineers
- Mechanical Engineers

Robotics

From science fiction to factory floors, robots are everywhere. The M2E consulting firm is pursuing a government contract for a specialized robot. They will combine all of the knowledge and skills learned from their foundational experience emphasizing problem-solving and combine it with their acquired programming skills to design and build a robot that can stand up to government specifications. Students must face the pressure of a performance based challenge to win the contract.

Cluster Objectives

This Robotics Module is classified under the STEM Career Cluster. Individuals that work in the STEM Career Cluster demonstrate the following skills and knowledge:

1. Apply engineering skills in a project that requires project management, process control and quality assurance.
2. Use technology to acquire, manipulate, analyze and report data.
3. Describe and follow safety, health and environmental standards related to science, technology, engineering and mathematics (STEM) workplaces.
4. Understand the nature and scope of the Science, Technology, Engineering & Mathematics Career Cluster and the role of STEM in society and the economy.
5. Demonstrate an understanding of the breadth of career opportunities and means to those opportunities in each of the Science, Technology, Engineering & Mathematics Career Pathways.
6. Demonstrate technical skills needed in a chosen STEM field.

Career Pathway

There are hundreds of related careers in the STEM Career Cluster, some more similar than others. By classifying these similar careers into narrower categories called pathways, it helps individuals look at a range of options when it comes to employment in an area with similar skills and knowledge. Although this system of classifying careers into clusters and pathways is helpful in navigating career options, it is not the only way. This module is more specifically aligned with the Engineering and Technology Career Pathway. Individuals in this pathway share a set of skills and knowledge that expands on the skills and knowledge needed in the STEM Career Cluster. Individuals in the Engineering and Technology Career Pathway demonstrate the following skills and knowledge:

1. Use STEM concepts and processes to solve problems involving design and/or production.
2. Display and communicate STEM information.
3. Apply processes and concepts for the use of technological tools in STEM.
4. Apply the elements of the design process.
5. Apply the knowledge learned in STEM to solve problems.
6. Apply the knowledge learned in the study of STEM to provide solutions to human and societal problems in an ethical and legal manner.

Real World Activities: M2E Company

Robot Design

In this project, your group will split into teams. The teams will use Solidworks to design a robot chassis based on step by step instructions. The chassis shall use component and assembly pieces from the Solidworks library. You will need to draw the metal framework of the chassis with all cross rails and fasteners according to the specifications.

Robot Assembly and Testing

Now that the basic chassis is drawn, your team can begin to assemble the chassis using the VEX components. In the first part of this project, you and your team will build the robot chassis and drivetrain. You will be adding the retrieval gripper and components later. In the second part of this project, you will program and test drive the robot chassis.

Pneumatic System-Assembly and Testing

In this project, you and your team will need to construct and test a pneumatic system for the M3 Robot. The pneumatic system will be used to launch the transmitter orbs. The pneumatic components are included in the VEX kit of parts.

Robot

NASA has contracted M2E to develop a Moon Mineralogy (M3) Robot. In this project, you and the M2E team will use what you've learned throughout the course of this module to develop a robot that meets NASA's criteria for gathering crucial data on lunar environments. The robot must be capable of driving to remote areas and pneumatically launching wooden balls (Transmitter Orbs

Case Study

A case study is a written account of an engineering activity as it was actually carried out. It's a true story, a narrative, with detailed backgrounds. Take a look at Gibson's Robotic Guitar Case Study.

Submit your answers to this question.

- As described in the case study, the robot guitar is revolutionary. Describe two other products that have recently been revolutionized by robotics.

Career Planning

In this module you have now experienced many of the tasks associated with the Engineering and Technology Career Pathway. In addition, you have made connections to some of the related careers in the STEM Career Cluster. There are two goals that we want to help you achieve by completing this module. The first is to help you identify and develop your skills and knowledge in the career cluster. The second is to give you a better idea of careers that you can pursue and a means to achieve those opportunities.

Select two of the careers listed and follow the links to My Next Move to research the next steps in pursuing each.

- Materials Engineers

- Robotics Engineer
- Electrical Engineers
- Mechanical Engineers

Manufacturing and Materials

Manufacturing and Materials provides students with the opportunity to gain an understanding of how technicians and engineers use 3-D design software to build components and assemblies. The M2E consulting firm is trying to break into a new market by designing and manufacturing a new custom guitar for the band Convergence. They will combine all of the knowledge and skills learned from their foundational experience including 3D modeling and combine it with their specific research on guitar components to design a custom body, headstock, and tuners to secure the contract. Students will then take their designs through the manufacturing process to develop a prototype for their presentation.

Cluster Objectives

This Manufacturing & Materials module is classified under the Architecture & Construction Career Cluster. Individuals that work in the Architecture & Construction Career Cluster demonstrate the following skills and knowledge:

1. Use vocabulary, symbols and formulas common to architecture and construction.
2. Use architecture and construction skills to create and manage a project.
3. Comply with regulations and applicable codes to establish and manage a legal and safe workplace.
4. Evaluate the nature and scope of the Architecture & Construction Career Cluster and the role of architecture and construction in society and the economy.
5. Describe the roles, responsibilities and relationships found in the architecture and construction trades and professions, including labor/management relationships.
6. Read, interpret and use technical drawings, documents and specifications to plan a project.
7. Describe career opportunities and means to achieve those opportunities in each of the Architecture & Construction Career Pathways.

Career Pathway

There are hundreds of related careers in the Architecture & Construction Career Cluster, some more similar than others. By classifying these similar careers into narrower categories called pathways, it helps individuals look at a range of options when it comes to employment in an area with similar skills and knowledge. Although this system of classifying careers into clusters and pathways is helpful in navigating career options, it is not the only way. This module is more specifically aligned with the Production Career Pathway. Individuals in this pathway share a set of skills and knowledge that expands on the skills and knowledge needed in the Architecture & Construction Career Cluster. Individuals in the Production Career Pathway demonstrate the following skills and knowledge:

1. Diagnose production process problems and take corrective action to meet production quality standards.
2. Manage safe and healthy production working conditions and environmental risks.
3. Make continuous improvement recommendations based on results of production process audits and inspections.
4. Coordinate work teams when producing products to enhance production process and performance.
5. Demonstrate the safe use of manufacturing equipment.

Real World Activities: M2E Company

Designing a Guitar Headstock

Designing an electric guitar involves cooperation between materials engineers, electrical engineers, machine technicians, assemblers, finishers and of course musicians. In this project, you will use SolidWorks to design and develop a guitar headstock for a 6-string electric guitar for the band "Convergence". You will have four class periods to complete this task.

Designing a Guitar Tuner

It is necessary to have a theoretical plan to build most objects. The designer or manufacturer must theorize, solve complex mathematical problems, use formulas, and create conceptual drawings to know and understand every detail of the product to be able to build the item to reasonable specifications.

The Convergence Guitar team at M2E has completed the Headstock Design and has moved on to the tuner design. In this project, you and the M2E team will design a signature guitar tuner for a 6-string electric guitar for the band "Convergence." You will work in teams of two and will have three class periods to complete the project.

Designing a Guitar Body

After completing the headstock and tuner designs, the next step in the Convergence Guitar design process is developing the guitar's body. In this project, you and the M2E team will use SolidWorks to design and develop a signature guitar body for a 6-string electric guitar for the band.

Designing a Custom Guitar

The guitar design process is now in your hands. In this project, you and the M2E team will use what you've learned throughout the course of this module to develop a new and improved custom electric guitar design that meets the band Convergence specifications for improved sustain, tone, resonance, playability and performance. They are counting on you to deliver a high-quality guitar - be sure you don't disappoint! You will also machine a 1/2 scale model using Computer Aided Manufacturing (CAM). You will work in teams of two and will have four class periods to complete this task.

Case Study

A case study is a written account of an engineering activity as it was actually carried out. It's a true story, a narrative, with detailed backgrounds. Take a look at both the Gibson's Tech Trek Case Study and the The Coughing Robot Case Study and go to the video and internet links in each.

Submit your answers to these questions.

- Think of 5 manufactured items that involve intricate detail cutting during production. Could each of these utilize a CNC program to increase productivity like the one you saw in the Warsaw Machinery videos?
- Engineers designed a viable solution to the clogged throat problem; however, an additional sensor was deemed necessary. Discuss several current technologies that exist that perhaps create more of a problem than a solution by over-complicating the situation.

Career Planning

In this module you have now experienced many of the tasks associated with the Engineering and Technology Career Pathway. In addition, you have made connections to some of the related careers in the STEM Career Cluster. There are two goals that we want to help you achieve by completing this module. The first is to help you identify and develop your skills and knowledge in the career cluster. The second is to give you a better idea of careers that you can pursue and a means to achieve those opportunities.

Select two of the careers listed and follow the links to My Next Move to research the next steps in pursuing each.

- Materials Engineers
- Industrial Engineers
- Electrical Engineers
- Mechanical Engineers
- Designer
- Electronics Engineering Technician

Text(s): Title: (no actual textbook required - online, cloud-based learning)

Edition: _____ Publication Date: _____

Publisher: _____ Author (s): _____

URL Resource(s) _____

☑ Usage ☐ Primary Text ☐ Read in entirety or near entirety

Pre-Requisites
Algebra 1, Foundations of Technology & Engineering
Co-Requisites

Supplemental Instructional Material: *Please Describe. If using online text or non-standard material, please provide the title of the material or webpage and the URL link.*

Online, cloud-based learning management system

Instructional Methods and/or Strategies:

Minimal "lecture." Lessons are on-line and formative assessments occur throughout the material.

Assessment Methods and/or Tools:

Each learning episode involves mastery checkpoints. Major checkpoint tests occur twice/unit.

Activities: *(if applicable)*

Each unit is hands-on, project based learning. Final project (report and presentation).

Certificate: *(if applicable)*

SolidWorks test may be taken if student desires.

Advanced Small Gas Engines

Santa Maria Joint Union High School District

asic Course Information

hool(s) Offering This Course:

School Name	Course Learning Environment	Transcript Code(s)
ioneer Valley High School (053847)	Classroom Based	Abbreviation / Course Code Adv Sm Gas EngA / IT6732 Adv Sm Gas EngB / IT6733

Title: Advanced Small Gas Engines

Length of course: Full Year

Subject area: College-Preparatory Elective (G) / Interdisciplinary

UC honors designation? No

Prerequisites: Small Gas Engines (Required)

Co-requisites: None

Integrated (Academics / CTE)? Yes

Grade levels: 10th, 11th, 12th

ourse Description

urse overview:

This is a technical class with lab work for students who are interested in exploring a possible path to technician work in the outdoor power equipment field. Students who are generally interested in engines of all types should also take this class. The course covers the theory and repair procedures related to power equipment engines. During this course all students will work on live running air cooled engines of the lawn mower or go-cart type and the type used for powering generators and pumps. Students will work on engines in groups of two. All students should keep a daily note book with assigned reading and lecture notes. Students will be graded on attendance, test scores, lab work, skills mastery and the completion of required projects.

urse content:

1. CAREER AND VOCATIONAL UNIT

Education, Public School Instructor, Private or Vocational School Instructor, as well as Private Industry Instructor or Presenter will be covered. Other occupational Titles related to this area will be covered such as Service writer, Facility manager, Mechanic, Technician, and Engineer. Education and training opportunities are found in Academic/Vocational Institutions, High School, Community College, Private or Vocational Schools, and at the University level.

Unit Assignment(s):

Students will create a presentation about a specific career opportunity related to the small gas engine industry.

2. Power Equipment Shop Practices

Students will review the shop/classroom safety procedures associated with small gas engine tools and mechanics and maintenance of the shop. They will also study procedures and safety practices for lifting, working independently and collaboratively. Students will learn basic first aid steps to use in the event of an accident or injury. They will be introduced to Material Safety Data Sheets (MSDS) and glean pertinent safety information from them. Students will then take a safety exam as a demonstration of knowledge.

Unit Assignment(s):

Students will demonstrate through a written quiz their knowledge of shop rules and procedures, tools and equipment safety, and personal safety procedures. Students will also recognize any and all safety concerns within, around the shop and around the school campus. They will discuss how to correct and how to protect themselves when working within the shop. Students shall work in groups and make a PowerPoint presentation to the class exhibiting their findings.

3. Measurements, Tools, and Equipment

Students will recognize basic hand tools and will identify the correct tool for the job. They will also demonstrate proper use of the tools. Students will differentiate between various service manuals. They will explore the precision measuring tools including rulers, gauges, and micrometers and learn how to use them to obtain precise measurements. Students will identify a variety of fasteners and their uses.

Unit Assignment(s):

Students will demonstrate their knowledge of tools and equipment by using industry-accepted terminology when referring to specific tools and equipment. They will select and justify the appropriate tools for a teacher given project. Students will demonstrate in the lab/shop their knowledge of tool and equipment use, maintenance, and storage by successfully completing the NATEF (National Automotive Technicians Education Foundation) related tasks.

4. 4-Stroke (OHV-head) Engine Disassembly

Student will receive Lab/Shop orientation instruction as well as work station and storage, tool checkout and storage, cleanup and safety, and shop etiquette. Engine orientation and procedures as well as operating systems, and engine handling safety practices will be covered. Engine model identification, engine repair manual for disassembly/assembly procedures as well as service and specifications will be covered.

Unit Assignment(s):

Students will disassemble an 8 HP “OHV-head” engine and identify the systems as well as the engine parts.

5. Small Gas Engine Electrical System

Students will review electrical theory and practices related to the small gas engine. Electron movement, Ions, Ohms, Volts and Amps will be covered, Electrical circuit design, power supply without a battery (the magneto system) will be covered. Mathematical calculations using Ohm’s Law will be covered. (Calculating amperage (I = E/R); voltage (E = I x R); Calculating resistance (R = E/I)

Unit Assignment(s):

Students will construct a schematic drawing for the electrical system for the engine on which they are working.

---

6. Small Gas Engine Cooling and Lubrication Systems

Students will review the cooling and lubrication systems related to the small gas engine. The splash lubrication system will be compared to the pressurized pump lubrication system normally found in larger car engines. The lubrication system will also be examined for its cooling effects on the engine. The air cooled system found on most small gas engines will be compared to the liquid cooling systems also found on larger internal combustion engines.

Unit Assignment(s):

Working in pairs or teams students will construct a model of one of the following and present it to the class. A splash lubrication system, a pump (pressurized) lubrication system, an air cooled system, or a liquid radiator cooling system will be assigned or selected for the model making assignment. Students will also explain in a presentation how the engine they are working on is cooled and lubricated.

---

7. Small Gas Engine Fuel System

Students will learn about fuel systems related to small gas engines. Carburation is the most popular type at this point in time. However, fuel injection will be explored and covered.

Unit Assignment(s):

Working in pairs or teams students will construct a model and present it to the class of one of the following: A gravity fed carbureted fuel system, a pressurized carbureted fuel system, or a pressurized injected fuel system.

---

8. 4-Stroke (OHV-head) Engine Assembly

After learning about the different systems and parts students will assemble the 8 HP OHV-engine that they disassembled earlier. An engine repair manual will be consulted for specifications related to the assembly procedures.

Unit Assignment(s):

Students will assemble an 8 HP “OHV” engine.

9. Air Cooled Engine and Equipment Service

Students will learn about trouble shooting equipment problems and scheduling a repair and service for such equipment. A service and repair guide sheet will be used. They will learn how to write a work order, create a parts order, review customer service procedures, and bill out costs for a typical small gas engine service. Students will learn how to clean cooling fins, change oil, change or service the air filter, check the spark plug, and test run equipment.

Unit Assignment(s):

In pairs or teams students will be assigned equipment and engines to diagnose and repair or service. Following a service guide sheet students will familiarize write a work order, and create a parts order, review customer service procedures, and bill out costs for small gas engine equipment. Students will consult repair manuals and trouble shoot problems to repair and service assigned equipment.

Course Title

Architectural Drawing 1A

Description of Target Group

This course is for 10th, 11th, and 12th grade students. Students should have an interest in an architectural career or as a potential home consumer. This is a 2 + 2 course with Allan Hancock Community College.

Purpose

The purpose of Architectural Drawing 1A is to give students an opportunity to explore the area of architectural design and practices. This is the first semester of a one year course. It is best for students to have previously taken Survey of Drafting. Note: This is not currently offered at Righetti High School, but is available as part of R.O.P. Advanced Drafting. Lab Fee Required.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Provide own pencils and erasers.
2. Develop fundamentals of lettering, dimensions, line work, layout, and use of architecture scale.
3. Complete assigned lab, clean-up, reading, and written work.
4. Understand and use basic architectural terminology.
5. Develop an interest in a possible career in the field of architectural or consumer concerns.
6. Develop freehand/sketching fundamentals.
7. Develop fundamental skills with drafting equipment.
8. Develop fundamental floor plans.
9. Develop fundamental wall section and foundation construction.
10. Develop fundamental elevation.
11. Develop fundamentals of solving design problems.
12. Pay all fees pending.

Instructional Materials

Text and Supplementary Materials
Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Architectural Drawing 1A (continued)

Activities

1. Individual work
2. Lectures
3. Class participation
4. Demonstrations
5. Audio-visual materials
6. Field trips
7. Small group activities
8. Outside resource people
9. Project construction

Course Title

Architectural Drawing 1B

Description of Target Group

This course is for 10th, 11th, and 12th grade students. Students should have an interest in an architectural career or as a potential home consumer. It is recommended that students complete Architectural Drawing 1A prior to enrollment in this class. This is a 2+2 course with Allan Hancock Community College.

Purpose

The purpose of Architectural Drawing 1B is to give students an opportunity to explore the area of architectural design and practices. This is the second semester of a one-year course. Note: This is not currently offered at Righetti High School, but is available as part of R.O.P. Advanced Drafting.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Develop fundamental house design steps.
2. Develop house plans including foundation, electrical, and roof.
3. Develop fundamental material schedule.
4. Develop various rendering media.
5. Draw house perspectives and freehand rendering.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, lectures, class participation, demonstrations, audiovisual materials, field trips, small group activities, outside resource people, and project construction.

Course Title

Architectural Drawing 2A

Description of Target Group

This course is for 11th and 12th grade students. Students should have an interest in an architectural career. It is recommended that students complete ARCHITECTURAL DRAWING 1A/B prior to enrollment in this class.

Purpose

The purpose of Architectural Drawing 2A is to develop entry skills into college architectural drawing and to develop a greater understanding of drawing board geometry. This is the first semester of a one year course. NOTE: This is not currently offered at Righetti High School, but is available as part of R.O.P. Advanced Drafting. Lab fee required.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Research the design requirements for a larger, more complex structure than the Architectural Drawing 1A/B project.
2. Develop a portfolio of plans and presentation drawings for this structure.
3. Develop fundamental computer aided drafting (CAD) skills.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Computer aided design and drawing, individual work, lectures, class participation, demonstrations, audio visual materials, field trips, small group activities, outside resource people, and project construction.

Course Title

Architectural Drawing 2B

Description of Target Group

This course is for 11th and 12th grade students. Students should have an interest in an architectural career. It is recommended that students complete Architectural Drawing 2A prior to enrollment in this class.

Purpose

The purpose of Architectural Drawing 2B is to develop entry skills into college architectural drawing and to develop a greater understanding of drawing board geometry. This is the second semester of a one year course. Note: This is not currently offered at Righetti High School, but is available as part of R.O.P. Advanced Drafting.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Amplify an area of student interest.
2. Technical knowledge of the architectural field.
3. Computer aided drafting fundamentals

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Computer aided design and drawing, individual work, lectures, demonstrations, audiovisual materials, field trips, small group activities, outside resource people, and project construction.

Santa Maria Joint Union High School District – Career Technical Education

AUTO FUNDIMENTALS

DATE:

INDUSTRY SECTOR: Transportation Sector

PATHWAY: Systems Diagnostics, Service and Repair

CALPADS TITLE: Intermediate Systems Diagnostics, Service, and Repair (Concentrator)

CALPADS CODE: 8531

HOURS:

Total	Classroom	Laboratory/CC/CVE
180	76	104

JOB TITLE	O*NET CODE	JOB TITLE	O*NET CODE
Automotive Service Technicians and Mechanics	49-3023.00	Automotive Master Mechanics	49-3023.01
Automotive Engineers	17-2141.02	Parts Salespersons	41-2022.00
Automotive Specialty Technicians	49-3023.02		

COURSE DESCRIPTION:

This course is for 9th through 12th grade students with priority given to those students expressing and interest in pursuing a career in the automotive industry.

A-G APPROVAL: No

ARTICULATION: None

DUAL ENROLLMENT: None

PREREQUISITES: None

METHODS OF INSTRUCTION

- Direct instruction
- Group and individual applied projects
- Multimedia
- Demonstration
- Field trips
- Guest speakers

STUDENT EVALUATION:

- Student projects
- Written work
- Exams
- Observation record of student performance
- Completion of assignment

INDUSTRY CERTIFICATION:

- None

RECOMMENDED TEXTS:

- AUTO UPKEEP

PROGRAM OF STUDY

Grade	Fall	Spring	Year	Course Type	Course Name
9, 10, 11, 12				Concentrator	AUTO FUNDIMENTALS
11, 12				Capstone	ADVANCED AUTO

Course Title

Automotive Chassis and Drive Trains

Description of Target Group

This advanced course is for 11th and 12th grade students who are at least 16 years old and have a grade of B or better in Fundamentals of Auto A/B and/or instructor's recommendation.

Purpose

The purpose of Automotive Chassis and Drive Trains is to give students an opportunity to continue in automotive and develop skills in repairing automobile frames, suspension and transmissions. This is a two-term course. This class is designed to prepare the student for entry into the job market or entry into an advanced training program in a specialty school or junior college with employment in the automotive field as the ultimate goal.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Complete a safety test with a passing score.
2. Develop an interest in a possible career in the field of auto mechanics.
3. Provide and use protective clothing and eye protection when and where required.
4. Complete assigned laboratory and written work.
5. Complete assigned clean-up responsibility.
6. Develop an understanding of safe working habits and conditions.
7. Understand and use automotive terminology.
8. Operate safely and demonstrate ability in the proper use of hand and power equipment available.
9. Develop basic skills in repair and service procedures in the following areas:
    a. Suspension
    b. Brakes
    c. Transmissions
    d. Drive Lines
    e. Wheel Alignment

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual laboratory work, lectures, class participation, demonstrations, audiovisual materials, field trips, small group laboratory activities, and outside resource people.

Course Title

Automotive Engines and Tune-Up

Description of Target Group

This advanced course is for 11th and 12th grade students who are at least 16 years old and have a grade of B or better in Fundamentals of Auto A/B and/or instructor's recommendation.

Purpose

The purpose of Automotive Engines and Tune-Up is to give students an opportunity to continue in automotive and develop skills in repairing and tuning automobile engines. This is a two-term course. This class is designed to prepare the student for entry into the job market or entry into an advanced training program in a specialty school or junior college with employment in the automotive field as the ultimate goal.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Complete a safety test with a passing score.
2. Develop an interest in a possible career in the field of auto mechanics.
3. Provide and use protective clothing and eye protection when and where required.
4. Complete assigned laboratory and written work.
5. Complete assigned clean-up responsibility.
6. Develop an understanding of safe working habits and conditions.
7. Understand and use automotive terminology.
8. Operate safely and demonstrate ability in the proper use of hand and power equipment available.
9. Develop basic skills in repair and service procedures in the following areas
    a. Engines
    b. Fuel Systems
    c. Ignition Systems
    d. Emission Control Systems

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual laboratory work, lectures, class participation, demonstrations, audiovisual materials, field trips, small group laboratory activities, and outside resource people.

Course Title

Automotive Fundamentals 1A

Description of Target Group

This course is for 9th through 12th grade students with priority given to those students expressing and interest in pursuing a career in the automotive industry.

Purpose

The purpose of Automotive Fundamentals 1A is to give the student a working knowledge of the automobile and its component parts and provide an introduction into the field of automotive service and repair. This is the first semester of a one year course. A fee is required.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Complete a safety test with a passing score.
2. Develop an interest in a possible career in the field of auto mechanics.
3. Provide and use protective clothing and eye protection when and where required.
4. Complete assigned laboratory and written work.
5. Complete assigned clean-up responsibility.
6. Develop and understanding of safe working habits and conditions.
7. Understand and use basic automotive terminology.
8. Operate safely and demonstrate ability to properly use hand and power equipment available.
9. Develop a basic understanding and working knowledge of the following systems.
    a. Engines: Operation, design, function, and basic repair.
    b. Cooling: Theory, maintenance, testing and repair, and environmental concerns.
    c. Lubrication: Automotive preventative maintenance, lubrication products industry standards and expectations, and proper lubrication techniques and service intervals.
    d. Wheels and Tires: Design and construction of wheels and tires and service techniques for mounting, dismounting, balancing, and repairing tires.
    e. Fuel Systems: Theory of fuel systems, basic carburetor and carburetor circuits, and an introduction to fuel injection systems.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, lectures, class participation, demonstrations, audio visual materials, field trips, small group activities, outside resource people, use of miscellaneous equipment, hands on projects and lab work.

Description of Target Group

This course is for 9th through 12th grade students who have previously taken Automotive Fundamentals 1A and wish to continue their education in the automotive field.

Purpose

The purpose of Automotive Fundamentals 1B is to give the student a working knowledge of the automobile and its component parts and provide an opportunity to explore the field of automotive service and repair. This is a second semester of a one year course. A fee is required.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Complete a safety test with a passing score.
2. Develop an interest in a possible career in the field of auto mechanics.
3. Provide and use protective clothing and eye protection when and where required.
4. Complete assigned laboratory and written work.
5. Complete assigned clean-up responsibility.
6. Develop and understanding of safe working habits and conditions.
7. Understand and use basic automotive terminology.
8. Operate safely and demonstrate ability to properly use hand and power equipment available.
9. Develop a basic understanding and working knowledge of the following systems.
    a. Electricity and electronics used in the automobile, including series and parallel circuitry, Ohms law, testing and diagnosis with a multimeter, and reading wiring diagrams.
    b. Brakes and braking system theory and operation.
    c. Suspension and steering theory and operation.
    d. Drive lines and rear differential theory and operation.
    e. Standard and automatic transmission basic theory and operation.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, lectures, class participation, demonstrations, audio visual materials, field trips, small group activities, outside resource people, use of miscellaneous equipment, hands on project and lab work.

SANTA BARBARA COUNTY EDUCATION OFFICE

REGIONAL OCCUPATIONAL PROGRAM

COURSE IDENTIFICATION

CBEDS Code: 5701

CBEDS Title: Drafting Occupations

ROC/P Course Title: Computer Aided Drafting/Manufacturing

JOB TITLES FOR WHICH STUDENTS WILL BE PREPARED:

CODE	TITLE
017.281-014	Apprentice Drafter
005.281-014	Structural Drafter
007.281-010	Mechanical Drafter
001.261-010	Architectural Drafter
600.280-034	Machinist Apprentice
600.380-026	Machine Set-Up Operator

ENROLLMENT REQUIREMENTS

1. 16 years and older and either in the 11th, 12th grade or an adult

2. Prerequisite: Introduction to Drafting or Instructor Approval

3. Students who enroll in this program should have serious intention of entering the broad cluster of occupations related to their training.

COURSE DESCRIPTION (Total Hours of Instruction: 360 hours)

This course is designed to prepare students for entry level employment as a draftsperson/manufacturer or to continue with advanced training at the community college and college level. Upgrading and retraining is also covered through skill preparation in the field of computer aided drafting/manufacturing. Areas of instruction include introduction of advanced drafting skills, computer knowledge/mechanics of CAD, and computer aided manufacturing.

COURSE OUTLINE:

The following table outlines the major subject areas of the course and the amount of time each student will spend on each subject area.

MAJOR SUBJECT AREAS		AVERAGE HOURS OF TRAINING
I.	General Orientation	5
II	Introduction to CAD	80
III.	Pictorial Drawing	50
IV.	Surface Developments	15
V.	Welding Drafting	10
VI.	Technical Illustration	30
VII.	Plotting	10
VIII.	Advanced Mechanical Drafting	50
IX.	Measurement	10
X.	Architectural Drafting	50
XI.	Computer Aided Manufacturing Technology	5
XII.	Toolpath and NC Code Generation	25
XIII.	Employability Related	20
	Total	360

SANTA BARBARA COUNTY SCHOOLS REGIONAL OCCUPATIONAL PROGRAM

COMPUTER AIDED DRAFTING/MANUFACTURING

1. ORIENTATION — 5 HOURS

A. ROP Regulations/Paperwork
B. Course Overview
C. Safety

II. INTRODUCTION TO CAD — 80 HOURS

A. Basic Computer Concepts
B. 2 D Systems
C. Use of Add Functions
D. Use of Modify Functions
E. Setting Grids and Layers
F. Use of Text and Dimensioning
G. Use of Blocks&Selections Sets
H. Use of Zoom Function
I. Filing - Saving & Retrieving
J. Output to Plotter & Printer
K. 3D Systems & Basic Geometric Primitives
L. Model Space, Paper Space, Viewports
M. Use of Overlays and Symbols

III. PICTORIAL DRAWING — 50 HOURS

A. Isometric Pictorials
B. Oblique Pictorials
C. Perspective Drawings
D. CAD Applications

IV. SURFACE DEVELOPMENTS — 15 HOURS

A. Sheet Metal Patterns
B. Sheet Metal Layouts
C. CAD Applications

V. WELDING DRAFTING — 10 HOURS

A. Welding Symbols
B. Placement of Welding Symbols on Drawings
C. CAD Applications

Computer Aided Drafting/Manufacturing Course Outline Continued

VI. TECHNICAL ILLUSTRATIONS — 30 HOURS

A. Advanced Grid Sketching
B. Shading
C. Exploded Views
D. CAD Applications

VII. PLOTTING 10 HOURS

A. Use and Care of Equipment
B. Line Values
C. Plotter Pens, Mylar
D. Inking

VIII. MECHANICAL DRAFTING 50 HOURS

A. Two and Three View Drawings
B. Industrial Design/Electrical & Mechanical (HVAC) & Plumbing
C. CAD Applications

IX. MEASUREMENT 10 HOURS

A. Use of Scale
B. Use of Micrometer and Caliper
C. Tolerances/ANSI Standards

X. ARCHITECTURAL DRAFTING 50 HOURS

A. Initial Design Ideas & Sketching
B. Floor Plans
C. Elevations
D. Cross Sections
E. Site Plans
F. Framing Details
G. Design and Models
H. Perspectives
J. CAD Applications

XI. COMPUTER AIDED MANUFACTURING TECHNOLOGY 5 HOURS

A. Manufacturing Production Engineering
   a. Design and manufacturing cycle
   b. Process planning

B. Numerical Control and Machine Motions
   a. Type of NC systems
   b. Machine tool applications

XII. TOOLPATH AND NC CODE GENERATION 25 HOURS

A. 3 Axis Mill
   a. Steps to generate 3 axis mill tool paths and NC Codes
   b. Create 3 axis features

c. Change 3 axis roughing and finishing strategies
d. Generate operation plans
e. Generate tool paths and simulate material removal
f. Reorganization, suppression and combining of features
g. Post processing tool paths

B. 2 Axis Lathe Tuning
a. Steps to generate turned tool paths and NC Code
b. Insert an OD profile for threading
c. Generate an operation plan and tool path
d. Post processing tool paths
e. Editing machinable features
f. Modify and ID profile feature
g. Ad and ID groove feature
h. Display location symbols and define the chuck

XIII. JOB SEEKING SKILLS/GENERAL WORKPLACE SKILLS 20 HOURS

A. Job Search Fundamentals
B. Résumé and Employment Applications
C. The Employment Interview
D. General Workplace Skills
(1) Job Attitudes/Work Ethics
(2) Personal Organization, Goal Settings and Time Management
(3) Personal Grooming
(4) Oral and Written Communication
(5) Teamwork
(6) Common workplace Rules and Regulations
(7) Further Training and Career Ladders

TOTAL 360 HOURS

Course Title

CISCO Network Academy 1A

Description of Target Group

This 5-unit course is for 11th and 12th grade students who are interested in beginning a career in the computer networking industry. These students should have above average reading comprehension skills, to acquire and integrate course terminology and concepts.

Prerequisite: Enrolled in or completion of Algebra 1 or IMP 1

Purpose

CISCO 1A is a 1 term (one-semester) course to teach the basics of computer networking technology with an introduction to electronics. Students successfully completing this course will hopefully continue with CISCO 1B and CISCO 2A&B. CISCO courses 3 & 4 are available at Allan Hancock College and Santa Barbara City College. Students that complete all four courses receive the certification of CISCO Certified Network Associate.

Course Content

Safety related to the electronics industry.
Online Internet study and testing.
Simple PC troubleshooting.
Devices required to build a Local Area Network.
Hexadecimal Math.
Terminate Category 5 network cables.
Introduction to Networking OSI layers.
Soldering and de-soldering of electronic assemblies.
Use a Digital Multimeter and network cable testers.
Ethernet, Token Ring, FDDI topologies.

Standards of Student Achievement

Install network interface cards, terminate and test Category 5 network cables, measure resistance and voltage with a Digital Multimeter, Work cooperatively with others, use the internet for distance learning and testing, soldering of electronic assemblies, convert decimal, hexadecimal, octal, and binary numbers.

CISCO Network Academy 1A (continued)

Assessment of Student Learning

Completion of "Lab" exercises.
Maintaining a course notebook/lab journal.
Class participation.
Teacher evaluation.
Chapter quizzes.
Online, multiple choice, final exam.
Skill based final exam.

Instructional Materials

Online: CISCO Networking Academy curriculum; Internet informational links
Text: CCNA First-Year Companion Guide; Amato et. al
Hardware: CISCO Academy Hardware set (routers, hubs, switches, patch panels, cable etc.)
Software: MS Windows; Internet Explorer; TBD network management software;

Activities

This course will be conducted using the CISCO online curriculum, CISCO Lab Experiments, CISCO quizzes and exams. Students will study online, cooperatively, and at home. The instructor will provide additional classroom activities in computer maintenance, hardware and software installation, internet browser use, electrical soldering, digital meter and other test equipment use.

Concurrent College Credit

Students will be concurrently registered at Santa Barbara City College, and will receive 4 semester units of college credit upon successful completion of the CISCO 1A/B sequence. Credit agreements with Allan Hancock College is being pursued.

Course Title

CISCO Network Academy 1B

Description of Target Group

This 5-unit course is for 11th and 12th grade students who are interested in beginning a career in the computer networking industry. These students should have above average reading comprehension skills, to acquire and integrate course terminology and concepts.

Prerequisite: A passing grade in CISCO Network Academy 1A.

Purpose

CISCO 1B is a 1 term (one-semester) course to teach the basics of computer networking technology with an introduction to electronics. Students successfully completing this course will have a strong start in the networking industry, and hopefully continue with CISCO 2A&B. CISCO courses 3 & 4, are available at Allan Hancock College and Santa Barbara City College. Students that complete all four courses receive the certification of **CISCO Certified Network Associate**.

Course Content

Safety related to the electronics industry.
Online Internet study and testing.
Structured cable installation.
Internet Protocol addressing and routing.
Local Area Network design.
ARP and RARP routing protocol.
OSI Layers 4 through 7.
Operation of Email and HTTP

Standards of Student Achievement

Completion of a structured cable installation, design a simple Local Area Network, classify the types of IP addresses, work cooperatively with others, use the internet for distance learning and testing, demonstrate the use of packet diagrams, explain the function and processes of OSI layers 4 through 7, and explain how Email and HTTP work.

Assessment of student learning

Completion of "Lab" exercises.
Maintaining a course notebook/lab journal.
Class participation.
Teacher evaluation.
Chapter quizzes.
Online, multiple choice, final exam.
Skill based final exam.

Instructional Materials

Online: CISCO Networking Academy curriculum; Internet informational links

Text: CCNA First-Year Companion Guide; Amato et. al

Hardware: CISCO Academy Hardware set (routers, hubs, switches, patch panels, cable etc.)

Software: MS Windows; Internet Explorer; TBD network management software;

Activities

This course will be conducted using the CISCO online curriculum, CISCO Lab Experiments, CISCO quizzes and exams. Students will study online, cooperatively, and at home. Field trips to networking facilities. Performing a structured cable installation. The instructor will provide additional classroom activities in computer maintenance, electronics testing, network hardware and software operation.

Concurrent College Credit

Students will be concurrently registered at Santa Barbara City College, and will receive 4 semester units of college credit upon successful completion of the CISCO 1A/B sequence. Credit agreements with Allan Hancock College is being pursued.

Course Title

Consumer Automotive

Description of Target Group

This course is designed for all students in grades 9-12. It is a one term (nine week) course.

Purpose

This course introduces students to the automotive industry and the world of automotive repair. The student will learn basic principles of how an automobile works. Proper routine maintenance will be stressed. The student will have the opportunity to experience hands-on maintenance and minor repairs using proper tools and safety procedures. Proper disposal methods of automotive waste products will be stressed. The student will be exposed to career opportunities in the automotive industry as well as consumer awareness.

Prerequisites: None

Standards of Expected Student Achievement

1. Working safely in the auto shop.
2. Introduction to the auto industry.
3. Tool identification and use.
4. How does a car work?
5. Routine maintenance.
6. Changing oil.
7. Tire repair, rotation and balance.
8. Belts and hoses.
9. Brake inspection and cleaning.
10. Cooling system.
11. Safety inspection.
12. Battery and electrical (where are the fuses?).
13. What if my car won't start?
14. What is a tune-up?
15. Smog inspection; how to help your car pass.
16. Finding information - resources.
17. When do I really need a mechanic?
18. Buying parts for your car.
19. Buying a used car.
20. How to find a good mechanic?
21. Automotive careers.
22. Handling and disposal of waste materials.

Consumer Automotive (continued)

Assessment of Student Learning

1. Students will present evidence of learning by cooperating with group or individual assignments and presentations based on projects and skills.
2. Students will present evidence of learning by presenting ideas, solutions and conclusions to proposed or presented problems.
3. Students will present evidence of learning through teacher observations.
4. Students will present evidence of learning through quizzes, tests, and homework.
5. Teacher evaluations.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Course Title

Electronics 1A

Description of Target Group

This course is for sophomores, juniors, and seniors who have completed the Survey of Electronics course, and want to gain a more thorough knowledge of electronics. A student may also qualify to take this course by obtaining the instructor's approval, in writing.

Purpose

Electronics 1A is the first term of a one-year course, and is to prepare the student for entry- level positions in the electronics industries. It is also a good foundation for students pursuing engineering majors in college. It is assumed that students will continue with the Electronics 1B course.

Prerequisites: Passing Survey of Electronics, Automotive Fundamentals, or Physics

Standards of Expected Student Achievement

Upon successful completion of this course, students will be able to demonstrate the following knowledge/skills:

1. Safety related to the electronics industry
2. Proficiency with digital multi-meter
3. Use of the Proto Board
4. Calculations of voltage, current, and resistance in DC circuits
5. Identify series and parallel circuits
6. Soldering and de-soldering electronic assemblies
7. Solving basic Ohm's Law calculations

Assessment of Student Learning

1. Students will present evidence of learning by cooperating with group or individual assignments and presentations based on projects and skills.
2. Students will present evidence of learning by presenting ideas, solutions and conclusions to proposed or presented problems.
3. Students will present evidence of learning through teacher observations.
4. Students will present evidence of learning through quizzes, tests, and homework.
5. Teacher evaluations.

Instructional Materials

Text: Introduction to Electronics, Earl D. Gates
Supplementary Materials: Manufacturers documentation; videos

Activities

Lab experimentation, lectures, class participation, demonstrations, audio visual materials, field trips, small group activities, outside resource people, and electronic assembly.

Course Title

Electronics 1B

Description of Target Group

This course is for sophomores, juniors, and seniors who have completed Electronics 1A, and wish to continue their study of electronics. A student may also qualify to take this course by obtaining the instructor's approval, in writing.

Purpose

The purpose of Electronics 1B, the second term of a one-year course, is to prepare the student for entry level positions in the electronics industries. It is also a good foundation for students pursuing engineering majors in college.

Prerequisites: Passing Electronics 1A

Standards of Expected Student Achievement

Upon successful completion of this course, students will be able to demonstrate the following knowledge/skills:

1. Assemble simple circuits from schematic diagrams
2. Use the Proto Board to test electronic circuits
3. Use of capacitors, transistors, diodes, silicon controlled rectifiers
4. Locate faults in simulated automotive circuits
5. Knowledge of basic AC signals
6. Understand the operation of the oscilloscope
7. Understand the basic operation of the TV, VCR, CD player, and computer

Assessment of Student Learning

1. Students will present evidence of learning by cooperating with group or individual assignments and presentations based on projects and skills.
2. Students will present evidence of learning by presenting ideas, solutions and conclusions to proposed or presented problems.
3. Students will present evidence of learning through teacher observations.
4. Students will present evidence of learning through quizzes, tests, and homework.
5. Teacher evaluations.

Instructional Materials

Supplementary Materials: Manufacturers documentation; videos

Activities

Lab experimentation, lectures, class participation, demonstrations, audio visual materials, field trips, small group activities, outside resource people, and electronic assembly.

Course Title

Electronics 2A

Description of Target Group

This course is for juniors and seniors who have completed Electronics 1B and want to gain experience with advanced equipment and electronic repair. Students must be willing to work both independently, and in small study teams, to accomplish assigned projects/tasks.

Purpose

The purpose of Electronics 2A**,** the first term of a one-year course, is to build a functional knowledge of advanced electronic components; to obtain proficiency in the operation of analog and digital oscilloscopes; and teach the basic skills and techniques used to service and repair consumer electronic equipment.

Prerequisites: Completing Electronics 1B with a "C" or better.

Standards of Expected Student Achievement

Upon successful completion of this course, students will be able to demonstrate the following knowledge/skills:

1. Use of circuit simulation software.
2. Identify advanced electronic components.
3. Utilize advanced electronic test equipment, including oscilloscopes.
4. Interpret vendor reference data to perform equipment service and repair.
5. Communicate equipment problems with "customers.
6. Perform routine electronic equipment maintenance.
7. Complete typical electronic equipment repairs.
8. Perform equipment upgrades in personal computers.

Assessments of Student Learning

1. Students will present evidence of learning by cooperating with group or individual assignments and presentations based on projects and skills.
2. Students will present evidence of learning by presenting ideas, solutions and conclusions to proposed or presented problems.
3. Students will present evidence of learning through teacher observations.
4. Students will present evidence of learning through quizzes, tests, and homework.
5. Teacher evaluations.

Instructional Materials

Text: Introduction to Electronics, Earl D. Gates; Vendor Manuals Supplementary Materials: Manufacturers documentation; videos

Activities

Independent projects, vendor component research, computer simulations, demonstrations, audiovisual materials, field trips, electronic equipment repair, computer trouble shooting/upgrading, and electronic equipment repair.

Course Title

Electronics 2 B

Description of Target Group

This course is for juniors and seniors who have completed Electronics 2A and want to continue studying advanced test equipment, electronic components, and perform electronic repair. Students must be willing to work both independently, and in small study teams, to accomplish assigned projects/tasks.

Purpose

The purpose of Electronics 2B**,** the second term of a one-year course, is to enhance the student's knowledge of advanced electronic components; increase proficiency in the operation of analog and digital oscilloscopes; continue teaching techniques used to service and repair consumer electronic equipment, especially computers.

Prerequisites: Completing Electronics 2A with "C" or better.

Standards of Expected Student Achievement

Upon successful completion of this course, students will be able to demonstrate the following knowledge/skills:

1. Communicate equipment problems with "customers."
2. Perform routine electronic equipment maintenance.
3. Complete typical electronic equipment repairs.
4. Perform equipment upgrades in personal computers.
5. Identify and replace defective computer assemblies.
6. Utilize advanced electronic test equipment, including logic analyzers.
7. Use a variety of manufacturer's documentation to perform electronic service.

Assessment of Student Learning

1. Students will present evidence of learning by cooperating with group or individual assignments and presentations based on projects and skills.
2. Students will present evidence of learning by presenting ideas; solutions and conclusions to proposed or presented problems.
3. Students will present evidence of learning through teacher observations.
4. Students will present evidence of learning through quizzes, tests, and homework.
5. Teacher evaluations.

Instructional Materials

Text: Introduction to Electronics, Earl D. Gates; Vendor Manuals Supplementary Materials: Manufacturers documentation; videos

Activities

Independent projects, computer simulations, demonstrations, audiovisual materials, field trips, electronic equipment repair, computer trouble shooting/upgrading, and electronic equipment repair.

Comments:

Course Purpose: *What is the purpose of this course?*

Foundations of Technology and Engineering provides a student experience that develops career ready practices in the context of project based learning. Students work in teams of 4 using a cloud-based content learning management system which allows students to access the content anytime, anywhere, and on any device providing immediate feedback to keep the student fully informed of their mastery of the content. All knowledge and skills are based on career clusters and pathway standards to promote college and career readiness. Areas of study include Alternative Energy, Architectural Design, Biotechnology, Construction Technology, Environmental Technology, Manufacturing Technology, Materials Science, Transportation Technology, Robotics and Automation, and Digital Electronics. Students will work productively in teams, use technology to enhance productivity, plan their education and career paths, utilize critical thinking, define problems and persevere in solving them, demonstrate creativity and innovation, employ valid and reliable research methods, and apply appropriate academic and technical skills. Every unit requires that students submit evidence of learning for each project, write in context (narrative and argumentative), complete 2 objective assessments, and present a design brief solution the class as proof of knowledge and skill attainment. Please see the following pages for specific details regarding each of the modules.

B. COURSE CONTENT

Course Outline: *A detailed descriptive summary of all topics covered. All historical knowledge is expected to be empirically based, give examples. (i.e. California State Standards).*

A. Introduction to the cloud-based learning management system and beginning teamwork collaboration with an emphasis in the overarching skills, knowledge, and behaviors that individuals will need to be successful, regardless of their chosen career pathway.

1. Students will be able to maneuver the learning management system including routine checks for understanding.
2. Team building solving a specific problem
3. Lab expectations and safety guidelines
4. Design process lab
5. College and career readiness exploration (students work through ideas such as acting as responsible and contributing citizens and employees; applying appropriate academic and technical skills; attending to personal health and financial well-being; communicating clearly, effectively and with reason; consider the environmental, social and economic impacts of decisions; demonstrate creativity and innovation; employ valid and reliable research strategies; utilize critical thinking to make sense of problems and persevere in solving them; model integrity, ethical leadership and effective management; plan education and career path that is aligned to personal goals; use technology to enhance productivity; and work productively in teams while using cultural/global competence.)

Architectural Design Module

A. Students will become aware of the decisions architects make each day with regard to materials, their application to the site, and their visual appeal. They will work through a series of design exercises and team projects in a professional architectural environment. Architectural form modeling, combined with the use of CAD software will provide them with an opportunity for genuine design activities.

In this unit students will:

1. Define the nature of architecture and describe how architecture has influenced society.
2. Examine the history of architecture; classify and become familiar with historical events, from early designs to the evolution of CAD systems, as a development of graphic language.
3. Define the importance of technical and computer-aided drawing technologies that are essential to the language of industry; use sketching techniques and computer-aided drawing systems to produce both 2-D and technical illustrations and drawings.
4. Interpret and create drawings using universal drawing standards; define the reasons for applying various types of drawings such as oblique and perspective.
5. Describe the impact of environmental and ecological awareness on architectural design; define the relationship of town planning, socioeconomic factors, and urban growth to current architectural practices.
6. Define geographic and topographic mapping techniques, and apply them to drawings using current industry standards.

The Architectural Design, Design Brief Problem: Design the appropriate plans that will communicate a solution to the following problem. Context Life exists on Mars! Well, not exactly. Life will exist on Mars. From positive feedback from the Viking and Pathfinder missions to Mars, NASA has decided that the next phase of their Mars exploration program will be to develop a colony for scientists to further study the planet. The students act as an architectural firm that has been selected to work closely with NASA to develop a

design for their first Mars space colony: Magellan I. NASA expects to have this colony operational by the year 2025, as part of the new Millennium Program.

Pre-task Activity

a. Brainstorm possible solutions with the team.
b. Develop a timeline for appropriate completion of the problem.
c. Outline all objectives that will be accomplished.
d. Assign specific activities to each member of the team.

Task Activity: The finished project should include:

a. Research on Mars, provide one 18" x 24" sheet with photo-copied images of the planet;
b. A two-page essay describing the project in detail, including a description of Mars, explaining the possibility of human habitation and how it will occur. Discuss the design and summarize the team's design process, (use websites for information);
c. Site plan: select a site on Mars, show how all the buildings in the colony fit into the landscape, and label each node accordingly;
d. Four different conceptual sketches of the entire colony in felt-tip marker or colored pencils mounted on a single sheet of paper (to demonstrate the breadth of the team's ideas);
e. Four conceptual sketches of EVN-01 in felt-tip marker or colored pencils mounted on a single sheet of paper;
f. Plans, sections, and elevations at 1/4" of EVN-01;
g. Society study: colony circulation, and one drawing representing how people will move through the colony;
h. Technology study: one or two detailed drawings demonstrating the structural system and construction components of EVN-01, (include material callout, angles, and dimensions as necessary);
i. Environmental study: one section of EVN-01 at 1" = 1'-0" describing how the building works with the site and solar geometry, and demonstrating how the earth will be viewed; and
j. One model at 1/4" = 1'-0" of EVN-01 made from materials available in the classroom, or a perspective view of the project representing how visitors will perceive the building.

Expectations for a Successful Solution

a. Fulfill all of the program criteria specified above in an efficient, functional, and artistic manner.
b. Create an Earth Viewing Node, EVN-01 that provides a tranquil, contemplative place away from the Experiment Nodes and the Living Nodes.
c. Communicate good design by offering a presentation of drawings and a model of high quality, demonstrating an understanding of architecture.
d. Present the solution in a logical manner. Students must defend their result as the best possible solution.

Alternative Energy Module

A. Students will be using a variety of energy production and experimentation equipment including wind power, the Sterling engine, PEM fuel cell, and a photovoltaic array, to explore current technologies in alternate energy as well as the future applications of hydrogen fuel and biomass. In this unit students will:

1. Define and describe the differences between non-renewable and renewable forms of energy.
2. Explore the benefits and consequences of nuclear energy as an alternative energy source.

3. Identify the various forms of energy, and their applications for residential and commercial buildings by investigating, through hands on use, wind power, solar PV and hydroelectricity. Explore matter and energy utilizing the Theory of Relativity.
4. Explore external combustion engines.
5. Identify alternative energy sources for transportation through hands-on experimentation with solar PV and fuel cell technology.
6. Define and describe current programs and explorations in nuclear, geothermal and ocean tide based alternative energy programs.
7. Define the role of biomass technology in long range energy forecasting and explore long-range private and government programs for sustainable energy resources.

This Alternative Energy unit is classified under the STEM Career Cluster. Individuals that work in the STEM Career Cluster demonstrate the following skills and knowledge:

1. Apply engineering skills in a project that requires project management, process control and quality assurance.
2. Use technology to acquire, manipulate, analyze and report data.
3. Describe and follow safety, health and environmental standards related to science, technology, engineering and mathematics (STEM) workplaces.
4. Understand the nature and scope of the Science, Technology, Engineering & Mathematics Career Cluster and the role of STEM in society and the economy.
5. Demonstrate an understanding of the breadth of career opportunities and means to those opportunities in each of the Science, Technology, Engineering & Mathematics Career Pathways.
6. Demonstrate technical skills needed in a chosen STEM field.

Alternative Energy Design Brief - Solar Cooker

Pre-task Activity

1. Research solar oven designs on the Internet.
2. Allocate the different assignments in the research, design, and construction of the oven, as well as the writing of the summary, to the various members of the team.

Task Activity

a. Design a solar oven no larger than 1 square foot.
b. Construct a solar oven no larger than 1 square foot.
c. Perform required tests on the oven, and analyze the results.
d. Modify the oven's specifications, if necessary, and perform the tests again.
e. Write a written summary of the design project.

Expectations for a Successful Solution

a. Divide work up evenly among all team members.
b. Use research data to create a unique oven that meets the specific needs of the Navy.
c. Use test results and research to improve the design of the solar oven
d. Write a clear and precise written summary that supports and explains the solar oven that your design team has developed.

Biotechnology Module

A. From the extraction of DNA to the use of microbes to clean up environmental damage, the science of biotechnology has surged to the forefront of technological advancement. In this unit, students will perform a series of significant industrial and biological experiments that explore the bioscience advancements that enhance the utility of fiber, food, fuel, and plastics as the building blocks of our modern society.

In this unit students will:

1. Examine the historical elements of bioengineering and compare and contrast the ways in which bioengineering has evolved in this century.
2. Define the use of Bioengineering on food production and industrial applications and the ways that bioengineering has impacted commercial products.
3. Examine through DNA and RNA modeling the fundamentals of the four nucleic acid bases and DNA stranding.
4. Examine the impact of bioengineering on the environment and, through hands-on experimentation, establish how bioengineering can assist in environmental and ecological remediation.
5. Demonstrate the use of Polymerase Chain Reaction (PCR) technology on recombinant DNA samples and perform an Electrophoresis experiment to validate DNA amplification.
6. Examine the uses of Bioengineering within genetics and determine the effects of bioengineering discoveries within medical and pharmaceutical application.

B. This unit is more specifically aligned with the Science and Math Career Pathway. Individuals in this pathway share a set of skills and knowledge that expand on the skills and knowledge needed in the STEM Career Cluster. Individuals in the Science and Math Career Pathway demonstrate the following skills and knowledge:

1. Apply science and mathematics to provide results, answers and algorithms for engineering and technological activities.
2. Apply science and mathematics concepts to the development of plans, processes and projects that address real world problems.
3. Analyze the impact that science and mathematics have on society.
4. Apply critical thinking skills to review information, explain statistical analysis, and to translate, interpret and summarize research and statistical data.

C. Narrative Writing - The doctors in the Kiser Medical Group specialize in infant and children's health. They are interested in adding a research lab to study genetic birth defects. Not all of the physicians are convinced the lab is a good idea. Some have mixed emotions about biotechnology. They all seem to agree that the technology is important, but are not sure how it could really help improve the care they provide. As their lead consultant, you were asked to provide information about biotechnology as it relates to birth defects. The Medical Group will not make a decision until they see your report.

Paragraph One: Consider all the benefits of biotechnology. Provide examples of how DNA research has helped improve lives, especially the lives of newborns and young children.

Paragraph Two: Consider the negative factors, too. You must provide the Medical Group with a balanced report. What are the negative effects of DNA research? Your explanation should be about 300 words, or about one page long.

Construction Technology Module

A. In this unit, students will explore construction systems including framing, HVAC, electrical, plumbing, and plot planning. Construction mathematics is emphasized using a transit and a laser level. In this module they will understand systems thinking, and the integration of materials, labor, costs, and site management in every phase of building. In this unit students will:

1. Interpret blueprints to examine planning and layout processes typically used in architectural construction and apply the information to basic planning.
2. Examine the importance of energy saving applications within home construction and perform experiments on four window glass designs.
3. Apply skills and procedures for land surveying using transits, lasers and mapping tools to develop plot plans and geological considerations for residential home design and town planning.
4. Examine and define typical construction processes of masonry, framing, and plumbing, HVAC, electrical, security and entertainment systems and their integration into a system for construction of the modern home and office.
5. Apply the various mathematical operations, techniques and theorems that are used with construction technology.
6. Examine the ramifications of alternative energy, energy conservation and environmental considerations in residential and commercial construction and design systems.

B. There are hundreds of related careers in the Architecture & Construction Career Cluster, some more similar than others. By classifying these similar careers into narrower categories called pathways, it helps individuals look at a range of options when it comes to employment in an area with similar skills and knowledge. Although this system of classifying careers into clusters and pathways is helpful in navigating career options, it is not the only way. This module is more specifically aligned with the Construction Career Pathway. Individuals in this pathway share a set of skills and knowledge that expand on the skills and knowledge needed in the Architecture & Construction Career Cluster. Individuals in the Construction Career Pathway demonstrate the following skills and knowledge:

1. Describe contractual relationships between all parties involved in the building process.
2. Describe the approval procedures required for successful completion of a construction project.
3. Implement testing and inspection procedures to ensure successful completion of a construction project.
4. Apply scheduling practices to ensure the successful completion of a construction project.
5. Apply practices and procedures required to maintain job-site safety.
6. Manage relationships with internal and external parties to successfully complete construction projects.
7. Compare and contrast the building systems and components required for a construction project.
8. Demonstrate the construction crafts required for each phase of a construction project.
9. Safely use and maintain appropriate tools, machinery, equipment and resources to accomplish construction project goals.

C. The Construction Technology Design Brief Problem: Design and build a 1/4" scale model of a house and create a real estate multiple listing specification sheet for the house.

Pre-task Activity: Use the Internet to access real estate websites. View the sites and note the information provided in their real estate listing specifications.

1. Visit a local real estate or construction company. Ask them for information on local homes that are for sale. If you visit a home contractor, ask them for information on potential homes that they can build for customers.

2. Plan and organize the structure of your construction team.
3. Distribute the work between team members. Decide who will be responsible for each task and its completion.
4. Create a short project schedule listing the tasks that need to be completed.

Task Activity

1. Review the floor plans and determine what materials your team will use to construct the model home.
2. Design and build a 1/4" scale that replicates the model home.
3. Create a real estate specification listing that highlights all of the features of the home and indicates the final sales price.
4. Prepare your presentation for the home owners' association.

Environmental Technology Module

A. Defining the effects of technology's impact on water, land and air quality is the primary mission of this exploration into environmental management. In this unit, students will use professional quality water and air sampling apparatus and perform a variety of particulate and chemical tests. They will also use the unique water table and earth strata simulator to investigate the effects of pollution on ground water. In this unit students will:

1. Explore the history of the U.S. Environmental Protection Agency and how it affects the goods and services that are produced today.
2. Define the differences between exhaustible, renewable, and inexhaustible resources; define and describe alternative ways of heating homes and fueling vehicles.
3. Investigate the effects of design and technological activities on the environment, taking into account both positive and negative impacts on the Earth and its resources.
4. Analyze through hands-on experimentation the ecological effects of ground water flow.
5. Describe the effects through experimentation of acid rain, and perform a water analysis and gray-water treatment experiment.
6. Analyze air samples and define air pollution and pollen index criteria to evaluate environmental conditions.

B. This unit is more specifically aligned with the Environmental Service Systems Career Pathway. Individuals in this pathway share a set of skills and knowledge that expand on the skills and knowledge needed in the Agriculture, Food & Natural Resources Career Cluster. Individuals in the Environmental Service Systems Career Pathway demonstrate the following skills and knowledge:

1. Use analytical procedures and instruments to manage environmental service systems.
2. Evaluate the impact of public policies and regulations on environmental service system operations.
3. Develop proposed solutions to environmental issues, problems and applications using scientific principles of meteorology, soil science, hydrology, microbiology, chemistry and ecology.
4. Demonstrate the operation of environmental service systems (e.g., pollution control, water treatment, waste water treatment, solid waste management and energy conservation).
5. Use tools, equipment, machinery and technology common to tasks in environmental service systems.

C. The Environmental Technology Design Brief Problem: Design and create a scale model of an environmental education park constructed entirely of recycled materials, for elementary school students.

Task

1. Your design team must draw detailed plans demonstrating the layout of the educational park.
2. You must construct a scale model of the park on a 28" x 28" x 2" tray, using only recycled and organic materials.
3. Your team must also create detailed drawings and descriptions of each of the four environmental education exhibits to be included in the park.
4. Your team is also required to complete a 5-minute presentation to the city planners. This presentation must explain the plan for the park, and the purpose and structure of each environmental education exhibit.

Design Criteria Materials: The drawings of the park design must be drawn on the maps provided by the city planners. The scale model must be produced in the tray provided and can only be constructed using organic and common recycled materials (glass, plastic, paper, and rubber.)

Plan Criteria: All plan designs for both the park and individual exhibits must include a legend and a description of the plan. The description of the exhibit drawings must detail which environmental concepts are being taught, and how the exhibit is teaching those concepts to the elementary school student.

Manufacturing Technology Module

A. Manufacturing and production technology is a conscious exploration of the processes that take raw materials to finished goods. In this unit, students will take their designs from a concept sketch to a finished product, while defining the systems structure of a manufacturing enterprise. The manufacturing process activities use CNC equipment, 3D printing, plastics mold design and rapid prototyping. This unit provides students with the opportunity to create new products of their own design. In this unit students will:

1. Examine the history of manufacturing processes and contrast them to current (Just-In-Time) manufacturing processes.
2. Practice using elements of production management to synthesize planning, engineering, resources allotment, and manufacturing processes by establishing a student management team.
3. Identify and classify the purposes and processes of inspection and SPC (statistical process control) in the manufacturing environment to assure uniformity and the adherence to design specifications.
4. Analyze and demonstrate in application the relationship of CAD/CAM/CIM and 3D printing in industry and manufacturing production.
5. Define and interpret the components of the industrial design process, and produce drawings and renderings for new products.
6. Examine the environmental and ecological aspects of manufacturing systems.

B. This Manufacturing Technology unit is classified under the Manufacturing Career Cluster. Individuals that work in the Manufacturing Career Cluster demonstrate the following skills and knowledge:

1. Evaluate the nature and scope of the Manufacturing Career Cluster and the role of manufacturing in society and in the economy.
2. Analyze and summarize how manufacturing businesses improve performance.
3. Comply with federal, state and local regulations to ensure worker safety and health and environmental work practices.
4. Describe career opportunities and the means to achieve those opportunities in each of the Manufacturing Career Pathways.
5. Describe government policies and industry standards that apply to manufacturing.

6. Demonstrate workplace knowledge and skills common to manufacturing.

C. The Manufacturing Technology Design Brief Problem: Investigate the opportunity to start a small business manufacturing wooden signs using CNC (Computer Numerical Control) software and machinery. Context: Small Business, Big impact! There are millions of small businesses across the United States and the cumulative impact of the small business sector is enormous.

Historical References: Many urban gathering and shopping areas prohibit the use of electric and neon signs for environmental reasons. Wooden signs have been used for hundreds of years whether painted or carved. Wooden signs can be recycled and are made from a renewable resource. The scrap material from making a wooden sign can also be recycled.

Pre-task Activity

1. Make sure you have watched all the videos on using the CNC software and machinery.
2. Begin drawing thumbnail sketches and mock-up drawings for your signs.
3. Conduct sample surveys with people in your school to determine whether wooden signs would be a desirable product.
4. Brainstorm a marketing strategy that will highlight the features of your sign business.

Task Activity

1. Complete your final detailed drawing illustrating dimensions and design feature placement. If you choose to add a 3D printed component discuss with your team how each feature will be manufactured.
2. Select the best material suited for the design solution.
3. Begin designing and manufacturing your prototype sign.
4. Make a presentation to the class as to whether you think you can make money in this business.

Transportation Technology Module

A. Transportation technology is the systematic movement of people and goods and its effect on society. Each system, land, sea, and air, is a group of micro-systems working together for efficiency and effectiveness. In this unit, students will design a maglev train, use a buoyancy tank to test scale hull designs, and investigate the characteristics of wing sections in the wind tunnel. They will also use an aeronautics trainer to chart and execute flight operations. In this unit students will:

1. Examine the history of transportation systems and their effects on worldwide technological advancement. Compare and contrast transportation systems, which move goods and people, for their application, safety considerations, and impact on society.
2. Demonstrate the principles of hydrodynamics and aerodynamics through hands-on experimentation using a wind tunnel and a buoyancy stability tank.
3. Examine through hands-on use the impact of satellite communications and GPS technology on transportation systems.
4. Define the integration of communications technologies and transportation technologies to move packages and the effect of that movement on the global economy.
5. Examine the environmental and ecological impacts of transportation systems and how new and future technologies can affect these systems.

B. This unit is more specifically aligned with the Engineering and Technology Career Pathway. Individuals in this pathway share a set of skills and knowledge that expand on the skills and

knowledge needed in the STEM Career Cluster. Individuals in the Engineering and Technology Career Pathway demonstrate the following skills and knowledge:

1. Use STEM concepts and processes to solve problems involving design and/or production.
2. Display and communicate STEM information.
3. Apply processes and concepts for the use of technological tools in STEM.
4. Apply the elements of the design process.
5. Apply the knowledge learned in STEM to solve problems.
6. Apply the knowledge learned in the study of STEM to provide solutions to human and societal problems in an ethical and legal manner.

C. The Transportation Technology Design Brief Problem: Develop a prototype maglev vehicle that is aerodynamically efficient and appealing to commuters.

Context: The Canadian Transportation Department (CTD) is planning to construct a magnetic highway to travel from Vancouver, British Columbia to Seattle, Washington. The CTD believes that a high-speed ecologically friendly transportation system would encourage tourism between the United States and Canada. They have contacted your transportation engineering firm, Salazar & Jarrard, to design a maglev vehicle. The CTD has requested Salazar & Jarrard produce a small working model – a prototype – of the maglev system. The scale model should demonstrate the shape of the vehicle, the method of propulsion, and the possible speed that the maglev vehicle can travel. Your design team has been selected to produce the prototypes for the CTD and to demonstrate the speed and stability of the maglev system.

Task: Each two-person team is responsible for creating a maglev vehicle. The vehicle should have an aerodynamic design, and a propeller and electrical motor for propulsion. The vehicle should balance evenly on the magnetic track, and should be as fast as possible. Test your design against the other team's vehicle, the best design should be selected for the final presentation.

Design Criteria Materials

1. Each maglev vehicle will be constructed from a foam block, 8 magnets, and a motor and propeller system.
2. The vehicle may be shaped in any manner that you determine will be aerodynamically efficient. Your design team may select any material, such as wire, tape, glue, or other fasteners to connect the motor and propeller to the body of the vehicle. You may also choose any material to prevent the vehicle from sliding against the metal side rails of the magnetic track.
3. Your vehicle must have a finished appearance.

Model Design

1. A side, top, and front view of the vehicle body design must be drawn before beginning model construction. These drawings must correspond to the model that is built.
2. The model design must be aerodynamic. The body shape must be designed to cut through the wind. The wind tunnel may be used to test the aerodynamic efficiency of your vehicle.
3. The vehicle must pick up electrical power from the side rails on the track.
4. The length of the vehicle can be no less than 6". Performance
5. The maglev vehicle must be balanced when placed upon the magnetic track.
6. The maglev vehicle must be able to run the length of the magnetic track while remaining balanced.

Pre-task Activity

1. Research aerodynamic design models, and gather information regarding magnetic levitation.
2. Produce detailed drawings of the top, side, and front designs of the maglev vehicle body.
3. Determine the best possible shape of the vehicle body to increase aerodynamic efficiency and promote stability.

Task Activity

1. Design and create the maglev vehicle body out of the foam block.
2. Attach the motor and propeller unit to the vehicle body.
3. Balance the completed train body and engine on the magnetic track.
4. Test the completed vehicle by timing its speed over the length of the magnetic track.
5. Modify your prototype to improve its performance.

Materials Science Module

A. In this unit, students will develop an understanding of the materials and processes used to create the products they encounter every day. They will use, test, and process natural and synthetic materials like plastics, metals, wood composites and textiles. Using the Paxton TSB 5000 Materials Tester and other technical apparatus, they will explore the properties of raw and processed materials. In this unit students will:

1. Define the way in which raw materials are collected and processed to produce industrial materials.
2. Define the Universal Systems Model.
3. Demonstrate and explain testing and process methods used to produce new and recycled common materials.
4. Understand and demonstrate the use of tools and machines in the processing of materials through forming, casting or molding, separating, conditioning, finishing and assembling materials.
5. Compare and contrast properties of materials and test for tensile strength, compression strength, flame resistance and tear strength.
6. Compare and contrast the types and uses for textiles within commercial applications.

B. This Materials Science module is classified under the STEM Career Cluster. Individuals that work in the STEM Career Cluster demonstrate the following skills and knowledge:

1. Apply engineering skills in a project that requires project management, process control and quality assurance.
2. Use technology to acquire, manipulate, analyze and report data.
3. Describe and follow safety, health and environmental standards related to science, technology, engineering and mathematics (STEM) workplaces.
4. Understand the nature and scope of the Science, Technology, Engineering & Mathematics Career Cluster and the role of STEM in society and the economy.
5. Demonstrate an understanding of the breadth of career opportunities and means to those opportunities in each of the Science, Technology, Engineering & Mathematics Career Pathways.
6. Demonstrate technical skills needed in a chosen STEM field.

C. The Materials Science Design Brief Problem: Analyze and select the best material to build a functional product.

Context: Wake-Up Inc. is interested in producing and marketing a wakeboard that out performs any board ever made. The owners of the well-known water sports chain of stores have extensive background in water ski competition and are well informed about the latest equipment. They have proposed a partnership with your company, Big Island Research. If your group will help them develop a board that will revolutionize the market, they will sponsor a series of events to market the product throughout the west. This high-performance board will only be sold in their stores. For your company, this means the re-engineering of the materials and production processes for their new product. It means exposure in a whole new industry, more new clients, and celebrity. It sounds like a good deal, so sign on. Time to catch some waves.

Task

1. Your team of experts must begin to plan a strategy of convincing Wake-Up Inc. that your boards and design will exceed their wakeboard requirements.
2. From your knowledge of materials, material properties, characteristics, and process methodology, design, sketch and produce a model wakeboard that will perform to the design specifications outlined by Wake-Up. You should also design and produce each board using different reinforcing materials.
3. Since you will be making a formal presentation to the Board of Directors of WakeUp, Inc. you will need to produce scale models of each of the wakeboard designs you are producing. Your manufacturing team must also describe and present in detail what materials, properties, characteristics, and process methods you will utilize and require to produce the required parts and the entire product.

Design Criteria

Applied Technology: The wakeboard will be completely redesigned. The employees of the shop are very picky as to the outcome of this new board, and want properties and materials considered for each of the points below.

1. The board itself (the deck) must be extremely light and flexible. It should be able to hold a minimum weight of 300 lbs.
2. The design graphics used on the board must appeal to the target audience of 18- to 25-year-old active young adults.
3. Cost is of some concern and must be justified to meet the design considerations.
4. If you can argue for high cost materials and processes, go ahead. Because the board will be used for competitions, Wake-Up will pay for it and your expertise.

Materials:

- Molds for board lay-up
- Materials for lay-up, including reinforcing materials
- Fiberglass • Carbon fiber
- Tools and supplies for finishing, trimming, and cutting, etc
- Digital camera to document final open-ended problem solving process.

Communications

- Video on Nano-technology

Digital Electronics

A. Digital Electronics is a foundational STEM subject and while it may seem like it has a language all its own, the fundamentals are easy to understand. In this module, students will use state of the art circuit simulation software as well as computer interfaced circuit breadboarding. Students will be using an Arduino based circuit board to complete several experiments and learn how computer code can be used to control digital circuits.

In this unit students will:

- Learn the historical developments of digital electronics, and explain the impact of those developments on current technology. Identify and define the hardware parts of a modern desktop computer, and explain the operation of each part.
- Demonstrate through hands-on exploration the use of circuit simulations.
- Define basic semiconductor physics through hands-on experiments; and explain diodes, transistors, circuit configurations, and their applications.
- Compare and contrast logic functions, memory circuits, and clock and timing circuits, as well as their applications to electronic systems.
- Demonstrate through hands-on application the use of computer coding to control prototype circuits.

B. This Digital Electronics module is classified under the STEM Career Cluster. Individuals that work in the STEM Career Cluster demonstrate the following skills and knowledge:

1. Apply engineering skills in a project that requires project management, process control and quality assurance.

2. Use technology to acquire, manipulate, analyze and report data.

3. Describe and follow safety, health and environmental standards related to science, technology, engineering and mathematics (STEM) workplaces.

4. Understand the nature and scope of the Science, Technology, Engineering & Mathematics Career Cluster and the role of STEM in society and the economy.

5. Demonstrate an understanding of the breadth of career opportunities and means to those opportunities in each of the Science, Technology, Engineering & Mathematics Career Pathways.

6. Demonstrate technical skills needed in a chosen STEM field.

C. Argumentative Writing: In 1965 Gordon Moore, co-founder of Intel, predicted that the number of transistors per square inch on integrated circuits would double every year. He believed that from the time that integrated circuits were invented, their costs would steadily decrease. Moore predicted that this trend would continue for the near future. The pace has slowed slightly, but experts believe this will be the trend for the next two decades.

Paragraph One: As a writer for Software Seller Today, your editor has asked you to prepare an update of Moore's Law. He has asked that you write a paragraph on the prediction that computing power will increase even as costs decrease. The main theme is this: If Moore's Law holds true for the next twenty years, predict how the price, size, and power of computers will change the devices we currently use. Describe what the devices may be able to do in the future.

Paragraph Two: To defend your opinions and judgment you'll need to show the reader that the predictions you are making are based on current facts.

The student argumentative writing piece should be about 300 words or about one page. Information should be kept concise, but with enough detail to covey the information.

Robotics & Automation

A. Students will use two computer controlled robots and a fluid power/pneumatics trainer to emulate industrial processes. They will see how the electronic and mechanical components of robots function. They will also gain an understanding of sensors and programming methods used in robotics while conducting a series of robotic experiments.

In this unit students will:

- Contrast and compare the various types of robots and their applications within manufacturing and service industries.
- Examine through hands-on experimentation the properties of fluids and pneumatics, the fundamentals of fluid and pneumatic power, and the application of the Bernoulli theorem and Boyle's law.
- Demonstrate the operation of a closed hydraulic and pneumatic system to generate motion from the flow of liquids and gases.
- Program and operate an autonomous robot to perform a variety of exploration and data generation operations.
- Compare and contrast the uses of various types of sensors and controls used in robotics and automation.
- Define the use of computer-integrated manufacturing (CIM) within production and manufacturing.

B. This unit is more specifically aligned with the Engineering and Technology Career Pathway. Individuals in this pathway share a set of skills and knowledge that expand on the skills and knowledge needed in the STEM Career Cluster. Individuals in the Engineering and Technology Career Pathway demonstrate the following skills and knowledge:

1. Use STEM concepts and processes to solve problems involving design and/or production.
2. Display and communicate STEM information.
3. Apply processes and concepts for the use of technological tools in STEM.
4. Apply the elements of the design process.
5. Apply the knowledge learned in STEM to solve problems.
6. Apply the knowledge learned in the study of STEM to provide solutions to human and societal problems in an ethical and legal manner.

C. Autonomous and Remote Control Robot Design Brief

Problem: ClearBot Inc. has been contacted by the Colorado Department of Environmental Protection about removing hazardous chemicals from an abandoned mine. The chemicals are stored in barrels, deep underground. Because the barrels are corroding, the job is too dangerous for human workers and must be performed by a robot. Although the robot can be safely operated by remote control, the depth of the mine causes remote control communications to occasionally black out. If the robot wanders into a blind spot, it must be able to autonomously find its way to an area where remote control communications can be resumed.

Design and Performance Specifications

- The robot must begin the activity, in the middle of the maze, facing a wall.
- The robot must escape from the maze through one of the four corners autonomously, within 20 seconds.
- If the robot collides into a wall, moving the wall, it will be disqualified.
- The robot must be completely clear of the corner exit before it times out.
- After the autonomous task, immediately begin the remote control task.
- The barrels must be placed outside the maze for pickup with 3 barrels at each corner.
- The barrels must be brought into the center of the maze and stacked two barrels high.
- The winning team will be the one that completes both tasks in the shortest amount of time.

Evaluation

- Perform the demonstration compliant with all Design and Performance Specifications.

Explain the following during your presentation:

- Design process and development
- Modifications made throughout the design process
- Explanation of your completed Step/Action Worksheet
- Demonstrate compliance with all Design and Performance Specifications
- Explain testing outcomes and conclusions of the design results
- Describe additional applications of your robot design

Text(s): Title: (no text required - online, cloud based learning)

Edition: _____ Publication Date: _____

Publisher: Paxton Patterson Author (s): _____

URL Resource(s) _____

☑ Usage ☐ Primary Text ☐ Read in entirety or near entirety

Pre-Requisites
Algebra 1
Co-Requisites

Supplemental Instructional Material: *Please Describe. If using online text or non-standard material, please provide the title of the material or webpage and the URL link.*

Paxton Patterson website for student login: www.paxpat.com ($2800 for 5 yr site license renewal)

Instructional Methods and/or Strategies:

Project based learning via career clusters and pathway standards. Research online.

Assessment Methods and/or Tools:

Written essay (narrative & argumentative), mult choice exams, project designs presented to class

Activities: *(if applicable)*

A multitude of activities as described in the course content

Certificate: *(if applicable)*

Course Title

Furniture Construction A/B

Description of Target Group

This course is for 10th, 11th, and 12th grade students. It is recommended that Wood A/B and Mechanical Drawing 1A/B be completed, or teacher's recommendation, before enrolling in this course.

Purpose

The purpose of Furniture Construction is to allow students to design and develop or select approved projects that require working plans, plans of procedure and a bill of materials. A lab fee is required. Students may provide their own materials or purchase them from the school. This is a two semester or two period course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Pass safety information form.
2. Operate machines properly.
3. Complete any required project.
4. Construct common wood joints and cuts.
5. Draw to scale, cabinets and furniture projects.
6. Complete selected projects including finishes.
7. Be able to recognize and select good materials.
8. Figure cost and board feet.
9. Be aware of the world of work.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, lectures, class participation, demonstrations, audio visual materials, field trips, small group activities, and outside resource people.

Graphic Arts 1 A/B

Pioneer Valley High School (053847)

UC honors designation?	No
Prerequisites:	none (Recommended)
Co-requisites:	None
Integrated (Academics / CTE)?	Yes: Design, Visual and Media Arts
Grade levels:	9th, 10th, 11th, 12th

ourse Description

urse overview:

Graphic Arts 1 A/B is a one-year, Career Technical Education course that introduces and emphasizes the development of professional design skills in visual communications, graphic design, and layout. The course incorporates project-based learning and is constructed so that each unit builds and prepares student skills to be applied in subsequent units. A rigorous framework of reading, writing, class discussions, and design exercises enable each student to master a foundation of techniques and skills they apply to assigned projects using page-layout or image-editing software such as Adobe Illustrator and Adobe Photoshop. The course objective is to enable unique and effective, critical and creative problem solving skills for an entry-level career *or* for more advanced studies in graphic arts.

urse content:

Unit 1. What is Graphic Design?

In this unit, students are introduced to concepts of *design thinking* and examine the design process through the lens of Contemporary publishing materials.

Students will learn how good design combines from the merging of *form*, as art, and function, as utility. They learn how design drives visual culture and that graphic design is a powerful method to communicate. The availability of computer has made everyone a graphic designer, proving the need for students to learn the design rules for using technology tools. Students survey how the Internet has changed everything for graphic designers. They are instilled with the basic fundamentals that graphic design is a *plan for organizing visuals, typography, and space*. By the end of this unit, students will understand the basic rules that provide them a practical graphic design/layout guide. This will provide them with the foundation of concepts and practices necessary for producing effective visual communication across a variety of formats from print media to electronic media.

⊒ Unit Assignment(s):

Students find a printed example of graphic design; one in which they feel is well designed and communicates a message. They will write an explanation sighting specific instances in their example of each of the four basic characteristics of a successful graphic design layout: what captures their attention at first look; how the layout controls each eye movement through the layout; what kind of information is conveyed and how the design accomplished this; is there any emotion induced from the layout.

Successful completion of this assignment (by rubric) validates student understanding of the four basic characteristics of a graphic design layout, and their ability to analyze a layout and identify these characteristics.

Unit 2. History of Graphic Design

History is a recurring theme across the entire curriculum. This unit, however, is intended to help cultivate students' curiosity and provide them additional resources for their projects. Students learn that the history of graphic design gives them an understanding of the evolution of visual communications from the earliest cave paintings through the latest digital media. History helps clarify meaning and eases visual communication. As students learn about world events, they explore how graphic design has contributed to the growth of civilization and influences our contemporary society and culture. This unit makes conclusive how understanding history enhances a designer's perceptions. Rather than borrowing a style, students learn how to expand on styles because they know how these styles evolved.

⮒ Unit Assignment(s):

Students select and research three significant events in the history of graphic communication. From this, they write an explanation of how these events socially and culturally impacted the world, and what impact still affects the present day. They must include specific evidence and appropriate visual references that support their opinion. When completed, students share their papers with the class in a five-minute presentation.

Successful completion of this assignment will indicate students' ability to interpret historical social and cultural influences on graphic communications on the past and present periods.

Unit 3. Generating Ideas

No matter what the purpose, design is not spontaneously generated. New designers often go directly to the production steps in creating visual communication, while professional designers work on cultivating ideas by research, brainstorming, and sketching their thoughts. This unit offers students a view of *design thinking*, a methodology to develop their ideas. Students learn to research, or collect basic information in words and diagrams about the design's purpose, deadline, audience, and how it coordinates with related events. Once completed, students learn to use their research data to brainstorm the project's design concepts and layout possibilities. They learn three brainstorming techniques to help stimulate creativity, which can be used individually or in collaboration. Ideas often come from looking at work create by other designers, so a segment of this unit is devoted to exploring famous designs and designers. Finally, brainstorming becomes visual by creating sketches, thumbnails, or storyboards that represent simplified ideas to solve the visual problem at hand. This task might unveil dozens of possibilities, and students learn how to evaluate the best solutions to the visual problem.

⮒ Unit Assignment(s):

Students write a checklist that traces the workflow and organizes the design process focused on in this unit. Their list is based on reading assignments, class discussions, and research. It must include all the steps and details required, along with explanations and examples, in order to complete an affective graphic design layout. Students then draw a tabloid-sized diagram, or flow chart, of their checklist using available media. (This checklist becomes part of the rubrics used to evaluate and grade the students design work.)

Successful completion of this assignment will give students an understanding of the *professional* methodology they are expected to follow in completing assignments in this and subsequent graphic communications classes as well as in a real world career.

Unit 4. Layout Basics

Basic layout entails exploring the physical structure of a design layout by introducing eight essential components of a successful layout. By demonstration and practice, students learn the functions of these components and can conclude what makes a good layout. This understanding helps them to identify the essential components in either simple or complex layout designs. They learn how to create an effective, reader –friendly layout for simple projects such as flyers and information sheets. With this knowledge and practice, students are able to apply essentials in their own simple projects. Testing and analyzing their work provides evidence that their layouts are effective because of the reading characteristics of the Western culture; from left to right and from top to bottom. Controlling the reader's eye movement is key in designing effective layouts. At the end of this unit, students will have a conceptual layout that will work in most graphic design purposes.

⮒ Unit Assignment(s):

Students develop and produce a public service announcement (PSA) poster about a social issue in which they are passionate. Using the techniques presented in this and the previous unit, they will do research, develop the concept, write the copy and tags for the poster, create thumbnail sketches and a comp, locate suitable visuals, pair up fonts that work well together and support the content.

Successful completion of this assignment will give evidence that students understand the various tasks and how they interrelate in creating a graphic design layout. It also gives students experience in working out problems that arise with both the mechanics and the content.

Unit 5. Newbie Errors

There are a variety of errors that new graphic design students are likely to make. Each of these errors can minimize the result of their layout. This unit visually surveys these errors and the rationale behind them, with the intent that students will avoid them in creating their own design layouts. These errors are presented by example, which simplifies the process of understanding them and being able to identify them. By carefully learning how to avoid these errors, students are able to maintain control over the viewer's eyes, improve readability, and thereby improving the chances of conveying a message. To contrast these errors, students acquire five steps to visual success, which include establishing a clear focal point, minimizing the number of groupings the eye must scan, creating visual sight lines to guide the eye, properly set type, and the use of simplicity and restraint.

⮒ Unit Assignment(s):

Students find seven examples of the design errors that newbie designers are prone to make. Clip or photocopy at least four errors found in print media such as flyers, magazine ads, etc., and make screen prints of errors on the web to total the seven. Explain each error and create rough thumbnail sketches that show a fix for the errors.

Completing this assignment successfully will prove that students can identify common design errors and be able to provide alternatives that are more functional and affective.

---

6. Elements and Principles of Design

This unit focuses on the tools of design and their application to creating a layout. These areas of exploration that students learn include the *Elements*, or basic units of Design, the *Principles* of how they are applied, and four *Gestalt Theories* that define how people perceive patterns. These represent are the building blocks that students use to create a visual layout. Being familiar with the elements, principles and theories will help a student converse about a layout and allow them to be used to create more effective visual messages. Students also study how designers use the Golden Proportion and the Rule of Thirds to organize the visuals, type, and components and space in their layouts.

Unit Assignment(s):

Working in pairs, students locate print material containing examples of each of the *Elements of Design*, *Principles of Design*, and applied *Gestalt Theories*. They evaluate and label each example, indicating the dominant occurrence of the element or principle, and noting any secondary occurrences. Look in print material such as magazine and newspaper ads, brochures, and flyers.

By successfully finishing this assignment, students enhance their skills at identifying the tools of art and design. By recognizing them, they can better understand how to use them in their own design layouts.

---

7. Visualizing and Grid Design

Grids are an important part of graphic design. They are the structural force behind design, whether print or electronic media. They are organizational tools that bring order to a layout and define space. Students learn by hands on how grids give the designer control over composition, create effective visual communications, and provide unity over their design. In this unit, students also learn about various formats of layout, and the use of grid to organize the space of a layout. Finally, students evaluate examples of composition aided by multi columned grids. They learn about aspect ratios, proportions of margins, columns, alleys and gutters, how to establish a focal point, where to place objects, use of Greek text, and how to control negative space. In this unit, students also encounter layouts with multiple topics on the same page. They also discover objects not previously considered basic components of a layout, and so they adopt new techniques for playing these objects in optimal locations within the working structure of their layout.

⮒ Unit Assignment(s):

Using the essential components learned in previous lessons, create a poster publicizing an event of your choice. Students are required to create a grid using single page margin calculations, write the copy and tags, locate appropriate visuals, and the manipulate text and headlines to work with the content. When completed, students write an analysis of how their grid worked with the *Elements of Design*, *Principles of Design*, and applied *Gestalt Theories*, to support the four characteristics of an effective layout.

In addition to practicing the techniques learned in this and previous units, students will show their ability to combine the components learned into an effective graphic design layout, and to defend their designs.

Unit 8. Typography

Type surrounds us every moment of the day. It's an integral part of graphic design, especially when it merges with photographs, illustrations and the thoughts that we intend to communicate. With thousands of typefaces available, designers need an understanding of how to combine type with the other basic visual elements. This unit discusses the mechanics and classifications of type, the classical typefaces that have endured for hundreds of years, the traditional methods of how we use type and readability. It also enjoins creative methods of designing with type and contemporary techniques of how our words work with the other visual elements to convey our ideas and thoughts. By completing several exercises in typography, students learn the nuances of typefaces, styles, alignment, and size. Students also learn to make the connections between typeface and content, explore techniques to evoke the readers' emotions, and create designs with type for logos and infographics.

⮒ Unit Assignment(s):

Students create a vertical folding restaurant menu on a 9 inch by 12 inch document (the finished size is 4½ inches wide by 12 inches high). Students chose the type of food, write all the copy, design the front and back covers, and design the inside two-page spread showing the menu items offered. Use typography that that suits the cuisine, and create a visual hierarchy with a sense of order. This must show proper punctuation marks, indicate paragraph, bulleted lists with hanging indents, tabs, tab leaders, and whatever else is required by your design.

A successful assignment will show that students comprehend the visual character and nuance of various typefaces and how they enhance and *couple* with words in our languages. Further, they understand the technical structure, punctuation marks, and alignment required by typesetting.

Unit 9. Color Theory

Each color we use conveys tone and meaning; which is essential to affecting audiences' judgments and reactions. Students learn that color is more than just a visual phenomenon—it is uniquely an emotional language and a symbolic tool for all designers. They learn that it is not simply a decorative afterthought and should be leveraged to its full extent. Color has the

power to capture the reader's attention, to control their eye flow, and to evoke their emotions. Influences of a designer's color choices are from culture, history, and nature, each of which is explored in the course. Successful application of color requires an understanding of color technologies and an understanding of how colors relate to each other on a color wheel. Students interpret these relationships of color by creating color schemes, and learn how these relate to design.

⮒ Unit Assignment(s):

Students create a Color Journal with three color schemes taken from the ink/paint color model. Use only hues, no black or white, with each scheme based on one of the following: 4 color complements, 4 analogous colors, and 5 colors extracted from a photograph (included on the page) of a natural environment. Create journals as a letter size page from a logbook, using lined paper for a background.

A successful assignment shows that students understand the relationships of colors in a traditional color wheel (ink/paint model), and are able to create various color schemes for various purposes.

Unit 10. Working with photos and illustrations

It is easily possible to create a document comprised entirely of words. We see this every day. Most of us, however, prefer photos, illustrations, or infographics embedded in our reading material to make it more interesting, more informative, and break up uninteresting blocks of type. Students will learn that graphics carefully selected can add color, texture, visual impact, and create a sense of movement and rhythm in a static layout. More importantly, visuals add to the eye flow by providing entry points to a layout. In this unit, students will encounter matters of quality and suitability of content, but also learn about the technical side of images: resolution, file format, size, and bleed off. They learn how to select the right visuals to support the content in their layouts, how to scale images to the proper size without distorting the proportions, how to choose more than one photo, where to get photos, and about alternatives to photos. This unit finishes by delving into copyright law, where students learn what a copyright is, and understand a variety of terms encountered in graphic design such as exclusive rights, public domain, intellectual property, fair use, and attribution.

⮒ Unit Assignment(s):

Collect several advertisements relating to four topics given to you by your teacher. Compare and contrast the photo treatments in each ad in a short writing. Consider the compositions, use of color and alterations applied using digital editing software. Choose one of the topics and create your own two ads. One ad must be within a style consistent with convention; the other one using a totally different style. Use digital stock images and any photo editing software available to you. Print both and submit them along with your written thoughts.

Success with this assignment indicates that students can evaluate images slanted toward different content. They are also are able to depicted images that reinforce and support different content.

Unit 11. Infographics

21st century technology demands fast chunks of visual communication are in high demand. In this unit, students learn that news organizations and advertising agencies are relying more and more on infographics to deliver content quickly and clearly. They learn how to improve cognition by utilizing graphics to enhance the human visual system's ability to see patterns and trends. Infographics are the merging of information with the visual skills of a graphic designer. Students are presented with a multitude of best practices for designing maps, pie charts, graphs, and time lines. It is a quick process to discover that infographics is beyond journalism or business communications; it is well within the realm of the graphic designer.

⮒ Unit Assignment(s):

Students create a two dimensional illustration of the living room in your home. Starting with the rules of creating maps, synthesize your own visual style of lines, shapes and color to detail areas of the room. Students should devise a method of placing furniture around the room. Take liberties to develop an interesting view, add textures and patterns that help represent the details, but still maintain proportion and scale.

This assignment is intended to give students an opportunity to practice skills of illustrating and devising a style that enhances the presentation of the illustration.

Unit 12. Corporate Identity and Branding

Corporate Identity relates to a combination of designs, words, and color schemes that make a visual statement about a company and the business philosophy it chooses to communicate. Associated with this is a symbol, or icon, that represents the company—a logo. In this unit, students learn how to synthesize a corporate identity including colors, tag lines, stationery, and an icon, all of which can provide easy identification of the company by the public. Corporate Identity has become part of what has become known as *branding*. As an introduction to *branding strategies*, students will study examples of *branding standards* created by several well know corporations. From these, they will learn the purpose of branding, and how the success of most businesses relies on presenting a consistent image to the public, where every detail is considered, and controlled.

⮒ Unit Assignment(s):

Students research an existing corporation to determine a new identity for the business. From this research, they design a new business logo in color using typographic ligatures and techniques demonstrated and detailed in this unit. The logo will be placed on the business stationery, which includes a business card for you, the CEO, letterhead with a tag line, and matching business sized envelope. Students' design must be a total *facelift* for the corporation. To complete this assignment, students defend their design by writing an explanation of the change in identity.

Students will succeed with the assignment when they have created a new identity for the business they choose, and can justify their design.

Unit 13. An Overview of Papers and Printing

Printing will never disappear even though we seem to be heading toward a paperless existence. Handheld devices offer access to electronic documents. But print media will not disappear. Paper offers a sensory element not available with electronic media, which strengthens the ability to communicate through design. There are huge varieties of textures and finishes available, providing students with ample evidence to support that the tactile feel of paper is more persuasive than an electronic document. Students learn how to choose the right paper for project by considering the look, the feel, the color of the paper, various treatments that may be applied, common paper folds and binding types, and, of course the costs. Methods of printing are compared, including commercial offset, web offset, and digital printing. Students complete the unit by learning how to specify a project for getting an estimated cost, and how to prepare their documents for printing. A representative from a major paper company will address the class and discuss about paper lines offered by the company.

⮒ Unit Assignment(s):

Students design a tri fold brochure printed on landscape letter sized paper for any product they choose, real or fabricated. They complete research, brainstorming, thumbnail sketches, write copy and tag lines, and locate three of four images to support the content. Using page-layout or image-editing software, they complete final artwork, with notation for the printer (crop marks, color bars, registration marks, and color specifications). The final steps include paper selection, writing the printing specifications and get printing quotes either online or from a print shop.

Students who complete this assignment successfully confirm they have learned the process and understand how to design and produce a simple brochure printed using an outside source.

Unit 14. Designing for the Web

Many of the visual communication skills developed in graphic design are applicable to web design. Designing for the web is a more complex task because of its interactive nature, and the fast pace of continuing advancements in technology. However, both deal with certain rules about visual communication, and so this unit introduces communication issues in designing for the web. Students learn such things as how fonts are displayed on a computer screen, how color changes, there are a few different rules for controlling the viewer's eye, and a different method of *navigating* from page to page. They learn how the web works, so they may understand what to expect when working with websites and how files are displayed. Designing for the web is similar to print design. The graphic design rules and skills developed in the course for print layout apply to web design. But students also learn that there are differences, as well, such as the inability to totally control layouts on screen, as on a sheet of paper, or that the canvas continually changes with the device being used to view the pages. Finally, students learn that the best web pages are collaboration between good design skills and good technology skills.

⮒ Unit Assignment(s):

This is a collaborative assignment with the Advanced Web Media & Design class. Students draw several thumbnail sketches and brainstorm ideas for an online personal portfolio. They choose their best idea to develop using page-layout or image-editing software to create their portfolio website. Starting with a site map, they create a home page, and determine what secondary pages will be necessary. Their final website must include consistent navigation, a strong graphic user interface, and detailed specifications for type, images and other visuals. Since this is not a web design course, the completed website will be scripted by the Web Media & Design class. Final website designs must conform to the standards developed in both the Basic Graphic Design and the Advanced Web Media & Design courses.

A successful assignment will yield a website based on students' ability to transfer their design ideas to another student. Critiques from the advanced students will help validate communicate design ideas and the accuracy of the specification.

Unit 15. Education and Careers

In this unit, students learn the difference between a job, an occupation, and a career.

They learn about the various segments of the graphic design industry so they can decide which best suits their interests and talents. It is important that students understand what is required for entering the industry and its potential growth, and how to research and explore careers in order to make critical decisions about their futures. Surveying schools that offer advanced education in graphic communications shows them how to better prepare for a career. They learn to create, produce and present professional portfolios, and are responsible for documenting, presenting and evaluating their skills and experience. Knowing how to get their first job is equally important because it is their first step on the road to a successful career.

⮒ Unit Assignment(s):

Students select a career in the visual arts industry to do an in-depth study. This study includes several facets: *investigating* the career to identify basic requirements such as knowledge, skills, education, and abilities; *researching* salary and wage information, average working conditions, and the economic outlook for future jobs; *interviewing* a professional in the industry, asking them predetermined questions; *examining* professional associations to determine how membership would help their success in the career. Finally, students write a career paper including the facts and information they accumulated about the career they chose, a summary of their interview, and a conclusion about why they would pursue such a career.

Successful completion will confirm that students have learned how to research a career. The assignment has either given them a career direction, or at least the skills with which to find a different one.

hool(s) Offering This Course:

School Name	Course Learning Environment	Transcript Code(s)	
		Abbreviation	Course Code
ioneer Valley High School (053847)	Classroom Based	Graphic Arts 2A	IT6663
		Graphic Arts 2B	IT6664

Title:	Graphic Arts 2 A/B
Length of course:	Full Year
Subject area:	College-Preparatory Elective (G) / Visual & Performing Arts
UC honors designation?	No
Prerequisites:	Graphic Arts 1 A/B (Required)
Co-requisites:	None
Integrated (Academics / CTE)?	Yes: Design, Visual and Media Arts
Grade levels:	10th, 11th, 12th

ourse Description

urse overview:

Graphic Arts 2 A/B is a one-year, capstone Career Technical Education course that prepares students for careers or post-secondary education in visual communications, graphic design, and layout. The course is founded on project-based learning. Students will apply knowledge and skills acquired in Graphic Arts 1 A/B to an understanding of copyright and intellectual property law, design theory and processes, image generation and assembly, applied arts, color, typography, and print production & electronic publishing. Students will also participate in providing support to school events such as theatre productions, the yearbook, and the school newspaper. Historical design and aesthetics will continue to be a student focus including how technology, politics, social media, and cultural beliefs influence artwork.

urse content:

Unit 1: The Graphic Design Industry - History, Designers, Trade Associations

In this unit, students will examine the history of graphic design. Students will identify major influences and attributes from various cultures and historical figures that have emerged, and through class discussion and analysis, describe their impact on the field of graphic design. Students will research and analyze the various job classifications and trade associations within the design, visual, and media arts industry. Students will understand and apply the practice of personal and occupational safety and protecting the environment by using materials and processes in accordance with industry standards, OSHA requirements, and environmental regulations. Students will understand, practice, and apply the safe and appropriate use of tools, equipment, work processes, and hazardous waste handling and disposal. Students will be introduced to Tech Notes and the Design Blog, and the monthly assignment of evaluating current events in graphic design.

Unit Assignment(s):

Graphic Design Careers and Certifications

In this assignment, students will research and analyze the various job classifications within the graphic design industry and consider the pros and cons of the role, certification and education level required, compensation, companies who are hiring, and watch videos of individuals who work in the various career opportunities. Students will design a career pathway that includes the skills and education required to pursue their specific career, develop a presentation, and present their findings to their peers in a multimedia format.

Current Events in Graphic Design

Each month, students will research current event articles from online Graphic Design journals and magazines; to name a few: *Print Magazine, HOW Design, Eye, Idea*. Students will obtain, evaluate, and communicate information by writing short reflections and participating in whole class discussions.

Ongoing - Tech Notes and Design Blog

Tech Notes are digital notes taken by the student on topics such as computer application tools and procedures, the graphic design print process, materials and production, and electronic publishing methods. Students will also respond to Design Blog writing prompts that are directly related to graphic design and design theory questions.

Unit 2: Copyright, Intellectual Property Law, and Ethics

Copyright and intellectual property law are the foundations of many creative and expressive art industries. In this unit, students will explore the source and nature of copyright protection. Students will become familiar with the Copyright Act; they will visit the US Copyright Office website where they will explore the text of the nation's copyright laws, news on proposed copyright legislation, basic information on copyright, perform a search of copyright records, and learn how to register the copyright for a work they have created. Students will also study intellectual property law from both a moral and commercial value perspective.

Students will also analyze the industry of photo manipulation and discuss the influence and manipulation of popular media. Using magazine covers, fashion magazines, and other images, students will explore the ethics of manipulation. Students will engage in classroom debate on the artist and artistic liberties in the context of false information. Students will also engage in a Socratic seminar asking open-ended questions that will require students to actively listen to their peers, and then evaluate and articulate their own thoughts and responses.

⮒ Unit Assignment(s):

What's in a Picture?

In this assignment, students will write a research paper that considers the ethical challenges of working with visual material. Specifically, students will focus on the role the media plays in publishing images that may or may not be truthful, and the impact it has on personal, social, and political issues. Students will analyze several manipulated images of food products, politicians, and other news features such as:

- a *Time* magazine artist who reworked OJ Simpson's mug shot (*Time*, July 27, 1994)
- a *National Geographic* artist who adjusted the great pyramids of Egypt to better fit a cover layout (VanRiper, 1994)
- a *Time cover* photograph, reportedly presenting Bill Clinton in an agitated state over the Whitewater affair, which was, in reality, taken months before in a totally different context (Kramer, 1994)

Students will then address the following questions in their paper:

1. What constitutes a manipulated image?
2. When is the manipulation of "reality" justified? What about context?
3. Is it fitting to use such an image? If so, when and how?
4. Is it proper to appropriate images, removing them from their original context?
5. Is it ethical to manipulate a "borrowed image"? If so, how much? And who owns the final "new" image?
6. Is it ethical to manipulate an image to invoke an emotional response?

Unit 3: Gestalt Design Theory and the Design Process

In this unit, students will learn and apply the theory of the Gestalt design with a focus on computer interface design. Students will learn the fundamentals of two-dimensional design, the foundation of art, graphic design, and visual communication. Students will examine how simple, yet intentional visual manipulation, points, lines, planes, gestalt, and color can communicate and create meaning. Students will also learn and apply the five steps of design - Define, Learn, Generate Ideas, Design Development, and Implementation in an effort to know and understand exactly what a client wants and needs.

⮒ Unit Assignment(s):

Gestalt Principles

The Gestalt approach attempts to define principles of perception—a list of "perceptual laws" which determine the way humans perceive objects. Further research into the perception of patterns and objects has been used as a theoretical backdrop to inform the design of website interface.

In this assignment, students will learn and apply the form-shaping capabilities of the human visual perceptual system, particularly with regards to how designers use these effects to create interesting designs. Students will first read the Gestalt excerpts from the *Universal Principles of Design* which covers the five principles: closure, similarity, continuity, proximity, and uniform connectedness. Students will then research and find examples of the last four principles online in an existing website interface. Students will place a screenshot of each example in a html or PDF document. Students will include a short narrative, the original source link, and identify which Gestalt principle(s) are observed in each screenshot. Students will present their work to their peers in a multimedia format.

Unit 4: The Principles and Elements of Applied Arts

In this unit, students will learn and apply the principles and elements of applied arts to the design and decoration of everyday objects to make them aesthetically pleasing. Students will also examine the application of design and aesthetics to objects of function and everyday use in the fields of industrial design, graphic design, fashion design, and interior design. Students products will include a logo design and marketing materials for an object they've chosen from a kitchen.

⮒ Unit Assignment(s):

Design and Visual Communication

In this assignment, students will observe small objects at home that are part of their everyday lives. They will select one object they think is remarkable and research the following:

1. Where did it come from?
2. Why was it invented?
3. What materials is it made of?
4. What problem does it solve?

Students will then imagine they are a museum curator who is including the object in an exhibition and write a wall label that describes the object. Students will then exhibit their object and wall label for peer review.

Students will then work in small groups to invent their own kitchen appliance or utensil. Students will draw a picture of their invention and address:

1. What is it made of?
2. What is special about it?
3. What function does it serve?
4. Who will use it?
5. What is it called?

Finally, students will design a logo and marketing material addressing who their audience is and what they want to draw attention to. Students will then exhibit their products for peer review. Peers will identify the intended audience, the focus of the marketing material, what makes their kitchen item design aesthetically appealing, and participate in small group and whole class discussion.

Unit 5: Color

In this unit, students will explore the use of color in the surface decoration of canvas and fabrics. Students will experiment with color mixing and make color samples. They will explore tonal variations and contrasts in color, keeping all samples and information in a dye notebook or folder. Students will apply the use of household dyes to look at color and how it functions in fabric design. Students will explore how color is used on clothing and fashion, and discuss trends and influences that dictate the choice and use of color in everyday life. Students will also examine two international artists who use colored dots in their works of art. They will then explore the use of color and create a painting on canvas using just dots.

⮒ Unit Assignment(s):

Dots on Canvas: A Self Portrait

In this assignment, students will create a painting using just dots with a particular focus on the use of color, size, pattern, and repetition. First, students will examine the painting *Grandmothers Country* by Australian Aboriginal artist Michelle Possum Nungurrayi and her use of color, size, pattern, and repetition of dots. Students will then examine the work of Yayoi Kusama, a Japanese artist who is obsessed with dots and has been using them since her role as an avant-garde artist in 1960s counterculture. Students will respond in writing on how both artists use dots in the context of their similarities and differences, mood, theme, and the story they are trying to tell. Students will then design and render their own painting on canvas using acrylic paints by just painting dots. They will create a self portrait that uses color, size, pattern, and repetition.

Unit 6: Typography

In this unit, students will be introduced to the power of words through typography; the art and technique of arranging type to make written word legible, readable, and appealing when displayed. After a brief but relevant history of the alphabet, students will learn and apply the use of typography as a communication tool; not only to make artful design, but to organize and communicate the meaning of an idea. Students will understand how the arrangement of type involves the selection of typefaces, point sizes, line lengths, line spacing, and space adjustment between pairs of letters, to make text readable and coherent, and how it can organize content for ease of use and comprehension.

⮒ Unit Assignment(s):

Visual Poetry

Visual Poetry, in its simplest form, is an arrangement of words that echo the theme of a poem; where the shapes of the words are just as important as what they say. A visual poem can be expressionistic, where clusters of syllables, punctuation, color, shape, space or letter-forms resonate together and suggest various sounds. In this assignment, students will be given the words to a poem, and asked to visually create an expressionistic visual poem, a visual mosaic of words, that clearly articulates their own interpretation of the poem.

Unit 7: Visualizing and Grid Design

Visualizing and Grid Design are elements of design that aim to help the artist develop creative methods of thinking and a critical approach to their work. In this unit, students will learn how to organize and visualize data and information in an understandable and effective way. Students will understand how to apply a grid system, a framework of spaced bars that are parallel to or cross one other, to achieve an organized design. Students will explore grids in an interactive design using multiple devices with different screen sizes. Students will also learn and apply the technique of visualizing as they communicate quantitative or qualitative information in a way that tells a story about data and information, depicting a pattern of their relationship. The main objective is for students convey information in a manner that remains readable and comprehensible, while in graphic form.

⮒ Unit Assignment(s):

Creative Jobs Snapshot

In this assignment, students will create an Infographic, a graphic visual representation of information, data, or knowledge designed to present complex information quickly and clearly. The goal of this assignment is for students to explore creative ways to layout data and complex information in a manner that is quick and easy to read. Students will choose a particular graphic designer job and research and select information and data to create a job snapshot. Students will utilize the grid design technique, use type and image as the visual elements, and use fonts, color, shape, and size to represent specific feelings and emotions. The image size will be 9" x 15" and be mounted on a 11" x 17" bristle board. Students will present their infographic to their peers for peer review.

Unit 8: Print Production & Electronic Publishing

In this unit, students will learn the technology and terminology of digital art, photographic production, and electronic publishing. Typography is revisited as an important design element in electronic publishing. Design considerations and compositional techniques such as the rule of thirds, lines of motion, leading lines, visual hierarchy, repetition, alignment, proximity, and contrast are examined in print production. Students will learn and apply photoshop to enhance, retouch, restore, and color correct images to improve the quality of online image display at several resolution levels. File transmission and compression methods, digital color theory, and a variety of output considerations will also be explored in an effort to cover all aspects of print production and electronic publishing.

⮒ Unit Assignment(s):

Print Production and Electronic Publishing

In this assignment, students will first study the components of a print ad in preparation for creating an advertisement for a magazine. Students will examine:

1. the header - does it attracts attention to the ad and let the reader know what they will find out in the copy
2. the image - does it create curiosity and communicate what the viewer will learn by continuing to read the ad
3. the body - does it elaborate on the concept of the title, and build interest in the product or service
4. the call to action - does it lead the reader to take a specific action, such as visiting the store or contacting the store for more information
5. the contact information - does it include as much information as appropriate to make it easy for the reader to find the business

Next, students will create and produce a mazagine advertisement for a consumable product. After the production of the print ad, students will repurpose the material to fit into a standard sized banner advertisement for placement on a webpage. Finally, following the restrictions and size constraints of each entity, students will rewrite the material and publish as a blog post, as a series of messages on Twitter, as a Google Adword link, and on Facebook as an advertisement.

Unit 9: Preparing for a Career in Graphic Design

In this unit, students will explore the expectations of professional conduct in the graphic design industry, including personal qualities of workers and attention to personal presentation. Students will focus on the importance of teamwork and the components of effective leadership. Students will review the multiple career paths available in graphic design and understand the process of looking and applying for a job; this will include an overview of the education and credentialing requirements in graphic design and how to navigate the application process.

⮒ Unit Assignment(s):

Social Media Professional Portfolio

In this two part assignment, students will perform a social media audit and develop their professional social media portfolio to prepare for a job in the graphic design industry. Additionally, students will understand the potential pitfalls created when employers review social media platforms that do not flatter a job applicant.

Part 1: Social Media Audit

In the social media self-audit, students will assess their presence on social media platforms such as Twitter, and Facebook. Their audit will consider their intended audience of each platform and what story their shared information is telling people about them. Students will then write a proposal for improving their social media presence in light of a future career in the graphic design industry.

Part 2: Professional Social Media Portfolio

Students are to develop a professional portfolio that demonstrates their social media capabilities and uses selected social media channels. Students will consider how they want to appear electronically to potential employers, relative to everyone else seeking a similar position. The social media portfolio will demonstrate their potential through a collection of digital artifacts articulating experiences, achievements, and learning. Students will aim for an impactful Linked-In profile that links to other media, including but not limited to a blog and Twitter account.

Course Title

Graphic Arts A

Description of Target Group

This course of theory and production is for sophomores, juniors, and seniors who have completed the Survey of Graphic Arts course with a passing grade, and want to gain a more thorough knowledge of graphic arts. A student may also qualify to take this course by obtaining the instructor's approval, in writing.

Purpose

The first term of a one-year course is designed to allow students to apply knowledge from the prerequisite course (Survey of Graphic Arts) by transitioning to more advanced levels of visual design, and an expanded scope of applications. Projects will involve students in a more challenging, problem-solving situations through extensive, personal collaboration with high school staff and/or community organizations and members.

Prerequisites: Passing grade in Survey of Graphic Arts, Art 1 or Survey of Drafting

Standards of Expected Student Achievement

Upon successful completion of this course, students will be able to demonstrate the following knowledge/skills:

- Making critical aesthetic judgments.
- Self-reliance and independent thinking.
- Solving problems individually and/or in small teams.
- Use of theoretical and practical skills as applied to design projects.
- Expanded specialized graphic arts vocabulary as it relates to theory and production.
- Organization of design projects from inception to completion.
- Use of computers as applied to graphic arts.
- Knowledge of safe and correct applications of graphic arts production equipment.
- Expressing intentions and accomplishments using oral and written skills in public (classroom) presentations.
- Awareness of related occupations.

Assessment of Student Learning

1. Students will present evidence of learning by cooperating with group or individual assignments and presentations based on projects and skills.

2. Students will present evidence of learning by presenting ideas, solutions and conclusions to proposed or presented problems.
3. Students will present evidence of learning through teacher observations.
4. Students will present evidence of learning through quizzes, tests, and homework.
5. Teacher evaluations.

Instructional Materials

Text and supplementary materials

- Adopted text: TBD
- Supplementary text:
  - Software instructional manuals
  - Trade magazines
- Supplementary Video

Activities

Lectures, teacher and student demonstrations, individual work, interfacing with staff and community, student presentations, guest speakers, and field trips.

Course Title

Graphic Arts A

Department: Industrial Technology

Career Path: Technology

Description of Target Group

This is the first term of a two term (one year) course for 9th through 12th grade students wanting to learn the fundamentals of graphic design. A lab fee may be required.

Prerequisite: none

Purpose

This course is an expanded version of Survey of Graphic Arts where the curriculum is designed to provide for a more in-depth experience for beginning level students. This is an exploratory course, which will expose students to the world of visual design. The fundamentals of graphic art design, theory, and production, will be investigated. As an introductory course students will follow a process of design from concept to production, using a variety of tools and equipment. Students will solve design problems assigned by instructor, and provided by on campus projects. This is a 5-unit course.

Standards of Expected Student Achievement

Upon successful completion of this course, each student will be able to demonstrate competency in the following:

1. Making critical aesthetic judgments
2. Self-reliance and independent thinking
3. Solving problems individually and/or in small teams
4. Using specialized graphic arts vocabulary as it relates to theory and production
5. Application of principles and elements of design to projects
6. Basic knowledge of computer use as applied to graphic arts
7. Knowledge of safe and correct applications of graphic arts production equipment
8. Expressing intentions and accomplishments using oral and written skills in public (classroom) presentations

Methods of Assessment of Student Learning:

1. Class participation
2. Quizzes covering each main module.
3. Teacher evaluation.
4. Independent projects.
5. Final examination.
6. Cooperative work with other students.

Instructional Materials:

Refer to: Secondary Adopted Texts and Approved Supplementary Books used in the Santa Maria Joint Union High School District.

1. Software Instructional Materials (printed/multimedia interactive)
2. Supplementary Video
3. Trade Publications

Activities:

1. Individual Work (projects)
2. Service Learning Projects
3. Lectures
4. Class laboratory shop work
5. Teacher & Student Demonstrations
6. Student Presentations
7. Small group activities
8. Class Critiques
9. Outside resource people
10. Field Trips

Course Title

Graphic Arts B

Department: Industrial Technology

Career Path: Technology

Description of Target Group

This is the second term of a two term (one year) course for 9th through 12th grade students wanting to learn the fundamentals of graphic design. A lab fee may be required.

Prerequisite: Graphic Arts A

Purpose

This course is the second term of Graphic Arts A where the curriculum is designed to continue a more in-depth experience for beginning level students. This is an exploratory course which will expose students to the world of visual design. The fundamentals of graphic art design, theory, and production, will be investigated . As an introductory course students will follow a process of design from concept to production, using a variety of tools and equipment. Students will solve design problems assigned by instructor, and provided by on campus projects. This is a 5-unit course.

Standards of Expected Student Achievement

Upon successful completion of this course, each student will be able to demonstrate competency in the following:

1. Making critical aesthetic judgments
2. Self-reliance and independent thinking
3. Solving problems individually and/or in small teams
4. Use of theoretical and practical skills as applied to design projects
5. Expanded specialized graphic arts vocabulary as it relates to theory and production
6. Organization of design projects from inception to completion
7. Application of principles and elements of design to projects
8. Expanded knowledge of computer use as applied to graphic arts using a variety of software programs
9. Knowledge of safe and correct applications of graphic arts production equipment

10. Expressing intentions and accomplishments using oral and written skills in public (classroom) presentations
11. Awareness of related occupations
12. Furthering development by involvement in related/more advanced courses:

a) Advanced Study Graphic Arts
b) Technical Sketching
c) Photography
d) Drafting
e) Mechanical Drawing
f) Art
g) Architecture

Methods of Assessment of Student Learning:

1. Class participation
2. Quizzes covering each main module.
3. Teacher evaluation.
4. Independent projects.
5. Final examination.
6. Cooperative work with other students.

Instructional Materials:

Refer to: Secondary Adopted Texts and Approved Supplementary Books used in the Santa Maria Joint Union High School District.

1. Software Instructional Materials (printed/multimedia interactive)
2. Supplementary Video
3. Trade Publications

Activities:

1. Individual Work (projects)
2. Service Learning Projects
3. Lectures
4. Class laboratory shop work
5. Teacher & Student Demonstrations
6. Student Presentations
7. Small group activities
8. Class Critiques
9. Outside resource people
10. Field Trips

Course Title

Graphic Arts Production A

Department: Industrial Technology

Career Path: Technology

Description of Target Group

This is the first term of a two term (one year) course for 10th through 12th grade students wanting to learn advanced levels of Graphic Design. A lab fee may be required.

Prerequisite: None

Purpose

This course is designed to allow students to apply knowledge from previous Graphics and related courses (if taken). Progressively more advanced levels of visual design and an expanded scope of applications will be experienced. Projects will involve students in more challenging, problem-solving situations through extensive, personal collaboration with High School staff and/or community organizations. This is a 5-unit course.

Standards of Expected Student Achievement

Upon successful completion of this course, each student will be able to demonstrate competency in the following:

1. Making critical aesthetic judgments
2. Self-reliance and independent thinking
3. Solving problems individually and/or in small teams
4. Understand and use specialized Graphic Arts production terms and vocabulary both verbally and in written work
5. Demonstrate a working knowledge of the safe and correct applications and operations of Graphic Arts production equipment
6. Demonstrate a working knowledge of various styles, compositions and layouts of Graphic Arts

Methods of Assessment of Student Learning:

1. Class participation
2. Quizzes covering each main module.

3. Teacher evaluation.
4. Independent projects.
5. Final examination.
6. Cooperative work with other students.

Instructional Materials:

Refer to: Secondary Adopted Texts and Approved Supplementary Books used in the Santa Maria Joint Union High School District.

1. Software Instructional Materials (printed/multimedia interactive)
2. Supplementary Video
3. Trade Publications

Activities:

1. Individual Work (projects)
2. Service Learning Projects
3. Lectures
4. Class laboratory shop work
5. Teacher & Student Demonstrations
6. Student Presentations
7. Small group activities
8. Class Critiques
9. Outside resource people
10. Field Trips

Course Title

Graphic Arts Production B

Department: Industrial Technology

Career Path: Technology

Description of Target Group

This is the second term of a two term (one year) course for 10th through 12th grade students wanting to learn advanced levels of Graphic Design. A lab fee may be required.

Prerequisite: Graphic Arts Production A

Purpose

This course is designed to allow students to continue and expand on applied knowledge from Graphic Arts Production A. Progressively more advanced levels of visual design and an expanded scope of applications will be experienced. Projects will involve students in more challenging, problem-solving situations through extensive, personal collaboration with High School staff and/or community organizations. This is a 5-unit course.

Standards of Expected Student Achievement

Upon successful completion of this course, each student will be able to demonstrate competency in the following:

1. Work with the High Schools staff's and/or community business Graphic Arts production needs
2. Work with computers and current software as it is related to Graphic Arts production
3. Understand the safe use, care, and maintenance of equipment and supplies used in Graphic Arts production.
4. Expanded use of specialized Graphic Arts production terms and vocabulary both verbally and in written work
5. Demonstrate a working knowledge of the safe and correct applications and operations of Graphic Arts production equipment
6. Organization and execution of Graphic Design projects from inception to completion
7. Understanding the career opportunities in Graphic Arts production

Methods of Assessment of Student Learning:

1. Class participation
2. Quizzes covering each main module.
3. Teacher evaluation.
4. Independent projects.
5. Final examination.
6. Cooperative work with other students.

Instructional Materials:

Refer to: Secondary Adopted Texts and Approved Supplementary Books used in the Santa Maria Joint Union High School District.

1. Software Instructional Materials (printed/multimedia interactive)
2. Supplementary Video
3. Trade Publications

Activities:

1. Individual Work (projects)
2. Service Learning Projects
3. Lectures
4. Class laboratory shop work
5. Teacher & Student Demonstrations
6. Student Presentations
7. Small group activities
8. Class Critiques
9. Outside resource people
10. Field Trips

Course Title

Graphic Arts B, Production

Description of Target Group

This course of theory and production is for sophomores, juniors, and seniors who have completed the Survey of Graphic Arts course with a passing grade and want to gain a more thorough knowledge of graphic arts. A student may also qualify to take this course by obtaining the instructor's approval, in writing.

Purpose

The second term of a one-year course designed to allow students to apply knowledge from prerequisite course (Survey of Graphic Arts) by progressing to more advanced levels of visual design, and an expanded scope of applications. Projects will involve students in more challenging, problem-solving situations through extensive, personal collaboration with high school staff and/or community organizations and members.

Prerequisites: Passing grade in Graphic Arts A

Standards of Expected Student Achievement

Upon successful completion of this course, each student will be able to demonstrate competency in the following:

1. Making critical aesthetic judgments.
2. Enhanced level of self-reliance and independent thinking at an increased level of sophistication.
3. Solving problems individually and/or in small teams.
4. Use of theoretical and practical skills as applied to design projects.
5. Expanded specialized graphic arts vocabulary as it relates to theory and production.
6. Interact with outside sources for design projects.
7. Expanded knowledge of computer use as applied to graphic arts using a variety of software programs.
8. Knowledge of safe and correct applications of graphic arts production equipment.
9. Expressing intentions and accomplishments using oral and written skills in public (classroom) presentations.
10. Awareness of related occupations.
11. Awareness of related and advanced courses:

Advanced Study Graphic Arts	Art 1
Technical Sketching	Mechanical Drawing
Photography	

Assessment of Student Learning

1. Students will present evidence of learning by cooperating with group or individual assignments and presentations based on projects and skills.
2. Students will present evidence of learning by presenting ideas, solutions and conclusions to proposed or presented problems.
3. Students will present evidence of learning through teacher observations.
4. Students will present evidence of learning through quizzes, tests, and homework.
5. Teacher evaluations.

Instructional Materials

Text and Supplementary Materials
Adopted Text: TBD
Supplementary Text:
Software instructional manuals.
Trade magazines.
Supplementary Video.

Activities

Individual work, teacher and student demonstrations, guest speakers, field trips, lectures, student presentations, and interfacing with staff and community.

Course Title

Industrial Technology - Advanced Studies

Description of Target Group

This course is for 11th &12th grade students who have shown a desire to do independent, advanced work. Each student desiring to enroll will make application to the Industrial Technology Department, stating their desired undertaking.

Purpose

The purpose of Industrial Technology - Advanced Study is to allow students to do individual advanced work in one or more industrial and vocational area. This is a one semester course. It may be repeated.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Successfully complete a safety test with a passing score.
2. Provide and use protective clothing and eye protection when and where required.
3. Demonstrate the ability to set up and work under safe working conditions independently.
4. Operate safely and demonstrate ability in the proper use of hand and power equipment available to them.
5. Complete the work that was agreed upon by the student and department advisors.
6. Demonstrate ability to work independently of constant supervision.
7. Present a typed summary of the results of their undertaking to their advisors.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Student, with the help of advisors, will provide materials and activities necessary for student to complete his undertaking.

Course Title

MANUFACTURING A

Description of Target Group

This course is for 10th, 11th and 12th grade students.

Purpose

The purpose of **MANUFACTURING A** is to provide the student with safe working skills and habits, learn to work with others, organization of time and design and production of a product. It is suggested the student has completed **SURVEY** classes before enrolling in this class.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Learn the importance of planning.
2. Learn to portray ideas through sketching.
3. Learn to read and follow directions.
4. Learn to develop safe work skills and habits.
5. Learn the importance of working with others.
6. Learn the importance of responsibility of doing a specific job on a assembly line.
7. Learn to identify and work with different materials.
8. Learn to identify and use a variety of fasteners and glues.
9. Learn to estimate and figure costs of materials in relationship to the cost of production.
10. Learn to set up and operate power equipment safely.

Instructional Materials
Text and Supplementary Materials
Refer to: Secondary Adopted Texts and Approve Supplementary Books Used in the Santa Maria Joint High School District

Activities

1. Lectures
2. Individual Lab work
3. Field trips
4. Audio-visual materials
5. Small group lab work
6. Demonstrations
7. Outside resource people

Course Title

MANUFACTURING B

Description of Target Group

This course is for 10th, 11th and 12th grade students who have successfully completed **MANUFACTURING A.**

Purpose

The purpose of **MANUFACTURING B** is to allow students to expand skills learned in **MANUFACTURING A**, to design, produce and market one or more products. Computer aided manufacturing, robotics and computer aided drafting will be explored and incorporated. This is the second semester of a two semester course. It is recommended that student has completed **MANUFACTURING A** before enrolling in this course. It is suggested that **SURVEY** classes have also been taken.

Standards of Expected Student Achievement

1. Learn jig and fixture design and construction.
2. Learn leadership concepts and skills.
3. Learn concepts related to manufacturing's effect on our environment.
4. Learn skills related to design and problem solving.
5. Learn about management and labor relations.
6. Learn packaging, advertising and marketing skills.
7. Learn CNC and robotics operations.
8. Learn career awareness and future trends in manufacturing.

Instructional Materials

Text and Supplementary Materials

Refer: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint High School District

Activities

1. Lectures
2. Individual Lab Work
3. Field trips
4. Audio-visual materials
5. Small group lab work
6. Demonstrations
7. Outside resource people

Mechanical Drawing 1 A/B

ourse Description

urse overview:

Mechanical Drawing 1 A/B is a yearlong course that meets 50 minutes every day. This is an introductory class where students will learn to read engineering drawings, evaluate print specifications, recognize orthographic views and visualize actual objects. Students will study the principles and application of engineering drawing, including orthographic projections, freehand sketching, pictorial drawings, engineering lettering, dimensioning, sections, auxiliary, surface finish, and standard tolerancing. Students will study the history of design and drafting and develop skills in sketching, shading and line technique using both free-hand and with drafting instruments. Students will also use a computer aided drafting system (CADD) extensively to complete the requirements of this course.

urse content:

Unit 1: Drafting Equipment and Supplies (Historical/Cultural Context)

This unit is designed to introduce students to the tools used in drawing and architectural projects throughout history. Class discussions will allow the students to understand the historical context of art and how the development of drawing has influenced our contemporary world of design and technology. Students will be introduced to the practices used throughout history in the development of construction documents from the building of huge basilicas to the modern architectural design. In the textbook students will need to identify each tool and its use. Videos and lectures along with class discussions will provide all the students with the necessary definitions and uses of the tools used in design. All students will be supplied with the required tools for the course and demonstrations will be done to show the proper use of the drafting machines and how to sharpen pencils properly for correct line weights and shading. A thorough explanation of the use of the triangles (30/60, & 45degree), French Curves and protractors will be demonstrated and modeled for the students with direct instruction and individual monitoring.

All students will be able to describe the tools used in drafting and CAD design with group discussions and completing a written quiz. Students will read the appropriate chapter of the textbook and keep a written journal of the different types of tools and equipment needed for the profession. These assignments will be kept in a portfolio.

⮒ Unit Assignment(s):

Although modern day drafting is done on computers, it is important to understand the more traditional techniques used to create working drawings. For the first drafting assignment students will be required to produce a simple three view working drawing of a stair shaped block. As they progress through the assignment they will learn how to use various traditional drafting tools including the T Square, Triangles, and Scale. In order to complete the assignment students will follow along and participate during the teacher guided instruction and refer to an example in the form of a handout provided to them.

Unit 2: Alphabet of Lines (Connections, Relations and Application)

Architects, engineers, artists and graphic arts specialists need to understand the different ways we construct lines to accurately describe and show the relationship and application to the visual representation that will be manufactured. Students will develop a vocabulary list from the textbook and be able to sketch and draw each type of line. Students will demonstrate the ability to understand and draw construction lines, border lines, object lines, hidden lines, centerline and cutting plane lines by sketching all of these various lines on scratch paper and compare and contrast the different uses of each application.

All of these applications will be used during daily assignments and evaluation will be determined by grading each individual assignment. Students will be given a test at the end of the unit to assess the ability to construct the Alphabet of Lines when designing a project. Students will be able to analyze and interpret why these lines are so critical to the design elements of architecture and landscape. Advanced applications of dimension lines, extension lines, phantom lines and sectioning lines will we be covered thoroughly with rigorous drawings in the second semester. Students will be able to apply the Alphabet of Lines to freehand and technical drawings from the textbook. They will complete sketches of basic geometric shapes to show their proficiency. Students will read the appropriate chapter in the textbook on drafting techniques and complete a test about their knowledge. Students will practice their lettering and alphabet of lines with daily homework assignments.

⮒ Unit Assignment(s):

There are several line types used on all class assignments. As the assignments become more involved a greater variety of line types are used. During the first assignment students were introduced to Border lines, Object lines and Construction lines. For this second assignment students will again create a working drawing of a simple object, but this time there will be a hole in it. In order to accurately render the hole in the various orthographic views, students will have to use two new line types: center lines and hidden lines. Unlike the previous project where all of the line types were continuous in nature, these two new line types are interrupted (there are dashes of differing lengths). Students will complete this assignment by following along and participating during teacher guided instruction.

Unit 3: Linear Measurement (Artistic Perception)

In the architecture and interior design field it is imperative that students be able to read different types of scales to get the right perspective or scale on a proposed design. The students will understand the English measurement system vs. the metric system and how we are still using various methods in the design field. Supplemental works via the Internet will be researched to show students the basic units of measure used when the pyramids and other older structures and objects were built. Students will be able to interpret and identify the use of the various scales of measurement used in design and drafting. The students will develop orthographic drawings using the architects scale, engineers scale and the sixteen-scale. These skills will allow them to solve problems in architectural design and landscape. Guided will provide students with the understanding they need to work with each type of linear measurement. Lecture will be the primary method of instructional delivery for this unit.

Students will study and understand the ruler. They will pass the ruler quiz and become familiar with all the types of scales in the textbook and be able to identify how each is used with different artistic applications. Students will draw specific orthographic and architectural problems using the various scales. These drawings will be evaluated to determine that all

students have a concrete understanding of drawing and designing with multiple types of measurement systems. They will demonstrate understanding of measurement systems by completing assignments using the standard ruler, metric scales and the architects scale improving their ability to convey design standards to clients.

Unit Assignment(s):

For this third assignment students will have to draw the three standard orthographic views true size. They will have to measure the object using a standard ruler with 1/16th graduations. Then they will draw the views actual size. Finally they will convert those measurements to decimal form and dimension the views to three decimal places.

Unit 4: Lettering (Artistic Perception, Historical Cultural Context)

In the engineering, architecture, design and landscape fields lettering is a necessity to develop professional looking documents, drawings and plans. Line weight is critical in developing accurate text. Students will be aware of the use of text and how it has impacted drawings historically in the past and how the application is professionally used today in artistic renderings and documents. Direct instruction will be given allowing the students an opportunity to visualize the proper lettering techniques used in drafting, architecture and landscape.

Instruction on Gothic lettering assignments will be presented on the overhead projector and Power Point presentations will illustrate the correct method of developing professional lettering practices used in designing drafting projects. They will focus on line weight and accuracy in completing the lettering activities. Students will be able to produce neat, precise, legible hand writing documents. They will demonstrate the difference between vertical and inclined lettering. Students will generate text, in a CAD drawing and be able to explain how the process was completed through class discussions. They will read the appropriate chapter in the textbook and show proficiency with proper lettering on the assigned work sheets. Students will complete all assigned lettering worksheets neatly and hand in daily. Lettering and line weight will be focused on a daily basis and constant monitoring of student progress will be ongoing. The graphic representations competed by the students is an integral part of the continuous growth they need to make in the design field incorporating the artistic elements necessary for architecture and related fields of study in college. Students will be familiar with and know how to apply shading color, tone, texture and apply materials to their drawings.

Unit Assignment(s):

The Single Stroke Gothic Lettering assignment will require students to print out many different notes using the single stroke lettering method. Although students will complete all of their assignments using this lettering technique, for this assignment they will be provided guidelines in between which they will print the specified notes. The notes will provide practice for all letters and numbers while the guidelines will constrain the height of the printing so that students become familiar with the commonly accepted 1/8th inch size.

Unit 5: Basic drawing techniques (Artistic Perception, Creative Expression)

In this unit students will develop basic drawing skills with sketching and hand drawings. They will learn how to solve problems using basic elements of design making accurate measurements and drawing; vertical, horizontal, inclined lines and identify common sheet sizes used in design. Students will use the textbook to identify correctly and define the use of each line.

Through lecture and class discussions students will learn the proper layout of sheet sizes and proper borders. Class discussions in small groups will provide an active learning environment. They will complete an “A” size sheet layout with the proper title block incorporating good line value and correct measurements. The instructor will model examples, during class lectures. The students will complete two layouts for evaluation demonstrating proper technique. The second assignment in this unit will focus on the development of proper horizontal, vertical and inclined lines using the appropriate drawing instruments. Examples on how to construct these lines will be demonstrated by the instructor. The third lesson will be given with direct instruction using examples on the dry erase board on how to draw circles and arcs with a compass. This lesson will also incorporated perpendicular bisectors, tangential lines and using the compass as a divider.

Student understanding will be evaluated with a quiz on how to construct various polygons and geometric shapes often used in architecture and landscape. Constant class monitoring will be conducted to insure that all students are abilities are being met and that they assessment is appropriate for the standards. Vocabulary terms will be highlighted from the text making sure the students can explain radius, diameter, chord and circumference during class discussions. The students will all complete a rigorous drawing at the end developing a perfect star, hexagons, octagons and dodecagons. This drawing will serve as the assessment to determine that the students can construct difficult geometric shapes using proper drawing techniques.

⮒ Unit Assignment(s):

For this assignment the students will all complete a rigorous drawing developing a perfect star, hexagons, octagons and dodecagons. The drawings will be draw to the required size and spaced out evenly to fit on an A size sheet with a border and title block per specifications. This drawing will serve as the assessment to determine that the students can construct difficult geometric shapes using proper drawing techniques.

Unit 6: Orthographic Projections (Artistic Perception, Creative Expression)

In this unit students will use the textbook to explain why we use orthographic projection or multi views to represent objects. Power Point presentations and lectures will be presented to highlight the fundamentals of drawing accurate orthographic drawings. Multiple examples will be shown so the students have a complete understanding of the projection of the views in different planes. Students will be able to identify planes and how we project orthographically to create the drawing. They will be able to identify features using the basic elements of design and be able to explain positive and negative mass as it relates to a drawing. Students will understand primary and secondary views and be able to explain how to center a drawing on a drawing sheet.

The students will acquire the knowledge necessary to create a multi-view drawing and demonstrate how these drawings represent the elements of art using texture, shape, color and line weight. They will answer the questions at the end of the chapter and be able to illustrate by sketching the three views of an object. Students will be able to explain the use and application of orthographics in artistic representations and how they are used in working drawings. They will complete rigorous drawings with exactness and preciseness with drafting tools and on the computer using Autocad. They will complete various orthographic drawings and hand each drawing in for evaluation.

Orthographic drawings are the foundation of architecture, manufacturing and design. These assignments will lead to more advanced applications in the textbook as the students develop their skills throughout the year. Students will keep examples of their best work to add to their portfolio.

The next chapter will show how the students can take their visual presentations from multi views to actual three-dimensional views by translating the views to an Isometric drawing or even perspectives.

Unit Assignment(s):

The next assignment will build upon the student's knowledge of orthographic drawing. In addition to the standard orthographic views (top, front and right side), students will have to create front and bottom views in order to accurately describe the considerably more complex object that is their subject. The object is a sliding bracket with intricate features on all sides, each of which must be accurately drawn actual size.

Unit 7: Pictorial Drawings (Creative Expression, Aesthetic Valuing, Historical/Cultural Context)

Pictorial drawings are used to draw visual representations of an object to highlight features not easily visualized in a working drawing. Students will focus on the direction of lines and the size of the drawing, learn to analyze, and make decisions about how to place the pictorials on the drawing sheet. In this unit the students will describe what a pictorial drawing is and why we use them. Students will able to identify perspective, oblique and isometric drawings. Students will understand the history and development of different drawings in architecture and engineering as they learn about one and two-point perspectives and vanishing points. They will be able to center isometric and oblique drawings and construct difficult isometric circles in more extensive applications. The pictorial drawings will challenge the students with rigorous drawings and sketches in laying out the various primitives not only by hand but also with three-dimensional solids in Autocad. The students will complete rigorous drawings in 3-D with Autocad and Solid Works.

Students will be taught through teacher lectures and live modeling how to compete these views focusing on line value and proper drawing techniques. They will develop and understanding of pictorials by reading the appropriate chapter in the book and answering the questions at the end of the chapter. Students will complete a series of 10 isometric drawings. They will then analyze and complete up to 10 more rigorous drawings from the textbook and other sources. After the isometrics are complete the students concentrate on the next portion of the pictorial unit and complete a series of 10 oblique drawings. These drawings allow students to visualize objects from a front perspective as an artist or architect would when doing renderings for a client. These perspectives become rigorous as the project becomes more detailed and specialized and they require the student to be precise and accurate. Renderings are a significant element of the art world and especially in architectural design and drafting.

Additionally, the students will complete a series of 10 advanced applications of perspective and oblique drawings. The students will complete the drawings accurately incorporating the elements of art with good line weight, shape, spacing and centering and layout. They will submit them for thorough critique and evaluation before proceeding to the next unit on computer aided drafting (CAD). With a solid background in drafting and design using the proper tools and techniques by hand the students are now ready to advance their skills using the latest technology available to prepare them for the rigorous college curriculum they will be exposed to when they advance to the UC/CSU system focusing on a major in art or drafting and design.

Unit Assignment(s):

This assignment will help students learn how to create a realistic looking 3D image on a flat sheet of paper. They will come to understand that although pictorials are not accurate enough to be dimensioned, they are very useful in how they quickly convey information. For this assignment the student will produce a two point perspective drawing of a machine component. It will be done using the traditional drafting instruments they have used on previous assignments.

Unit 8: Autocad (Creative Expression, Aesthetic Valuing, Connections, Relations & Application)

Technology will be used as a tool to teach the elements on art. Students will enhance their learning experience with the use of technology while analyzing and assessing multiple forms of technical drawings using Autocad and Solid Works. The elements of art using texture, materials, renderings, and color will be an integral part of the technical drawings created showing a direct relationship and how they apply to the real world of design. Students will study the history of CAD/CAM and be able to complete the basic drawing and editing commands. Students will memorize how to build layers, blocks and attributes as they progress through the basic technical drawings leading to more advanced applications to develop skills with visual perception and focusing on texture and color as they apply materials and shading to the assigned models. They will understand wire frame and solid modeling concepts incorporating the Boolean commands while completing rigorous three-dimensional and two-dimensional models on Autocad and Solid Works. Students will create multiple designs honing their skills. Instruction will be modeled by the teacher to instruct the students on how to use the commands properly to create parts and illustrate their mastery of applying color and texture to various models that were assigned. They will also be required to develop original designs through various engineering projects assigned throughout the year such as a ping pong ball Catapult, CNC Milling/3D printer Projects, and others

Each student will design a 3-D model and be required to produce a prototype on our 3-D printer. These advanced applications and use of the latest technology will prepare the students for the rigor of college. Common Core is focusing on Project Based Learning and this is what we do with the development of the student's artistic skills and technical skills in Technical Drawing & Design 1 leading to the advanced coursework that will they will complete in Technical Drawing & Design 2 and 3.

Hands-on activities will be the foundation for disseminating curriculum related to the Autocad software. Students have their own computer and they will work daily collaborating with each other while they complete rigorous drawings with the latest technology. Several lectures will be provided initially to explain the tool bars, menus and other related tools needed to generate a visual representation on the computer. Supplemental textbooks will be used for reference for students to research areas they need assistance.

Lecture and direct instruction will be used as well as one-on-one tutoring to assist students with the computer applications. Students will complete various class activities designed to develop the technical skills they need to be successful in designing artistic models on the computer. DVD and Power Point presentations will be used to enhance the students learning of the necessary commands needed to complete the assigned problems. Guided practice will be used to reinforce the curriculum presented through the Autocad drawings assigned. Students will complete the two coordinate exercises assigned and hand them in for evaluation before beginning the Autocad Drawings. The first 22 Autocad drawings of Phase 1 are difficult technical drawing that are specifically developed in a sequenced order to teach the commands in Autocad so the students can progress to more difficult and challenging rigorous three dimensional modeling and rendering. These drawings are two-dimensional but each drawing is sequenced in the level of difficulty to challenge the student with rigor and analytical thinking. Students will analyze the drawings, study the application and compare and contrast their design work to the real world. Students save all of their work on a flash drive and on the hard drive of the computer under

the student drawings folder. The rigor and degree of difficulty is built into each section of technical drawings on the computer. Once they have completed the first phase of technical drawings they will begin studying wire frame and 3-D modeling using basic primitives commands to express depth, volume and space. The primitives include spheres, cones, pyramids, donuts, cylinders, prism and frustums. Students will memorize these primitives that are the foundation of geometric constructions in the design and development of artistic drawings and renderings.

Students complete two wireframe drawings demonstrating their understanding of rotating the UCS to allow them to work in different planes. The UCS is the user coordinate system that allows the student to work on six different planes. This advanced application allows the students to complete difficult design problems and requires rigorous guided practice to develop the requisite skills that are required in the drafting and design field and to pursue a degree in college. Students will complete several solid-modeling drawings using the basic primitives and Boolean commands.

Students will acquire knowledge so they will be able to complete design problems in “paper space” and “model space”. Students will understand and be prepared to print all of their CAD files in paper space using A, B, and C size layouts. Students will be able to describe and identify depth, layout, and pen widths that will be featured in each drawing and they will add these designs that they created to their digital portfolio. This portfolio will represent the difficulty and rigor embedded in the assignments as these students matriculate to the UC/CSU system to continue their education in the visual, graphic and technical arts fields. Once the students have mastered the visual, technical and drawing techniques they will be required to complete a group project that will require them to work as a team. They will design a specific project that will emphasize the artistic, technical and mechanical elements necessary to complete a complex problem in the design and drafting field. The students will become aware of the real world application of the technical skills they are learning in the design field. Autocad opens up a whole new world for students in how they think and visualize the world around them, The cognitive skills that are developed will prepare them for advanced coursework in college.

⮒ Unit Assignment(s):

For their first Autocad assignment students will reproduce one of their previous paper and pencil three view working drawing assignments. By redrawing the same subject, students will be able to see that the new ACAD drawing is created in a manner similar to the previous traditional drawing. Additionally they will not have to focus so much on understanding the subject; they will be able to focus more on learning their new drafting tool: Autocad.

Unit 9: Sectional Views (Artistic Perception, Creative Expression, Aesthetic Valuing, Connections, Relations & Application)

Students will understand this unit by completing a series of sectional drawings, including advanced coursework. These advanced drawings represent the advanced skills needed to develop the various types of sectionals mentioned earlier. Sectioning allows students to understand and be able to explain the positive mass (solid portion) of the object that has been theoretically cut and removed by the cutting plane. Daily practice will allow the students to develop the sectional drawings so they can meet the criteria set up for our college articulation. In the automotive and aerospace industry artistic renderings and sectional views are used to highlight special features not shown in conventional practices.

Students will be evaluated by completing a complex sectional drawing on

Autocad. They will be required to complete drawings 2, 4, and 12 of the Sectionals on Autocad. Completion of these advanced drawings will allow students to analyze the importance of sectioning and how important they are in the development of a design project. Students will illustrate how each sectional is applied to a working drawing. This unit will

allow the students to work with a partner and peer-teach with one another. Instruction will be provided through lecture on each individual type of sectional and detailed processes required to accurately present a sectional view.

⮒ Unit Assignment(s):

In this assignment students will create a section view that details the dimensions of three fastener holes; specifically countersinks and counterbores. The drawing will be created in Autocad in a manner similar to the previous assignment. The students will learn a new line type: the "phantom" line type will be used to make the "cut" line delineating where the section occurs.

Unit 10: Auxiliary Drawings (Creative Expression, Aesthetic Valuing)

While they study Auxiliary drawings the students will be able describe and identify what an auxiliary view is. Students will acquire the knowledge to draw views constructed perpendicular to an angular surface using sketching techniques and hand drawing tools. Students will be able to develop detailed drawings of auxiliary views using Autocad and hand drawing skills and they will be able to explain why auxiliary views are necessary in the design process. Students will be able to analyze and distinguish between the various views presented in an auxiliary drawing. Students will present examples of situations where auxiliary views might be necessary. Students will develop an understanding of layout and proper line techniques used with these views applying the essential elements of art. They will be able to create complex drawings using auxiliary views in designing parts for designing CNC machined parts that could be used in sculptures, artistic designs or manufacturing. Students will develop the knowledge to produce detailed drawings incorporating the skills developed in this unit.

Guided practice and lecture will provide the students with the basics for completing auxiliary drawings. Daily monitoring and class discussions will be conducted to evaluate student growth. Peer teaching and collaboration will be allowed for students to expand the depth and breadth of the subject matter as they understand the value, lines and shapes related to the drawings they are creating.

Students will read and understand the appropriate chapter in the book and complete the and be quizzed on what they learned to check for understanding. They will define key terms and study the vocabulary and be able to define the elements of an auxiliary.

Students will apply the knowledge they have learned by completing a series of 10 drawings. Advanced level coursework will involve analyzing and illustrating student understanding by also completing a series of 5 auxiliary drawings.

Several of the CAD drawings will be printed to illustrate competency producing complex auxiliary views.

⮒ Unit Assignment(s):

For this assignments students will learn that an auxiliary view can be created to convey information that the standard orthographic views are not able to show. For this assignment one of the object's faces is 30 degrees off of normal. Students will project an auxiliary view perpendicular to this face in order to show it in its true shape and size. Like the previous assignment this project will also be done using Autocad.

Unit 11: Dimensioning and Notes (Creative Expression, Connections, Relations, & Application)

The objectives in this chapter focus on ANSI standards with geometric dimensioning and tolerancing. The students will be able to explain why we use dimensions and demonstrate their knowledge by placing notes on drawings and identify the two systems of linear measurement in dimensioning drawings. They will use hand drawing techniques and CAD applications in applying the general rules of dimensioning. Sketching will be used extensively to illustrate the proper dimensioning of counterbore, countersink, datum points, leaders, spotface, and tolerance. Unidirectional and aligned dimensioning will show and contrast the differences in both types of dimensioning. Students will understand how these drawing techniques have developed over centuries into our highly technical world of drawings and CAD today.

Lectures and class discussions will provide the students with the necessary background knowledge to successfully complete the dimensioning chapter. Prior knowledge will be checked to see if students have any previous experience with model building and scaling. Students will be provided one-on-one mentoring and daily monitoring as needed. Guided practice daily will be provided to check for understanding.

Students will analyze the process of dimensioning after they have read the appropriate chapter in the text book. They will develop an outline showing six key elements about dimensioning on scratch paper. They will staple this outline to the back of the first dimensioning drawing and hand in to demonstrate their knowledge of the ANSI standards.

Students will assess the proper techniques to use while completing a series of 10 dimensioning drawings. Advanced visual applications will be generated when they compete several rigorous drawings on Autocad using the elements of art and design. They will show their comprehension of the technical applications presented by completing a series of 5 drawings. To further illustrate mastery of the unit of study they will plot several of their drawings and include them in their portfolio.

⮒ Unit Assignment(s):

The most important aspect of the working drawing is the dimension. With this assignment students will understand the importance of drawing very accurately and then dimensioning those drawings accurately. Using Autocad, students will have to show that they are able to apply dimensions following the rules set fort by the American National Standards Institute.

ourse Description

urse overview:

Mechanical Drawing 2 A/B is the second course in a two year drafting program. It meets 50 minutes every day and lasts a full year. In this course students will further their ability to read engineering drawings, evaluate print specifications, recognize orthographic views and visualize actual objects.

Students' graphic communication skills will improve with effective instruction of a broad knowledge base, discipline oriented skills and progressive methodologies for creative problem solving. Specifically they will study rapid visualization, aesthetics, materials and processes, presentation techniques, principles of design methodology, elements of art, product development, human factors, and prototyping.

Students will complete their assignments using traditional pencil and paper techniques, a computer aided drafting system (CADD), and 3d printers.

urse content:

Unit 1: Nature of Design

Students will study and improve upon their freehand drawing techniques for creating graphical presentations. They will study the elements of art and principles of design. Students will gain experience in design review through class discussion and analysis of each others work. Students will identify and use the principles of design to discuss, analyze, and write about visual aspects in the environment and in works of art, including their own.

Unit Assignment(s):

Key Assignment:

Using paper and colored pencil students will sketch out and color an object of their choosing, for example a motorcycle wheel, in a manner that shows their understanding of dominance and subordination. They will then present this drawing to the class along with an explanation as to how these and other design principals were utilized in the drawing's creation.

Unit 2: Past and Present Artists and Engineering Designers

Students will learn about several artists and engineering designers and their contributions to society. They will compare the similarities and differences in the purposes of art created in past and current cultures. As a class we will identify and describe the role and influence of new technologies on contemporary works of art and inventions. We will also identify and

describe trends in the visual arts and discuss how the issues of time, place, and cultural influence are reflected in selected works of art. Students will discuss the purpose of art in engineering design.

We will discuss how personal beliefs, cultural traditions, and current social, economic and political contexts influence the interpretation of the meaning or message in a work of art. We will compare the ways in which the meaning of a specific work of art has been affected over time because of changes in interpretation and context. Students will formulate and support a position regarding the aesthetic value of a specific work of art and change or defend that position after considering the views of others. They will learn the conventions of art criticism in writing and speaking about works of art and put them to use.

⮒ Unit Assignment(s):

Key Assignment: Scientific Revolution Infomercial

Students must research an artist or engineer in history then teach the class about their chosen artist/engineering designer by creating an infomercial video or live performance to inform the class. They will address the following questions in their presentations.

1. What was the contribution of the thinker?
2. What was the person explaining?
3. Were there any challenges faced by the inventor or thinker in developing their new idea or invention?
4. What is the benefit of the new idea or invention in today's society? How did it change the world?
5. Highlight a company of today that utilizes the principles of the scientific thinker or invention.
6. Endorsements! Interview people who have heard of the person you are researching and include their comments in the infomercial.

Unit 3: Sketching and Rapid Visualization

Students will learn the purpose of rapid visualization and how it is used to communicate. They will develop their sketching skills as well as their ability to verbally describe their ides in a concise and direct manner. They will gain experience sketching their ideas and others' ideas as they are conveyed to them. They will gain experience in and understanding that sketches are meant to be reworked and massaged until all parties are happy with the visual representation of the idea/concept. Students will learn the process and rationale for refining and reworking your work of art after the peer review.

⮒ Unit Assignment(s):

Key Assignment: The Beginnings of a Great Product

For this assignment student will pair off and take turns pretending to be an inventor and a draftsman. They will each have to convey an idea to the other while that student attempts to create sketches that accurately capture the inventor's vision. The "inventor's" idea does not have to be original but should be very unusual, hopefully a product that the partner is not

familiar with.

Students will gain experience conveying their ideas verbally and carefully listening to others ideas, rapidly visualizing those ideas and then sketching those ideas out.

Unit 4: Graphic Representation

Providing accurate shape descriptions of objects by drawing methods requires that three dimensional object information be presented in a flat two dimensional drawing space. This is usually done with multiview drawings. In this unit students will further their knowledge of and experience with graphic representation by creating the following types of multiview drawings: concept drawings, scaled drawings, orthographic drawings, and sectioned detail drawings.

⮒ Unit Assignment(s):

Key Assignment: Students will design and create a napkin holder in the style of an artist/designer from Unit 2.

Students must present their napkin holder and justify their napkin holder style in a presentation to the class. Using paper, pencils and colored markers students must prepare a portfolio of original two-and-three dimensional works of art that reflects refined craftsmanship and technical skills. Students will have to explain how their two and three dimensional work of art reflects their chosen artist/designer.

Unit 5: Problem Solution Presentation

In this unit students will be completing activities that will accumulate to one final presentation showing their solution to the Semester Final design problem. All activities represent knowledge learned in the four previous Units. We will go further into the contributions of the most influential artists & engineers like Louise Nevelson and Buckminster Fuller. Students will rework their art by showing the creation progression of the rapid visualization drawings, marker concept orthographic drawings and final prototype development.

The unit will focus on the use of marker drawings when concept forming and the proper use of emphasis by drawing major objects, shapes, and using colors that make the piece of work balanced overall yet effective in communicating the desired focal point. Students will learn about the use shadow and fog techniques to help place emphasis on the proper focal point.

⮒ Unit Assignment(s):

Key Assignment: Students will research the environmental design work of Buckminster Fuller and design a consumer product that mimics a bubble in nature.

This design will be presented to the class on C size sheets of paper utilizing all of the sketching/drawing techniques covered so far this semester.
In their presentations students will address:
-Buckminster Fuller's distinctive style and its contribution to the meaning of the work.
-The principles of design as used in works of art, focusing on dominance and subordination.
-The purpose of art in engineering design.
-How their project evolved after considering the views of others.

Unit 6: Engineering Visualization: Comptational Design and Analysis

In this unit we will explain the advantages and disadvantages of using visualization. Students will study the most widely used three dimensional imaging techniques and learn about the various types of visualization images: modeling, still images, stereo images, holography, animation and virtual reality. We will also learn about the various methods used to represent variables. By the end of the unit students will be able to explain the various categories of engineering visualization: finite element analysis, thermal analysis, fluid dynamics and kinematic simulation.

⮒ Unit Assignment(s):

Key Assignment: To Solid Model or Not?

For this assignment students will be asked to create a project using traditional visualization techniques such as multiview CAD drawings as well as a 3D model that they will print out. They will have to write a paper comparing the advantages and disadvantages of each method with respect to their particular project. Ultimately they will make a case for their preferred visualization technique to the class.

Unit 7: Problem Solving (Second Semester Final Project)

Students are introduced to the Semester Final design problem so they can begin using the design process to formulate a solution as well as use their ideas to complete work for Units 8, 9 & 10. Their task will be to design a Tom Loser inspired chair or table.

In this unit students will study the standard design process: Identify, Gather, Refine, Analyze, Decide, Implement, Feedback. As a class we will go through the design process for Problem Solving. Students will research and find their own design process to follow.

⮒ Unit Assignment(s):

Key Assignment: Students organize and design a portfolio in preparation for the Semester Final presentation in Unit 10. For this assignment students will complete the following portion of the portfolio:

-A design brief made up of a Problem Statement and a Design Statement.

-A description of the visual arts problem that involves the effective use of the elements of art and the principles of design.

Unit 8: Models and Prototypes

This unit will the focus on further the students' knowledge of 3-d modeling and printing. As a class we will reverse engineer a student chair and recreate a scaled down version of it in 3-d computer space and as a 3-d printed model. Students will learn the basis of:

-Reverse Engineering Design

-Types and Uses

-Methods and Technique

-Materials

⮒ Unit Assignment(s):

Project Description:

Students will create the prototype of the chair they will present as their final project. After 3-d printing their initial prototype, they will rework the model through gained knowledge obtained from student, teacher, and self-critiques and evaluations. All changes will be documented and justified before the 2nd iteration of their project is 3-d printed.

Unit 9: Design Beyond Function

In this unit students learn about the product lifecycle post prototype. After a product concept has been finalized, they will discover the process to get it manufactured and finally the next steps to take a product to market. Students will watch the documentary "*Objectified."* As a class we will discuss the book *Cradle to Cradle*. This book outlines the mindset that engineering designers have when it comes to creating safe, healthy, and endlessly reusable products.

⮒ Unit Assignment(s):

Key Assignment: Design for more than just purpose.
For this assignment students will apply lessons learned from the video and book to their final project. They will document changes made to their design as a result of considering the additional factors brought to light in this unit. Specifically they will be required to define "end of use" and how this was considered in their design solution. They will also address the key components in a design patent and the regulatory agency that approves or denies patent submissions.

Unit 10: Engineering by Design Presentation

In this unit class discussion will summarize all of the design techniques and considerations learned over the course. This will aid students in improving their final designs and in their ability to constructively critique their fellow students' projects. Students will be reviewing and critiquing the work of the others in the class so that they students can then make a final presentation that incorporates the class criticisms/recommendations.

Some of the topics to recap are the significance of visual aspects in the environment and in works of art; the purpose of art in engineering design; and how personal beliefs, cultural traditions, and current social, economic and political contexts influence the interpretation of the meaning or message in a work of art/invention.

Unit Assignment(s):

Key Assignment: Design Presentations

During this problem solving process, students needed to formulate and support their position regarding how their work reflects the work done by other artists and designers. Students will present marker concept drawings in order to communicate their design solution. Students will be required to have marker detail drawings of every terminal and connection along with a 3d printed prototype that represents the drawings. Students will present their solution and listen to critical reviews for improving their concept. Students will then review and implement revisions and present their final solution a second time. The second presentation must also include a marketing component for their concept.

Course Title

Mechanical Drawing 1A

Description of Target Group

This course is for the 10th, 11th and 12th grade students. Students should have ability in fundamental math and abstract reasoning.

Purpose

The purpose of Mechanical Drawing 1A is to give students an opportunity to explore the area of drafting techniques. This is the first semester of a one year course. A lab fee is required.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Provide own pencils and erasers.
2. Develop fundamentals of lettering, dimensions, line work, layout and use of scale.
3. Complete assigned laboratory, clean-up, reading, and written work.
4. Understand and use basic drafting terminology.
5. Develop an interest in a possible career in the field of drafting.
6. Develop freehand fundamentals.
7. Develop fundamental skills with drafting equipment.
8. Pay all fees pending.
9. Develop fundamentals of geometric construction.
10. Develop fundamentals of orthographic projection (three-view construction).
11. Basic computer skills

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, lectures, project construction, demonstrations, audio visual materials, field trips, small group activities, outside resource people, model designing, building, and testing, and computer aided design and drawing.

Mechanical Drawing 1B

Description of Target Group

This course is for 10th, 11th and 12th grade students. Students should have ability in fundamental math and abstract reasoning. It is recommended that student has completed Mechanical Drawing 1A before enrolling in this course.

Purpose

The purpose of Mechanical Drawing 1B is to give students an opportunity to explore the area of drafting techniques. This is the second semester of a one year course. There is a $5.00 Shop Fee.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Develop fundamentals of two dimensional and three dimensional autocad computer aided drawing.
2. Develop fundamentals of simple section.
3. Develop fundamentals of auxiliary drawings.
4. Develop fundamentals of developments and intersections.
5. Basic computer skills

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, lectures, project construction, demonstrations, audio visual materials, field trips, small group activities, outside resource people, model designing, building, and testing, and computer aided design and drawing.

Course Title

Mechanical Drawing 2A

Description of Target Group

This course is for 10th, 11th, and 12th grade students. Completion of Mechanical Drawing 1B is recommended before enrollment in this class.

Purpose

The purpose of Mechanical Drawing 2A is to develop entry skills for college engineering drawing and to develop a greater understanding of drawing board geometry. This is the first semester of a one year course. NOTE: This is not currently offered at Righetti High School, but is available as part of R.O.P. Advanced Drafting. A lab fee is required.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Orthographic projection.
2. Working drawings.
3. General and technical knowledge of the drafting field.
4. Welding symbols.
5. Amplified area of student interest.
6. Basic computer skills

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, lectures, class participation, demonstrations, audiovisual materials, field trips, small group activities, outside resource people, project drawings and CADD.

Course Title

Mechanical Drawing 2B

Description of Target Group

This course is for 10th, 11th, and 12th grade students. Completion of Mechanical Drawing 2A is recommended before enrollment in this class.

Purpose

The purpose of Mechanical Drawing 2B is to develop entry skills for college engineering drawing and to develop a greater understanding of drawing board geometry. This is the first semester of a one year course. NOTE: This is not currently offered at Righetti High School, but is available as part of R.O.P. Advanced Drafting.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. General and technical knowledge of the drafting field.
2. Working drawings.
3. Mapping drawings.
4. Amplified area of student interest.
5. Basic computer skills

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, lectures, class participation, demonstrations, audiovisual materials, field trips, small group activities, outside resource people, project drawings, and CADD.

Course Title

Plastics as an Art Form

Description of Target Group

This course is for 9th through 12th grade students interested in developing a variety of skills.

Purpose

The purpose of Plastics as an Art Form is to offer students an opportunity to express themselves using plastic materials. This is a one-semester course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Make aesthetic judgements.
2. Demonstrate independent initiative.
3. Demonstrate the safe use of tools, supplies, and equipment.
4. Demonstrate the knowledge and application of design and color.
5. Demonstrate originality and craftsmanship.
6. Express knowledge of terms and materials, both in writing and orally.
7. Develop the ability to sketch.
8. Develop the ability to organize ideas, develop procedures, and assume the responsibility to finish projects.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, lectures, class participation, demonstrations, audiovisual materials, field trips, small group activities, outside resource people, and experiments.

Course Title

Product Design 1A

Department: Industrial Technology

Career Path: Technology

Description of Target Group

This is the first term of a two term (one year) course for 9th through 12th grade students wanting to learn the fundamentals how products are designed. A lab fee may be required.

Prerequisite: none

Purpose

Product Design 1A is an introductory course which exposes the student to the safety, techniques, terminology and procedures used in product design and production. The emphasis is on creating products with have esthetic appeal and ergonomic elements. This is a 5-unit course.

Standards of Expected Student Achievement

Upon successful completion of this course, each student will be able to demonstrate competency in the following:

1. Making critical aesthetic judgments
2. Self-reliance and independent thinking
3. Solving problems individually and/or in small teams
4. Use of theoretical and practical skills as applied to design projects
5. Organization and execution of design projects from inception to completion
6. Application of principles and elements of design to projects
7. Knowledge of safe and correct applications of design production equipment
8. Expressing intentions and accomplishments using oral and written skills in public (classroom) presentations

Methods of Assessment of Student Learning:

1. Class participation
2. Quizzes covering each main module.
3. Teacher evaluation.

4. Independent projects.
5. Final examination.
6. Cooperative work with other students.

Instructional Materials:

Refer to: Secondary Adopted Texts and Approved Supplementary Books used in the Santa Maria Joint Union High School District.

1. Software Instructional Materials (printed/multimedia interactive)
2. Supplementary Video
3. Trade Publications

Activities:

1. Individual Work (projects)
2. Service Learning Projects
3. Lectures
4. Class laboratory shop work
5. Teacher & Student Demonstrations
6. Student Presentations
7. Class Critiques
8. Guest Speakers

Course Title

Product Design 1B

Department: Industrial Technology

Career Path: Technology

Description of Target Group

This is the second term of a two term (one year) course for 9th through 12th grade students wanting to learn the fundamentals how products are esthetically designed. A lab fee may be required.

Prerequisite: Product Design A

Purpose

Product Design 1B is a continuation of Product Design 1A and exposes the student to more advanced levels of techniques, terminology and procedures used in product design and production. The emphasis is on creating products with have esthetic appeal and ergonomic elements. This is a 5-unit course.

This is a 5-unit course.

Standards of Expected Student Achievement

1. Expanded specialized design vocabulary as it relates to theory and production
2. Organization and execution of design projects from inception to completion
3. Application of principles and elements of design to projects
4. Knowledge of safe and correct applications of design production equipment
5. Expressing intentions and accomplishments using oral and written skills in public (classroom) presentations
6. Awareness of related occupations
7. Furthering development by involvement in related/more advanced courses:

Advanced Study Product Design	Wood
Technical Sketching	Mechanical Drawing
Drafting	Architecture

Product Design 1B (continued)

Methods of Assessment of Student Learning:

1. Class participation
2. Quizzes covering each main module.
3. Teacher evaluation.
4. Independent projects.
5. Final examination.
6. Cooperative work with other students.

Instructional Materials:

Refer to: Secondary Adopted Texts and Approved Supplementary Books used in the Santa Maria Joint Union High School District.

1. Software Instructional Materials (printed/multimedia interactive)
2. Supplementary Video
3. Trade Publications

Activities:

1. Individual Work (projects)
2. Service Learning Projects
3. Lectures
4. Class laboratory shop work
5. Teacher & Student Demonstrations
6. Student Presentations
7. Class Critiques
8. Guest Speakers

Course Title
Product Design 2A

Department: Industrial Technology

Career Path: Technology

Description of Target Group
This is the first term of a two term (one year) course for 10th through 12th grade students wanting to learn advanced levels of Product Design. A lab fee may be required.

Prerequisite: Product Design 1A/B

Purpose
Product Design 2A is an advanced level course which will allow students to apply technical and esthetic skills to the design and fabrication of products. Progressively more advanced levels of design and an expanded scope of applications will be experienced. Projects will involve students in more challenging, problem-solving situations, which will expose the student to more advanced levels of techniques, terminology and procedures used in product design and production. The emphasis is on creating products with esthetic appeal and ergonomic elements. This is a 5-unit course.

This is a 5-unit course.

Standards of Expected Student Achievement

1. Making critical aesthetic judgments
2. Self-reliance and independent thinking
3. Solving problems individually and/or in small teams
4. Use of theoretical and practical skills as applied to design projects
5. Organization and execution of design projects from inception to completion

Course Title

Reinforced Plastics A

Description of Target Group

This course is for 11th and 12th grade students who are interested in plastics as a possible vocation or avocation.

Purpose

The purpose of Reinforced Plastics A is to provide interested students with practical experience in working with reinforced plastics (fiberglass) materials and processes. This is the first semester of a one year course. Student is expected to pay for project materials.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Complete a safety test with a passing score.
2. Develop an interest in a possible career in the field of Reinforced Plastics.
3. Provide and use protective clothing and eye protection when and where required.
4. Complete assigned laboratory and written work.
5. Complete assigned clean-up responsibility.
6. Develop an understanding of safe working habits and conditions.
7. Understand and use basic reinforced plastics terminology
8. Operate safely and demonstrate the ability in the proper use of hand and power equipment available to them.
9. Perform required hand lay-ups.
10. Develop the ability to spray gel coats.
11. Learn basic mold construction.
12. Develop the ability to evaluate processing problems.
13. Learn spary-up techniques.
14. Learn mold preparation.
15. Develop the ability to do minor fiberglass repair.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, lectures, class participation, demonstrations, audio visual materials, field trips, small group activities, and outside resource people.

Reinforced Plastics B

Description of Target Group

This course is for 11th or 12th grade students who have passed Reinforced Plastics A and have shown a willingness to do advanced work.

Purpose

The purpose of Reinforced Plastics B is to allow qualified students to use the knowledge they learned in Reinforced Plastics A. This is the second semester of a one-year course. Student is expected to pay for project materials.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Complete a safety test within that school year with a passing score.
2. Explain their interest in a possible career in Reinforced Plastics.
3. Provide and use protective clothing and eye protection when and where required.
4. Complete assigned laboratory and written work.
5. Complete assigned clean-up responsibility.
6. Develop an understanding of safe working habits and conditions.
7. Understand and use reinforced plastics terminology.
8. Operate safely and demonstrate ability in the proper use of hand and power equipment available to them.
9. Contract with the instructor for the type of work or project agreeable to both student and instructor.
10. Reinforce the knowledge about reinforced materials and processes.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, lectures, project construction, demonstrations, audio visual materials, field trips, small group activities, and outside resource people.

Course Purpose: *What is the purpose of this course?*

Students will work in pairs and quads as an engineering team. They will design, build and test increasingly complex robots that will be used in problem solving activities and competitions. The course will involve the engineering design process, the importance of integrating sensors, effectors and controls. Students will discuss robot learning and multi-robot systems. Robots will be used to solve bi-weekly challenges. The course culminates in a final project where student teams design, build, and program a robot for a final competition.

B. COURSE CONTENT

Course Outline: A *detailed descriptive summary of all topics covered. All historical knowledge is expected to be empirically based, give examples. (i.e. California State Standards).*

Unit 1 — Electricity

In this unit students will be introduced to electrical concepts. Students will start with an introduction to electric direct currents, voltages, resistors, and batteries. Students will learn and use the symbols to create basic circuit diagrams. This will be followed by an introduction to Ohms Law and its applications as related to series resistance, parallel resistance, and circuit analysis.

Upon completion of this unit;

-Students will understand electronic symbols (resistors, capacitors, diodes, switches, transformers, and batteries), the properties of parallel and series circuits. Students will master Ohms Law and calculating voltage and current through a parallel or series circuit.

-Students will be able to solder wires to resistors, batteries, switches, etc. After the completion of constructing a circuit, students will measure voltage and current through the circuit.

-Students will demonstrate mastery of the circuitry by completing a detailed 3 page report or electronic presentation on the circuit, calculations, and measurements done during the lesson.

-Students will required to begin (and continue throughout the course) a detailed journal of all their designs and activities. This will create a "tool box" from which the students can refer as the course progresses. Each design or activity will be accompanied by an in-depth reflection on what was successful and what needs to be improved, as well as schematics of any circuits created. Students will master the skill of scientific writing and data recording.

Signature Assignment:

Students will be required to use tools and best practices that are standard in the fields of electrical engineering and electronics engineering. Students will use their knowledge of electrical circuits to create a small flashlight out of a candy box or a similar project. The tools that they will use include, but are not limited to, digital multi-meters, soldering equipment, wire crimping and stripping tools. Students will learn how to strip wire insulation and attach solderless (crimping) connectors, tin wires, properly use flux and solder, among other things. Additionally, because this is the first unit, laboratory safety practices and procedures will be taught and practiced.

Unit 2 — Engineering Design Fundamentals

The engineering projects for this course will utilize tools, software, and conventions found in engineering fields. Students will be familiarized with basic tools, themes, and strategies regularly used in the fields of engineering. As this course progresses over the year students will draw from this "tool box" of skills as they encounter each new learning experience. Students will, in turn, master these tools, themes, and strategies by applying them when necessary rather than practicing them in abstraction.

Upon completion of this unit;

-Students will understand drafting and fundamental scaling. Students will master ratios, athematic, unit conversions and drawing.

-Students will master the use of tools (hand and power). "Shop" safety will also be taught and practiced.

-Students will work in teams to fabricate a catapult that will achieve specific objectives related to distance and accuracy.

-Students will add related entries and reflection to their journal related to their accomplishments and acquired knowledge/skills.

-Students will complete a detailed 3-5 page report or electronic presentation to tie in everything in this unit from drafting to fabrication and testing their design.

Signature Assignment:

Students will be introduced to sketching fundamentals and drafting conventions and standards, by working collaboratively to create a catapult. Students will learn how to create schematics and learn how to draw parts and assemblies. Students will begin the assignment with basic drafting tools and then progress toward current product development drawing tools (CAD software). Students will experience the steps of the design process including topics such as prototyping, model building, testing and manufacturing. Students will supplement their in-class learning with assigned internet research and completed learning logs or journal entries.

Unit 3 — Construction of VEX Robots

Students will begin to apply engineering principles, as outlined in the Next Generation Science Standards, to the design and construction of robots. Students will study the fundamental design of a Vex robot. While students are learning how to fabricate their first Vex robot, they will also be required to draw upon physics concepts such as speed, velocity and angular momentum. Further a significant amount of math is necessary to fabricate the complex geometries of the parts that are required for robots. Students will create a robotic platform capable of two-dimensional motion at a variety of speeds. This platform must also be capable of supporting a variety of sensors (unit 6) and electrical systems for remote access (unit 4). Through this project students will be introduced to the various fastening and joining methods typically used in production development. These include, but are not limited to, screws, bolts, nuts, rivets, and welding. Students will be introduced to specification sheets for materials used in engineering and also start to learn about concepts related to materials stress, strain, toughness, elasticity, thermal conductivity, etc.

Upon completion of this unit;

-Students will understand how different components (batteries, multi-controllers, motors, gears and wheels) interact with each other in unison.

-Students will master the construction of a functioning robot with hand tools.

-Students will master installing motors, bearings and making adjustments for motion.

-Students will understand how different gear rations and different sized wheels affect the movement of the robot.

-Students will add related entries and reflection to their journal related to their accomplishments and acquired knowledge/skills.

-Students will complete a detailed 3-5 page report or electronic presentation to tie in everything in this unit from design to fabrication and the related physics and mathematics of robots.

Signature Assignment:

Students will construct their first Vex robot, the BaseBot. They will learn how to use basic assembly tools as well as how to identify available Vex robotic components from the classroom inventory system. Students will learn the subsystems (chassis, drivetrain, electrical, control) during the BaseBot construction activity. After the robot is constructed, students will test and troubleshoot their creation. Best engineering practices require testing, troubleshooting and adjustments/modifications of a design. This is followed by reflection and re-engineering to recognize that multiple solutions are possible for a problem/challenge. The designs, troubleshooting and re-engineering possibilities will be recorded in the student journals.

Unit 4 — Wireless Interfacing

Students will experience current technologies when they interface their robots with wireless game controllers. Students will need to use their prior knowledge of electronics and begin to master the basics of Easy-C programming language that is used in the Vex robotics system. Students will program the BaseBot constructed in unit 3 to remotely control it to move in straight lines, reverse motion as well as rotate to navigate through an obstacle course. Another activity will be for the students to write their initials using their robot and a whiteboard marker within the constraints of a walled robot competition field.

Upon completion of this unit;

-Students will link a wireless receiver (attached to the robot) with a hand-held controller.

-Students will understand how wireless-controllers work and their application in our current technological world.

-Students will add related entries and reflection to their journal related to their accomplishments and acquired knowledge/skills.

-Students will complete a detailed 3-5 page report or electronic presentation to tie in everything in this unit from design to fabrication and the related physics and mathematics of robots.

Signature Assignment:

Students will program the BaseBot constructed in unit 3 to remotely control it to move in straight lines, reverse motion as well as rotate to navigate through an obstacle course. Students will have multiple opportunities to test and refine their designs for improved performance and better results (higher points).

Unit 5 — Sensors

Students are introduced to open and closed loop robotic navigation using sensors and the Easy-C program. This unit builds on the dead reckoning programs constructed in unit 3. Digital bumper switches are added to the BaseBot so that it can interpret its environment autonomously. An ultrasonic range-finding sensor is introduced to allow the robot to sense its environment without touching it. A set of advanced drive functions is taught in order to simplify the autonomous control of the speed and direction of the robot. These drive functions are used in conjunction with a line-following sensor to have the BaseBot autonomously follow a line through a portion of the competition field.

Upon completion of this unit;

-Students will further broaden their understanding of how different components (sensors, batteries, multi-controllers, motors, gears and wheels) interact with each other in unison.

-Students will master the understanding of sensors. What sensors are and what role they play in our everyday life.

-Students will become familiar with two types of sensor constructions. The first will be bumper switches on all sides of the base that will allow the robot to sense objects with which it comes in contact.

-The second sensor construction students will understand is a ground-line sensor that allows the robot follow a line through part of the designed obstacle course for this unit.

-Students will increase their Easy-C programing skills related to the sensors in this unit.

-Students will add related entries and reflection to their journal related to their accomplishments and acquired knowledge/skills.

-Students will complete a detailed 3-5 page report or electronic presentation to tie in everything in this unit related to the effects of sensors linked with a robot.

Signature Assignment:

Students must program their robots to autonomously navigate and knock down some obstacles (binders or wood blocks) while not touching others in a specified order and in a specified time range. Students will have multiple opportunities to test and refine their designs for improved performance and better results (higher points).

Unit 6 — Arms and End effectors

Students will combine elements introduced in units 3-5. An arm will be added to the BaseBot and a basic physics analysis is done on how the arm effects the overall robot design and performance. The concept of center of gravity will be understood as the construction of the arm, the end effector and the weight of an object attached to the end effector is applied. Stall torque is examined related to the arm function as well as speed and gear ratio. The student is challenged with incorporating two limit switches into the design of the arm to control its movement. An end effector (claw) is added to the arm for gripping a game object used in the final unit.

Upon completion of this unit;

-Students will understand how different components (batteries, multi-controllers, motors, gears and wheels) interact with each other in unison.

-Students will master the construction of a functioning robot with hand tools.

-Students will master installing motors, bearings and making adjustments for motion.

-Students will understand how different gear rations and different sized wheels affect the movement of the robot.

-Students will add related entries and reflection to their journal related to their accomplishments and acquired knowledge/skills.

-Students will complete a detailed 3-5 page report or electronic presentation to tie in everything in this unit from design to fabrication and the related physics and mathematics of robots.

Signature Assignment:

The student must add an arm and end effector to the BaseBot. The Basebot, arm and end effector will be added to the Easy-C program for controlling the robot. The student will navigate the robot on the competition field to retrieve one or more competition game pieces and deliver it/them to a specified goal. The student will be timed for this activity. Students will have multiple opportunities to test and refine their designs for improved performance and better results (higher points).

Unit 7 — Final or Competition Robot Capstone Project

Students will combine all elements from this course to re-design and create a competition robot. The robot will compete in a classroom based competition with new game pieces introduced in this unit. The previous robot must be modified to effectively compete in the new game. Throughout this unit students will use analytical, expository writing to document and describe their work on the project in their engineering notebooks (journals). After the competition, students will create an invention and design report that focuses on the challenges and adjustments encountered in the process resulting in their final robot

Comments:

Course Purpose: *What is the purpose of this course?*

Students will work in pairs and quads as an engineering team. They will design, build and test increasingly complex robots that will be used in problem solving activities and competitions. The course will involve the engineering design process, the importance of integrating sensors, effectors and controls. Students will discuss robot learning and multi-robot systems. Robots will be used to solve bi-weekly challenges. The course culminates in a final project where student teams design, build, and program a robot for a final competition.

B. COURSE CONTENT

Course Outline: *A detailed descriptive summary of all topics covered. All historical knowledge is expected to be empirically based, give examples. (i.e. California State Standards).*

Unit 1 — Electricity

In this unit students will be introduced to electrical concepts. Students will start with an introduction to electric direct currents, voltages, resistors, and batteries. Students will learn and use the symbols to create basic circuit diagrams. This will be followed by an introduction to Ohms Law and its applications as related to series resistance, parallel resistance, and circuit analysis.

Upon completion of this unit;

-Students will understand electronic symbols (resistors, capacitors, diodes, switches, transformers, and batteries), the properties of parallel and series circuits. Students will master Ohms Law and calculating voltage and current through a parallel or series circuit.

-Students will be able to solder wires to resistors, batteries, switches, etc. After the completion of constructing a circuit, students will measure voltage and current through the circuit.

-Students will demonstrate mastery of the circuitry by completing a detailed 3 page report or electronic presentation on the circuit, calculations, and measurements done during the lesson.

-Students will required to begin (and continue throughout the course) a detailed journal of all their designs and activities. This will create a "tool box" from which the students can refer as the course progresses. Each design or activity will be accompanied by an in-depth reflection on what was successful and what needs to be improved, as well as schematics of any circuits created. Students will master the skill of scientific writing and data recording.

Signature Assignment:

Students will be required to use tools and best practices that are standard in the fields of electrical engineering and electronics engineering. Students will use their knowledge of electrical circuits to create a small flashlight out of a candy box or a similar project. The tools that they will use include, but are not limited to, digital multi-meters, soldering equipment, wire crimping and stripping tools. Students will learn how to strip wire insulation and attach solderless (crimping) connectors, tin wires, properly use flux and solder, among other things. Additionally, because this is the first unit, laboratory safety practices and procedures will be taught and practiced.

Unit 2 — Engineering Design Fundamentals

The engineering projects for this course will utilize tools, software, and conventions found in engineering fields. Students will be familiarized with basic tools, themes, and strategies regularly used in the fields of engineering. As this course progresses over the year students will draw from this "tool box" of skills as they encounter each new learning experience. Students will, in turn, master these tools, themes, and strategies by applying them when necessary rather than practicing them in abstraction.

Upon completion of this unit;

-Students will understand drafting and fundamental scaling. Students will master ratios, athematic, unit conversions and drawing.

-Students will master the use of tools (hand and power). "Shop" safety will also be taught and practiced.

-Students will work in teams to fabricate a catapult that will achieve specific objectives related to distance and accuracy.

-Students will add related entries and reflection to their journal related to their accomplishments and acquired knowledge/skills.

-Students will complete a detailed 3-5 page report or electronic presentation to tie in everything in this unit from drafting to fabrication and testing their design.

Signature Assignment:

Students will be introduced to sketching fundamentals and drafting conventions and standards, by working collaboratively to create a catapult. Students will learn how to create schematics and learn how to draw parts and assemblies. Students will begin the assignment with basic drafting tools and then progress toward current product development drawing tools (CAD software). Students will experience the steps of the design process including topics such as prototyping, model building, testing and manufacturing. Students will supplement their in-class learning with assigned internet research and completed learning logs or journal entries.

Unit 3 — Construction of VEX Robots

Students will begin to apply engineering principles, as outlined in the Next Generation Science Standards, to the design and construction of robots. Students will study the fundamental design of a Vex robot. While students are learning how to fabricate their first Vex robot, they will also be required to draw upon physics concepts such as speed, velocity and angular momentum. Further a significant amount of math is necessary to fabricate the complex geometries of the parts that are required for robots. Students will create a robotic platform capable of two-dimensional motion at a variety of speeds. This platform must also be capable of supporting a variety of sensors (unit 6) and electrical systems for remote access (unit 4). Through this project students will be introduced to the various fastening and joining methods typically used in production development. These include, but are not limited to, screws, bolts, nuts, rivets, and welding. Students will be introduced to specification sheets for materials used in engineering and also start to learn about concepts related to materials stress, strain, toughness, elasticity, thermal conductivity, etc.

Upon completion of this unit;

-Students will understand how different components (batteries, multi-controllers, motors, gears and wheels) interact with each other in unison.

-Students will master the construction of a functioning robot with hand tools.

-Students will master installing motors, bearings and making adjustments for motion.

-Students will understand how different gear rations and different sized wheels affect the movement of the robot.

-Students will add related entries and reflection to their journal related to their accomplishments and acquired knowledge/skills.

-Students will complete a detailed 3-5 page report or electronic presentation to tie in everything in this unit from design to fabrication and the related physics and mathematics of robots.

Signature Assignment:

Students will construct their first Vex robot, the BaseBot. They will learn how to use basic assembly tools as well as how to identify available Vex robotic components from the classroom inventory system. Students will learn the subsystems (chassis, drivetrain, electrical, control) during the BaseBot construction activity. After the robot is constructed, students will test and troubleshoot their creation. Best engineering practices require testing, troubleshooting and adjustments/modifications of a design. This is followed by reflection and re-engineering to recognize that multiple solutions are possible for a problem/challenge. The designs, troubleshooting and re-engineering possibilities will be recorded in the student journals.

Unit 4 — Wireless Interfacing

Students will experience current technologies when they interface their robots with wireless game controllers. Students will need to use their prior knowledge of electronics and begin to master the basics of Easy-C programming language that is used in the Vex robotics system. Students will program the BaseBot constructed in unit 3 to remotely control it to move in straight lines, reverse motion as well as rotate to navigate through an obstacle course. Another activity will be for the students to write their initials using their robot and a whiteboard marker within the constraints of a walled robot competition field.

Upon completion of this unit;

-Students will link a wireless receiver (attached to the robot) with a hand-held controller.

-Students will understand how wireless-controllers work and their application in our current technological world.

-Students will add related entries and reflection to their journal related to their accomplishments and acquired knowledge/skills.

-Students will complete a detailed 3-5 page report or electronic presentation to tie in everything in this unit from design to fabrication and the related physics and mathematics of robots.

Signature Assignment:

Students will program the BaseBot constructed in unit 3 to remotely control it to move in straight lines, reverse motion as well as rotate to navigate through an obstacle course. Students will have multiple opportunities to test and refine their designs for improved performance and better results (higher points).

Unit 5 — Sensors

Students are introduced to open and closed loop robotic navigation using sensors and the Easy-C program. This unit builds on the dead reckoning programs constructed in unit 3. Digital bumper switches are added to the BaseBot so that it can interpret its environment autonomously. An ultrasonic range-finding sensor is introduced to allow the robot to sense its environment without touching it. A set of advanced drive functions is taught in order to simplify the autonomous control of the speed and direction of the robot. These drive functions are used in conjunction with a line-following sensor to have the BaseBot autonomously follow a line through a portion of the competition field.

Upon completion of this unit;

-Students will further broaden their understanding of how different components (sensors, batteries, multi-controllers, motors, gears and wheels) interact with each other in unison.

-Students will master the understanding of sensors. What sensors are and what role they play in our everyday life.

-Students will become familiar with two types of sensor constructions. The first will be bumper switches on all sides of the base that will allow the robot to sense objects with which it comes in contact.

-The second sensor construction students will understand is a ground-line sensor that allows the robot follow a line through part of the designed obstacle course for this unit.

-Students will increase their Easy-C programing skills related to the sensors in this unit.

-Students will add related entries and reflection to their journal related to their accomplishments and acquired knowledge/skills.

-Students will complete a detailed 3-5 page report or electronic presentation to tie in everything in this unit related to the effects of sensors linked with a robot.

Signature Assignment:

Students must program their robots to autonomously navigate and knock down some obstacles (binders or wood blocks) while not touching others in a specified order and in a specified time range. Students will have multiple opportunities to test and refine their designs for improved performance and better results (higher points).

Unit 6 — Arms and End effectors

Students will combine elements introduced in units 3-5. An arm will be added to the BaseBot and a basic physics analysis is done on how the arm effects the overall robot design and performance. The concept of center of gravity will be understood as the construction of the arm, the end effector and the weight of an object attached to the end effector is applied. Stall torque is examined related to the arm function as well as speed and gear ratio. The student is challenged with incorporating two limit switches into the design of the arm to control its movement. An end effector (claw) is added to the arm for gripping a game object used in the final unit.

Upon completion of this unit;

-Students will understand how different components (batteries, multi-controllers, motors, gears and wheels) interact with each other in unison.

-Students will master the construction of a functioning robot with hand tools.

-Students will master installing motors, bearings and making adjustments for motion.

-Students will understand how different gear rations and different sized wheels affect the movement of the robot.

-Students will add related entries and reflection to their journal related to their accomplishments and acquired knowledge/skills.

-Students will complete a detailed 3-5 page report or electronic presentation to tie in everything in this unit from design to fabrication and the related physics and mathematics of robots.

Signature Assignment:

The student must add an arm and end effector to the BaseBot. The Basebot, arm and end effector will be added to the Easy-C program for controlling the robot. The student will navigate the robot on the competition field to retrieve one or more competition game pieces and deliver it/them to a specified goal. The student will be timed for this activity. Students will have multiple opportunities to test and refine their designs for improved performance and better results (higher points).

Unit 7 — Final or Competition Robot Capstone Project

Students will combine all elements from this course to re-design and create a competition robot. The robot will compete in a classroom based competition with new game pieces introduced in this unit. The previous robot must be modified to effectively compete in the new game. Throughout this unit students will use analytical, expository writing to document and describe their work on the project in their engineering notebooks (journals). After the competition, students will create an invention and design report that focuses on the challenges and adjustments encountered in the process resulting in their final robot

ourse Description

urse overview:

Small Gas Engines is a competency based class designed as an introductory small gas engine mechanic course that introduces students to service and repair systems. It provides students with project-based experiences in small gas engine technologies. Instruction includes an orientation, classroom and workplace policies and procedures, resource management, measurements, tools and equipment, and employ-ability skills. Emphasis is placed on 2-stroke and 4-stroke engine designs, engine cooling systems, engine lubrication systems, engine electricity, charging systems, and starting systems.

This course will also provide students with the opportunity to apply and extend concepts studied in their math and science classes (related to algebra, basic arithmetic, physics, and electrical, computer, and chemical sciences) to the small gas engine technology industry.

urse content:

1. History & Careers: The History, Careers, Certifications, and Basic Overview of Small Gas Engine Technologies

Students will research the history and origins of Small Gas Engine Technology and appreciate the rich history of Small Gas Engine Technology as a profession or career option. They will review key historical concepts of the Small Gas Engine Industry. Students will research the background of small gas engine uses the necessary requirements for a variety of small gas engine careers, the opportunities available for a professional small gas engine service technician, and certification criteria.

Unit Assignment(s):

In a report or presentation format students will describe the different occupations in the Small Gas Engine Industry sector and related automotive technician options. Students will choose a specific career option to emphasize in their report.

2. Outdoor Power Equipment Shop Practices

Students will review the shop/classroom safety procedures associated with small gas engine tools and mechanics and maintenance of the shop. They will also study procedures and safety practices for lifting, working independently and collaboratively. Students will learn basic first aid steps to use in the event of an accident or injury. They will be introduced to Material Safety Data Sheets (MSDS) and glean pertinent safety information from them. Students will then take a safety exam as a demonstration of knowledge.

Unit Assignment(s):

Activity or Assignment: Students will demonstrate through a written quiz their knowledge of shop rules and procedures, tools and equipment safety, and personal safety procedures. Students will also recognize any and all safety concerns within, around the shop and around the school campus. They will discuss how to correct and how to protect themselves when working within the shop. Students shall work in groups and make a PowerPoint presentation to the class exhibiting their findings.

3. Measurements, Tools, and Equipment

Students will recognize basic hand tools and will identify the correct tool for the job. They will also demonstrate proper use of the tools. Students will differentiate between various service manuals. They will explore the precision measuring tools including rulers, gauges, and micrometers and learn how to use them to obtain precise measurements. Students will identify a variety of fasteners and their uses.

Unit Assignment(s):

Students will demonstrate their knowledge of tools and equipment by using industry-accepted terminology when referring to specific tools and equipment. They will select and justify the appropriate tools for a teacher given project. Students will demonstrate in the lab/shop their knowledge of tool and equipment use, maintenance, and storage by successfully completing the NATEF (National Automotive Technicians Education Foundation) related tasks.

4. 2-Stroke and 4-Stroke Air Cooled Engines

Students will explore Engine design and theory for both the 2-stroke and 4-stroke engine. Students will learn about internal combustion engine theory and the related internal engine components. The fuel system, cooling system, Electrical system, and lubrication systems will be introduced.

Unit Assignment(s):

In pairs or teams students will create and present a PowerPoint presentation of an assigned engine system or engine type (2-stroke or 4-stroke operation).

5. 4-Stroke (L-head) Engine Disassembly

Student will receive Lab/Shop orientation instruction as well as work station and storage, tool checkout and storage, cleanup and safety, and shop etiquette. Engine orientation and procedures as well as operating systems, and engine handling safety practices will be covered. Engine model identification, engine repair manual for disassembly/assembly procedures as well as service and specifications will be covered.

Unit Assignment(s):

Students will disassemble a 3.5 HP “L-head” engine and identify the systems as well as the engine parts.

---

6. Small Gas Engine Electrical System

Students will learn about electrical theory and practice related to the small gas engine. Electron movement, Ions, Ohms, Volts and Amps will be covered, Electrical circuit design, power supply without a battery (the magneto system) will be covered. Mathematical calculations using Ohm’s Law will be covered. (Calculating amperage (I = E/R); voltage (E = I x R); Calculating resistance (R = E/I)

Unit Assignment(s):

Students will construct a simple circuit and using multimeters measure and record voltage and resistance of both a parallel and series circuit.

---

7. Small Gas Engine Cooling and Lubrication Systems

Students will learn about cooling and lubrication systems related to the small gas engine. The splash lubrication system will be compared to the pressurized pump lubrication system normally found in larger car engines. The lubrication system will also be examined for its cooling effects on the engine. The air cooled system found on most small gas engines will be compared to the liquid cooling systems also found on larger internal combustion engines.

Unit Assignment(s):

Working in pairs or teams students will construct a model and present it to the class of one of the following: A splash lubrication system, a pump (pressurized) lubrication system, an air cooled system, or a liquid radiator cooling system will be assigned or selected for the model making assignment.

---

8. 4-Stroke (L-head) Engine Assembly

After learning about the different systems and parts students will assemble the 3.5 HP engine that they disassembled earlier. An engine repair manual will be consulted for specifications related to the assembly procedures.

Unit Assignment(s):

Students will assemble a 3.5 HP “L-head” engine.

9. Air Cooled Engine Service

Students will learn about a service guide sheet, familiarize themselves with industry practices. They will learn how to write a work order, create a parts order, review customer service procedures, and bill out costs for a typical small gas engine service. Students will learn how to clean cooling fins, change oil, change or service the air filter, check the spark plug, and test run equipment.

Unit Assignment(s):

Following a service guide sheet students will familiarize themselves with industry practices, write a work order, and create a parts order, review customer service procedures, and bill out costs for a typical small gas engine service. Students will clean cooling fins, change oil, change or service the air filter, check the spark plug, and test run equipment.

Course Title

Small Gas Engines A

Description of Target Group

This is the first term of a two term (one year) course for 9th through 12th grade students wanting to learn the fundamentals of engine lab procedures and engine technology. A lab fee is required.

Purpose

Small Gas Engines A is a course to introduce the student to the safety, tools, methods and procedures used in the shop environment. Students will also be taught the components, function and theory of operation of the internal combustion engine, including hands-on experience in engine disassembly, assembly and operations. This is a 5-unit course.

Standards of Expected Student Achievement

Complete a comprehensive safety exam.
Use protective clothing and eye protection when required.
Complete assigned laboratory and written work.
Complete assigned clean-up responsibilities.
Work safely and with diligence.
Understand and use basic small gasoline engine terminology.
Demonstrate the ability to properly use hand tools.
Complete the assembly and disassembly of a small gasoline engine.
Use various instruments and measuring devices for engine evaluation.
Accurately follow written instructions for small gas engine service.
Explain the mechanical operation of small gasoline engines.

Methods of Assessment of Student Learning

Class participation
Quizzes covering each main module.
Teacher evaluation.
Independent projects.
Final examination.
Cooperative work with other students.

Instructional Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books used in the Santa Maria Joint Union High School District.

Activities

Individual work, lectures, class laboratory shop work, demonstrations, small group activities, and outside resource people.

Course Title

Small Gas Engines B

Description of Target Group

This is the second term of a two term (one year) course for 9th through 12th grade students wanting to learn the fundamentals of engine lab procedures and engine technology. A lab fee is required.

Prerequisite: Small Gas Engines A

Purpose

Small Gas Engines B is a course to advance the study for students in safety, tools, methods and procedures, components, function and theory of operation of the internal combustion engine. This is a 5-unit course

Standards of Expected Student Achievement

Learn the fundamentals of engine design and theory.
Complete assigned laboratory and written work.
Use technical manual as a resource to specifications and procedures.
Understand and use basic small gasoline engine terminology.
Complete the assembly and disassembly of a small gasoline engine.
Use various instruments and measuring devices for engine evaluation.
Accurately follow written instructions for small gas engine service.
Prepare for additional studies of automotive and mechanical systems.
Minor repairs of small engines.

Methods of Assessment of Student Learning

Class participation
Quizzes covering each main module.
Teacher evaluation.
Independent projects.
Final examination.
Cooperative work with other students.

Instructional Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books used in the Santa Maria Joint Union High School District.

Activities

Individual work, lectures, class laboratory shop work, demonstrations, small group activities, and outside resource people.

Course Title

Survey of Drafting

Description of Target Group

This course is for all students.

Purpose

The purpose of Survey of Drafting is to give students an opportunity to explore the area of drafting. This is a one semester course. NOTE: This is not currently offered at Righetti High School. There is a lab fee required.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Supply drafting pencils and erasers.
2. Complete assigned laboratory, written, reading assignments and clean-up responsibilities.
3. Understand and use drafting terminology.
4. Develop fundamentals in lettering, dimensioning, line work, sheet layout, and the use of the scale.
5. Develop proper identification, usage, and care of drafting equipment.
6. Develop fundamental geometric construction.
7. Develop fundamental freehand drawing skills.
8. Develop an interest in a possible career in the field of drafting.
9. Complete lab assignments relating to the areas of architecture, electronics, wood, automotive, plastics, and welding.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, lectures, class participation, demonstrations, audiovisual materials, field trips, small group activities, outside resource people, and drawing production.

Course Title

Survey of Electronics

Description of Target Group

This course is for all students. No prior knowledge of electronics/electricity is required. It is recommended that students have knowledge of basic math, especially very large and very small decimal numbers.

Purpose

The purpose of Survey of Electronics**,** a one-term course, is to introduce students to the skills needed for the electronics repair field, including the basic concepts of electrical measurement and electrical soldering. This course is the prerequisite course for the Electronics 1A course.

Standards of Expected Student Achievement

Upon successful completion of this course, students will be able to demonstrate the following knowledge/skills:

1. Safety related to the electronics industry.
2. Computing resistor color code values and tolerance.
3. Use of the digital multi-meter.
4. Understand the concepts of voltage, current, and resistance.
5. Soldering / electronic assembly skills.
6. Knowledge of skills necessary to work in the electronics industry.

Assessment of Student Learning

1. Students will present evidence of learning by cooperating with group or individual assignments and presentations based on projects and skills.
2. Students will present evidence of learning by presenting ideas, solutions and conclusions to proposed or presented problems.
3. Students will present evidence of learning through teacher observations.
4. Students will present evidence of leaning through quizzes, tests, and homework.
5. Teacher evaluations.

Instructional Materials

Text: Introduction to Electronics, Earl D. Gates
Supplementary Materials: Manufacturers documentation; videos

Activities

Lab experimentation, lectures, class participation, demonstrations, audiovisual materials, small group activities, outside resource people, and electronic assembly.

Course Title

Survey of Graphic Arts

Description of Target Group

Beginning students, grades 9, 10, 11 & 12 who may have an interest in art, design or graphics.

Purpose

A one-term course of theory and practice is designed to introduce students to the fundamentals of graphic art design theory and production. This is an exploratory course, which will expose students to the world of visual design. As in introductory course, students will follow a process of design from concept to production, using a variety of tools and equipment.

Standards of Expected Student Achievement

Upon successful completion of this course each student will be able to demonstrate competency in the following:

1. • Making critical aesthetic judgments.
2. • Self-reliance and independent thinking.
3. • Solving problems individually and/or in small teams.
4. • Using specialized graphic arts vocabulary as related to theory and production.
5. • Application of principles and elements of design to projects.
6. • Use of theoretical and practical skills as applied to design projects.
7. • Basic knowledge of computer use as applied to graphic arts.
8. • Knowledge of safe and correct applications of graphic arts production equipment.
9. • Expressing intentions and accomplishments using oral and written skills in public (classroom) presentations.
10. • Awareness of related occupations.
11. • Awareness of related and more advanced courses:

Graphic Arts A/B	Advanced Study Graphic Arts
Technical Sketching	Photography
Art 1	Mechanical Drawing

Assessment of Student Learning

1. Students will present evidence of learning by cooperating with group or individual assignments and presentations based on projects and skills.
2. Students will present evidence of learning by presenting ideas, solutions and conclusions to proposed or presented problems.
3. Students will present evidence of learning through teacher observations.

4. Students will present evidence of learning through quizzes, tests, and homework.
5. Teacher evaluations.

Instructional Materials

Refer to: Text and supplementary materials
Adopted text: TBD
Supplementary text:
Software instructional manuals
Trade magazines
Supplementary Video

Activities

Individual work, lectures, teacher and student demonstrations, student presentations, guest speakers, and field trips.

Course Title

Survey of Manufacturing

Description of Target Group

This course is an exploratory course in manufacturing for students in grades 9 through 12 with priority given to students in grades 9 and 10. There is a lab fee required.

Purpose

This one semester course is designed to give students an opportunity to explore the areas of manufacturing.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Pass a safety test and demonstrate the ability to properly and safely use hand and power equipment available to them.
2. Complete assigned laboratory and written work.
3. Learn the importance of planning before starting a procedure or operation.
4. Learn to illustrate ideas through sketching.
5. Learn the importance of teamwork.
6. Understand and use basic manufacturing technology and terminology.
7. Learn to identify and work with current materials.
8. Learn to estimate and figure costs of materials.
9. Learn basic robot operations and applications.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District.

Activities

Lecture, lab work, field trips, audiovisual materials, and outside resource people.

Course Title

Survey of Plastics

Description of Target Group

This course is for 9th through 12th grade students with priority given to students in grades 9 and 10.

Purpose

The purpose of Survey of Plastics is to give students an opportunity to explore the area of plastics. This is a one-semester course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Complete a safety test with a passing score.
2. Develop an interest in a possible career in the field of plastics.
3. Provide and use protective clothing and eye protection when and where required.
4. Complete assigned laboratory and written work.
5. Complete assigned clean-up responsibility.
6. Develop an understanding of safe working habits and conditions.
7. Understand and use basic plastic terminology.
8. Operate safely and demonstrate ability in the proper use of hand and power equipment available to them.
9. Identify samples of plastics using destructive techniques.
10. Develop an understanding of basic plastic materials and processes.
11. Construct one mold.
12. Develop an understanding of the advantages and disadvantages of plastic materials.

Instructional Materials

Text and Supplementary Materials
Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, lectures, class participation, demonstrations, audiovisual materials, field trips, small group activities, outside resource people, and project construction.

Course Title

Survey of Wood A

Description of Target Group

This is the first term of a two term (one year) course for 9th through 12th grade students. This course is designed for students wishing to learn wood working skills through a hands-on experience. A lab fee will be required.

Purpose

The purpose of this course is to give students an opportunity to explore the area of wood. Students are expected to pay for materials. 5-units of elective credit.

Standards of Expected Student Achievement

1. Complete a safety test with a passing score.
2. Provide and use protective clothing and eye protection when and where required.
3. Complete assigned laboratory and written work.
4. Develop an understanding of safe work habits and conditions.
5. Understand and use basic woodworking terminology.
6. Operate safely and demonstrate ability in the proper use of hand and power equipment available to them.

Methods of Assessment of Student Learning

1. Written exams
2. Finished project graded
3. Construct assigned projects by following a step-by-step procedure sheet
4. Work cooperatively with others
5. Teacher evaluations

Instructional Materials

Text and Supplementary materials

Safety Videos

Refer to: Secondary Adopted Texts and Approved Supplementary Books used in the Santa Maria Joint Union High School District.

Activities

Individual work, lectures, project construction, demonstrations, audiovisual materials, small group activities, and outside resource people.

Course Title

Survey of Wood B

Description of Target Group

This is the second term of a two term (one year) course for 9th through 12th grade students. This course is designed for students wishing to learn wood working skills through a hands-on experience.

Prerequisite: Survey of Wood A

Purpose

The purpose of this course is to give students an opportunity to explore the area of wood. Students are expected to pay for materials. 5-units of elective credit.

Standards of Expected Student Achievement

1. Develop an interest in a possible career in the field of wood.
2. Complete assigned laboratory and written work.
3. Understand and use basic woodworking terminology.
4. Operate safely and demonstrate ability in the proper use of hand and power equipment available to them.
5. Demonstrate the ability to select and apply a finish to a project.

Methods of Assessment of Student Learning

1. Written exams
2. Finished project graded
3. Construct assigned projects by following a step-by-step procedure sheet
4. Work cooperatively with others
5. Teacher evaluations

Instructional Materials

Text and supplementary materials

Safety Videos

Refer to: Secondary Adopted Texts and Approved Supplementary Books used in the Santa Maria Joint Union High School District.

Activities

Individual work, lectures, project construction, demonstrations, audiovisual materials, small group activities, and outside resource people.

Course Title

Technical Sketching A

Description of Target Group

This course is for 10th, 11th, and 12th grade students. The student should have an ability in abstract reasoning.

Purpose

The purpose of Technical Sketching A is to give students an opportunity to explore mechanical drawing in the area of freehand drawing practice. This is the first semester of a one year course. NOTE: This is not currently offered at Righetti High School, but is available as part of R.O.P. Advanced Drafting. The student is expected to pay for project materials. A lab fee is required.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Provide own pencils and erasers.
2. Develop fundamentals of freehand line work, layout, use of scale, and lettering.
3. Complete assigned laboratory, clean up, reading, and written work.
4. Understand and use basic geometric terminology.
5. Develop an interest in freehand usage in a possible career.
6. Develop freehand straight line techniques.
7. Develop freehand curve line techniques.
8. Develop fundamental shading.
9. Develop fundamental freehand pictorial.
10. Develop fundamental freehand from models.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, lectures, class participation, demonstrations, audiovisual materials, field trips, small group activities, outside resource people, and project construction.

Course Title

Technical Sketching B

Description of Target Group

This course is for 10th, 11th, and 12th grade students. The student should have an ability in abstract reasoning. It is recommended that the student complete Technical Sketching A before entering this class.

Purpose

The purpose of Technical Sketching B is to give students an opportunity to explore mechanical drawing in the area of freehand drawing practice. This is the second semester of a one-year course. NOTE: This is not currently offered at Righetti High School, but is available as part of RO.P. Advanced Drafting. Student is expected to pay for project materials.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Provide own pencils and erasers.
2. Develop fundamentals of freehand line work, layout, use of scale, and lettering.
3. Complete assigned laboratory, clean up, reading, and written work.
4. Understand and use basic geometric terminology.
5. Develop an interest in freehand usage in a possible career.
6. Develop freehand straight-line techniques.
7. Develop freehand curve line techniques.
8. Develop fundamental shading.
9. Develop fundamental freehand pictorial.
10. Develop fundamental freehand from models.
11. Use various types of reproduction media and be acquainted with such techniques as pencil, air brushing, pastel, watercolor, etc.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, lectures, class participation, demonstrations, audiovisual materials, field trips, small group activities, outside resource people, and project construction.

Course Title

Vocational Automotive A

Description of Target Group

This advanced course is for 11th and 12th grade students who are at least 16 years old and have a grade of B in Fundamentals of Auto A/B and/or instructor's recommendation.

Purpose

The purpose of Vocational Automotive A is to give students an opportunity to continue in automotive and develop skills in repairing automobiles. This is the first semester of a one-year course. NOTE: This course has been supplanted by R.O.P. Advanced Automotive a multiple track vocationally oriented class. This is a class designed to prepare the student for entry into the job market or entry into an advanced training program in a specialty school or junior college with employment in the automotive field as the ultimate goal.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Complete a safety test with a passing score.
2. Develop an interest in a possible career in the field of auto mechanics.
3. Provide and use protective clothing and eye protection when and where required.
4. Complete assigned laboratory and written work.
5. Complete assigned clean-up responsibility.
6. Develop an understanding of safe working habits and conditions.
7. Understand and use automotive terminology.
8. Operate safely and demonstrate ability in the proper use of hand and power equipment available.
9. Develop basic skills in repair and service procedures in the following areas:
    a. Engines
    b. Carburization
    c. Tune-up

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual laboratory work, lectures, class participation, demonstrations, audiovisual materials, field trips, small group laboratory activities, and outside resource people.

Course Title

Vocational Automotive B

Description of Target Group

This advanced course is for 11th and 12th grade students who are at least 16 years old and have a grade of B in Fundamentals of Auto A/B and/or instructor's recommendation.

Purpose

The purpose of Vocational Automotive B is to give students an opportunity to continue in automotive and develop skills in repairing automobiles. This is the second semester of a one-year course. NOTE: This course has been supplanted by R.O.P. Advanced Automotive a multiple track vocationally oriented class. This is a class designed to prepare the student for entry into the job market or entry into an advanced training program in a specialty school or junior college with employment in the automotive field as the ultimate goal.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Complete a safety test with a passing score.
2. Develop an interest in a possible career in the field of auto mechanics.
3. Provide and use protective clothing and eye protection when and where required.
4. Complete assigned laboratory and written work.
5. Complete assigned clean-up responsibility.
6. Develop an understanding of safe working habits and conditions.
7. Understand and use automotive terminology.
8. Operate safely and demonstrate ability in the proper use of hand and power equipment available.
9. Develop basic skills in repair and service procedures in the following areas:
    a. Suspension
    b. Brakes

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual laboratory work, lectures, class participation, demonstrations, audio visual materials, field trips, and small group laboratory activities.

Wood A/B

Santa Maria Joint Union High School District

asic Course Information

hool(s) Offering This Course:

School Name	Course Learning Environment	Transcript Code(s)
ioneer Valley High School (053847)	Classroom Based	Abbreviation / Course Code Wood A (P) / IT6687 Wood B (P) / IT6688

Title:	Wood A/B
Length of course:	Full Year
Subject area:	College-Preparatory Elective (G) / Interdisciplinary
UC honors designation?	No
Prerequisites:	None (Recommended)
Co-requisites:	None
Integrated (Academics / CTE)?	Yes
Grade levels:	9th, 10th, 11th, 12th

ourse Description

urse overview:

Using wood as a primary medium, students will be introduced to design of wood products, as well as practical and career applications. Students will experience real applications by designing and making projects using appropriate materials related to assigned and student selected projects. Wood A/B is part of a sequence of courses in design engineering, construction, cabinet making and technical theater pathways. The purpose of this course is to provide students with a foundation of knowledge, skills and experience in the elements of wood technology principles of design that would advance them toward further education toward a career in a skilled position related to a variety of career options.

urse content:

Introduction to Wood Technology (A/B) and Related Careers and Employment

Within this unit students are given an overview of working in woods technology and the related career fields connected with the skills that will be learned in the course. Students will choose a career field to research and produce a report. The report will consist of entry level requirements, advancement opportunities, possible pay ranges, technical skills required, academic skills required, soft job skills desired, habits of mind desired, tools used and their cost, technical schools or higher education possibilities, and job placement predictions.

Unit Assignment(s):

A completed report will be produced in two forms. The first form will be a completed research paper and the second form will be an electronic presentation such as a MicroSoft PowerPoint, Apple KeyNote or Prezi that will then be presented to the class.

Workplace and Shop or Lab Safety Practices

Students will receive instruction in safety practices in a shop or lab and related to a construction work area. Safety related to hand tool use and an introduction to power tool safety will also be addressed in this unit. Specific and detailed safety instruction related to power tools will be provided during the course as the tools are needed for specific projects. Students will be instructed about Cal-OSHA requirements and practices. Students will practice general shop safety skills required to work and create a safe working environment. Part of this practice applies to safe work etiquette, good housekeeping and cleanliness of the work areas, safe and appropriate use of hand tools. Shop safety procedures will emphasize working with and transporting sharp materials and tools such as saws, chisels, nails, files, etc...

Unit Assignment(s):

Students will be required to pass a general safety procedures test before being allowed to work in the shop or lab. Students will be required to pass specific written and practical use safety tests related to each power tool before being allowed to operate them. Students will also produce a safety poster or electronic presentation for a specific assigned safety practice or power tool.

Principles of Design, Measurement and Project Planning

Students will be instructed about different wood joints and fastener options for construction of a project. Project joint strength and structural integrity will be addressed. Students will be instructed in the standard and metric measurement systems. The measurement instruction will include a review of fractions and decimals, mixed numbers, common denominators, adding, subtracting, multiplying, dividing, scaling, reading a ruler and tape measure to the nearest 1/16th of an inch for the standard system and millimeter in the metric system. Students will be provided with a working drawing and project plan documentation (bill of materials and cut list) for a “skill frame” learning activity. Students will select from provided materials to complete the required activity.

Unit Assignment(s):

Students will create a “skill frame” to demonstrate safe work practices, wood joinery as well as appropriate measurement applications. Students will be provided with a working drawing that they must read and interpret to create the project. Students will demonstrate safe hand tool practices as well as their understanding of applied math concepts in measurement. While producing the project students will communicate with the instructor using appropriate trade terminology and demonstrating proper use of hand tools and practices, with safety as a paramount goal.

Creating a Working Drawing and Using CAD to Produce Project Plans

Using the skill frame example and instructions from unit 3 students will select a project for which they will create working drawings. The detailed project plans must include accurate measurement and joinery information. Students can work as individuals or in groups of 2 or 3. If working in groups, students must keep a log of who completed the specific parts of the project. As an introduction to CAD and computer 3-D drawing programs, Students will physically examine and measure a part of the classroom and its related objects to sketch on graph paper and transition into the computer. Using a step by step guide the student will recreate the assigned classroom section in the computer 3-D drawing program.

Unit Assignment(s):

Students will select a project from a provided list to create a scaled working drawing with labeled measurements on graph paper. The student will then take the graded paper drawing and create a 3-D electronic version using a computer program such as SketchUp, Vector Works, or Solid Works.

Creating a Model or Prototype and a Written Proposal for Client/Instructor

Using the working drawings, the project will be scaled up or down to create a model of appropriate size of the project from the previous 2 units. The model and supporting documentation will be presented to the client/instructor for final approval to build a full-size prototype or finished product of the actual project.

Unit Assignment(s):

Using cardboard, balsa wood or other materials students will create a scaled model of a project. Students will use a working drawing and blueprint to follow the projects' design and dimensions but at a scaled version.

Estimating Project Cost and Materials

Students will be introduced to a spread sheet program such as MicroSoft Excel, Google Sheets, or Apple Numbers to create supporting documentation to accompany the working plans created in Unit 4. Students will consider and discuss different material and fastener/joinery options for the appropriate application to best build their project. The supporting documentation will be completed after a set of materials and assembly elements have been chosen.

Unit Assignment(s):

Using the project from Unit 4 students will create a bill of materials and cut list. Using the internet, students will look up different material options and gather pricing from 3 different vender sources to calculate the best total price for the project. Using a chosen set of materials and assembly elements the students will calculate a final overall cost.

Building a Full-Size Product

Upon approval of the documentation and model presentation of the project from unit 4 students will build the full-size project. At this point the students will demonstrate mastery of work place safety procedures and precautions. Students will demonstrate mastery of wood fabrication processes as well as material choices, the applications of joinery methods, fastening choices, and finishing processes to complete and deliver the end product. The instructor and if applicable the client will determine the overall grade for the project. While the final evaluation for a grade is the instructor's responsibility, the instructor will seek feedback from the client and as a part of the course students will evaluate each other's projects using a provided rubric.

Unit Assignment(s):

Students will demonstrate mastery of wood fabrication processes as well as material choices, the applications of joinery methods, fastening choices, and finishing processes to complete and deliver the end product.

Final or Capstone Project

Students will use all of the elements from this course to design and create a student selected project. The selection can be a personal project that the student is responsible for purchasing the materials. Or, the project can be selected from an instructor provided list for which the organization or client would be responsible for purchasing the materials. A student may also have his or her own client for whom they complete this project. A complete set of design and working drawings with all supporting documentation will be a required part of the project. Also, a model will be provided and a signed agreement/approval for the final design and plans for project must be presented to the instructor before the full size project can be started. All parts from design to the finished piece will be evaluated for the final grade.

Unit Assignment(s):

Students working individually or in teams will design and build a specific project. While the final evaluation for a grade is the instructor's responsibility, as a part of the course students will evaluate each other's projects using a provided rubric.

ourse Description

urse overview:

Using wood as a primary medium, students will provided an in-depth experience in design perception, personal and theatrical context, aesthetic valuing, creative expression, as well as practical and career applications by designing and making projects using appropriate materials related to assigned and student selected projects. Wood Tech is part of a sequence of courses in design engineering, construction, cabinet making and technical theater pathways. The purpose of this course is to provide students with a foundation of knowledge, skills and experience in the elements of wood technology principles of design that would advance them toward further education toward a career in a skilled position related to a variety of career options.

urse content:

Introduction to Wood Tech and Related Careers and Employment with a focus on Stage Craft and Technical Theater

Within this unit students are given an overview of working in woods technology and the related career fields connected with the skills that will be advanced in the course from Wood A/B. In particular, students will explore career options related to the entertainment industry. Students will choose a career field to research and produce a report. The report will consist of entry level requirements, advancement opportunities, possible pay ranges, technical skills required, academic skills required, tools used and their cost, technical schools or higher education possibilities, and job placement predictions.

Unit Assignment(s):

A completed report will be produced in two forms. The first form will be a completed research paper and the second form will be an electronic presentation such as a MicroSoft PowerPoint, Apple KeyNote or Prezi that will then be presented to the class.

Workplace and Shop or Lab Safety Practices and Introduction to Stagecraft and the PAC Auditorium

Students will receive instruction in safety practices in a shop or lab, in the PAC facility and related to a construction work area Safety related to hand tool use and an introduction to power tool safety will also be addressed in this unit. Specific and detailed safety instruction related to power tools will be provided during the course as the tools are needed for specific projects. Students will be instructed about Cal-OSHA requirements and practices. Students will practice general shop safety skills required to work and create a safe working environment. Part of this practice applies to safe work etiquette, good housekeeping and cleanliness of the work areas, safe and appropriate use of hand tools. Shop safety procedures will emphasize working with and transporting sharp materials and tools such as saws, chisels, nails, files, etc...

Unit Assignment(s):

Students will be required to pass a general safety procedures test before being allowed to work in the shop or lab. Students will be required to pass specific written and practical use safety tests related to each power tool before being allowed to operate them. Students will also produce a safety poster or electronic presentation for a specific assigned safety practice.

Principles of Design, Measurement and Project Planning to include Theater Personnel and Operations

Students will be instructed about different wood joints and fastener options for construction of a project. Project joint strength and structural integrity will be addressed. Students will be instructed in the standard and metric measurement systems. The measurement instruction will include a review of fractions and decimals, mixed numbers, common denominators, adding, subtracting, multiplying, dividing, scaling, reading a ruler and tape measure to the nearest 1/16th of an inch for the standard system and millimeter in the metric system. Students (working in teams as a “set crew”) will be provided with a working drawing and project plan documentation (bill of materials and cut list) for a “skill frame” or other project learning activity. Student teams will select from provided materials to complete the required activity. Theater personnel hierarchy will be covered as well as stage crew operations. The PAC sound system and light rigging will also be introduced.

Unit Assignment(s):

Student teams will create a “skill frame” (or other assigned project) to demonstrate safe work practices, wood joinery as well as appropriate measurement applications. Students will be provided with a working drawing that they must read and interpret to create the project. Students will demonstrate safe hand tool practices as well as their understanding of applied math concepts in measurement. While producing the project students will communicate with the instructor using appropriate trade terminology and demonstrating proper use of hand tools and practices, with safety as a paramount goal.

Creating a Working Drawing and Using CAD to Produce Project Plans (Scenic Elements and Set Construction)

Using the skill frame example and instructions from unit 3 students will select a project related to the PAC (such as flats, platforms, wagons, stairs...) for which they will create working drawings. The detailed project plans must include accurate measurement and joinery information. Students can work as individuals or in groups of 2 or 3. If working in groups, students must keep a log of who completed the specific parts of the project. As an introduction to CAD and computer 3-D drawing programs, Students will physically examine and measure a part of the classroom, production set piece and its related objects to sketch on graph paper and transition into the computer. Using a step by step guide the student will recreate the assigned classroom selection or set piece in the computer 3-D drawing program.

Unit Assignment(s):

Students will select a project from a provided list to create a scaled working drawing with labeled measurements on graph paper. The student will then take the graded paper drawing and create a 3-D electronic version using a computer program such as SketchUp or Solid Works. Student teams will then create a model, prototype or full size piece for their assigned element.

Creating a Model or Prototype and a Written Proposal for Client/Instructor (Design & Practical Applications Lighting, Sets, & Sound)

Using the working drawings for a set or prop piece, the project will be scaled up or down to create a model of appropriate size of the project from the previous 2 units. The model and supporting documentation will be presented to the client/instructor for final approval to build a full-size prototype or finished product of the actual project. Working is teams this project could include Lighting a production, creating a set, creating props, and setting up a sound system.

Unit Assignment(s):

Using cardboard, balsa wood or other materials students will create a scaled model of a project. Students will use or create a working drawing and/or CAD drawing to follow the projects' design and dimensions but at a scaled version. OR- Create a lighting plot & successfully connect stage lighting fixtures for use in a production, pass a practical exercise using the lighting controls, pass a practical exercise using the sound system controls, successfully patch equipment for use from stage to sound porch.

Estimating Project Cost and Materials (Performance Application I)

Students will be introduced to a spread sheet program such as MicroSoft Excel, Google Sheets, or Apple Numbers to create supporting documentation to accompany the working plans created in Unit 4. Students will consider and discuss different material and fastener/joinery options for the appropriate application to best build their project. The supporting documentation will be completed after a set of materials and assembly elements have been chosen.

Unit Assignment(s):

Using the projects from Unit 4 students will create a bill of materials and cut list. Using the internet, students will look up different material options and gather pricing from 3 different vender sources to calculate the best total price for the project. Using a chosen set of materials and assembly elements the students will calculate a final overall cost.

Building a Full-Size Product (Performance Application II)

Upon approval of the documentation and model presentation of the projects from unit 4 students will build the full-size project. At this point the students will demonstrate mastery of work place safety procedures and precautions. Students will demonstrate mastery of wood fabrication processes as well as material choices, the applications of joinery methods, fastening choices, and finishing processes to complete and deliver the end product. The instructor and if applicable the client will determine the overall grade for the project. While the final evaluation for a grade is the instructor's responsibility, the instructor will seek feedback from the client and as a part of the course students will evaluate each other's projects using a provided rubric.

Unit Assignment(s):

Students will demonstrate mastery of wood fabrication processes as well as material choices, the applications of joinery methods, fastening choices, and finishing processes to complete and deliver the end product. The instructor and if applicable the client will determine the overall grade for the project.

Final or Capstone Project (Performance Application III)

Students will use all of the elements from this course to design and create student selected projects. The selection can be a personal project that the student is responsible for purchasing the materials. Or, the project can be selected from an instructor provided list for which the organization or client would be responsible for purchasing the materials. A student may also have his or her own client for whom they complete this project. A complete set of design and working drawings with all supporting documentation will be a required part of the project. Also, a model will be provided and a signed agreement/approval for the final design and plans for projects must be presented to the instructor before the full-size project can be started. All parts from design to the finished piece will be evaluated for the final grade.

Unit Assignment(s):

Students working individually or in teams will design and build a specific project. While the final evaluation for a grade is the instructor's responsibility, as a part of the course students will evaluate each other's projects using a provided rubric.

Comments:

Course Purpose: *What is the purpose of this course?*

Using wood as a primary medium, students will provided an in-depth experience in design perception, personal and theatrical context, aesthetic valuing, creative expression, as well as practical and career applications by designing and making projects using appropriate materials related to assigned and student selected projects.

Wood Tech is part of a sequence of courses in design engineering and technical theater pathways. The purpose of this course is to provide students with a foundation of knowledge, skills and experience in the elements of wood technology principles of design that would advance them toward further education toward a career in a skilled position related to a variety of career options.

Students are provided with various design theories related to working with wood and wood structures as well as skills in communication, research, creativity, critical thinking, project management, and providing an end product for themselves, a client or the instructor related to differing needs. The product, the design and creation process must meet safety standards as well as the client's desired request. The client referred to above might be school administration, the drama teacher for elements of a theatrical set, a classroom teacher, the Wood Technology instructor, a parent, friend or relative as well as the student themselves. Students will demonstrate learned and acquired skills by designing on paper end electronically (3-D CAD), creating a bill of materials and cut list, creating a model and or a prototype and then producing a final product. Project construction mathematics will be extensively used during the project design and creation process. Knowledge and practice of safety standards are emphasized throughout the process and course. Students will learn to read working drawings and blueprints, as well as creating these documents. Students will build or produce projects meeting the specifications of the working drawings and blueprints provided or created.

B. COURSE CONTENT

Course Outline: *A detailed descriptive summary of all topics covered. All historical knowledge is expected to be empirically based, give examples. (i.e. California State Standards).*

Unit 1 — Introduction to Wood Technology and Related Careers and Employment Possibilities
Within this unit students are given an overview of working in woods technology and the related career fields connected with the skills that will be learned in the course. Students will choose a career field to research and produce a report. The report will consist of entry level requirements, advancement opportunities, possible pay ranges, technical skills required, academic skills required, tools used and their cost, technical schools or higher education possibilities, and job placement predictions.
Signature Assignment:
A completed report will be produced in two forms. The first form will be a completed research paper and the second form will be an electronic presentation such as a MicroSoft PowerPoint, Apple KeyNote or Prezi that will then be presented to the class.

Unit 2 — Workplace and Shop or Lab Safety Practices
Students will receive instruction in safety practices in a shop or lab and related to a construction work area Safety related to hand tool use and an introduction to power tool safety will also be addressed in this unit. Specific and detailed safety instruction related to power tools will be provided during the course as the tools are needed for specific projects. Students will be instructed about Cal-OSHA requirements and practices. Students will practice general shop safety skills required to work and create a safe working environment. Part of this practice applies to safe work etiquette, good housekeeping and cleanliness of the work areas, safe and appropriate use of hand tools. Shop safety procedures will emphasize working with and transporting sharp materials and tools such as saws, chisels, nails, files, etc…
Signature Assignment:
Students will be required to pass a general safety procedures test before being allowed to work in the shop or lab. Students will be required to pass specific written and practical use safety tests related to each power tool before being allowed to operate them. Students will also produce a safety poster or electronic presentation for a specific assigned safety practice.

Unit 3 — Principles of Element Design, Measurement Systems and Project Planning
Students will be instructed about different wood joints and fastener options for construction of a project. Project joint strength and structural integrity will be addressed. Students will be instructed in the standard and metric measurement systems. The measurement instruction will include a review of fractions and decimals, mixed numbers, common denominators, adding, subtracting, multiplying, dividing, scaling, reading a ruler and tape measure to the nearest 1/16th of an inch for the standard system and millimeter in the metric system. Students will be provided with a working drawing and project plan documentation (bill of materials and cut list) for a "skill frame" learning activity. Students will select from provided materials to complete the required activity.
Signature Assignment:
Students will create a "skill frame" to demonstrate safe work practices, wood joinery as well as appropriate measurement applications. Students will be provided with a working drawing that they must read and interpret to create the project. Students will demonstrate safe hand tool practices as well as their understanding of applied math concepts in measurement. While producing the project students will communicate with the instructor using appropriate trade terminology and demonstrating proper use of hand tools and practices, with safety as a paramount goal.

Unit 4 — Creating a Working Drawing and Using CAD to Produce Project Plans
Using the skill frame example and instructions from unit 3 students will select a project for which they will create working drawings. The detailed project plans must include accurate measurement and joinery information. Students can work as individuals or in groups of 2 or 3. If working in groups, students must keep a log of who completed the specific parts of the project.
As an introduction to CAD and computer 3-D drawing programs, Students will physically examine and measure a part of the classroom and its related objects to sketch on graph paper and transition into the computer. Using a step by step guide the student will recreate the assigned classroom section in the computer 3-D drawing program.
Signature Assignment:
Students will select a project from a provided list to create a scaled working drawing with labeled measurements on graph paper. The student will then take the graded paper drawing and create a 3-D electronic version using a computer program such as SketchUp or Solid Works.

Unit 5 — Creating a Model or Prototype and a Written Proposal for Client/Instructor
Using the working drawings, the project will be scaled up or down to create a model of appropriate size of the project from the previous 2 units. The model and supporting documentation will be presented to the client/instructor for final approval to build a full-size prototype or finished product of the actual project.
Signature Assignment:
Using cardboard, balsa wood or other materials students will create a scaled model of a project. Students will use a working drawing and blueprint to follow the projects' design and dimensions but at a scaled version.

Unit 6 — Estimating Project Cost and Materials
Students will be introduced to a spread sheet program such as MicroSoft Excel, Google Sheets, or Apple Numbers to create supporting documentation to accompany the working plans created in Unit 4. Students will consider and discuss different material and fastener/joinery options for the appropriate application to best build their project. The supporting documentation will be completed after a set of materials and assembly elements have been chosen.
Signature Assignment:
Using the project from Unit 4 students will create a bill of materials and cut list. Using the internet, students will look up different material options and gather pricing from 3 different vender sources to calculate the best total price for the project. Using a chosen set of materials and assembly elements the students will calculate a final overall cost.

Unit 7 — Building a Full-Size Product
Upon approval of the documentation and model presentation of the project from unit 4 students will build the full-size project. At this point the students will demonstrate mastery of work place safety procedures and precautions. Students will demonstrate mastery of wood fabrication processes as well as material choices, the applications of joinery methods, fastening choices, and finishing processes to complete and deliver the end product. The instructor and if applicable the client will determine the overall grade for the project. While the final evaluation for a grade is the instructor's responsibility, the instructor will seek feedback from the client and as a part of the course students will evaluate each other's projects using a provided rubric.

Unit 8 — Final or Capstone Project
Students will use all of the elements from this course to design and create a student selected project. The selection can be a personal project that the student is responsible for purchasing the materials. Or, the project can be selected from an instructor provided list for which the organization or client would be responsible for purchasing the materials. A student may also have his or her own client for whom they complete this project. A complete set of design and working drawings with all supporting documentation will be a required part of the project. Also, a model will be provided and a signed agreement/approval for the final design and plans for project must be presented to the instructor before the full size project can be started. All parts from design to the finished piece will be evaluated for the final grade.
Signature Assignment:
Students working individually or in teams will design and build a specific project. While the final evaluation for a grade is the instructor's responsibility, as a part of the course students will evaluate each other's projects using a provided rubric.

Various instructional materials will be accessed and used:

Course Purpose: *What is the purpose of this course?*

Students will work in pairs and quads as an engineering team. They will design, build and test increasingly complex robots that will be used in problem solving activities and competitions. The course will involve the engineering design process, the importance of integrating sensors, effectors and controls. Students will discuss robot learning and multi-robot systems. Robots will be used to solve bi-weekly challenges. The course culminates in a final project where student teams design, build, and program a robot for a final competition.

B. COURSE CONTENT

Course Outline: A *detailed descriptive summary of all topics covered. All historical knowledge is expected to be empirically based, give examples. (i.e. California State Standards).*

Unit 1 — Electricity

In this unit students will be introduced to electrical concepts. Students will start with an introduction to electric direct currents, voltages, resistors, and batteries. Students will learn and use the symbols to create basic circuit diagrams. This will be followed by an introduction to Ohms Law and its applications as related to series resistance, parallel resistance, and circuit analysis.

Upon completion of this unit;

-Students will understand electronic symbols (resistors, capacitors, diodes, switches, transformers, and batteries), the properties of parallel and series circuits. Students will master Ohms Law and calculating voltage and current through a parallel or series circuit.

-Students will be able to solder wires to resistors, batteries, switches, etc. After the completion of constructing a circuit, students will measure voltage and current through the circuit.

-Students will demonstrate mastery of the circuitry by completing a detailed 3 page report or electronic presentation on the circuit, calculations, and measurements done during the lesson.

-Students will required to begin (and continue throughout the course) a detailed journal of all their designs and activities. This will create a "tool box" from which the students can refer as the course progresses. Each design or activity will be accompanied by an in-depth reflection on what was successful and what needs to be improved, as well as schematics of any circuits created. Students will master the skill of scientific writing and data recording.

Signature Assignment:

Students will be required to use tools and best practices that are standard in the fields of electrical engineering and electronics engineering. Students will use their knowledge of electrical circuits to create a small flashlight out of a candy box or a similar project. The tools that they will use include, but are not limited to, digital multi-meters, soldering equipment, wire crimping and stripping tools. Students will learn how to strip wire insulation and attach solderless (crimping) connectors, tin wires, properly use flux and solder, among other things. Additionally, because this is the first unit, laboratory safety practices and procedures will be taught and practiced.

Unit 2 — Engineering Design Fundamentals

The engineering projects for this course will utilize tools, software, and conventions found in engineering fields. Students will be familiarized with basic tools, themes, and strategies regularly used in the fields of engineering. As this course progresses over the year students will draw from this "tool box" of skills as they encounter each new learning experience. Students will, in turn, master these tools, themes, and strategies by applying them when necessary rather than practicing them in abstraction.

Upon completion of this unit;

-Students will understand drafting and fundamental scaling. Students will master ratios, athematic, unit conversions and drawing.

-Students will master the use of tools (hand and power). "Shop" safety will also be taught and practiced.

-Students will work in teams to fabricate a catapult that will achieve specific objectives related to distance and accuracy.

-Students will add related entries and reflection to their journal related to their accomplishments and acquired knowledge/skills.

-Students will complete a detailed 3-5 page report or electronic presentation to tie in everything in this unit from drafting to fabrication and testing their design.

Signature Assignment:

Students will be introduced to sketching fundamentals and drafting conventions and standards, by working collaboratively to create a catapult. Students will learn how to create schematics and learn how to draw parts and assemblies. Students will begin the assignment with basic drafting tools and then progress toward current product development drawing tools (CAD software). Students will experience the steps of the design process including topics such as prototyping, model building, testing and manufacturing. Students will supplement their in-class learning with assigned internet research and completed learning logs or journal entries.

Unit 3 — Construction of VEX Robots

Students will begin to apply engineering principles, as outlined in the Next Generation Science Standards, to the design and construction of robots. Students will study the fundamental design of a Vex robot. While students are learning how to fabricate their first Vex robot, they will also be required to draw upon physics concepts such as speed, velocity and angular momentum. Further a significant amount of math is necessary to fabricate the complex geometries of the parts that are required for robots. Students will create a robotic platform capable of two-dimensional motion at a variety of speeds. This platform must also be capable of supporting a variety of sensors (unit 6) and electrical systems for remote access (unit 4). Through this project students will be introduced to the various fastening and joining methods typically used in production development. These include, but are not limited to, screws, bolts, nuts, rivets, and welding. Students will be introduced to specification sheets for materials used in engineering and also start to learn about concepts related to materials stress, strain, toughness, elasticity, thermal conductivity, etc.

Upon completion of this unit;

-Students will understand how different components (batteries, multi-controllers, motors, gears and wheels) interact with each other in unison.

-Students will master the construction of a functioning robot with hand tools.

-Students will master installing motors, bearings and making adjustments for motion.

-Students will understand how different gear rations and different sized wheels affect the movement of the robot.

-Students will add related entries and reflection to their journal related to their accomplishments and acquired knowledge/skills.

-Students will complete a detailed 3-5 page report or electronic presentation to tie in everything in this unit from design to fabrication and the related physics and mathematics of robots.

Signature Assignment:

Students will construct their first Vex robot, the BaseBot. They will learn how to use basic assembly tools as well as how to identify available Vex robotic components from the classroom inventory system. Students will learn the subsystems (chassis, drivetrain, electrical, control) during the BaseBot construction activity. After the robot is constructed, students will test and troubleshoot their creation. Best engineering practices require testing, troubleshooting and adjustments/modifications of a design. This is followed by reflection and re-engineering to recognize that multiple solutions are possible for a problem/challenge. The designs, troubleshooting and re-engineering possibilities will be recorded in the student journals.

Unit 4 — Wireless Interfacing

Students will experience current technologies when they interface their robots with wireless game controllers. Students will need to use their prior knowledge of electronics and begin to master the basics of Easy-C programming language that is used in the Vex robotics system. Students will program the BaseBot constructed in unit 3 to remotely control it to move in straight lines, reverse motion as well as rotate to navigate through an obstacle course. Another activity will be for the students to write their initials using their robot and a whiteboard marker within the constraints of a walled robot competition field.

Upon completion of this unit;

-Students will link a wireless receiver (attached to the robot) with a hand-held controller.

-Students will understand how wireless-controllers work and their application in our current technological world.

-Students will add related entries and reflection to their journal related to their accomplishments and acquired knowledge/skills.

-Students will complete a detailed 3-5 page report or electronic presentation to tie in everything in this unit from design to fabrication and the related physics and mathematics of robots.

Signature Assignment:

Students will program the BaseBot constructed in unit 3 to remotely control it to move in straight lines, reverse motion as well as rotate to navigate through an obstacle course. Students will have multiple opportunities to test and refine their designs for improved performance and better results (higher points).

Unit 5 — Sensors

Students are introduced to open and closed loop robotic navigation using sensors and the Easy-C program. This unit builds on the dead reckoning programs constructed in unit 3. Digital bumper switches are added to the BaseBot so that it can interpret its environment autonomously. An ultrasonic range-finding sensor is introduced to allow the robot to sense its environment without touching it. A set of advanced drive functions is taught in order to simplify the autonomous control of the speed and direction of the robot. These drive functions are used in conjunction with a line-following sensor to have the BaseBot autonomously follow a line through a portion of the competition field.

Upon completion of this unit;

-Students will further broaden their understanding of how different components (sensors, batteries, multi-controllers, motors, gears and wheels) interact with each other in unison.

-Students will master the understanding of sensors. What sensors are and what role they play in our everyday life.

-Students will become familiar with two types of sensor constructions. The first will be bumper switches on all sides of the base that will allow the robot to sense objects with which it comes in contact.

-The second sensor construction students will understand is a ground-line sensor that allows the robot follow a line through part of the designed obstacle course for this unit.

-Students will increase their Easy-C programing skills related to the sensors in this unit.

-Students will add related entries and reflection to their journal related to their accomplishments and acquired knowledge/skills.

-Students will complete a detailed 3-5 page report or electronic presentation to tie in everything in this unit related to the effects of sensors linked with a robot.

Signature Assignment:

Students must program their robots to autonomously navigate and knock down some obstacles (binders or wood blocks) while not touching others in a specified order and in a specified time range. Students will have multiple opportunities to test and refine their designs for improved performance and better results (higher points).

Unit 6 — Arms and End effectors

Students will combine elements introduced in units 3-5. An arm will be added to the BaseBot and a basic physics analysis is done on how the arm effects the overall robot design and performance. The concept of center of gravity will be understood as the construction of the arm, the end effector and the weight of an object attached to the end effector is applied. Stall torque is examined related to the arm function as well as speed and gear ratio. The student is challenged with incorporating two limit switches into the design of the arm to control its movement. An end effector (claw) is added to the arm for gripping a game object used in the final unit.

Upon completion of this unit;

-Students will understand how different components (batteries, multi-controllers, motors, gears and wheels) interact with each other in unison.

-Students will master the construction of a functioning robot with hand tools.

-Students will master installing motors, bearings and making adjustments for motion.

-Students will understand how different gear rations and different sized wheels affect the movement of the robot.

-Students will add related entries and reflection to their journal related to their accomplishments and acquired knowledge/skills.

-Students will complete a detailed 3-5 page report or electronic presentation to tie in everything in this unit from design to fabrication and the related physics and mathematics of robots.

Signature Assignment:

The student must add an arm and end effector to the BaseBot. The Basebot, arm and end effector will be added to the Easy-C program for controlling the robot. The student will navigate the robot on the competition field to retrieve one or more competition game pieces and deliver it/them to a specified goal. The student will be timed for this activity. Students will have multiple opportunities to test and refine their designs for improved performance and better results (higher points).

Unit 7 — Final or Competition Robot Capstone Project

Students will combine all elements from this course to re-design and create a competition robot. The robot will compete in a classroom based competition with new game pieces introduced in this unit. The previous robot must be modified to effectively compete in the new game. Throughout this unit students will use analytical, expository writing to document and describe their work on the project in their engineering notebooks (journals). After the competition, students will create an invention and design report that focuses on the challenges and adjustments encountered in the process resulting in their final robot

Course Title

Wood A

Description of Target Group

This course is for all students who show an interest in working with wood.

Purpose

The purpose of Wood A is to acquaint the student with hand and machine woodworking, stressing safe and proper use of machinery typically found in industry. Students will construct a variety of projects. Class is 40% lecture and 60% activity. Quality workmanship is emphasized. This is the first semester of a one year course. A lab fee of $10 is required.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Complete a safety test with a passing score.
2. Demonstrate the ability to recognize and use correctly, common hand tools and power machinery.
3. Provide and use protective clothing and eye protection when needed.
4. Plan and draw a simple wood project.
5. Develop the ability to work and cooperate with other students.
6. Demonstrate the ability to figure material costs.
7. Explore several employment opportunities in the field of wood.
8. Successfully complete one or more wood projects.
9. Complete all assigned laboratory and written work.
10. Develop an understanding of safe working habits and conditions.

Instructional Materials

Text and Supplementary Materials
Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, lectures, class participation, demonstrations, audiovisual materials, field trips, small group activities, outside resource people, and project construction.

Course Title

Wood B

Description of Target Group

This course is for all students who show an interest in working with wood. It is recommended that students complete Wood A before entering this class.

Purpose

The purpose of Wood B is to acquaint the student with hand and machine woodworking, stressing safe and proper use of machinery typically found in industry. Students will construct a variety of projects. Class is 40% lecture and 60% activity. Quality workmanship is emphasized. This is the second semester of a one year course. A lab fee of $10 is required.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Complete a safety test with a passing score.
2. Demonstrate the ability to recognize and use correctly, common hand tools and power machinery.
3. Provide and use protective clothing and eye protection when needed.
4. Plan and draw a selected wood project.
5. Develop the ability to work and cooperate with other students.
6. Demonstrate the ability to figure material costs.
7. Explore several employment opportunities in the field of wood.
8. Successfully complete one or more wood projects.
9. Complete all assigned laboratory and written work.
10. Develop an understanding of safe working habits and conditions.
11. The ability to construct various wood joints.
12. Develop awareness for the broad range of materials available.

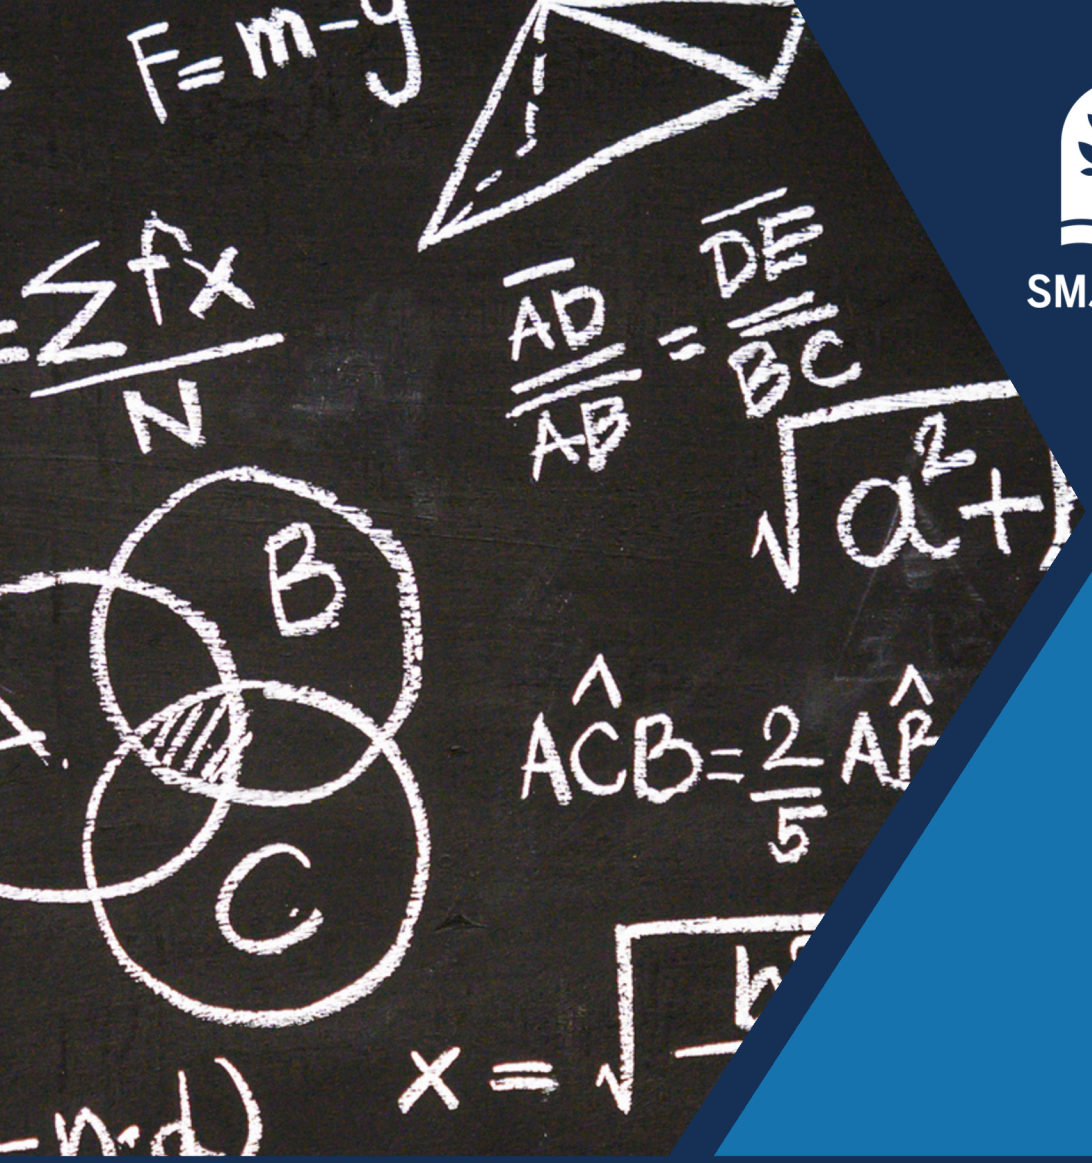
Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, lectures, class participation, demonstrations, audiovisual materials, field trips, small group activities, outside resource people, and project construction.



SMJUHSD

MATHEMATICS

%

Course Title

2-Year Algebra 1A

Description of Target Group

This course is for students who have shown some proficiency in basic mathematic skills. Students enrolled in this course generally are unable to grasp algebraic concepts at a rapid pace and require greater maturation prior to progressing to the course in geometry.

Purpose

The purpose of 2-year Algebra 1A is to allow students to complete algebra at a slower pace. It allows students to learn concepts on sets, variables, open sentences, and operations with the numbers of arithmetic, ratio, proportion, and percent, measurement, area, volume. Students also learn the relationship between "word" problems and open sentences, order symbols, and concepts. Some axioms are introduced. This is the first semester of a four semester course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Use set symbolism and concepts.
2. Increase arithmetic skills and apply these skills to ratio, proportion and percent problems.
3. Use measurement, area, and volume concepts and formulas (time permitting).
4. Convert elementary types of "word" problems to open sentences.
5. Solve simple linear equations and able to graph elementary order relations.
6. Perform operations on numbers of arithmetic-being able to factor, use prime numbers, and find least common multiple.

Instructional Materials

Text and Supplementary Materials
Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

1. Individual work
2. Lectures
3. Class participation
4. Demonstrations
5. Audio-visual materials

6. Field trips
7. Small group activities
8. Outside resource people

Description of Target Group

This course is a continuation beyond 2-year Algebra 1A. Students enrolled in this course are generally unable to grasp algebraic concepts at a rapid pace, and therefore, require greater maturation prior to progressing to the course in geometry.

Purpose

The purpose of 2-year Algebra 1B is to allow students to complete algebra at a slower pace. Students will learn real numbers, including negatives. Skills of the real numbers are developed. Axioms are introduced, solving linear equations, and order relations developed. Rudimentary probability and statistics are introduced. This is the second semester of a four semester course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Show arithmetic competency with both positive and negative real numbers.
2. Solve and graph linear equations and order relations.
3. Graph functions and relations in a plane.
4. Develop the ability to solve simple probability and statistics problems (time permitting).

Instructional Materials

Text and Supplementary Materials
Refer to:Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

1. Individual work
2. Lectures
3. Class participation
4. Demonstrations
5. Audio-visual materials
6. Field trips
7. Small group activities
8. Outside resource people

2-Year Algebra 1B

Description of Target Group

This course is a continuation beyond 2-year Algebra 1A. Students enrolled in this course are generally unable to grasp algebraic concepts at a rapid pace, and therefore, require greater maturation prior to progressing to the course in geometry.

Purpose

The purpose of 2-year Algebra 1B is to allow students to compete algebra at a slower pace. Students will learn real numbers, including negatives. Skills of the real numbers are developed. Axioms are introduced, solving linear equations, and order relations developed. Rudimentary probability and statistics are introduced. This is the second semester of a four-semester course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Show arithmetic competency with both positive and negative real numbers.
2. Solve and graph linear equations and order relations.
3. Graph functions and relations in a plane.
4. Develop the ability to solve simple probability and statistics problems (time permitting).

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities:

1. Individual work
2. Lectures
3. Class participation
4. Demonstrations
5. Audio-visual materials
6. Field trips
7. Small group activities
8. Outside resource people

Course Title

2-Year Algebra 1C

Description of Target Group

This course is a continuation beyond 2-Year Algebra 1B. Students enrolled in this course generally are unable to grasp algebraic concepts at a rapid pace, and therefore, require maturation prior to progressing to the course in geometry. Students who have had difficulty with regular Algebra 1A should enroll in 2-year Algebra 1A & 1B the first year and 2-year Algebra 1C & 1D the second year. Students that have completed 2-year Algebra 1C and 2-year Algebra 1D have met the rigorous requirements of Algebra 1A/B. Credit will constitute the A-F college entrance requirements.

Purpose

The purpose of 2-Year Algebra 1C is to allow students to complete algebra at a slower pace. Students will learn the concept of real numbers; use of algebra in science; graphing and working with inequalities; products and quotients of powers; powers of products and quotients; meaning of square root; operation of radicals; products of factoring polynomials; graphing and functions of ordered pairs; domain and range; graphing of linear functions by different methods; and use of functions or formulae. This is the third semester of a four semester course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Solve and graph inequalities.
2. Work with powers and roots.
3. Obtain polynomial products, factor polynomials.
4. Develop in the use of linear functions and use them as formulae.

2-Year Algebra 1D

Description of Target Group

This course is a continuation beyond 2-Year Algebra 1C. Students enrolled in this course generally are unable to grasp algebraic concepts at a rapid pace, and therefore, require maturation prior to progressing to the course in geometry. Students that have completed 2-year Algebra 1C and 2-year Algebra 1D have met the rigorous requirements of Algebra 1A/B. Credit will constitute the A-F college entrance requirements.

Purpose

The purpose of 2-Year Algebra 1D is to allow students to complete algebra at a slower pace. Students will learn methods for solving systems of linear equations and inequalities; application of four fundamental operations of rational depressions; quadratic equations, and truth sets for these functions; and elementary properties of angles, segments, and trigonometry relations. This is the fourth semester of a four semester course. Upon successful completion of the four semesters this course will provide one year toward the A-F mathematics requirements for college entry.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Solve systems of linear equations and inequalities.
2. Show competence working with rational expressions (add, subtract, multiply, and divide).
3. Graph quadratic functions, find the zeros of the quadratic polynomial and show competence in working with the quadratic formula.
4. Develop the ability to apply simple geometric and trigonometric relations to problems.

Title:	Accelerated Algebra 2
Length of course:	Full Year
Subject area:	Mathematics (C) / Algebra II / Trigonometry
UC honors designation?	No
Prerequisites:	None
Co-requisites:	None
Integrated (Academics / CTE)?	No
Grade levels:	10th, 11th

ourse Description

urse overview:

In this accelerated course, students will review and extend concepts taught in Algebra 1 and Geometry and will cover the Common Core Content Standards for both Algebra 2 and Pre-Calculus. Topics covered in this course are expressions, equations, inequalities, functions along with transformation of functions using a parent graph, linear systems, quadratic functions and equations, polynomials and their functions, including the binomial theorem, radical functions and exponents, exponential and logarithmic functions including growth and decay applications, rational functions, sequences and series, quadratic relations, probability and statistics, matrices, periodic functions and trigonometry, trigonometric identities and equations. By providing an extensive coverage of trigonometry, that is traditionally covered in a Pre-Calculus course, including a complete study of conic sections, polar coordinates, vectors, and parametric equations, this course is designed to prepare students to take AP Calculus the next year. It is an expectation that in this course, students demonstrate proficiency in solving higher order thinking problems and fluency in their responses. This course is modeled after a recommendation in the Appendix of the new California State Math Framework: "Create a hybrid Algebra II/Precalculus or Mathematics 3/Precalculus course that allows students to go straight to Calculus in the grade twelve." The course was designed to allow advanced students to progress at a high pace and to enable them to reach Calculus BC in grade twelve. Students who are successful in the course will be prepared for success in AP Calculus AB.

urse content:

Unit 0: Linear Functions and Equations--Prerequisite Material

In this unit, students will explore expressions, equations and inequalities. Using algebraic expressions, students will represent patterns, and solve equations and inequalities. Students will investigate the properties of real numbers and solve absolute value equations. Throughout this unit, students will choose and produce an equivalent form of an expression to reveal and explain properties of the quantity represented by the expression. Students will interpret parts of an expression such as terms, factors and coefficients and create equations that describe numbers or relationships. Linear functions and Slope-Intercept form will be covered and students will graph linear equations to write equations of line which will then lead to writing equations of lines given its slope and point on the line.

Unit Assignment(s):

1. Students will complete a summer homework assignment reviewing many topics which are covered in Algebra 1.
2. **Upon returning to school, students will review topics in class to ensure mastery.**
3. **A unit test is given at the end of Week 1 to ensure that the student has mastered the prerequisite skills for the course.**

4. Unit exams are given in approximately three-week intervals. All unit exams are cumulative, including content from all previous units. Unit exams include a combination of vocabulary, procedural skills, problem solving skills, and may reference projects completed during the unit. Students will reflect on these exams in order to self assess current content mastery and to set goals for the following units.
5. At the end of each semester, a comprehensive final will be administered, including content from all units taught.

Unit 1: Linear Systems

Students will explore linear systems in this unit. Topics covered in this unit include solving systems using graphs and algebraically, systems of inequalities, linear programming, and systems with three variables. Students will solve systems of linear inequalities, solve problems using linear programming and solve systems in three variables using elimination and substitution. Students will model and analyze real life situations using systems of equations.

Unit Assignment(s):

1. Students will complete daily class work and notes for each new topic. These notes will be assessed using a common rubric.
2. Students will complete nightly homework assignments to practice skills and concepts taught in class. All skills and concepts are related to the topic list above.
3. Daily mini-assessments or exit tickets are meant to quick check student mastery of small pieces of content taught daily.
4. Quizzes are given during the unit and are meant to monitor progress as well as inform students of their mastery level. Quiz content is confined to current unit topics only.
5. Unit exams are given in approximately three-week intervals. All unit exams are cumulative, including content from all previous units. Unit exams include a combination of vocabulary, procedural skills, problem solving skills, and may reference projects completed during the unit. Students will reflect on these exams in order to self assess current content mastery and to set goals for the following units.
6. At the end of each semester, a comprehensive final will be administered, including content from all units taught.

Unit 2: Polynomials and Polynomial Functions

Students will investigate polynomials and polynomial functions in this unit. Students begin by identifying and classifying polynomials and demonstrate how polynomials can be combined and multiplied, then move on to dividing polynomials using both long division and synthetic division. Students will demonstrate a variety of factoring skills including by grouping and be able to recognize and apply common patterns to factor not only quadratic but cubic and quartic expressions. By analyzing the factored form of a polynomial, students will then write a polynomial function from its zeros. Using this understanding of polynomials, students will then solve polynomial equations by factoring. Students will explore polynomial models in the real world and learn to fit data to linear, quadratic, cubic or quartic models.

Unit Assignment(s):

1. Students will complete daily class work and notes for each new topic. These notes will be assessed using a common rubric.
2. Students will complete nightly homework assignments to practice skills and concepts taught in class. All skills and concepts are related to the topic list above.
3. Daily mini-assessments or exit tickets are meant to quick check student mastery of small pieces of content taught daily.
4. Quizzes are given during the unit and are meant to monitor progress as well as inform students of their mastery level. Quiz content is confined to current unit topics only.
5. Unit exams are given in approximately three-week intervals. All unit exams are cumulative, including content from all previous units. Unit exams include a combination of vocabulary, procedural skills, problem solving skills, and may reference projects completed during the unit.
6. At the end of each semester, a comprehensive final will be administered, including content from all units taught.

Unit 3: Rational Functions

Students will recognize and use inverse variation and then move on to graph reciprocal functions and translations of reciprocal functions. Through the exploration of rational functions and their graphs, students will identify properties of rational functions, including finding both vertical and horizontal asymptotes and graph them. Studnents will graph rational functions with more than one vertical asymptote and be able to predict the placement of the graph based on the equation and the asymptotes. Following their investigation of rational functions students will simplify rational expressions and use multiplication, division, addition and subtraction on rational expressions. Finally, students will solve rational expressions and use them to solve problems.

Unit Assignment(s):

1. Students will complete daily class work and notes for each new topic. These notes will be assessed using a common rubric.
2. Students will complete nightly homework assignments to practice skills and concepts taught in class. All skills and concepts are related to the topic list above.
3. Daily mini-assessments or exit tickets are meant to quick check student mastery of small pieces of content taught daily.
4. Quizzes are given during the unit and are meant to monitor progress as well as inform students of their mastery level. Quiz content is confined to current unit topics only.
5. Unit exams are given in approximately three-week intervals. All unit exams are cumulative, including content from all previous units. Unit exams include a combination of vocabulary, procedural skills, problem solving skills, and may reference projects completed during the unit. Students will reflect on these exams in order to self assess current content mastery and to set goals for the following units.
6. At the end of each semester, a comprehensive final will be administered, including content from all units taught.

Unit 4: Radical Functions and Rational Exponents

This unit focuses on radical functions and rational exponents. In this unit, students will learn how to work with radicals, whether they occur by themselves or as parts of functions or equations. Students will learn to find nth roots. The multiplication and division of radical expressions will then be explored by students. Students will then explore binomial radical expressions and add and subtract radical expressions. Simplifying expressions with rational exponents, and solving square roots and other radical equations will be the next subjects of study in this unit. They will analyze the solutions to detremine the viabilty of the answers. Students will explore the family of square roots graphs and other radical functions and graph their translations. Students will explore the concepts of Domain and Range and how they change based on the translation of the graph. Finally, students look at radical functions and, from the equation, describe the resulting translations using the appropriate terms (reflection, dialation, translation, etc.)

Unit Assignment(s):

1. Students will complete daily class work and notes for each new topic. These notes will be assessed using a common rubric.
2. Students will complete nightly homework assignments to practice skills and concepts taught in class. All skills and concepts are related to the topic list above.
3. Daily mini-assessments or exit tickets are meant to quick check student mastery of small pieces of content taught daily.
4. Quizzes are given during the unit and are meant to monitor progress as well as inform students of their mastery level. Quiz content is confined to current unit topics only.
5. Unit exams are given in approximately three-week intervals. All unit exams are cumulative, including content from all previous units. Unit exams include a combination of vocabulary, procedural skills, problem solving skills, and may reference projects completed during the unit. Students will reflect on these exams in order to self assess current content mastery and to set goals for the following units.
6. At the end of each semester, a comprehensive final will be administered, including content from all units taught.

Unit 5: Quadratic Functions and Equations

This unit covers quadratic functions and equations. Students will reexplore factoring and find common and binomial factors of quadratic expressions and factor special quadratic expressions. Then students will solve quadratic equations by factoring; this will include factoring quartic equations that fit the quadratic pattern. Completing the square will by the next subject covered in this unit where students will learn to factor trinomials as the square of a binomial and solve equations and rewrite functions by completing the square. Solving quadratic equations using the quadratic formula and determining the number of solutions by using the discriminant will be the next subject of investigation. Students will identify and graph quadratic equations while learning the key terms associated with it such as parabola, vertex, axis of symmetry and minimum/maximum values. To expand upon this, students will then use translations to graph quadratic functions that are written in standard form, and move on to model data with quadratic functions. They will solve quadratic equations written in general form by first completing the square to put them in standard form and applying the rules of translations to draw the graph, then stating the zeros. Finally, students end this unit by identifying, graphing and performing operations with complex numbers and finding complex number solutions of quadratic equations.

Unit Assignment(s):

1. Students will complete daily class work and notes for each new topic. These notes will be assessed using a common rubric.
2. Students will complete nightly homework assignments to practice skills and concepts taught in class. All skills and concepts are related to the topic list above.
3. Daily mini-assessments or exit tickets are meant to quick check student mastery of small pieces of content taught daily.
4. Quizzes are given during the unit and are meant to monitor progress as well as inform students of their mastery level. Quiz content is confined to current unit topics only.
5. Unit exams are given in approximately three-week intervals. All unit exams are cumulative, including content from all previous units. Unit exams include a combination of vocabulary, procedural skills, problem solving skills, and may reference projects completed during the unit. Students will reflect on these exams in order to self assess current content mastery and to set goals for the following units.
6. At the end of each semester, a comprehensive final will be administered, including content from all units taught.

Unit 6: Quadratic Relations and Conic Sections

This unit focuses on quadratic relations and conic sections. Students will learn how to work with curves that they can trace along the surface of a cone. In their exploration of conic sections, students will learn to graph and identify conic sections. The investigation will move on to parabolas where students will write the equation of a parabola and graph parabolas. Students will then explore circles and write and graph the equation of a circle and then find the center and radius of a circle use them to graph a circle. The next topic of study will be ellipses where students will write the equation, find the foci and graph an ellipse. Students will next graph and find the use of the foci of hyperbolas. Given information about a given conic section (endpoints of the axes, foci, etc), students will write the equation. Students will translate conic sections by writing equations of a translated conic section and identifying a translated conic section from an equation. Given an equation in general form, students will be able to identify the specific conic section and put the equation in standard form. Solving systems of quadratic equalities and inequalities both graphically and algebraically will the final subject of this unit.

Unit Assignment(s):

1. Students will complete daily class work and notes for each new topic. These notes will be assessed using a common rubric.
2. Students will complete nightly homework assignments to practice skills and concepts taught in class. All skills and concepts are related to the topic list above.
3. Daily mini-assessments or exit tickets are meant to quick check student mastery of small pieces of content taught daily.
4. Quizzes are given during the unit and are meant to monitor progress as well as inform students of their mastery level. Quiz content is confined to current unit topics only.
5. Unit exams are given in approximately three-week intervals. All unit exams are cumulative, including content from all previous units. Unit exams include a combination of vocabulary, procedural skills, problem solving skills, and may reference projects completed during the unit. Students will reflect on these exams in order to self assess current content mastery and to set goals for the following units.
6. At the end of each semester, a comprehensive final will be administered, including content from all units taught.

Unit 7: Functions

In this unit, students will expand upon their knowledge of graphing quadratic, rational, and radical functions and move through graphing absolute values and piecewise functions. They will apply that knowledge to real life situations, modelling them graphically. Students will use their understanding of the distinguishing behaviors of polynomial functions to then graph them and describe the end behavior. Student will then explore theorems about roots of polynomial equations and solve equations using the Rational Root Theorem and the Conjugate Root Theorem, as well as find the equations given some of the roots. The Fundamental Theorem of Algebra will be used to solve polynomial equations with complex solutions. Students will explore polynomial models in the real world and learn to fit data to linear, quadratic, cubic or quartic models.

Unit Assignment(s):

1. Students will complete daily class work and notes for each new topic. These notes will be assessed using a common rubric.
2. Students will complete nightly homework assignments to practice skills and concepts taught in class. All skills and concepts are related to the topic list above.
3. Daily mini-assessments or exit tickets are meant to quick check student mastery of small pieces of content taught daily.
4. Quizzes are given during the unit and are meant to monitor progress as well as inform students of their mastery level. Quiz content is confined to current unit topics only.
5. Unit exams are given in approximately three-week intervals. All unit exams are cumulative, including content from all previous units. Unit exams include a combination of vocabulary, procedural skills, problem solving skills, and may reference projects completed during the unit. Students will reflect on these exams in order to self assess current content mastery and to set goals for the following units.
6. At the end of each semester, a comprehensive final will be administered, including content from all units taught.

Unit 8 Exponential and LogarithmicFunctions

At the beginning of this unit, students will then add, subtract, multiply and divide functions and find the composite of two functions. The topic of study will then move on to finding the inverse of a relation or function. This leads into students investigating exponential and logarithmic functions. Students will learn that logarithms provide a way to work with the inverses of exponential functions. The properties of exponential functions will be investigated and students will graph exponential funtions with a base. Students will learn to write and evaluate logarithmic expressions and graph logarithmic functions by using the properties of logarithms. Students will use the properties of logarithms to solve logarithmic equations. Moving on in this unit, students will use the properties of logarithms and natural logarithms to solve exponential equations with different bases, simplifying them to calculator ready form before using a calculator to solve. Students will model exponential growth and decay and apply to real life situations such as compound interest, including continuously, and virus spread, etc. They will use natural logs to solve growth and decay problems.

Unit Assignment(s):

1. Students will complete daily class work and notes for each new topic. These notes will be assessed using a common rubric.
2. Students will complete nightly homework assignments to practice skills and concepts taught in class. All skills and concepts are related to the topic list above.
3. Daily mini-assessments or exit tickets are meant to quick check student mastery of small pieces of content taught daily.
4. Quizzes are given during the unit and are meant to monitor progress as well as inform students of their mastery level. Quiz content is confined to current unit topics only.
5. Unit exams are given in approximately three-week intervals. All unit exams are cumulative, including content from all previous units. Unit exams include a combination of vocabulary, procedural skills, problem solving skills, and may reference projects completed during the unit.
6. At the end of each semester, a comprehensive final will be administered, including content from all units taught.

Unit 9: Sequences and Series

Students will explore arithmetic and geometric sequences and series in this unit. By identifying mathematical patterns found in a sequence, students will use a formula to find the *n*th term of a sequence. Moving on, students will define, identify and apply arithmetic sequences and then define, identify and apply geometric sequences. By learning the definition for arithmetic series, students will be able to fund their sums. Likewise, students will also define geometric series and find their sums, including infinite geometric series; this will lead to an introduction to the concept of limits. Students will model situations using series and sequences. The unit concludes with students being introduced to the concept of the factorial leading exploring the binomial theorem and expanding binomials using Pascal's Triangle and the Binomial Theorem. Students will also be able to find the nth term of an expanded binomial.

Unit Assignment(s):

1. Students will complete daily class work and notes for each new topic. These notes will be assessed using a common rubric.
2. Students will complete nightly homework assignments to practice skills and concepts taught in class. All skills and concepts are related to the topic list above.
3. Daily mini-assessments or exit tickets are meant to quick check student mastery of small pieces of content taught daily.
4. Quizzes are given during the unit and are meant to monitor progress as well as inform students of their mastery level. Quiz content is confined to current unit topics only.
5. Unit exams are given in approximately three-week intervals. All unit exams are cumulative, including content from all previous units. Unit exams include a combination of vocabulary, procedural skills, problem solving skills, and may reference projects completed during the unit. Students will reflect on these exams in order to self assess current content mastery and to set goals for the following units.
6. At the end of each semester, a comprehensive final will be administered, including content from all units taught.

Unit 10: Trigonometry and Introduction to Periodic Functions

Students will explore periodic functions and trigonometry in this unit. Students will investigate right triangles by finding lengths of sides in a right triangle and finding measures of angles in a right triangle and solve real world problems involving right triangles using trigonometric ratios. Then, students will find the area of any triangle and practice using the Law of Sines. Moving on, students will use the Law of Cosines in finding the measures of sides and angles of a triangle and apply both Laws of Sines and Cosines to real life situations. By learning about how geometric measurements relate to trigonometry, students will utilize radian and radian measure, write and graph functions and describe periodic data in this unit. Through their exploration of periodic data, students will identify cycles and periods of periodic functions and find the amplitude of periodic functions. Students will then learn how the unit circle enables the extension of trigonometric functions to all real numbers, interpret as radian measures of angles traversed counterclockwise around the unit circle. As a result students will work with angles in standard position and find coordinates of points on the unit circle. Students will use radian measure for angles. Finally, the unit will cover the evaluation of inverse trigonometric functions.

Unit Assignment(s):

1. Students will complete daily class work and notes for each new topic. These notes will be assessed using a common rubric.
2. Students will complete nightly homework assignments to practice skills and concepts taught in class. All skills and concepts are related to the topic list above.
3. Daily mini-assessments or exit tickets are meant to quick check student mastery of small pieces of content taught daily.
4. Quizzes are given during the unit and are meant to monitor progress as well as inform students of their mastery level. Quiz content is confined to current unit topics only.
5. Unit exams are given in approximately three-week intervals. All unit exams are cumulative, including content from all previous units. Unit exams include a combination of vocabulary, procedural skills, problem solving skills, and may reference projects completed during the unit. Students will reflect on these exams in order to self assess current content mastery and to set goals for the following units.
6. At the end of each semester, a comprehensive final will be administered, including content from all units taught.

Unit 11: Trigonometric Identities and Equations

In this unit, students will learn to graph the six trigonometric functions and to apply the trigonometric identities to prove other identities and to solve trigonometric equations. To begin, students will explore the sine function and identify properties of the sine function and graph sine curves. Subsequently, students will also explore the cosine function and graph and write cosine functions and solve trigonometric equations. Students will also graph the tangent function. In their exploration of translating sine and cosine functions, students will graph translations of trigonometric functions and write equations of translations. Given real life data, students will use trigonometric equations to to create a mathematical model. Lastly, students will evaluate reciprocal trigonometric functions and graph reciprocal trigonometric functions. Moving on in this unit, students will focus on trigonometric identities and equations. Students will discover and verify trigonometric identities, and solve trigonometric equations; students will verify and use sum and difference identities, double angle identities and half angle identities. The final section in this unit synthesizes these skills through the solving of trigonometric equations.

Unit Assignment(s):

1. Students will complete daily class work and notes for each new topic. These notes will be assessed using a common rubric.
2. Students will complete nightly homework assignments to practice skills and concepts taught in class. All skills and concepts are related to the topic list above.
3. Daily mini-assessments or exit tickets are meant to quick check student mastery of small pieces of content taught daily.
4. Quizzes are given during the unit and are meant to monitor progress as well as inform students of their mastery level. Quiz content is confined to current unit topics only.
5. Unit exams are given in approximately three-week intervals. All unit exams are cumulative, including content from all previous units. Unit exams include a combination of vocabulary, procedural skills, problem solving skills, and may reference projects completed during the unit. Students will reflect on these exams in order to self assess current content mastery and to set goals for the following units.
6. At the end of each semester, a comprehensive final will be administered, including content from all units taught.

Unit 12: Polar Coordinates and Vectors

This unit covers polar coordinates, vectors and parametric equations. Students will learn to convert from polar to rectangular coordinates and vice versa. They will apply that skill to vector operations in both rectangular and polar form, and will apply vectors to basic physics problems. They will perform vector operations both algebraically and geometrically. Students will learn dot products and identify parallel and perpendicular vectors. Moving through the unit, students will be able to parametrize circle equations as well as express real life situations through the use of parametric equations.

Unit Assignment(s):

1. 1. Students will complete daily class work and notes for each new topic. These notes will be assessed using a common rubric.
   2. Students will complete nightly homework assignments to practice skills and concepts taught in class. All skills and concepts are related to the topic list above.
   3. Daily mini-assessments or exit tickets are meant to quick check student mastery of small pieces of content taught daily.
   4. Quizzes are given during the unit and are meant to monitor progress as well as inform students of their mastery level. Quiz content is confined to current unit topics only.
   5. Unit exams are given in approximately three-week intervals. All unit exams are cumulative, including content from all previous units. Unit exams include a combination of vocabulary, procedural skills, problem solving skills, and may reference projects completed during the unit. Students will reflect on these exams in order to self assess current content mastery and to set goals for the following units.
   6. At the end of each semester, a comprehensive final will be administered, including content from all units taught.

Unit 13: Matrices

This unit focuses on matrices. Students will use a matrix to represent and solve systems of equations and use matrices to make transformations of geometric objects. Initially in this unit, students will learn to practice adding and subtracting matrices and solve matrix equations. They will be introduced to the zero and identity matrices and understand the role they play in addition and multiplication. Students will multiply matrices using scalar and matrix multiplication. Next students will explore determinants and inverses and find the inverse of a matrix while investigating the square matrix, multiplicative identity matrix, multiplicative inverse matrix, determinant and singular matrix. Students will study inverse matrices and systems and solve systems of equations using matrix inverses and multiplication. Moving on in the unit, students will transform geometric figures using matrix operation and understanding image, preimage, dilation, rotation and center of rotation.

Unit Assignment(s):

1. 1. Students will complete daily class work and notes for each new topic. These notes will be assessed using a common rubric.
   2. Students will complete nightly homework assignments to practice skills and concepts taught in class. All skills and concepts are related to the topic list above.
   3. Daily mini-assessments or exit tickets are meant to quick check student mastery of small pieces of content taught daily.
   4. Quizzes are given during the unit and are meant to monitor progress as well as inform students of their mastery level. Quiz content is confined to current unit topics only.
   5. Unit exams are given in approximately three-week intervals. All unit exams are cumulative, including content from all previous units. Unit exams include a combination of vocabulary, procedural skills, problem solving skills, and may reference projects completed during the unit. Students will reflect on these exams in order to self assess current content mastery and to set goals for the following units.
   6. At the end of each semester, a comprehensive final will be administered, including content from all units taught.

Unit 14: Probability and Statistics

Students will explore the subject of probability and statistics in this unit. Students will use permutations and combinations to compute probabilities of compound events and solve problems. In their study of probability, students will find the probability of an event using theoretical, experimental and simulation methods. They will then explore the probability of multiple events by applying rules to interpret answers for probabilities of events A and B and the probability of event A or B. Their study will move on to conditional probability where students will use tables and tree diagrams to determine conditional probabilities. Students will use probabilities to make fair decisions and analyze decisions. In their exploration of standard deviation, students will find the standard deviation and variance of set values and apply standard deviation and variance to analyze normal distribution and estimate population percentages. The unit will cover samples and surveys in which students will identify sampling methods and recognize bias in samples and surveys. Finally students will use normal distributions and recognize that there are data sets for which such a procedure is not appropriate.

Unit Assignment(s):

1. Students will complete daily class work and notes for each new topic. These notes will be assessed using a common rubric.
2. Students will complete nightly homework assignments to practice skills and concepts taught in class. All skills and concepts are related to the topic list above.
3. Daily mini-assessments or exit tickets are meant to quick check student mastery of small pieces of content taught daily.
4. Quizzes are given during the unit and are meant to monitor progress as well as inform students of their mastery level. Quiz content is confined to current unit topics only.
5. Unit exams are given in approximately three-week intervals. All unit exams are cumulative, including content from all previous units. Unit exams include a combination of vocabulary, procedural skills, problem solving skills, and may reference projects completed during the unit. Students will reflect on these exams in order to self assess current content mastery and to set goals for the following units.
6. At the end of each semester, a comprehensive final will be administered, including content from all units taught.

9. Subject Area

- ☐ History/Social Science
- ☐ English
- ☒ Mathematics
- ☐ Laboratory Science
- ☐ Language other than English
- ☐ Visual & Performing Arts
  - ☐ Intro ☐ Advanced
- ☐ College Prep Elective

10. Grade Level(s) for which this course is designed

☒ 9 ☐ 10 ☐ 11 ☐ 12

11. Seeking "Honors" Distinction?

☐ Yes ☒ No

12. Unit Value

- ☐ 0.5 (half year or semester equivalent)
- ☐ 1.0 (one year equivalent)
- ☐ 2.0 (two year equivalent)
- ☒ Other: 5.0 units

13. Is this an Internet-based course? ☐ Yes ☒ No

If "Yes", who is the provider? ☐ UCCP ☐ PASS/Cyber High ☐ Other _____

14. Complete outlines are not needed for courses that were previously approved by UC. If course was previously approved, indicate in which category it falls.

- ☐ A course reinstated after removal within 3 years. Year removed from list? _____
  Same course title? ☐ Yes ☐ No
  If no, previous course title? _____
- ☐ An identical course approved at another school in same district. Which school? _____
  Same course title? ☐ Yes ☐ No
  If no, course title at other school? _____
- ☐ Approved Advanced Placement (AP) or International Baccalaureate (IB) course
- ☐ Approved UC College Prep (UCCP) Online course
- ☐ Year-long VPA course replacing two approved successive semester courses in the same discipline
- ☐ Approved P.A.S.S./Cyber High course
- ☐ Approved ROP/C course. Name of ROP/C? _____
- ☐ Approved CDE Agricultural Education course

☒ Other. Explain: Summer math class, enrichment course to prepare incoming 9th grade students for Algebra 1 and pass the CAHSEE in Math.

15. Is this course modeled after an UC-approved course from another school outside your district? ☐ Yes ☒ No

If so, which school(s)? _____

Course title at other school _____

16. Pre-Requisites

Pre-Algebra

17. Co-Requisites (application, teacher recommendation)

18. Is this course a resubmission? ☐ Yes ☒ No

If yes, date(s) of previous submission? _____

Title of previous submission? _____

19. Brief Course Description

Focus Group—Incoming 9th graders who have completed Pre-Algebra but were not be recommended for Algebra 1 as a freshman (B/C students). The objective is to prepare these students for entrance in Algebra in 9th grade and at the same time prepare them to pass the CAHSEE. Students also participate in college readiness seminars where they are introduced to SMHS graduation requirements, a-g requirements, career exploration, and visit university campuses.

B. COURSE CONTENT

Please refer to instructions

20. Course Goals and/or Major Student Outcomes

Focus Group—Incoming 9th graders who have completed Pre-Algebra but were not be recommended for Algebra 1 as a freshman (B/C students). The objective is to prepare these students for entrance in Algebra in 9th grade and at the same time prepare them to pass the CAHSEE. Students also participate in college readiness seminars where they are introduced to SMHS graduation requirements, a-g requirements, career exploration, and visit university campuses.

21. Course Objectives

Prepare incoming 9th grade students for Algebra 1, pass the CAHSEE in Math, and learn about university requirements and graduation requirements.

22. Course Outline

Pre-Algebra topics

- Fractions/Decimals/Percents
- Statistics including Central Tendencies and graphing
- Measurement (English and metric)
- Ratio/Proportion
- Basic Geometry

Algebra Topics

- Solving equations
- Exponents
- Graphing on a coordinate plane (points, lines, parabolas, and more?)
- The language of Algebra (translating phrases into mathematical expressions and equations)

In the academic advising component, students learn the entrance requirements for the University of California, the California State University system, private universities, and the community college option. Students participate in academic seminars and workshops that discuss university admissions requirements, financial aid, the differences between the four college systems, and learning environments.

Students will visit two university campuses during the program. This will give students the opportunity to view the campuses and get a "feel" of college life. Parents will be encouraged to participate in these trips as well as be mandated to attend at least one parent workshop during the institute.

23. Texts & Supplemental Instructional Materials

Text: Secondary adopted texts and approved supplementary books used in the Santa Maria joint Union High School District.

24. Key Assignments

All topics addressed in this course will include assignments that progress from direct instruction and guided practice to application in a real-world scenario. All assignments will include a critical thinking component.

- Assignments using the graphing calculator and TI Ranger to explore the shapes of graphs and how they are formed.
- Assignments using the graphing calculator to collect data and use the data to create a graphical representation
- Assignments using the computer to research and collect data for future graphical representation
- Assignments that will explore the following topics:
    - Fractions
    - Measurement
    - Ratio/proportion/percent

Basic geometry

25. Instructional Methods and/or Strategies

- Direct instruction through multiple example sources (traditional, visual, and real-world)
- Guided practice through the use of textbooks, manipulatives, and technology
- Group work where students can learn from their peers

26. Assessment Methods and/or Tools

- Traditional (paper tests and quizzes)
- Group assessment (tests that are graded based on the group's performance)
- Verbal (oral) assessment through individual and group presentations
- Checking for immediate understanding through the use of flash cards and individual dry erase boards

C. HONORS COURSES ONLY

Please refer to instructions

27. Indicate how this honors course is different from the standard course.

D. OPTIONAL BACKGROUND INFORMATION

Please refer to instructions

28. Context for Course (optional)

29. History of Course Development (optional)

Course Title

Algebra 1 CPM (P)

Description of Target Group

Algebra 1 College Preparatory Mathematics (CPM) is a year long course for students who have successfully completed eighth grade mathematics or Math A.

Purpose

This Algebra 1 course has been designed to move towards the goals of the new Mathematics Framework of the state and still retain the major Algebra 1 topics as indicated in the Framework.

Standards of Expected Student Achievement

On completion of this course, students should be able to:

1. Express, interpret, and graph functions, specifically linear and quadratic, but they will have experience with others.

2. Solve linear and quadratic equations and systems of linear equations, and understand their relationship to graphs of functions.

3. Use ratio, proportion, and direct variation from numeric, geometric, and algebraic perspectives (percent, similarity, right triangles, slope and probability).

4. Use variables to represent relations from tables, graphs, verbally stated problems, and geometric diagrams, and understand that algebraic relations can be tested by substitutions of numbers.

5. Develop number sense and estimation skills particularly in relation to large and small (between 0 and 1) numbers and in relation to geometric relationships (in particular, the Pythagorean Theorem and square root).

6. Use the distributive property and order of operations to reorganize algebraic expressions into more useful forms. Early examples in conjunction with perimeter and area relationships.

In addition, students will:

1. Move away from a rule applying approach to a rule generating approach.

2. Learn to use a scientific calculator effectively and efficiently.

3. Continue to develop confidence as problem solvers, extending their use of strategies to the solution of algebra problems as well as developing new strategies such as writing equations and relating them to their graphs—but be able to change direction when as approach isn't working. they will persevere in working on open ended questions and investigations.

4. Become more aware of their own thinking about problems and describe their efforts both orally and in writing.

5. Develop the positive attitude: "Math is important, useful, desirable and very much connected. And I can learn it."

6. Develop organizational skills in study habits as well as in doing mathematics.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District.

Activities

This course will be presented as determined by the methods and techniques of the instructor and will utilize lecture, demonstration, group work, investigations, oral and written communication, study, drills, quizzes, and examinations.

Course Title

Algebra 1A (P)

Description of Target Group

This course is for all students who demonstrate successful mathematics interest, achievements, and ability.

Purpose

The purpose of Algebra 1A is to emphasize concepts and notation of sets. Students learn the real number set by using numbers of arithmetic; number inverses (negative numbers, except for the irrational); rules (theorems) for adding, subtracting, multiplying, and dividing positive and negative numbers; field axioms, theorems; absolute values and inequalities; and stress is placed on realistic word problems. This is the first semester of a one year course. Credit will constitute the A-F college entrance requirements.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Use algebraic symbols, sets and subsets.
2. Analyze algebraic statements with variables.
3. Solve first degree algebraic equations and inequalities.
4. Analyze and solve word problems.
5. Perform operation with polynomial expressions.
6. Factor polynomial expressions.

Instructional Materials

Text and Supplementary Materials

Refer to:Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, lectures, class participation, demonstrations, audio visual materials, small group activities, and outside resource people.

Course Title

Algebra 1B (P)

Description of Target Group

This course is for all students who have demonstrated interest and proficiency by successfully completing Algebra 1A or by demonstrating comparable proficiency.

Purpose

The purpose of Algebra 1B is to provide extensive study of the graphing of first degree equalities with some work in second degree qualities; irrational numbers, functions and quadratic equations. This is the second semester of a one year course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Interpret and use graphs.
2. Analyze and solve word problems.
3. Demonstrate the ability to factor.
4. Solve quadratic equations and inequalities.
5. Solve systems of equations in two variables.
6. Use functions and variations.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, lectures, class participation, demonstrations, audio visual materials, field trips, small group activities, and outside resource people.

Course Title

Algebra 2 CPM (P)

Description of Target Group

Algebra 2 College Preparatory Mathematics (CPM) is a year long course for students who have successfully completed Geometry with a grade C or better or have been recommended by their eighth grade teacher.

Purpose

This Algebra 2 course has been designed to move towards the goals of the new Mathematics Framework of the state and still retain the major Algebra II topics as indicated in the Framework.

Standards of Expected Student Achievement

On completion of this course, students should be able to meet all the standards for Algebra I and Geometry emphasizing the following:

1. Use problem solving skills in conjunction with knowledge of the inter connections among algebra, geometry, and functions to analyze problems and formulate appropriate solutions and to extend current knowledge by making new connections.
2. Be able to visualize, express, interpret, and graph functions (and their inverses when they exist) in various positions in two dimensions. In many cases, given the graph, be able to represent it with an equation.
3. Use variables to represent relations from tables, graphs, verbally stated problems, and geometric diagrams, and understand that algebraic relations can be tested by substitutions of numbers.
4. Set up and solve most equations in one and two variables and linear systems of equations in three or more variables.
5. Use ratio, proportion, and direct variation form numerical, geometric, and algebraic perspectives (percent, similarity, right triangles, slopes, and probability).
6. Develop facility with manipulating algebraic expressions in order to put them into more useful forms.
7. Extend the use of trigonometry to the laws of sines and cosines and connect right triangle definitions with trigonometric functions.
8. Further develop the ability to construct convincing arguments and to support or prove assertions and be able to communicate their mathematical ideas clearly using appropriate vocabulary.
9. Be able to apply mathematics to problems in economics, biology, chemistry, and physics.
10. Use elementary probability and statistics to solve problems.

Algebra 2 CPM A/B (P) (continued)

In addition, students will:

1. Move away from a rule applying approach to a rule generating approach.
2. Learn to use a graphing calculator effectively and efficiently.
3. Continue to develop confidence as problem solvers.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books used in the Santa Maria Joint Union High School District

Activities

This course will be presented as determined by the methods and techniques of the instructor and will utilize lecture, demonstration, group work, investigations, oral and written communication, study, drills, quizzes, and examinations.

Course Title

Algebra 2A (P)

Description of Target Group

This course is for all students who have completed Algebra 1A/1B and Geometry 1A/1B or have demonstrated comparable proficiency.

Purpose

The purpose of Algebra 2A is to develop an understanding of number systems, to perform deductive reasoning procedures, to increase the skills of problem solving, and to analyze problems. This is the first semester of a one year course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Recognize and use number systems, properties, and operations.
2. Use coordinate geometry successfully (including graphing lines and in equalities in two variables).
3. Solving systems of linear equations.
4. Use linear functions.
5. Factor polynomials.
6. Simplifying rational expressions.
7. Solve problems using quadratic functions and equations.
8. Use complex number systems in an expanded capability.
9. Use first and second degree equations in two variables.
10. Apply second year algebra topics to the solution of word problems.

Instructional Materials

Text and Supplementary Materials
Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, lectures, class participation, demonstrations, audio visual materials, field trips, small group activities, and outside resource people.

Course Title

Algebra 2B (P)

Description of Target Group

This course is for all students who have completed Algebra 1A/B, Geometry IA/B, and Algebra 2A or have demonstrated comparable proficiency.

Purpose

The purpose of Algebra 2B is to develop an understanding of number systems, to perform deductive reasoning procedures, to increase the skills of problem solving, and to analyze problems. This is the second semester of a one year course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Solve equations over the set of complex numbers.
2. Solve systems of equations and in inequalities in two variables.
3. Solve systems of equations in three variables.
4. Graph second degree equations in two variables (including conic sections).
5. Use exponential functions and logarithms.
6. Work with sequences and series.
7. Solve problems using the basics of trigonometry.
8. Prove trigonometric identities and formulas.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Individual work, drills, lectures, class participation, demonstrations, audio visual materials, field trips, small group activities, and outside resource people.

Course Title

Algebra A (Honors)

Description of Target Group

This course is for students with high aptitude and interest in mathematics or math-science areas.

Purpose

The purpose of ALGEBRA A (HONORS) is to provide a greater in-depth study of ALGEBRA A with emphasis placed on proof. This is the first semester of a one year course.

Standards of Expected Students Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Use algebraic symbols, sets and subsets.
2. Analyze algebraic statements with variables.
3. Solve first degree algebraic equations and inequalities.
4. Analyze and solve word problems.
5. Perform operations with polynomial expressions.
6. Factor polynomial expressions.

Instructional Materials

Text and supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

1. Individual work
2. Lectures
3. Class participation
4. Demonstrations
5. Audio-visual materials
6. Field trips
7. Small group activities
8. Outside resource people

Course Title

Algebra B (Honors)

Description of Target Group

This course is for students who have satisfactorily completed ALGEBRA A (HONORS) or demonstrated comparable proficiency.

Purpose

The purpose of ALGEBRA B (HONORS) is to provide a greater in-depth study of ALGEBRA B with emphasis placed on proof. This is the second semester of a one year course.

Standards of Expected Students Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Interpret and use graphs.
2. Analyze and solve word problems
3. Demonstrate the ability to factor.
4. Solve quadratic equations and inequalities in two variables.
5. Use functions and variations (optional).

Instructional Materials

Text and supplementary Materials

Course Title: CALCULUS A (AP)

Department: SMHS Mathematics

Description of Target Group:

This is the first term (semester) of a two term (semester) course for college bound students who have successfully completed MATH ANALYSIS or IMP IV or their equivalent, and are planning to enter into any mathematical or science related field. All students are encouraged to take the College Board Advanced Placement Exam for Calculus AB in May.

Course Length: One Term (Semester), 5 units

Course Adoption: UC/CSU "a-g" inclusion

Standards of Expected Student Achievement: Upon completion of this course, students will be able to successfully demonstrate understanding of the following standards:

I. Functions, graphs, and limits

A. Analysis of graphs including local and global behavior of a function.

B. Limits of Functions (Including one-sided limits)
1. The limiting process
2. Calculating limits using algebra
3. Estimating limits from graphs or tables of data

C. Asymptotic and unbounded behavior
1. Asymptotes in terms of graphical behavior
2. Asymptotic behavior in terms of limits involving infinity
3. Relative magnitudes of functions and their rates of change

D. Continuity as a property of functions
1. Intuitive understanding of continuity
2. Understanding continuity in terms of limits
3. Geometric understanding of graphs of continuous functions
a. Intermediate Value Theorem
b. Extreme Value Theorem

II. Derivatives

A. Concept of a derivative
1. Derivative presented graphically, numerically, and analytically
2. Derivative interpreted as an instantaneous rate of change
3. Derivative defined as the limit of the difference quotient
4. Relationship between differentiability and continuity

B. Derivative at a point
   1. Slope of a curve at a point
   2. Tangent line to a curve at a point and local linear approximation
   3. Instantaneous rate of change as the limit of average rate of change
   4. Approximate rate of change from graphs and tables of values

C. Derivative as a function
   1. Corresponding characteristics of graphs of f and f'
   2. Relationship between the increasing and decreasing behavior of f and the sign of f'
   3. The Mean Value Theorem and its geometric consequences
   4. Equations involving derivatives

D. Second derivatives
   1. Corresponding characteristics of the graphs of f, f', and f''
   2. Relationship between the concavity of f and the sign of f''
   3. Points of inflection as places where concavity change

E. Applications of derivatives
   1. Analysis of curves, including the notions of monotonicity and concavity
   2. Optimization, both absolute (global) and relative (local) extrema
   3. Modeling rates of change, including related rates problems
   4. Use of implicit differentiation to find the derivative of an inverse function
   5. Interpretation of the derivative as a rate of change
   6. Geometric interpretation of differential equations via slope fields and the relationship between slope fields and solution curves for differential equations.

F. Computation of derivatives
   1. Knowledge of derivatives of basic functions
   2. Basic rules for the derivative of sums, products, and quotients of functions
   3. Chain rule and implicit differentiation

Methods of assessment of student learning: Assigned homework, written examinations (multiple choice and free response)

Text and Supplementary Materials:

Refer to:Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Course Title: Calculus B (AP)

Department: SMHS Mathematics

Description of Target Group: This is the second term (semester) of a two term (semester) course for college bound students who have completed Calculus A. All students are encouraged to take the College Board Advanced Placement Exam for Calculus AB in May.

Course Length: One term (semester), 5 units

Course Adoption: UC/CSU "a-g" inclusion

Standards of Expected Student Achievement: Upon completion of this course, students will be able to successfully demonstrate understanding of the following standards:

I. Interpretations and properties of definite integrals

A. Rieman Sums
B. Definite integral as a limit of Riemann sums
C. Definite integral of the rate of change of a quantity
D. Basic properties of definite integrals

II. Applications of Integration

A. Area of a region
B. Volume of a solid with known cross sections
C. Average value of a function
D. Distance traveled by a particle along a line.

III. Fundamental Theorem of Calculus

A. Use to evaluate definite integrals
B. Use to represent a particular antiderivative

IV. Techniques of antidifferentiation.

A. Antiderivatives following directly from derivatives of basic functions
B. Antiderivatives by substitution of variables

Calculus B (AP) continued

V. Applications of antidifferentiation

A. Finding specific antiderivatives using initial conditions
B. Solving separable differential equation and using them in modeling

VI. Numerical approximations to definite integrals

Methods of Assessment of Student Learning: Assigned homework, written examinations (multiple choice and free response)

Text and Supplementary Materials:

Refer to:Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

AP-Calculus (BC)

Main Text: "Calculus, Graphical, Numerical, Algebraic" by Finney, Demana, Waits, Kennedy (2003).

Supplemental Text: "Calculus-Brief Edition, A New Horizon" by Howard Anton (6th Ed., 1999).

The following is organized according to the chapter layout of the primary textbook. When the supplemental text is used, it will be so indicated. Timelines are approximate, and include holidays and abbreviated schedules (minimum days, rally schedules, etc.), as well as tests and quizzes.

Technology - If the students don't already own their own graphing calculator, the mathematics department has TI-83+ calculators to issue to them for use throughout the school year. Internet access is available to all students via the computer lab on campus.

Throughout the course, assignments covering topics that can be solved both with calculators and without calculators require that each student show all steps involved with both methods. This is, they must show and explain their solutions to problems BOTH WAYS. The same approach is used on most tests as well, in the same manner as the AP Exams, where part of the exam must be done "by hand", and part of the exam requires utilizing a graphing calculator to obtain solutions to problems.

Real-world data analysis and interpretation are constructed by collaborative student-centered activities that create authentic learning opportunities and provide learning and assessments in both written and verbal manners. This includes manual, calculator and computer modeling on a regular basis.

Course Outline

Chapter 1: (1 week) Prerequisites for Calculus

1.1) Functions and Graphs
1.2) Exponential Functions
1.3) Parametric Functions
1.4) Functions and Logarithms
1.5) Trigonometric Functions

Chapter 2: (2 weeks) Limits and Continuity

2.1) Rates of Change and Limits
2.2) Limits Involving Infinity
2.3) Continuity
2.4) Rates of Change and Tangent Lines

Test on Chapter 2.

Chapter 3: (4 weeks) Derivatives

3.1) Derivative of a Function
3.2) Differentiability
3.3) Rules for Differentiation
3.4) Velocity and Other Rates of Change
3.5) Derivatives of Trigonometric Functions
3.6) Chain Rule
3.7) Implicit Differentiation
3.8) Derivatives of Inverse Trigonometric Functions
3.9) Derivatives of Exponential and Logarithmic Functions

Test on Chapter 3.

Chapter 4: (3 weeks) Applications of Derivatives

4.1) Extreme Values of Functions
4.2) Mean Value Theorem
4.3) Connecting f' and f" with the Graph of f
4.4) Modeling and Optimization
4.5) Linearization and Newton's Method
4.6) Related Rates

Test on Chapter 4.

Chapter 5: (2 weeks) The Definite Integral

5.1) Estimating with Finite Sums (Riemann Sums)
5.2) Definite Integrals
5.3) Definite Integrals and Antiderivatives
5.4) Fundamental Theorem of Calculus (Part I & II)
5.5) Trapezoidal Rule

Test on Chapter 5.

Chapter 6: (2 weeks) Differential Equations and Mathematical Modeling

6.1) Antiderivatives and Slope Fields
6.2) Integration by Substitution

6.3) Integration by Parts
6.4) Exponential Growth and Decay
6.5) Population Growth
6.6) Numerical Methods

Test on Chapter 6.

Chapter 7: (2 weeks) Applications of Definite Integrals

7.1) Integral as Net Change
7.2) Areas in the Plane
7.3) Volumes
7.4) Lengths of Curves
7.5) Applications from Science and Statistics

Test on Chapter 7.

First Semester Final Exam: (25 questions taken from previously released AP Exams, using a Guessing Penalty)

Chapter 8: (3 weeks) L'Hopital's Rule, Improper Integrals, and Partial Fractions

8.1) L'Hopital's Rule
8.2) Relative Rates of Growth
8.3) Improper Integrals
8.4) Partial Fractions and Integral Tables

Test on Chapter 8.

Chapter 9: (4 weeks) Infinite Series

9.1) Power Series
9.2) Taylor Series
9.3) Taylor's Theorem
9.4) Radius of Convergence
9.5) Testing Convergence at Endpoints

Test on Chapter 9.

Chapter 10: (4 weeks) Parametric, Vector, and Polar Functions

10.1) Parametric Functions
10.2) Vectors in the Plane
10.3) Vector-valued Functions
10.4) Modeling Projectile Motion
10.5) Polar Coordinates and Polar Graphs
10.6) Calculus of Polar Curves

Test on Chapter 10.

Review for the AP-Calculus (BC) Exam (4 weeks)

Using the most recently released AP Exams, each student in the class works independently for a couple of weeks on all problems (both multiple choice and free-response questions) while regular progress continues in the class covering select topics for the AP-Calculus (BC) Exam. The last week or two prior to the AP Exam is dedicated to students sharing solutions on the board, while answering questions from classmates and myself. When time permits, a practice exam is taken (using a different previously released exam) on a Saturday morning.

Second Semester Final Exam: (35-40 questions taken from previously released AP Exams, without using a guessing penalty)

Teaching Strategies:

Throughout the course, students work together on a regular basis. Sometimes I set up groups to work on a particular topic. One of my favorite group activities is used on the topic of Related Rates (Ch. 4, Section 6 of Anton's Brief Edition), where I divide the class into teams of 4-6 students. Each team is equally balanced by having an A student, a B student, a C student, etc. Problems are selected by me, and each group is assigned two or three of these problems. They are given a couple of days to work out the solutions to their assigned problems, but they must learn and know those solutions so well, that ANY member of that group knows the solution equally well. I then have each group take turns presenting their solutions on the board to the other groups, usually by starting off with the lowest=performing student of that group. Then at any given step in the solution, upon my direction, another student "steps in" and takes over the explanation of the problem. Once the presentation of each group's problems has been completed, each and every student has had a turn in explaining a portion of the solutions. This activity can be duplicated with a variety of topics, especially Infinite Series and Polar Functions for the BC students.

Early in the course, I teach the students how to use the Regression Analysis features of the graphing calculators. Raw data must be first entered into the "list" columns, and then graphed using "stat-plot". Then the modeled equations that best fit the data must be found and graphed as well. From there, the students must apply learned techniques of the course to analyze the newly acquired equations. For example, Riemann Sums and Trapezoidal Approximations would be computed on the "raw" data. Then, applying techniques of integration to the equation found from Regression Analysis, area under the curve is calculated, and results from the various methods are compared. Student projects are required each semester where "real world" data is collected and analyzed in this manner. They must present their project to the class, as well as submit a written report showing all details of the project.

Another component of this course involves using ALL of the Calculus students as tutors for our after-school tutoring program. Each student is required to tutor at least two hours twice per semester. Many students work many more hours, receiving credit for community service hours. Most students find that tutoring any and all subjects prior to Calculus helps them improve their own understanding of the review material. BC students are expected to help tutor the AB students as well. The last week of school, I take some of my Calculus students to

the Math Analysis classes for “question and answer” opportunities regarding what topics they feel that incoming students should be sure to know best in order to better succeed in the Calculus course. Many times, hearing this information from their peers rather than from their teachers has a greater impact in the seriousness of being prepared for the rigors of advanced mathematics.

Course Title

Basic Math A/B

Description of Target Group

This is an individualized course is for students who need to improve their basic mathematics skills in diagnosed areas of deficiency.

Purpose

The purpose of BASIC MATH A/B is to provide students with individualized opportunities to improve their basic mathematics skills in computations and practical applications. Included in these basic mathematics skills are those needed for everyday living and further study in mathematics. This is a one year course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Add, subtract, multiply, and divide whole numbers.
   - SPO: Recognize different methods of notation for each whole number operation (2)6; 62; 6 - 2).
   - SPO: Add the number of calories in each item of food for a meal and determine the number allowable for the remainder of the day if you are to stay within a given total.
   - SPO: Divide a five-digit whole number by a two-digit whole number with a remainder.

2. Add, subtract, multiply, and divide decimals.
   - SPO: Add the cost of several items of sales slip, figure sales tax and find the total amount of the sale.
   - SPO: Multiply and divide decimals by multiples of ten by simply relocating the decimal point.
   - SPO: Divide a decimal number with three decimal places by a number with two decimal places.

3. Add, subtract, and divide fractions.
   - SPO: Half, double, or triple a recipe.
   - SPO: Manipulate fractions to find sizes of œrresponding parts of proportional objects.
   - SPO: Divide a mixed number by a mixed number.

4. Solve problems involving percentage and interest.
   - SPO: Express a common fraction or its equivalent decimal as a percent.
   - SPO: Express a given percent as a ration of two whole numbers in simplest form.
   - SPO: Given the score on a test, compute the percent that are correct.

5. Solve problems involving the measurement of length, area, volume, width, time, and temperature.
   SPO: Given the time in hours and minutes, find the time 3 hours and 15 minutes later.
   SPO: Compute the volume of a solid given the appropriate formula and the values for the variables.
   SPO: Given a picture of a ruler, correctly read the length indicated.

6. Perform activities providing exposure to the following areas: basic number properties, negative numbers, identify elements, inverse relations, rounded number (estimate), number sequence, number theory, mathematic sentences, non-metric geometry, place value, numeration systems, sets, statistics, charts, and graphs.
   SPO: Given a circular graph of stae expenditures, identify the percent designated for education.
   SPO: Change a word problem to a mathematical sentence.
   SPO: Specify the value of any digit in a seven-place numeral.

7. Utilize the basic skills of mathematics to solve day-to-day job and consumer prelated problems.
   SPO: See SPOs for objectives 1 through 6.

8. Utilize the computer for mathematic procedures.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

The students will spend approximately half of their time in Basic math working on the computer. The computer keeps track of each student's progress individually and allows each student to work at a level, which is appropriate to him or her. Students will participate in an individualized learning program based upon their diagnosed needs.

1. Individual work
2. Computer lab work
3. Lectures
4. Class participation
5. Demonstrations
6. Audio-visual materials
7. Small group activities
8. Outside resource people

Course Title

Calculus A (Honors)

Description of Target Group

This course is for all students who have successfully completed MATH ANALYSIS or demonstrated comparable proficiency.

Purpose

The purpose of CALCULUS A is to help students understand mathematical concepts of limits, derivatives, and the definite integral as well as concepts in analytical geometry. This is the first semester of a one year course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Solve problems involving absolute values and inequalities.
2. Write the equation of a line tangent to a given curve at a given point.
3. Compute the derivative of a given function by formula.
4. Compute the derivative of a given function from the definition of a derivative.
5. Apply the second derivative test.
6. Compute the limit (if possible) of a given function as the independent variable approaches a given a value.
7. Find the points of discontinuity (if any) of a given function.
8. Apply the concepts of maximum and minimum functions to problem solving.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

1. Individual work
2. Lectures
3. Class participation
4. Demonstrations
5. Audio-visual materials
6. Field trips
7. Small group activities
8. Outside resource people

Course Title

Calculus B (Honors)

Description of Target Group

This course is for all students who have successfully completed MATH ANALYSIS or demonstrated comparable proficiency.

Purpose

The purpose of CALCULUS B is to help students understand mathematical concepts of limits, derivatives, and the definite integral as well as concepts in analytical geometry. This is the second semester of a one year course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Graph functions of one variable by using information obtained from the derivatives as well
2. Approximate the value of a function using the differential approximation.
3. Use the mean theorem to compute the average of a function or to bound the function
4. Set up and solve problems involving related rates and maximum/minimum values of a
5. Find areas and lengths of curves by definite integrals.
6. Prove at least one important theorem used in the course.
7. Compute the integral of a given function.
8. Use applications of integration to find volumes of solids.
9. Learn techniques of integration.

Instructional Materials

Course Title

Consumer Mathematics A

Description of Target Group

This course is for 11th and 12th grade students who have shown some success with basic mathematics skills.

Purpose

The purpose of CONSUMER MATHEMATICS A is to stress the application of basic mathematics to consumer problems of personal money records, buying problems, and wage income problems. Included in these area will be checking account records, budgeting, sales tax, figuring unit price, buying fractions of a unit, wage deductions, family budget problems, mortgages, amortization, figuring MPG for automobiles, investments, credit, and income tax. This is the first semester of a one year course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Reinforced arithmetic skills
2. Ability to develop methods to handle personal finances
    a. Keeping cash receipts and payment records
    b. Recording and balancing checking account records
    c. Budgeting
3. Show how to handle money in wholesale and retail phases of business
    a. Completing sales slip
    b. Computing unit prices
    c. Computing taxes
4. Explain and discuss career placement and computing income
    a. Computing salaries, wages, and overtime
    b. Working with different payment methods
    c. Computing deductions
5. Relate life experience to financial needs
    a. Buying investments
    b. Expenses related to automobiles
    c. Income taxes and related forms
    d. Mortgages, real estate purchases

Consumer Mathematics A (continued)

Instructional Materials

Text and Supplementary Materials

Comments:

Course Purpose: *What is the purpose of this course?*

The course will allow a College and Career ready mathematics option for students at Delta High School. The purpose of Foundations in Personal Finance is to empower students with knowledge and application of basic financial principles so they can make sound financial decisions for life. The course will stimulate interest in financial management and will inspire students from all backgrounds to achieve financial well being and foster an understanding and appreciation of ethical money management. It will cover mathematics that encompass basic math concepts leading to more advanced concepts in budgeting, financing, compound interest, financial gains/losses, risk return, understanding the cost of debt, and analyzing research and data. The course will also reinforce academic skills such as communication, mathematics, reading, research, and writing.

B. COURSE CONTENT

Course Outline: A *detailed descriptive summary of all topics covered. All historical knowledge is expected to be empirically based, give examples. (i.e. California State Standards).*

State Standards:
Financial Responsibility and Decision Making: Apply reliable information and systematic decision making to personal financial decisions
Find and evaluate financial information from a variety of sources
Summarize major consumer protection laws
Make financial decisions by systematically considering alternatives and consequences
Planning and Money Management: Organize and plan personal finances and use a budget to manage a cash flow
Develop a plan for spending and saving
Develop a system for keeping and using financial records
Describe how to use different payment methods
Develop a personal financial plan
Credit and Debt: Maintain creditworthiness, borrow at favorable terms, and manage debt
Identify the costs and benefits of various types of credit
Explain the purpose of a credit record and identify borrowers' rights
Describe ways to avoid or correct debt problems
Summarize major consumer credit laws
Risk Management and Insurance: Use appropriate and cost-effective risk management strategies
Identify common types of risks and basic risk management methods
Explain the purpose and importance of property and liability insurance protection
Explain the importance of insurance protection
Saving and Investing:
Implement a diversified investment strategy that is compatible with personal goals
Discuss how saving contributes to financial well-being
Evaluate investment alternatives
Explain how taxes affect the rate of return on investments
Investigate how agencies that regulate financial markets protect investors
CCSS.MATH.CONTENT.7.EE.B.3
Solve multi-step real-life and mathematical problems posed with positive and negative rational numbers in any form (whole numbers, fractions, and decimals), using tools strategically. Apply properties of operations to calculate with numbers in any form; convert between forms as appropriate; and assess the reasonableness of answers using mental computation and estimation strategies. For example: If a woman making $25 an hour gets a 10% raise, she will make an additional 1/10 of her salary an hour, or $2.50, for a new salary of $27.50. If you want to place a towel bar 9 3/4 inches long in the center of a door that is 27 1/2 inches wide, you will need to place the bar about 9 inches from each edge; this estimate can be used as a check on the exact computation.
CCSS.MATH.CONTENT.8.F.B.5
Describe qualitatively the functional relationship between two quantities by analyzing a graph (e.g., where the function is increasing or decreasing, linear or nonlinear). Sketch a graph that exhibits the qualitative features of a function that has been described verbally.
Syllabus Construct:
CCSS.MATH.CONTENT.7.RP.A.3
Use proportional relationships to solve multi-step ratio and percent problems. Examples: simple interest, tax, markups and markdowns, gratuities and commissions, fees, percent increase and decrease, percent error.
CCSS.MATH.CONTENT.7.NS.A.3
Solve real-world and mathematical problems involving the four operations with rational numbers.
Use random sampling to draw inferences about a population.
CCSS.MATH.CONTENT.7.SP.A.1
Understand that statistics can be used to gain information about a population by examining a sample of the population; generalizations about a population from a sample are valid only if the sample is representative of that population. Understand that random sampling tends to produce representative samples and support valid inferences.

Syllabus Breakdown
Introduction:
What is Personal Finance?
Money, the American Way
You and Money
The History of Credit in America

Savings:
Savings is an Exercise
Why Save Money
The Power of Compound Interest
Rate of Return
Sinking Fund Savings

Budgeting:
Budgeting 101
The Basics of Banking
Calculating Your Net Worth
The Importance of Having a Zero-Based Budget
How to Manage Checking/Savings/Personal Accounts
Reality Check
Minimum Wage
Realities of Cash Advances
Rent or Own

Debt:
Product, not Privilege
Debunking Credit Myths
The Hidden Cost of Credit
The Credit Score
Credit Bureas and Identity Theft
The True Cost of Ownership
The Debt Snowball

Life After High School:
Beware and Be Wise
Start with the End in Mind
Cash Flow Your College Education
Education Options for the 21st Century
Student Loans
College Expenses
Cost of Living

Course Title

General Mathematics A

Description of Target Group

This course is for 9th and 10th grade students who lack competency in decimals, percents, fractions, and measurements.

Purpose

The purpose of General Mathematics A is to teach computational skills with decimals, fractions, percents, and measurements and to prepare students for further math instruction. This is the first semester of a one year course. It is a required course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Demonstrate basic math skills with whole numbers.
2. Add, subtract, multiply, and divide fractions.
3. Add, subtract, multiply, and divide decimals.
4. Perform percent conversions to fractions and decimals, find a percent of a number, find what percent one number is of another, and find a number when a percent of it is known.
5. Apply math reading skills with particular emphasis on comprehension skills for solving word problems.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Union High School District.

Activities

1. Individual work
2. Lectures
3. Class participation
4. Demonstrations
5. Audio-visual materials
6. Small groups activities

Course Title

General Mathematics B

Description of Target Group

This course is for 9th and 10th grade students who lack competency in decimals, percents, fractions, and measurements.

Purpose

The purpose of General Mathematics B is to teach computational skills with decimals, fractions, percents, and measurements and to prepare students for further math instruction. This is the second semester of a one year course. It is a required course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Demonstrate basic math skills with whole numbers, fractions, and decimals.
2. Perform percent conversions to fractions and decimals, find a percent of a number, find what percent one number is of another, and find a number when a percent of it is known.
3. Apply math reading skills with particular emphasis on comprehension skills for solving word problems.
4. Solve problems in metric and customary measurement, measurement of perimeter, area and volume.
5. Read, interpret, and construct simple charts and graphs.
6. Demonstrate a knowledge of beginning algebra concepts.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

1. Individual work
2. Lectures
3. Class participation
4. Demonstrations
5. Audio-visual materials
6. Field trips
7. Small group activities
8. Outside resource people

Course Title

Geometry A

Description of Target Group

This course is for all students who have successfully completed Algebra A/B or have demonstrated comparable proficiency.

Purpose

The purpose of Geometry A is to provide an understanding of the basic structure of geometry, including inductive reasoning, informal proofs, deductive reasoning and geometric figures. Development and use of axioms, postulates, and theorems in the solution of problems will be stressed. A study of congruent triangles is included in this course. This is the first semester of a one year course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Visualize situations geometrically.
2. Analyze figures and situations.
3. Use informal deduction as the first stage of formal proofs.
4. Use deduction and development of a formal proof in problem solving.
5. Possess a sophisticated understanding of mathematical methods and the ability to generalize concepts without reference to concrete interpretations.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

1. Individual work
2. Lectures
3. Class participation
4. Demonstrations
5. Drills
6. Build a portfolio
7. Small group activities
8. Audio-visual materials
9. Outside resource people

Course Title

Geometry B

Description of Target Group

This course is for all students who have successfully completed GEOMETRY A or demonstrated comparable proficiency.

Purpose

The purpose of Geometry B is the study of polygons, circles, the volumes of solids, the Pythagorean theorem, sines, cosines, and tangents. Basic constructions are given in a pattern of development. Theorems in coordinate geometry allow alternative methods of proof. This is the second semester of a one year course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Solve problems and prove theorems involving circles, angles, areas, and right triangle trigonometry.
2. Solve problems involving constructions and loci.
3. Use coordinate geometry in solving problems and proving theorems.
4. Compute areas of polygons and circles.
5. Compute areas and volumes of solids.

2. Lectures
3. Class participation
4. Demonstrations
5. Drills
6. Audio-visual materials
7. Build a portfolio
8. Small group activities
9. Outside resource people

Course Title: IMP-1A (P) (H)

Replacing an existing course? Updating IMP-Course 1A (Honors)

To be submitted for A-G? Yes

Department Mathematics

Career Path – (if any)

Description of Target Group

IMP-1A (Honors) is for students who have completed the seventh-grade mathematics standards or Math A and who wish to extend their learning beyond the core topics taught in IMP-1.

Purpose

a) Length of course: one term/one semester
b) Units: 5

IMP is a fully integrated, four-year college preparatory sequence of courses in mathematics designed to replace the traditional Algebra I, Geometry, Algebra II sequence. The sequence of topics is herein being rearranged between IMP-1 and IMP-2 in order to allow students to meet state math requirements for graduation in a single course and to facilitate a more natural transition from 8th-grade algebra to IMP-2. All Algebra-1 standards are being moved down into IMP-1.

IMP Course 1 (Honors) students will enroll in the heterogeneous IMP Course 1 and will independently complete honors assignments in addition to the regularly assigned course work. The additional honors assignments will be a variety of projects, reports and assignments that will extend application of the concepts beyond that studied in the basic course. The honors work will require approximately three hours of independent study per week, over and above all regularly assigned work for IMP Course 1.

Criteria

In order to receive honors credit, students enrolled in IMP Course 1 will have to meet the following criteria:

- Earn an "A" or "B" in IMP Course 1. Honors assignments will not contribute to the course grade, but merely to eligibility for honors credit.
- Complete all additionally assigned (honors) assignments with "A" or "B" quality workmanship. Students will be given an opportunity to revise assignment responses that do not initially exhibit the expected quality.

Students who only partially meet the above requirements will receive regular (non-honors) credit for completing IMP Course 1.

The topics listed below are covered in IMP-1A in a unified fashion, in the context of meaningful larger mathematical problems.

- Understanding the meaning of angles and their measurement
- Developing relationships among interior and exterior angles of polygons, including angle sum formulas
- Using variables and algebraic expressions
  - to represent concrete situations
  - to generalize results
  - to describe functions

- Using ratio and proportion in problem situations
- Developing equivalent equations for proportions
- Interpreting graphs and using graphs to represent situations
- Relating graphs to their equations (with emphasis on linear and quadratic relationships)
- Solving systems of equations by graphing
- Fitting equations to data, both with and without graphing calculators
- Understanding, modeling and computing with signed numbers
- Developing and using principles for equivalent expressions and equivalent equations
- Expressing problem situations in terms of equations
- Solving linear equations in one variable
- Solving non-routine equations using graphing calculators
- Understanding and using the distributive property

Prerequisites – Successful completion of Math A or another course that includes the State standards for seventh grade mathematics with a grade of C or better.

Standards of Expected Student Achievement

- Problem-solving
  - Working on long-term problems
  - Drawing on diverse knowledge and methods to solve problems
  - Applying appropriate technology to problem solving
  - Posing questions related to a problem
  - Generalizing problems
- Group work
  - Working cooperatively with others
  - Sharing ideas
  - Asking for assistance
  - Subdividing a task so that group members can work independently on different parts of it
- Writing and communication
  - Reading and understanding complex problems
  - Summarizing the essential ideas of a problem
  - Describing methods used to approach a problem
  - Explaining reasoning used in solving a problem
  - Evaluating and improving the quality of written work
  - Making oral presentations

Methods of Assessment of Student Learning

Students will be assessed using a combination of individual and cooperative group tests and quizzes, class work and homework assignments, Problems of the Week, oral presentations and portfolios.

Instructional Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

This course will be presented as determined by the methods and techniques of the instructor and will utilize lecture, demonstration, group work, cooperative learning, investigations, manipulatives, graphing calculators, oral and written communication, study, drills, quizzes, and examinations.

- Writing and communication
  - Reading and understanding complex problems
  - Summarizing the essential ideas of a problem
  - Describing methods used to approach a problem
  - Explaining reasoning used in solving a problem
  - Evaluating and improving the quality of written work
  - Making oral presentations

Methods of Assessment of Student Learning

Students will be assessed using a combination of individual and cooperative group tests and quizzes, class work and homework assignments, Problems of the Week, oral presentations and portfolios.

Instructional Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

This course will be presented as determined by the methods and techniques of the instructor and will utilize lecture, demonstration, group work, cooperative learning, investigations, manipulatives, graphing calculators, oral and written communication, study, drills, quizzes, and examinations.

Course Title: IMP-1B (P) (H)

Replacing an existing course? Updating IMP-Course 1B (Honors)

To be submitted for A-G? Yes

Department Mathematics

Career Path – (if any)

Description of Target Group
IMP-1B (Honors) is for students who have completed IMP-1A with a grade of C or better and who wish to extend their learning beyond the core topics taught in IMP-1.

Purpose

a) Length of course: one term/one semester
b) Units: 5

IMP is a fully integrated, four-year college preparatory sequence of courses in mathematics designed to replace the traditional Algebra I, Geometry, Algebra II sequence. The sequence of topics is herein being rearranged between IMP-1 and IMP-2 in order to allow students to meet state math requirements for graduation in a single course and to facilitate a more natural transition from 8th-grade algebra to IMP-2. All Algebra-1 standards are being moved down into IMP-1.

IMP Course 1 (Honors) students will enroll in the heterogeneous IMP Course 1 and will independently complete honors assignments in addition to the regularly assigned course work. The additional honors assignments will be a variety of projects, reports and assignments that will extend application of the concepts beyond that studied in the basic course. The honors work will require approximately three hours of independent study per week, over and above all regularly assigned work for IMP Course 1.

Criteria
In order to receive honors credit, students enrolled in IMP Course 1 will have to meet the following criteria:

- Earn an “A” or “B” in IMP Course 1. Honors assignments will not contribute to the course grade, but merely to eligibility for honors credit.
- Complete all additionally assigned (honors) assignments with “A” or “B” quality workmanship. Students will be given an opportunity to revise assignment responses that do not initially exhibit the expected quality.

Students who only partially meet the above requirements will receive regular (non-honors) credit for completing IMP Course 1.

The topics listed below are covered in IMP-1B in a unified fashion, in the context of meaningful larger mathematical problems.

- Relating graphs to their equations (with emphasis on linear and quadratic relationships)
- Solving systems of equations by graphing
- Fitting equations to data, both with and without graphing calculators
- Expressing problem situations in terms of equations and inequalities
- Solving linear equations in one variable
- Solving non-routine equations using graphing calculators
- Understanding and using exponential expressions, including zero, negative and fractional exponents

- Developing and using laws of exponents
- Developing graphical properties of functions of the form $y = a^x$
- Understanding scientific notation and its relationship to the metric system
- Using scientific notation in scientific situations and as an aid in estimation and computation
- Understanding and using significant digits in estimation
- Writing and graphing linear inequalities in two variables
- Discovering the relationship between parallel lines in the coordinate plane and their equations
- Developing and using principles of linear programming
- Developing and using several methods for solving systems of linear equations in two variables
- Developing and using several methods for solving quadratic equations

Prerequisites – Completion of IMP-1A with a grade of C or better.

Standards of Expected Student Achievement

- Problem-solving
  - Working on long-term problems
  - Drawing on diverse knowledge and methods to solve problems
  - Applying appropriate technology to problem solving
  - Posing questions related to a problem
  - Generalizing problems
- Group work
  - Working cooperatively with others
  - Sharing ideas
  - Asking for assistance
  - Subdividing a task so that group members can work independently on different parts of it
- Writing and communication
  - Reading and understanding complex problems
  - Summarizing the essential ideas of a problem
  - Describing methods used to approach a problem
  - Explaining reasoning used in solving a problem
  - Evaluating and improving the quality of written work
  - Making oral presentations

Methods of Assessment of Student Learning
Students will be assessed using a combination of individual and cooperative group tests and quizzes, class work and homework assignments, Problems of the Week, oral presentations and portfolios.

Instructional Materials
Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities
This course will be presented as determined by the methods and techniques of the instructor and will utilize lecture, demonstration, group work, cooperative learning, investigations, manipulatives, graphing calculators, oral and written communication, study, drills, quizzes, and examinations.

Course Title: IMP-1B (P)

Replacing an existing course? Updating IMP- Course 1B

Course Title: IMP-2A (P) (H)

Replacing an existing course? Updating IMP-Course 2A (Honors)

To be submitted for A-G? Yes

Department Mathematics

Career Path – (if any)

Description of Target Group

IMP-2A (P) (H) is for students who have successfully completed IMP-1 or Algebra-1 and who wish to extend their learning beyond the core topics covered in IMP-2.

Purpose

a) Length of course: one term/one semester
b) Units: 5

IMP is a fully integrated, four-year college preparatory sequence of courses in mathematics designed to replace the traditional Algebra I, Geometry, Algebra II sequence. The sequence of topics is herein being rearranged between IMP-1 and IMP-2 in order to allow students to meet state math requirements for graduation in a single course and to facilitate a more natural transition from 8th-grade algebra to IMP-2. All Algebra-1 standards are being moved down into IMP-1, and the geometry, statistics, probability and trigonometry topics are being moved from IMP-1 to IMP-2.

IMP Course 2 (Honors) students will enroll in the heterogeneous IMP Course 2 and will independently complete honors assignments in addition to the regularly assigned course work. The additional honors assignments will be a variety of projects, reports and assignments that will extend application of the concepts beyond that which is studied in the basic course. The honors work will require approximately three hours of independent study per week, over and above all regularly assigned work for IMP Course 2.

Criteria

In order to receive honors credit, students enrolled in IMP Course 2 will have to meet the following criteria:

- Earn an “A” or “B” in IMP Course 2. Honors assignments will not contribute to the course grade, but merely to eligibility for honors credit.
- Complete all additionally assigned (honors) assignments with “A” or “B” quality workmanship. Students will be given an opportunity to revise assignment responses that do not initially exhibit the expected quality.

IMP-2A (P) (H) – continued

Students who only partially meet the above requirements will receive regular (non-honors) credit for completing IMP Course 2.

The topics listed below are covered in IMP-2A in a unified fashion, in the context of meaningful larger mathematical problems.

From Geometry:
- Working with similar polygons
- Developing criteria for similarity
- Using properties of similar polygons to solve concrete problems
  - Using ratio and proportion in problem situations
  - Developing equivalent equations for proportions
- Defining and using trigonometric functions for right triangles

From Trigonometry:
- Developing and applying right triangle trigonometric functions and their inverses.

From Probability and Statistics:
- Constructing area models to represent probabilistic situations
- Developing basic methods for calculating probabilities
- Understanding, calculating, and interpreting expected value
- Distinguishing between theoretical and experimental probabilities
- Planning and carrying out experiments
- Collecting and analyzing data
- Constructing frequency bar graphs
- Learning about normal distributions and properties of the normal curve
- Calculating mean and standard deviation, and applying these concepts to concrete situations
- Using simulations to estimate probabilities
- Drawing inferences from statistical data
- Designing, conducting and interpreting statistical experiments
- Making and testing statistical hypotheses
- Solving problems that involve conditional probability

From Logic:
- Making and testing conjectures
- Constructing sound logical arguments
- Formulating counterexamples
- Developing and describing algorithms and strategies
- Understanding the idea of proof
- Working with indirect proof and proof by contradiction
  Using “if..., then” statements

IMP-2A (P) (H) – continued

Prerequisites – Completion of IMP-1 or Algebra-1 with a grade of C or better.

Standards of Expected Student Achievement

- Problem-solving
  - Working on long-term problems
  - Drawing on diverse knowledge and methods to solve problems
  - Applying appropriate technology to problem solving
  - Posing questions related to a problem
  - Generalizing problems
- Group work
  - Working cooperatively with others

In order to receive honors credit, students enrolled in IMP Course 2 will have to meet the following criteria:

- Earn an “A” or “B” in IMP Course 2. Honors assignments will not contribute to the course grade, but merely to eligibility for honors credit.
- Complete all additionally assigned (honors) assignments with “A” or “B” quality workmanship. Students will be given an opportunity to revise assignment responses that do not initially exhibit the expected quality.

IMP-2B (P) (H) – continued

Students who only partially meet the above requirements will receive regular (non-honors) credit for completing IMP Course 2.

The topics listed below are covered in IMP-2B in a unified fashion, in the context of meaningful larger mathematical problems.

From Geometry:

- Using trigonometric functions for right triangles
- Developing the meaning of area, including use of non-standard units
- Developing and using several methods for finding areas of polygons, including formulas for area of triangles, rectangles, parallelograms, trapezoids and regular polygons
- Understanding and finding surface area and volume for three-dimensional solids, including prisms and cylinders
- Discovering and using the Pythagorean Theorem, and understanding a proof of it
- Finding figures of maximum area for a given perimeter
- Understanding the relationship between area of similar figures
- Using and developing methods for creating tessellations

From Trigonometry:

- Developing and applying right triangle trigonometric functions and their inverses.

From Probability and Statistics:

- Collecting and analyzing data
- Drawing inferences from statistical data
- Designing, conducting and interpreting statistical experiments
- Making and testing statistical hypotheses
- Formulating null hypotheses and understanding their role in statistical reasoning
- Understanding and using the c^2 (chi square) statistic

From Logic:

- Making and testing conjectures
- Constructing sound logical arguments
- Formulating counterexamples
- Developing and describing algorithms and strategies
- Understanding the idea of proof
- Working with indirect proof and proof by contradiction

Using "if..., then" statements

Prerequisites – Completion of IMP-2A with a grade of C or better..

Course Title

Interactive Mathematics Program (I. M. P.) Course 3 (Honors)

Description of Target Group

IMP Course 3 (Honors) is for students who have successfully completed IMP Course 2 with a grade of C or better.

Purpose

IMP Course 3 is the third year of an integrated four-year college preparatory course in mathematics designed to replace the traditional Algebra 1, Geometry, Algebra 2, Pre-Calculus sequence as well as probability and statistics. It was developed to fulfill the goals of the new Math Framework of the state, and the curriculum standards of the National Council of Teachers of Mathematics. The topics listed below are covered in a unified fashion, in the context of meaningful larger mathematical problems.

IMP Course 3 (Honors) students will enroll in the heterogeneous IMP Course 3 and will independently complete honors assignments in addition to the regularly assigned course work. The additional honors assignments will be a variety of projects, reports and assignments that will extend application of the concepts beyond that which is studied in the basic course. The honors work will require approximately three hours of independent study per week, over and above all regularly assigned work for IMP Course 3.

Criteria

In order to receive honors credit, students enrolled in IMP Course 3 will have to meet the following criteria:

- Earn an "A" or "B" in IMP Course 3. Honors assignments will not contribute to the course grade, but merely to eligibility for honors credit.
- Complete all additionally assigned (honors) assignments with "A" or "B" quality workmanship. Students will be given an opportunity to revise assignment responses, which do not initially exhibit the expected quality.

Students who only partially meet the above requirements will receive regular (non-honors) credit for completing IMP Course 3.

Content for Course 3

From Algebra:

- Working with exponential and logarithmic functions:
  - describing their graphs
  - finding that the derivative of an exponential function is proportional to the value of the function

- developing general laws of exponents
- understanding the meaning and significance of e
- approximating data by an exponential function

- Understanding and using function notation
- Understanding and using inverse functions
- Solving systems of linear equations and inequalities in several unknowns
- Working with matrices
  - developing the operations of matrix addition and multiplication in the context of applied problems
  - understanding their use in representing systems of linear equations
  - developing the concepts of identity element and inverse in the context of matrices
  - relating existence of matrix inverses to uniqueness of solution of corresponding systems of linear equations
  - using calculators to multiply and invert matrices
- Extending concepts of linear programming to problems with several variables

From Analytic and Coordinate Geometry:

- Defining slope and understanding its relationship to rate of change and to equations for straight lines
- Developing equations for straight lines from two points and from point-slope information
- Understanding the meaning of the derivative of a function at a point and its relationship to instantaneous rate of change
- Approximating the value of a derivative at a given point
- Developing and applying various formulas from coordinate geometry, including:
  - distance formula
  - midpoint formula
  - equation of a circle with arbitrary center and radius
- Finding the distance from a point to a line
- Developing and working with equations of planes in 3-dimensional coordinate geometry

From Geometry:

- Developing the relationship of the area and circumference of a circle to its radius
- Understanding the definition and significance of p
- Using regular polygons to approximate the area and circumference of a circle
- Defining congruence of triangles and understanding the relationship between congruence and similarity
- Developing and justifying criteria for establishing congruence
- Developing and justifying straightedge and compass constructions
- Finding locus descriptions of various geometric entities, such as:
  - perpendicular bisector
  - angle bisector
- Developing properties of parallel lines
- Developing the relationship between the volumes of similar figures
- Studying the possible intersections of planes in 3-space

IMP Course 3 (Honors) (continued)

From Trigonometry:

- Applying right triangle trigonometry to geometric problem situations

From Probability and Statistics:

- Developing and applying principles for finding the probability for sequence of events
- Estimating probabilities
- Using area diagrams and tree diagrams to analyze probability problems
- Developing methods for systemic listing of possibilities for complex problems
- Developing the meaning of combinatorial and permutation coefficients in the context of meaningful problems, and understanding the distinction between them
- Developing principles for computing combinatorial and permutation coefficients
- Understanding and using Pascal's triangle
- Developing and applying the binomial distribution

From Logic:

- Using "if and only if' in describing sets of points fitting given criteria
- Writing proofs to justify geometric constructions

Performance Skills for all four courses

- Problem-solving
  - ? Working on long-term problems
  - ? Drawing on diverse knowledge and methods to solve problems
  - ? Applying appropriate technology to problem solving
  - ? Posing questions related to a problem
  - ? Generalizing problems
- Group work
  - ? Working cooperatively with others
  - ? Sharing ideas
  - ? Asking for assistance
  - ? Subdividing a task so that group members can work independently on different parts of it
- Writing and communication
  - ? Reading and understanding complex problems
  - ? Summarizing the essential ideas of a problem
  - ? Describing methods used to approach a problem
  - ? Explaining reasoning used in solving a problem
  - ? Evaluating and improving the quality of written work
  - ? Making oral presentations

IMP Course 3 (Honors) (continued)

Activities

This course will be presented as determined by the methods and techniques of the instructor and will utilize lecture, demonstration, group work, cooperative learning, investigations, manipulatives, graphing calculators, oral and written communication, study, drills, quizzes, and examinations.

Course Title

Interactive Mathematics Program (I.M.P.) Course 3 A, B (P)

Department

Mathematics

Description of Target Group

(I.M.P.) Course 3 is for students who have successfully completed (I.M.P.) Course 2

Purpose

(I.M.P.) Course 3 is the third year of a fully integrated, three-year college preparatory course in mathematics designed to replace the traditional Algebra 1, Geometry, Algebra 2 sequence. It was developed to fulfill the goals of the new Math Framework of the state, and the curriculum standards of the National Council of Teachers of Mathematics. The topics listed below are covered in a unified fashion, in the context of meaningful larger mathematical problems.

Content for Course 1

From Algebra

- ? Working with exponential and logarithmic functions:
  - ¤ describing their graphs
  - ¤ finding that the derivative of an exponential function is proportional to the value of the function
  - ¤ developing general laws of exponents
  - ¤ understanding the meaning and significance of e
  - ¤ approximating data by an exponential function
- ? Understanding and using function notation
- ? Understanding and using inverse functions
- ? Solving systems of linear equations and inequalities in several unknowns
- ? Working with matrices
  - ¤ developing the operations of matrix addition and multiplication in the context of applied problems
  - ¤ understanding their use in representing systems of linear equations
  - ¤ developing the concepts of identity element and inverse in the context of matrices
  - ¤ reacting existence of matrix inverses to uniqueness of solution of corresponding systems of linear equations
  - ¤ using calculators to multiply and invert matrices
- ? Extending concepts of linear programming to problems with several variables

From Analytic and Coordinate Geometry

- ? Defining slope and understanding its relationship to rate of change and to equations for straight lines
- ? Developing equations for straight lines from two points and from point-slope information
- ? Understanding the meaning of the derivative of a function at a point and its relationship to instantaneous rate of change

? Approximating the value of a derivative at a given point
? Developing and applying various formulas from coordinate geometry, including:
¤ distance formula
¤ midpoint formula
¤ equation of a circle with arbitrary center and radius
? Finding the distance from a point to a line
? Developing and working with equations of planes in 3-dimensional coordinate geometry

From Geometry:
? Developing the relationship of the area and circumference of a circle to its radius
? Understanding the definition and significance of *p*
? Using regular polygons to approximate the area and circumference of A circle
? Defining congruence of triangles and understanding the relationship between congruence and similarity
? Developing and justifying criteria for establishing congruence
? Developing and justifying straightedge and compass constructions
? Finding locus descriptions of various geometric entities, such as
¤ perpendicular bisector
¤ angle bisector
? Developing properties of parallel lines
? Developing the relationship between the volumes of similar figures
? Studying the possible intersections of planes in 3-space

From Trigonometry:
? Applying right triangle trigonometry to geometric problem situations

From Probability and Statistics
? Developing and applying principles for finding the probability for sequence of events
? Estimating probabilities
? Using area diagrams and tree diagrams to analyze probability problems
? Developing methods for systematic listing of possibilities for complex problems
? Developing the meaning of combinatorial and permutation coefficients in the context of meaningful problems, and understanding the distinction between them
? Developing principles for computing combinatorial and permutation coefficients
? Understanding and using Pascal's triangle
? Developing and applying the binomial distribution

From Logic:
? Using “if” and only “if” in describing sets of points fitting given criteria
? Writing proofs to justify geometric constructions

<u>Performance Skills for all three courses</u>
? Problem-solving
¤ Working on long-term problems
¤ Drawing on diverse knowledge and methods to solve problems
¤ Applying appropriate technology to problem solving
¤ Posing questions related to a problem
¤ Generalizing problems

? Group work
    - ¤ Working cooperatively with others
    - ¤ Sharing ideas
    - ¤ Asking for assistance
    - ¤ Subdividing a task so that group members can work independently on different parts of it
? Writing and communication
    - ¤ Reading and understanding complex problems
    - ¤ Summarizing the essential ideas of a problem
    - ¤ Describing methods used to approach a problem
    - ¤ Explaining reasoning used in solving a problem
    - ¤ Evaluating and improving the quality of written work
    - ¤ Making oral presentations

Instructional Materials

Text and Supplementary Materials
Refer to: Secondary Adopted Texts and Approved Supplementary Books used in the Santa Maria Joint Union High School District

Activities
This course will be presented as determined by the methods and techniques of the instructor and will utilize lecture, demonstration, group work, cooperative learning, investigations, manipulatives, graphing calculators, oral and written communication, study, drills, quizzes, and examinations.

Course Title

Interactive Mathematics Program (I.M.P.) Course 4 (Honors)

Department

Mathematics

Description of Target Group

IMP Course 4 (Honors) is for students who have successfully completed IMP Course 3 with a grade of C or better.

Purpose

IMP Course 4 is the fourth year of an integrated four-year college preparatory course in mathematics designed to replace the traditional Algebra 1, Geometry, Algebra 2, Pre-Calculus sequence as well as probability and statistics. It was developed to fulfill the goals of the new Math Framework of the state, and the curriculum standards of the National Council of Teachers of Mathematics.

IMP Course 4 (Honors) students will enroll in the heterogeneous IMP Course 4 and will independently complete honors assignments in addition to the regularly assigned course work. The additional honors assignments will be a variety of projects, reports and assignments that will extend application of the concepts beyond that which is studied in the basic course. The honors work will require approximately three hours of study per week, over and above all regularly assigned work for IMP Course 4. It is expected that the honors student will find it necessary to seek and obtain instruction and guidance individually from the teacher outside of regular class hours.

Prerequisites

IMP Course 4 is available to all students who have successfully completed either IMP-3 or Algebra 2 with a grade of "C" or better. Any student enrolled in IMP Course 4 will be allowed to pursue honors credit by completing the honors assignments. At the end of the course, honors credit will be awarded to those students who have both completed the regular class work with a grade of "B" or better and have also completed every honors assignment with "A" or "B" quality workmanship. Students will be given an opportunity to revise assignment responses that do not initially exhibit the expected quality.

Students who only partially meet the above requirements will receive regular (non-honors) credit for completing IMP Course 4.

Standards of Expected Student Achievement

Upon completion of this course, students should be able to:

From Algebra:

- Utilize and prove the quadratic formula
- Determine the number of roots of a quadratic equation and relate this to the graph of the associated quadratic function
- Express the physical laws of falling bodies in terms of quadratic functions

From Pre-Calculus:

- Recognize and make use of families of functions from several perspectives:
  - through their algebraic representations
  - in relationship to their graphs
  - as tables of values
  - in terms of problem situations they represent
- Determine the effect of changing parameters on families of functions
- Work with asymptotes of rational functions
- Work with the algebra of functions, including composition and inverse functions
- Define the least-squares approximation and use a calculator's regression facility to do curve-fitting

From Analytic and Coordinate Geometry:

- Define and make use of polar coordinates
- Construct and analyze graphs of polar equations
- Express geometric transformations (translations, rotations, and reflections) in analytic terms
- Use matrices to represent geometric transformations
- Develop an analytic expression for projection onto a plane from a point perspective
- Represent a line in 3-space algebraically

From Trigonometry:

- Extend the right-triangle trigonometric functions to circular functions
- Use trigonometric functions to work with polar coordinates
- Define and make use of radian measure
- Graph the sine and cosine functions and variations of them
- Work with inverse trigonometric functions
- Develop and use various trigonometric formulas, including:
  - the Pythagorean identity
  - formulas for the sine and cosine of a sum of angles
  - the Law of Sines and the Law of Cosines

From Probability and Statistics:

- Use the binomial distribution to model a polling situation
- Distinguish between sampling with replacement and sampling without replacement
- Apply basic ideas about the normal distribution and standard deviation
- Understand the Central Limit Theorem as a statement about approximating a binomial distribution by a normal distribution
- Use area estimates to understand and use the normal distribution table
- Extend the concepts of mean and standard deviation from sets of data to probability distributions
- Apply formulas for mean and standard deviation of binomial sampling situations
- Use the normal approximation for binomial sampling to assess the significance of poll results
- Understand and apply the concepts of confidence interval, confidence level, and margin of error
- Understand the relationship between poll size and margin of error

From Programming:

- Use loops
- Write and interpret programs
- Use graphics facilities on a calculator to create programs involving animation

Assessment of Student Learning

Students will be assessed using a variety of methods, including: unit tests and cumulative term final exams, quizzes, projects and reports, student oral presentations, longer –term problems (such as Problems-of-the-Week), and daily class work and homework.

Instructional Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District.

Activities

This course will be presented as determined by the methods and techniques of the instructor and will utilize lecture, demonstrations, group work, cooperative learning, investigations, manipulatives, graphing calculators, oral and written communication, study, drills, quizzes, and examinations.

Course Title

Interactive Mathematics Program (I. M. P.) Course 4 (P)

Description of Target Group

IMP Course 4 is for students who have successfully completed IMP Course 3 with a grade of C or better.

Purpose

IMP Course 4 is the fourth year of an integrated four-year college preparatory course in mathematics designed to replace the traditional Algebra 1, Geometry, Algebra 2, Pre-Calculus sequence as well as probability and statistics. It was developed to fulfill the goals of the new Math Framework of the state, and the curriculum standards of the National Council of Teachers of Mathematics. The topics listed below are covered in a unified fashion, in the

Content for Course 4

From Algebra:

- Proving and using the quadratic formula
- Studying the number of roots of a quadratic equation and relating this to the graph of the associated quadratic function
- Expressing the physical laws of falling bodies in terms of quadratic functions

From Pre-calculus:

- Studying and using families of functions from several perspectives:
    - through their algebraic representations
    - in relationship to their graphs
    - as tables of value
    - in terms of problem situations they represent
- Studying the effect of changing parameters on families of functions
- Working with asymptotes of rational functions
- Working with the algebra of functions, including composition and inverse functions
- Define the least-squares approximation and using a calculator's regression facility to do curve-fitting

From Analytic and Coordinate Geometry:

- Defining polar coordinates
- Studying graphs of polar equations
- Expressing geometric transformations (translations, rotations and reflections) in analytic terms
- Using matrices to represent geometric transformations
- Developing and analytic expression for projection onto a plane from a point perspective
- Representing a line in 3-space algebraically

From Trigonometry:

- Extending the right-triangle trigonometric functions to circular functions
- Using trigonometric functions to work with polar coordinates
- Defining radian measure

- Graphing the sine and cosine functions and variations of them
- Working with inverse trigonometric functions
- Developing and using various trigonometric formulas, including:
    - the Pythagorean identity
    - formulas for the sine and cosine of a sum of angles
    - the Law of Sines and the Law of Cosines

From Probability and Statistics:

- Using the binomial distribution to model a polling situation
- Distinguishing between sampling with replacement and sampling without replacement
- Reviewing basic ideas about the normal distribution and standard deviation
- Understanding the Central Limit Theorem as a statement about approximating a binomial distribution by a normal distribution
- Using area estimates to understand and use the normal distribution table
- Extending the concepts of mean and standard deviation from sets of data to probability distributions
- Developing formulas for mean and standard deviation of binomial sampling situations
- Using the normal approximation for binomial sampling to assess the significance of poll results
- Working with the concepts of confidence interval, confidence level, and margin of error
- Understanding the relationship between poll size and margin of error

From Programming:

- Using loops
- Writing and interpreting programs
- Using graphics facilities on a calculator to create programs involving animation

<u>Performance Skills for all four courses</u>

- Problem-solving
    - ? Working on long-term problems
    - ? Drawing on diverse knowledge and methods to solve problems
    - ? Applying appropriate technology to problem solving
    - ? Posing questions related to a problem
    - ? Generalizing problems
- Group work
    - ?Working cooperatively with others
    - ?Sharing ideas
    - ?Asking for assistance
    - ?Subdividing a task so that group members can work independently on different parts of it
- Writing and communication
    - ?Reading and understanding complex problems
    - ?Summarizing the essential ideas of a problem
    - ?Describing methods used to approach a problem
    - ?Explaining reasoning used in solving a problem
    - ?Evaluating and improving the quality of written work
    - ?Making oral presentations

Title:	Intermediate Geometry
Length of course:	Full Year
Subject area:	Mathematics (C) / Geometry
UC honors designation?	No
Prerequisites:	Alg 1 (Recommended) 2 yr Alg C/D (Recommended)
Co-requisites:	None
Integrated (Academics / CTE)?	No
Grade levels:	10th, 11th, 12th

ourse Description

urse overview:

This course is for students who have shown some proficiency in basic mathematic skills, but whose mathematical history shows a need for practice in algebra with the introduction of geometric concepts. The purpose is to provide an understanding of the basic structure of geometry, including inductive reasoning, informal proofs, deductive reasoning and geometric figures. Text and supplemental materials incorporate visual analysis and geometric information in solving problems.

This course should follow successful completion of 2 Year Algebra C/D or by teacher recommendation following completion of Algebra 1. This course develops the mathematics skills necessary for successful entry into Intermediate Algebra 2 or Algebra 2. The course content satisfies the requirement of the California State Standards.

1. Students will utilize algebraic equations with geometric properties for a variety of polygons and circles to hypothesis and come to solutions and conclusions.
2. Students will assess and connect visual diagrams and symbols of geometric figures to the properties of these figures.
3. Students will determine what formulas and techniques and calculations are necessary to form conclusions about geometric figures. This will be based off investigation and developing facts with their understanding of various properties related to a geometric figure.
4. Students will use the relationship of congruence and similarity to investigate various polygons. This will be studied with an emphasis on the use of algebra.
5. Students will be able to use formulas of distance, slope and midpoint in coordinated geometry to reach conclusions.
6. Proofs will be in the form of data and understanding the related properties of geometric figures being studied.

urse content:

Unit 1: Basics of Geometry / Reasoning

1. Points/lines/planes
2. Seeing structure in patterns
3. Solving / using perimeter/area
4. Introduction to inductive reasoning and logical argument.

Unit Assignment(s):

- Each chapter will begin with a Maintaining mathematical proficiency assignment that links previously learned material to the chapter.
- Assignments include the mathematical practices to solve problems in everyday life, society and the workplace.
- Students will use multiple forms of instruction to model classwork assignments including and exploration for section. Technology and hands on materials with guidance will be in place to support these explorations.
- Students will be assigned a variety of DOK leveled problems to attempt.
- Similarly, the assignments will ask for students to apply learned topics to problems they have not encountered.
- Correcting and reworking the problems each day will clarify any misconceptions the students have encountered.

- Each Chapter students will have at minimum one Quiz

Instructional methods used in this unit will include:

1. Direction instruction, lecture with the use of organizers and study guides.
2. Group work followed by individual practice and self assessment
3. Incorporation of critical thinking questioning to ensure that students understand the material
4. Use of computer based programs to emphasis concepts and allow for student lead investigation.
5. Daily practice of concepts

Unit 2: Geometric Relationships

---

1. Identifying and understanding problems involving segments
2. Concept and usage of congruent segments
3. Graphing linear equations

Unit Assignment(s):

- Each chapter will begin with a Maintaining mathematical proficiency assignment that links previously learned material to the chapter.
- Assignments include the mathematical practices to solve problems in everyday life, society and the workplace.
- Students will use multiple forms of instruction to model classwork assignments including and exploration for section. Technology and hands on materials with guidance will be in place to support these explorations.
- Students will be assigned a variety of DOK leveled problems to attempt.
- Similarly, the assignments will ask for students to apply learned topics to problems they have not encountered.
- Correcting and reworking the problems each day will clarify any misconceptions the students have encountered.
- Each Chapter students will have at minimum one Quiz

Instructional methods used in this unit will include:

1. Direction instruction, lecture with the use of organizers and study guides.
2. Group work followed by individual practice and self assessment
3. Incorporation of critical thinking questioning to ensure that students understand the material
4. Use of computer based programs to emphasis concepts and allow for student lead investigation.
5. Daily practice of concepts

Unit 3: Angle relationships

---

1. Naming angles
2. Using angle measurement
3. Understanding angle addition
4. Relationships of angles : adjacent angles / linear pairs

5. Supplemental and congruent angles
6. Perpendicular lines, constructions (straightedge / compass)

Unit Assignment(s):

- Each chapter will begin with a Maintaining mathematical proficiency assignment that links previously learned material to the chapter.
- Assignments include the mathematical practices to solve problems in everyday life, society and the workplace.
- Students will use multiple forms of instruction to model classwork assignments including and exploration for section. Technology and hands on materials with guidance will be in place to support these explorations.
- Students will be assigned a variety of DOK leveled problems to attempt.
- Similarly, the assignments will ask for students to apply learned topics to problems they have not encountered.
- Correcting and reworking the problems each day will clarify any misconceptions the students have encountered.
- Each Chapter students will have at minimum one Quiz

Instructional methods used in this unit will include:

1. Direction instruction, lecture with the use of organizers and study guides.
2. Group work followed by individual practice and self assessment
3. Incorporation of critical thinking questioning to ensure that students understand the material
4. Use of computer based programs to emphasis concepts and allow for student lead investigation.
5. Daily practice of concepts

Unit 4: Parallel and Perpendicular Lines

---

1. Parallel lines
2. Transverals and angle relationships
3. proving lines parallel, slope / equations of lines

Unit Assignment(s):

- Each chapter will begin with a Maintaining mathematical proficiency assignment that links previously learned material to the chapter.
- Assignments include the mathematical practices to solve problems in everyday life, society and the workplace.
- Students will use multiple forms of instruction to model classwork assignments including and exploration for section. Technology and hands on materials with guidance will be in place to support these explorations.
- Students will be assigned a variety of DOK leveled problems to attempt.
- Similarly, the assignments will ask for students to apply learned topics to problems they have not encountered.
- Correcting and reworking the problems each day will clarify any misconceptions the students have encountered.
- Each Chapter students will have at minimum one Quiz

Instructional methods used in this unit will include:

1. Direction instruction, lecture with the use of organizers and study guides.
2. Group work followed by individual practice and self assessment

3. Incorporation of critical thinking questioning to ensure that students understand the material
4. Use of computer based programs to emphasis concepts and allow for student lead investigation.
5. Daily practice of concepts

Unit 5: Congruent Triangles

---

1. Classifying Triangles
2. Problem solving with angles of triangles
3. Congruent triangles proofs (recognizing sss, sas, asa, aas)
4. Using corresponding parts of congruent triangles

Unit Assignment(s):

- Each chapter will begin with a Maintaining mathematical proficiency assignment that links previously learned material to the chapter.
- Assignments include the mathematical practices to solve problems in everyday life, society and the workplace.
- Students will use multiple forms of instruction to model classwork assignments including and exploration for section. Technology and hands on materials with guidance will be in place to support these explorations.
- Students will be assigned a variety of DOK leveled problems to attempt.
- Similarly, the assignments will ask for students to apply learned topics to problems they have not encountered.
- Correcting and reworking the problems each day will clarify any misconceptions the students have encountered.
- Each Chapter students will have at minimum one Quiz

Instructional methods used in this unit will include:

1. Direction instruction, lecture with the use of organizers and study guides.
2. Group work followed by individual practice and self assessment
3. Incorporation of critical thinking questioning to ensure that students understand the material
4. Use of computer based programs to emphasis concepts and allow for student lead investigation.
5. Daily practice of concepts

Unit 6: Relationships with Triangles

---

1. Medians, altitudes
2. Bisectors in triangles
3. Angular inequalities
4. Isosceles/right triangles
5. Pythagorean theorem
6. Distance formula

Unit Assignment(s):

- Each chapter will begin with a Maintaining mathematical proficiency assignment that links previously learned material to the chapter.
- Assignments include the mathematical practices to solve problems in everyday life, society and the workplace.
- Students will use multiple forms of instruction to model classwork assignments including and exploration for section. Technology and hands on materials with guidance will be in place to support these explorations.
- Students will be assigned a variety of DOK leveled problems to attempt.
- Similarly, the assignments will ask for students to apply learned topics to problems they have not encountered.
- Correcting and reworking the problems each day will clarify any misconceptions the students have encountered.
- Each Chapter students will have at minimum one Quiz

Instructional methods used in this unit will include:

1. Direction instruction, lecture with the use of organizers and study guides.
2. Group work followed by individual practice and self assessment
3. Incorporation of critical thinking questioning to ensure that students understand the material
4. Use of computer based programs to emphasis concepts and allow for student lead investigation.
5. Daily practice of concepts

Unit 7: Theorems involving Triangle relationships

---

1. Exterior angle theorem
2. Inequalities within a triangle
3. Triangle inequality theorem

Unit Assignment(s):

- Each chapter will begin with a Maintaining mathematical proficiency assignment that links previously learned material to the chapter.
- Assignments include the mathematical practices to solve problems in everyday life, society and the workplace.
- Students will use multiple forms of instruction to model classwork assignments including and exploration for section. Technology and hands on materials with guidance will be in place to support these explorations.
- Students will be assigned a variety of DOK leveled problems to attempt.
- Similarly, the assignments will ask for students to apply learned topics to problems they have not encountered.
- Correcting and reworking the problems each day will clarify any misconceptions the students have encountered.
- Each Chapter students will have at minimum one Quiz

Instructional methods used in this unit will include:

1. Direction instruction, lecture with the use of organizers and study guides.
2. Group work followed by individual practice and self assessment
3. Incorporation of critical thinking questioning to ensure that students understand the material
4. Use of computer based programs to emphasis concepts and allow for student lead investigation.
5. Daily practice of concepts

Unit 8: Quadrilaterals

1. Quadrilateral Properties
2. Parallelograms
3. Rectangles
4. Rhombi
5. Squares
6. Trapezoids

Unit Assignment(s):

- Each chapter will begin with a Maintaining mathematical proficiency assignment that links previously learned material to the chapter.
- Assignments include the mathematical practices to solve problems in everyday life, society and the workplace.
- Students will use multiple forms of instruction to model classwork assignments including and exploration for section. Technology and hands on materials with guidance will be in place to support these explorations.
- Students will be assigned a variety of DOK leveled problems to attempt.
- Similarly, the assignments will ask for students to apply learned topics to problems they have not encountered.
- Correcting and reworking the problems each day will clarify any misconceptions the students have encountered.
- Each Chapter students will have at minimum one Quiz

Instructional methods used in this unit will include:

1. Direction instruction, lecture with the use of organizers and study guides.
2. Group work followed by individual practice and self assessment
3. Incorporation of critical thinking questioning to ensure that students understand the material
4. Use of computer based programs to emphasis concepts and allow for student lead investigation.
5. Daily practice of concepts

Unit 9: Similarity in Polygons

1. Ratios and proportions
2. Similar polygons
3. Similar triangles
4. Proportional parts and triangles
5. Triangle and parallel lines
6. Perimeters and similarity

Unit Assignment(s):

- Each chapter will begin with a Maintaining mathematical proficiency assignment that links previously learned material to the chapter.
- Assignments include the mathematical practices to solve problems in everyday life, society and the workplace.
- Students will use multiple forms of instruction to model classwork assignments including and exploration for section. Technology and hands on materials with guidance will be in place to support these explorations.
- Students will be assigned a variety of DOK leveled problems to attempt.
- Similarly, the assignments will ask for students to apply learned topics to problems they have not encountered.
- Correcting and reworking the problems each day will clarify any misconceptions the students have encountered.
- Each Chapter students will have at minimum one Quiz

Instructional methods used in this unit will include:

1. Direction instruction, lecture with the use of organizers and study guides.
2. Group work followed by individual practice and self assessment
3. Incorporation of critical thinking questioning to ensure that students understand the material
4. Use of computer based programs to emphasis concepts and allow for student lead investigation.
5. Daily practice of concepts

Unit 10: Two Dimensional Geometry

---

1. Naming Polygons
2. Diagonals and angle measure
3. Area: polygons, trapezoids, and triangles
4. Symmetry transformations

Unit Assignment(s):

- Each chapter will begin with a Maintaining mathematical proficiency assignment that links previously learned material to the chapter.
- Assignments include the mathematical practices to solve problems in everyday life, society and the workplace.
- Students will use multiple forms of instruction to model classwork assignments including and exploration for section. Technology and hands on materials with guidance will be in place to support these explorations.
- Students will be assigned a variety of DOK leveled problems to attempt.
- Similarly, the assignments will ask for students to apply learned topics to problems they have not encountered.
- Correcting and reworking the problems each day will clarify any misconceptions the students have encountered.
- Each Chapter students will have at minimum one Quiz

Instructional methods used in this unit will include:

1. Direction instruction, lecture with the use of organizers and study guides.
2. Group work followed by individual practice and self assessment
3. Incorporation of critical thinking questioning to ensure that students understand the material
4. Use of computer based programs to emphasis concepts and allow for student lead investigation.
5. Daily practice of concepts

Unit 11: Circles

1. Parts of a circle
2. Arcs and central angles
3. Inscribed angles
4. Equation of a circle
5. Circumference, area

Unit Assignment(s):

- Each chapter will begin with a Maintaining mathematical proficiency assignment that links previously learned material to the chapter.
- Assignments include the mathematical practices to solve problems in everyday life, society and the workplace.
- Students will use multiple forms of instruction to model classwork assignments including and exploration for section. Technology and hands on materials with guidance will be in place to support these explorations.
- Students will be assigned a variety of DOK leveled problems to attempt.
- Similarly, the assignments will ask for students to apply learned topics to problems they have not encountered.
- Correcting and reworking the problems each day will clarify any misconceptions the students have encountered.
- Each Chapter students will have at minimum one Quiz

Instructional methods used in this unit will include:

1. Direction instruction, lecture with the use of organizers and study guides.
2. Group work followed by individual practice and self assessment
3. Incorporation of critical thinking questioning to ensure that students understand the material
4. Use of computer based programs to emphasis concepts and allow for student lead investigation.
5. Daily practice of concepts

Unit 12: Three Dimensional Geometry

1. Solid Figures
2. Prisms and cylinders
3. Surface areas
4. Volume

Unit Assignment(s):

- Each chapter will begin with a Maintaining mathematical proficiency assignment that links previously learned material to the chapter.
- Assignments include the mathematical practices to solve problems in everyday life, society and the workplace.

- Students will use multiple forms of instruction to model classwork assignments including and exploration for section. Technology and hands on materials with guidance will be in place to support these explorations.
- Students will be assigned a variety of DOK leveled problems to attempt.
- Similarly, the assignments will ask for students to apply learned topics to problems they have not encountered.
- Correcting and reworking the problems each day will clarify any misconceptions the students have encountered.
- Each Chapter students will have at minimum one Quiz

Instructional methods used in this unit will include:

1. Direction instruction, lecture with the use of organizers and study guides.
2. Group work followed by individual practice and self assessment
3. Incorporation of critical thinking questioning to ensure that students understand the material
4. Use of computer based programs to emphasis concepts and allow for student lead investigation.
5. Daily practice of concepts

Unit 13: Introduction to Right Triangle Trigonometry

---

1. Special Right Triangles:45-45-90, 30-60-90
2. Right triangle trigonometric ratios: sine, cose, tangent,
3. Solving systems of equations

Unit Assignment(s):

- Each chapter will begin with a Maintaining mathematical proficiency assignment that links previously learned material to the chapter.
- Assignments include the mathematical practices to solve problems in everyday life, society and the workplace.
- Students will use multiple forms of instruction to model classwork assignments including and exploration for section. Technology and hands on materials with guidance will be in place to support these explorations.
- Students will be assigned a variety of DOK leveled problems to attempt.
- Similarly, the assignments will ask for students to apply learned topics to problems they have not encountered.
- Correcting and reworking the problems each day will clarify any misconceptions the students have encountered.
- Each Chapter students will have at minimum one Quiz

Instructional methods used in this unit will include:

1. Direction instruction, lecture with the use of organizers and study guides.
2. Group work followed by individual practice and self assessment
3. Incorporation of critical thinking questioning to ensure that students understand the material
4. Use of computer based programs to emphasis concepts and allow for student lead investigation.
5. Daily practice of concepts

Comments:

Course Purpose: *What is the purpose of this course?*

This is an introductory course using game design and development to emphasize mathematical and physical concepts. This course covers many of the concepts involved in game design, such as ratios & scaling, trigonometry, geometry, linear equations, conditional statements, and many more that are touched upon in advanced mathematics courses (such as Methods of Proof). This course will prepare students for advanced courses in Game Design.

Upon completion of this course, the student should be able to:

*discuss and define the terms and principles of game design and development.
*define the structure and duties of the game development team.
*practice animation production and creation tools.
*apply the mathematics used in game design.
*apply the physics needed to design computer games.
*apply artificial intelligence to developing computer games.

B. COURSE CONTENT

Course Outline: A *detailed descriptive summary of all topics covered. All historical knowledge is expected to be empirically based, give examples. (i.e. California State Standards).*

Course Content (units overlap, and are revisited quite often in a circular/reinforced curriculum)

*Intro To Programming/Software
*Character/Enemy/Projectile Design (Art Component)
*Intro To Variables
*Making Your Character Move: Using Variables in Linear Equations
*Scaling Actors: Using Transformations to Scale Actors Appropriately
*Changing the Speed of Your Character: Movement as a Vector of Speed/Direction
*Camera Follow: Incrementing Camera Actor Based on Character Coordinates
*Bound to Screen: Conditional Actions for Actor Based on Character Coordinates
*Calculating Placement for Auto-Fit: Algebriac Equations For Placing Actors Automatically
*Title/Winning/Ending/End Screen Behaviors: Advanced Conditionals
*Creating/Tracking/Destroying Actors: Calculating Angles Using Trig, Coordinate/Vector Comparisons & Conditionals
*Debugging: Looking through code to find logical, mathematical, and functional errors

Course Resources

*Stencyl (primary game development engine www.stencyl.com)
*paint.net (free paint program with many of the abilities of photoshop www.getpaint.com)
*code.org (free website with many activities to learn to code)
*opengameart.org (free website with art resources)
*kenney.nl (another free website with art resources)

Content Standards

CCSS.MATH.CONTENT.HSN.VM.A.1: Recognize vector quantities as having both magnitude and direction. Represent vector quantities by directed line segments, and use appropriate symbols for vectors and their magnitudes (e.g., v, |v|, ||v||, v).
CCSS.MATH.CONTENT.HSN.VM.A.2: Find the components of a vector by subtracting the coordinates of an initial point from the coordinates of a terminal point.
CCSS.MATH.CONTENT.HSN.VM.B.5: Multiply a vector by a scalar.
CCSS.MATH.CONTENT.HSA.SSE.A.1: Interpret expressions that represent a quantity in terms of its context.
CCSS.MATH.CONTENT.HSA.CED.A.1: Create equations and inequalities in one variable and use them to solve problems. Include equations arising from linear and quadratic functions, and simple rational and exponential functions.
CCSS.MATH.CONTENT.HSA.REI.B.3: Solve linear equations and inequalities in one variable, including equations with coefficients represented by letters.
CCSS.MATH.CONTENT.HSA.REI.D.10: Understand that the graph of an equation in two variables is the set of all its solutions plotted in the coordinate plane, often forming a curve (which could be a line).
Interpret expressions for functions in terms of the situation they model.
CCSS.MATH.CONTENT.HSF.LE.B.5: Interpret the parameters in a linear or exponential function in terms of a context.
CCSS.MATH.CONTENT.HSG.CO.A.1: Know precise definitions of angle, circle, perpendicular line, parallel line, and line segment, based on the undefined notions of point, line, distance along a line, and distance around a circular arc.
CCSS.MATH.CONTENT.HSG.CO.A.2: Represent transformations in the plane using, e.g., transparencies and geometry software; describe transformations as functions that take points in the plane as inputs and give other points as outputs. Compare transformations that preserve distance and angle to those that do not (e.g., translation versus horizontal stretch).
CCSS.MATH.CONTENT.HSG.CO.A.3: Given a rectangle, parallelogram, trapezoid, or regular polygon, describe the rotations and reflections that carry it onto itself.
CCSS.MATH.CONTENT.HSG.CO.A.5: Given a geometric figure and a rotation, reflection, or translation, draw the transformed figure using, e.g., graph paper, tracing paper, or geometry software. Specify a sequence of transformations that will carry a given figure onto another.

*It is also important to note that many of the mathematical standards reinforced by programming are for math courses generally taught outside of highschool, such as the logic and reasoning reinforced by Methods of Proof.

19. Brief Course Description

This course combines the concepts of trigonometry, geometry, and algebra as preparation for the study of calculus. Topics include polar coordinates and vectors, math induction, conics, complex roots, parametric functions, sequences and series and convergence, matrices, systems of equations and inequalities, exponents and logarithms.

D. OPTIONAL BACKGROUND INFORMATION

Please refer to instructions

28. Context for Course (optional)

29. History of Course Development (optional)

Math Analysis A/B (Honors)

Course Goals:

- Students know the identity $\sin^2 x \cos^2 x = 1$ and prove other trigonometric identities
- Students compute, by hand, the values of the trigonometric functions and the inverse trigonometric functions at various standard points
- Students demonstrate understanding of the addition formulas for sines and cosines, their proofs, and use them to prove other identities
- Students know the law of sines and the law of cosines, and apply them to problems
- Students are familiar with and can apply polar coordinates and vectors in the plane
- Students can give proofs of various formulas using the technique of mathematical induction
- Students demonstrate an understanding of functions and equations defined parametrically
- Students are familiar with and can apply polar coordinates and vectors in the plane
- Students are familiar with the notion of the limit of a sequence and the limit of a function They can determine if sequences converge or diverge
- Students solve simultaneous linear equations in any number of variables using Gauss-Jordan elimination

Course Outline:

- Graphs and Equations
    - Linear equations x
    - Circles
    - Inequalities
    - Linear curve fitting
- Functions and their Graphs
    - Graphing techniques
    - Operations on functions
    - Composite functions
    - Mathematical models
    - Constructing functions
- Polynomial and Rational Functions
    - Quadratic functions; curve fitting
    - Polynomial and power functions; curve fitting
    - Rational functions
    - Real and complex functions
    - Polynomial and rational inequalities
- Exponential and Logarithmic Functions
    - Inverse functions
    - Properties of logarithms
    - Logarithmic and exponential equations
    - Compound interest
    - Growth and decay
    - Logistic curve fitting
    - Logarithmic scales

Course Outline (continued)

- Trigonometric Functions
  - The unit circle
  - Properties and graphs of the trigonometric functions
  - The inverse trigonometric functions
- Analytic Trigonometry
  - Identities
  - Sum and difference formulas
  - Double-angle and half-angle formulas
  - Product-to-sum and sum-to-product formulas
  - Trigonometric equations
- Applications of Trigonometric Functions
  - The law of sines
  - The law of cosines
  - The area of a triangle
  - Sinusoidal graphs and curve fitting
  - Simple harmonic motion; damped motion
- Polar Coordinates; Vectors
  - Polar equations and graphs
  - The complex plane and demoivres theorem
  - Vectors
  - The dot product
  - Vectors in space
- Analytic Geometry
  - Conics
  - The parabola, ellipse, and hyperbola
  - Rotation of axes
  - Polar equations of conics
  - Plane curves and parametric equations
- Systems of Equations and Inequalities
  - Subtraction and elimination methods
  - Matrices
  - Systems of equations; determinants
  - Matrix algebra
  - Partial fraction decomposition
  - Systems of nonlinear equations
  - Systems of inequalities
  - Linear programming
- Sequences; Induction; Probability
  - Arithmetic and geometric sequences
  - Geometric induction
  - The binomial theorem
  - Permutations and combinations
  - Probability

Course Outline (continued)

- A Preview of Calculus: The Limit and the Derivative of a Funtion:
    - Finding limits using tables and graphs
    - Algebra techniques for finding limits
    - One-sided limits; continuous functions
    - The tangent problem; the derivative

Texts & Supplemental Instructional Materials

Texts currently in use: Pre-calculus, Graphing and Data Analysis, Sullivan, Sullivan III; Prentice Hall (1998)
The text for this course is currently under review
Supplemental materials: Graphing calculators and internet resources, overhead graphing demonstrations with the TI-83 Plus

Instructional Methods and/or Strategies:

- Lecture
- Small group activities
- Overhead demonstrations
- Graphing calculator activities

Assessments Methods and/or Tools

- Quizzes
- Chapter tests
- Daily homework and class work
- Course exit exam
- STAR assessment
- Notebooks

Indicate how this honors course is different from the standard course:

With more rigid pre-requisites to enter this course, the students will be expected to cover more material and do so in much greater depth than that of the standard course. (See course outline)

Submitted to UC 2/28/06
Requesting course be weighted

Co-Requisites:

Course Purpose: *What is the purpose of this course?*

The purpose of this course is to support students taking a-g course requriements including algebra 1, geometry, and algebra 2. The course is designed to build and promote self-efficacy in math. Teachers will support students through sprial review, addressing pre-requisite skill gaps, additional guided practice, and re-teaching of regular course content. This additional instruction and support will be in addition to and integrated with the regular coursework for algerba 1, geometry, and algebra 2. Students will have access to the required curriculum/standards with the support they need to be successful. No student will be palced in Math Support if he/she is not aslo enrolled in the corresponding a-g math course.

B. COURSE CONTENT

Course Outline: A *detailed descriptive summary of all topics covered. All historical knowledge is expected to be empirically based, give examples. (i.e. California State Standards).*

Spiral review of Algebra 1 including addressing pre-requisite skills gaps covered in CCSS in mathematics, use of technology to enhance the learning process, additional guided practice mirroring the standards taught in the concurrent math course, and re-teaching of regular course content to students who require more explanation and guided practice.

Spiral reveiw of Geometry including addressing pre-requisite skills gaps covered in CCSS in mathematics, use of technology to enhance the learning process, additional guided practice mirroring the standards taught in the concurrent math course, and re-teaching of regular course content to students who require more explanation and guided practice. Students will also have access to and practice with SBAC practice questions.

Spiral reveiw of Algebra 2 including addressing pre-requisite skills gaps covered in CCSS in mathematics, use of technology to enhance the learning process, additional guided practice mirroring the stanrads taught in the concurrent math course, and re-teaching of regular course content to students who require more explanation and guided practice. Students will also have access to and practice with SBAC practice questions.

Course Title

Math A 1

Description of Target Group

This course is designed for students who have some proficiency in basic mathematic skills. Students enrolled in this course are generally unable to grasp algebraic concepts at a rapid pace and require greater maturation prior to progressing to the course in algebra.

Purpose

The purpose of MATH A 1 is to improve computational skills with fractions, decimals and percents. It allows students to learn concepts of probability and statistics, logic, and measurement:

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Probability and Statistics
   a. construct and use frequency tables.
   b. determine the sample space for the outcomes of an experiment.
   c. estimate the probability of an event.
2. Logic
   a. recognize and complete patterns.
   b. use and discover function rules.
3. Measurement
   a. choose appropriate units of measurement.
   b. measure length, area, volume, and weight.

Instructional Materials

Text and Supplementary Materials
Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

1. Individual work
2. Lectures
3. Class participation
4. Demonstrations
5. Audio-visual materials
6. Field trips
7. Small group activities
8. Outside resource people

Course Title

Math A 2

Description of Target Group

This course is designed for students who have some proficiency in basic mathematic skills. Students enrolled in this course generally are unable to grasp algebraic concepts at a rapid pace and require greater maturation prior to progressing to the course in algebra.

Purpose

The purpose of Math A 2 is to improve computation skills and introduce negative numbers. It allows students to learn concepts of algebra and geometry. This is the second semester of a one year course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Algebra
   a. apply the rules for the order of operations on positive and negative rational numbers.
   b. evaluate algebraic expressions.
   c. solve linear equations.
   d. add and subtract polynomials.
2. Geometry
   a. determine perimeter and area of simple polygons.
   b. apply terminology of angles, lines' polygons, and circles.
   c. perform simple constructions with a compass and straightedge.

8. Outside resource people.

Course Title

Math Analysis A (Honors)

Description of Target Group

This course is for all students who have successfully completed Algebra 2B or demonstrated comparable proficiency. It is recommend that students enrolled in this class be concurrently enrolled in Physics A.

Purpose

The purpose of Math Analysis A is to introduce students to analytical mathematics by stressing: topics from advanced algebra; quadratic equations; coordinate geometry; polynomial algebra and theory of equations; inequalities and functions; exponents and logarithms; trigonometric functions; triangle trigonometry; use of scientific calculators; and applications of math to physics, astronomy, economics, biology and other fields. This is the first semester of a one year course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Represent and solve problems using linear programming and difference equations.
2. Solving and graphing inequalities of one (1) or two (2) variables.
3. Using exponent laws.
4. Using calculators for logarithm problems.
5. Proving trigonometric identities.
6. Show the connections between right triangle rations, trigonometric functions, and circular functions.
7. Apply general graphing techniques to trigonometric identities.

Instructional Materials

Text and Supplementary Materials
Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

1. Individual work
2. Lectures
3. Class participation
4. Demonstrations
5. Drills
6. Audio-visual materials
7. Build a portfolio
8. Small group activities
9. Outside resource people

Course Title

Math Analysis B (Honors)

Description of Target Group

This course is for all students who have successfully completed Math Analysis A or demonstrated comparable proficiency. It is recommended that students enrolled in this class be concurrently enrolled in Physics B.

Purpose

The purpose of Math Analysis B is to introduce the student to an advanced knowledge of analytical mathematics by stressing: trigonometric addition formulas and identities; graphing techniques such as stresses, reflections, and translations; applications of trigonometric polar coordinates and complex numbers; De Moivre's Theorem; conic sections; vectors and determinants; sequences and series; using scientific calculators; and including: an introduction to calculus, statistics, and probability. This is the second semester of a one year course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Determining maximum and minimum points of a graph and interpret the results in problem situations.
2. Investigating limiting process by examining infinite sequences and series.
3. Understand the connections between trigonometric functions and polar coordinates.
4. Development of the complex number system and demonstrate facility with its operations.

Instructional Materials

Text and Supplementary Materials
Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

1. Individual work
2. Lectures
3. Class participation
4. Demonstrations
5. Drills
6. Audio-visual materials
7. Build a portfolio
8. Small group activities
9. Outside resource people

Course Title

Math Prep 1

Description of Target Group

This pilot summer course is for students planning to take Algebra (CMP) or Interactive Math Program (IMP) Course 1.

Purpose

The purpose of Math Prep 1 is to provide the foundations for students to expand their problem-solving skills and is aligned with the new state Math framework. Students will work individually and cooperatively to understand mathematical concepts to improve computational skill and practice communicating their understanding both orally and in writing. Course will assist students to insure success in IMP, Algebra or higher Math courses. This is a six week summer course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Problem-solving
    a. Working on long-term problems
    b. Drawing on diverse knowledge and methods to solve problems
    c. Applying appropriate technology to problem solving
    d. Posing questions related to a problem
    e. Generalizing problems
2. Group work
    a. Working cooperatively with others
    b. Sharing ideas
    c. Asking for assistance
    d. Subdividing a task so that group members can work independently on different parts of it
3. Writing and communication
    a. Reading and understanding complex problems
    b. Summarizing the essential ideas of a problem
    c. Describing methods used to approach a problem
    d. Explaining reasoning used in solving a problem
    e. Evaluating and improving the quality of written work
    f. Making oral presentations

Instructional Materials

Text and Supplementary Materials

Refer to Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

This course will be presented as determined by the methods and techniques of the instructor and will utilize the following:

1. Individual work
2. Lectures
3. Class participation
4. Demonstrations
5. Audio-visual materials
6. Manipulatives
7. Investigations
8. Drills
9. Small group activities
10. Use of calculators
11. Outside resource people

Course Contents

From Algebra:

- ? Using variables and algebraic expressions
  - ? to represent concrete situations
  - ? to generalize results
  - ? to describe functions
- ? Using ratio and proportion in problem situations
- ? Developing equivalent equations for proportions
- ? Interpreting graphs and using graphs to represent situations
- ? Relating graphs to their equations (with emphasis on linear and quadratic relationships)
  - ? Solving systems of equations by graphing
  - ? Fitting equations to data, both with and without graphing calculators

From Geometry:

- ? Understanding the meaning of angles and their measurement
- ? Developing relationships among interior and exterior angles of polygons' including angle sum formulas
- ? Working with similar polygons
  - ? Developing criteria for similarity
  - ? Using properties of similar polygons to solve concrete problems

? Defining and using trigonometric functions for right triangles

From Probability and Statistics

? Constructing area models to represent probabilistic situations
? Developing basic methods for calculating probabilities
? Understanding, calculating, and interpreting expected value
? Distinguishing between theoretical and experimental probabilities
? Planning and carrying out experiments
? Collecting and analyzing data
? Constructing frequency bar graphs
? Learning about normal distributions and properties of the normal curve
? Calculating mean and standard deviation' and applying these concepts to concrete situations
? Using simulations to estimate probabilities

From Logic

? Making and testing conjectures
? Constructing sound logical arguments
? Formulating counterexamples
? Developing and describing algorithms and strategies

Course Title

Mathematical Analysis CPM (P)
«Formerly College Preparatory Mathematics ‹CPM› Math 4 (P)»

Description of Target Group

Mathematical Analysis CPM (P) is a year long course for students who have successfully completed Algebra 2 CPM 3.

Purpose

This course has been designed to move towards the goals of the new Mathematics Framework of the state and still retain the major pre calculus topics as indicated in the framework.

Standards of Expected Student Achievement

On completion of this course, students should be able to:

- Use problem-solving skills in conjunction with knowledge of the inter-connections among algebra, geometry, and functions to analyze problems and formulate appropriate solutions and to extend current knowledge by making new connections
- Visualize, express, interpret, and graph functions (and their inverses, when they exist) in various positions in two dimensions. In many cases, given the graph, be able to represent it with an equation
- Interpret the integral as a sum of areas of rectangles. Solve problems involving trigonometric functions and sinusoidal functions
- Graph polar coordinate equations
- Use basic statistical methods involving mean, median, standard deviation, z-scores and percentiles
- Given a set of data, find a line of best fit
- Perform basic operations on vectors as geometrically-defined and coordinate-defined quantities
- Use parametric equations
- Find limits of sequences and functions
- Calculate average rates of change and derivatives
- Solve problems involving conic sections and use conics for modeling data
- Communicate their mathematical ideas clearly using appropriate vocabulary
- Apply mathematics to problems in economics, biology, chemistry, and physics

Additional features will include more challenging problems for the more motivated student, SAT review questions, and multiple-choice questions to correct common algebraic misconceptions and promote precision.

In addition, students will:

1. Move away from a rule applying approach to a rule generating approach.

2. Learn to use a graphing calculator effectively and efficiently.

3. Continue to develop confidence as problem solvers, extending their use of strategies to the solution of algebra problems as well as developing new strategies such as writing equations and relating them to their graphs.

4. Become more aware of their own thinking about problems and describe their efforts both orally and in writing.

5. Develop organizational skills in study habits as well as in doing mathematics.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District.

Activities

This course will be presented as determined by the methods and techniques of the instructor and will utilize lecture, demonstration, group work, investigations, oral and written communication, study, drills, quizzes, and examinations.

19. Course Goals and/or Major Student Outcomes

This course is not a graduation requirement for the Santa Maria Joint Union High School District.
Standards of expected student achievement: Upon completion of this course, students will be able to successfully demonstrate understanding of the following standards:

1. Algebraic Expressions and Integers
   a. Order of Operations
   b. Integers and absolute value
   c. Adding, subtracting, multiplying and dividing integers
2. Solving one-step equations and inequities
   a. Simplifying variable expressions
   b. Solving equations and inequalities
3. Decimals and equations
   a. Mean, median and mode
   b. Metric System
4. Factors, fractions, and exponents
   a. Scientific notation
5. Operations and Fractions
6. Ratios, proportions, and percents
   a. Unit rates
   b. Mark up and discount
   c. Probability

20. Course Objectives

21. Course Outline

22. Texts & Supplemental Instructional Materials

Pre-Algebra (2001-Prentice Hall) by Davison, Landau, McCracken, and Thompson.

Course Title

Probability and Statistics

Description of Target Group

This course is for 11th and 12th grade students as an alternative to Math Analysis.

Purpose

The purpose of Probability and Statistics is to consolidate, deepen, and build upon student understanding of methods of exploratory data analysis and experiences with simulations and experimental probability previously encountered. This is a one semester course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Construct and draw inferences from charts, tables, and graphs that summarize data from real-world situations.
2. Use curve fitting to predict from data.
3. Understand and apply measures of central tendency, variability, and correlation.
4. Understand sampling and recognize its role in statistical claims.
5. Design a statistical experiment to study a problem, conduct the experiment, and interpret and communicate the outcomes.
6. Analyze the effects of data transformations on measures of central tendency and variability.
7. Transform data to aid in data interpretation and prediction.
8. Test hypotheses using appropriate statistics.
9. Use experimental or theoretical probability, as appropriate, to represent and solve problems involving uncertainty.
10. Use simulations to estimate probabilities.
11. Understand and explain the concept of a random variable
12. Create and interpret discrete probability distributions.
13. Describe, in general terms, the normal curve and use its properties to answer questions about sets of data that are assumed to be normally distributed.
14. Apply the concept of a random variable to generate and interpret probability distributions including binomial, uniform, normal, and Chi Square.

Comments:

Course Purpose: *What is the purpose of this course?*

The Early Assessment Program (EAP) Senior Year Math (ESM) course is the result of a regional partnership involving a team of math faculty from CSU Sacramento, local community colleges, county offices of education, and area high schools. The goal of the ESM course is to provide math options that support transition to college, focusing on seniors who typically choose to take no math their senior year, making transition to college-level math more challenging. This course is designed to strengthen students' mathematical foundation and deepen their conceptual understanding of mathematical theory, skills, and strategies. The course is grounded in an engaging and innovative learning environment focused on conceptual understanding, where students who may have previously considered themselves unsuccessful in math can learn and thrive.

B. COURSE CONTENT

Course Outline: *A detailed descriptive summary of all topics covered. All historical knowledge is expected to be empirically based, give examples. (i.e. California State Standards).*

COMPETENCIES AND SPECIFIC COURSE OUTCOMES

1. Linear Functions
2. Quadratic Functions
3. Exponential Functions and Expressions
4. Systems of Equations
5. Rational Expressions
6. Problem solving Strategies
7. Absolute Value
8. Financial Math
9. Geometry

INSTRUCTIONAL STRATEGIES

A variety of strategies are employed including lecture, individual and group work, simulations and the use of discovery through observation. Students are frequently presented with a real life situation that is first modeled through a simulation. They then discuss their findings with their group and make a conjecture about the situation.

OBJECTIVES/GOALS

- Become better problem solvers
- Increase critical thinking skills
- Enhance numeracy
- Gain appreciation of mathematics and its applications
- Increase perseverance to solve math problems that seem unfamiliar
- Work in groups to share mathematical ideas from students point of view
- Improve mathematical communication abilities
- Overcome fear of mathematics

Course Title

Senior Math

Description of Target Group

This course is for 12th grade students who need to fulfill the school district requirement for math in their senior year (if they do not already have 25-units of math).

Purpose

The purpose of Senior Math is to stress the application of basic mathematics to consumer problems of personal money records, buying problems, and wage income problems. Included in these areas will be checking account records, budgeting, sales tax, making change, figuring unit price, buying a fraction of a unit, wage deductions, and family budget problems. This is a one semester course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Work to reinforce arithmetic skills.
2. Develop a method to handle personal finances.
   a. Keeping cash receipts and payment records.
   b. Recording and balancing checking account records.
   c. Budgeting records.
3. Show how to handle money in the wholesale and retail phases of business.
   a. Completing a sales slip.
   b. Computing unit prices.
   c. Computing taxes.
   d. Consumer credit.
4. Explain and discuss career placement and computing income.
   a. Computing salaries, wages, and overtime.
   b. Working with different payment methods.
   c. Computing deductions.
   d. Filling out time cards.
5. Relate life experience to financial needs. (optional)
   a. Buying government bonds.
   b. Buying mutual funds.
   c. Buying and selling real estate (buying a house)
   d. Cost of doctors, lawyers, accountants, and community resources.
   e. Computer literacy, hands-on experience.

Instructional Materials

Text and Supplementary Materials

Course Title

Statistics A/B (AP)

Department

Math/RHS

Description of Target Groups

This course will be offered to college preparatory students who are interested in earning college credit.

Purpose

The purpose of Advanced Placement Statistics is to provide the student with a clear understanding of statistical techniques and to be able to apply those techniques to real life situations. This class is intended for students planning to pursue college degrees in Math, Science, or engineering areas of study. Course length is one year; total units is 10.

Prerequisites

Eligible students must have completed Algebra 2 with a "B" or better or a recommendation from instructor. All students are strongly recommended to have a TI 83 or equivalent graphing calculator.

Standards of Expected Student Achievement

Upon completion of this course students will be able to:

1. Analyze data using graphical and numerical techniques to study patterns and departures from patterns.
   - Interpreting graphical displays of distributions of univariate data.
   - Summarizing distributions of univariate data.
   - Comparing distributions of univariate data.
   - Exploring bivariate data.
   - Exploring categorical data.

2. Collect data in a well-developed plan.
   - Overview of methods of data collection.
   - Planning and conducting surveys.
   - Planning and conducting experiments.
   - Generalizability of results from observational studies, experimental studies, and surveys.

3. Use probability, as a tool for anticipating what the distribution of data should look like under a given model.
   - Probability as relative frequency.
   - Combining independent random variables.
   - The normal distribution.
   - Sampling distributions.

4. Select the appropriate models to make statistical inferences.
   - Confidence intervals.
   - Test of significance.
   - Special case of normally distributed data.

Methods of Assessment of Student Learning

Tests/ Quizzes
Homework
Projects
Activities

Instructional Materials

Text and Supplementary materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union School District

TI 83 Graphing calculators are recommended for all students
TI 83 Graphing overhead calculator
Classroom set of TI 83 Graphing calculators will be used

Dedicated statistical software will be used in computer lab

Activities

Presentation determined by the methods and techniques of the instructor utilizing the following activities.

1. Individual work
2. Lectures
3. Class participation
4. Demonstrations
5. Audio-visual materials
6. Drills
7. Field trips
8. Small group activities
9. Outside resource people
10. AP Exam

Course Title

Vocational Mathematics

Description of Target Group

This course is for students who are currently enrolled in one or more of the vocational courses offered and who have demonstrated some success with mathematic skills.

Purpose

The purpose of Vocational Mathematics is to develop an understanding of basic mathematics. It will provide the firm background needed for the vocational area of the student's choice. Skills will be developed which will be of use in mathematics as well a in solving problems found in jobs, business, industry, and in every day life as they relate to agriculture, trade and technical, and home economics. This is a one semester course.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Improve speed and skill in computation.
2. Use computational skills to solve template problems.
3. Measure with several measuring instruments.
4. Use computational skills to complete invoices.
5. Read a scale of micrometer or yardstick, as it relates to their own vocational class.
6. Use indirect measurement.
7. Make different types of measurement such as length, area, volume, weight, time and temperature, as it relates to their own vocational class.
8. Draw figures with a straight edge and/or protractor and/or compass as it relates to their own vocational class.
9. Estimate results in practical applications related to vocational class.
10. Use formulas in industrial application.
11. Solve problems in the metric system of measure.
12 Successfully demonstrate knowledge of the systems of measurement. Ability to
13 solve problems that require a basic knowledge of the United States customary system of measurement (i.e., linear, square, and cubic measure).
14. When asked to use the metric system of measurement, the student will be able to demonstrate skill through application to actual measurement situations found in the vocational class.

15. Given a problem in their own vocational field, the student will be equipped to apply new mathematical skills such as geometric construction, ratio and proportion, percentage, trigonometry, and statistical tables and graphs to the solution of such a problem.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Some class periods will utilize traditional methods of learning basic mathematics. Other periods will be used to allow the students to collect data and some will be a combination of the two, wherein the students will gain an appreciation for the application and meaning of Vocational Mathematics.

1. Individual work
2. Lectures
3. Data collection
4. Use of measuring instruments (i.e. rulers, micrometers, calipers)
5. Class participation
6. Demonstrations
7. Audio-visual materials
8. Field trips
9. Small group activities
10. Outside resource people

19. Brief Course Description

AP Placement French Language is designed to prepare students to take the Advanced Placement test in Language. It encompasses aural/oral skills, reading comprehension, grammar, and compositions. The course seeks to develop language skills that are useful in themselves and that can be applied to various activities and disciplines rather than to the mastery of any specific subject matter. Extensive training in the organization and writing of compositions must be an integral part of an AP French Language course. Student who enroll must already have a good command of French grammar and vocabulary and have competency in listening, comprehension, speaking, reading and writing.

B. COURSE CONTENT

Please refer to instructions

20. Course Goals and/or Major Student Outcomes

The purpose of the course is to increase students' competency in written and spoken French, and to prepare students for the AP examination. The course will contribute to the A-G college entrance requirements. The length of the course will be 2 terms, with 10 units of credit.

21. Course Objectives

1. The ability to understand spoken French in various contexts.
2. The ability to converse on a wide range of topics.
3. A sufficient vocabulary in French to understand non-technical writings such as newspapers and magazine articles and pieces of literature.
4. The ability to read, respond to, and discuss non-technical writings such as those listed above.
5. The ability to express themselves in both written and in spoken French with reasonable fluency and accuracy.

22. Outline of content and time allotment

Throughout the year teaches will vary the course by interweaving activities and exercises to help the students master listening, speaking ,reading, grammar and writing skills. Teachers will provide extensive training in all areas so that students are prepared to take the AP exam when offered.

23. Instructional Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria High School District.

24. Key assignments

Course content will include current events, the arts, literature, and sports. It will also include audio and visual recordings, newspapers and magazines. The course seeks to develop language skills (reading, writing, listening and speaking) that can be used in various activities and disciplines.

Extensive training in the development and writing of compositions will be emphasized. Less formal writing tasks will include responses to reading or to audio-visual materials, journal entries, and summaries of instruction. Grammar will be one component of the writing skills that will be worked on.

Reading will include introductory literature, current events, history, and articles from popular culture, such as magazines.

Listening will be practiced with various audio and audiovisual materials, including news, films and tapes.

Speaking will be integrated into all classroom activities.

25. Instructional methods

The course seeks to develop language skills that can be used in various activities and disciplines rather than to cover any body of subject matter. In addition to the basic text, a variety of materials will be sued to meet the needs of the students including:

- Dictation
- Student taping of selected readings
- Oral discussions
- Formal and informal discussions
- Grammar review
- Vocabulary review and enrichment
- Storyline pictures
- Listening drills
- Practice AP exams
- A special emphasis on the organization and writing of compositions

26. Assessment methods and/or tools

College Board rubrics for the AP exam will be applied to formal oral presentation and written work.
Discrete item quizzes will evaluate progress in areas of structure, syntax and orthography.
Student journals, projects and presentations.
Oral assessments, both formal (e.g., the COCI) and informal.

C. HONORS COURSES ONLY

Please refer to instructions

27. Indicate how this honors course is different from the standard course.

D. OPTIONAL BACKGROUND INFORMATION

Please refer to instructions

28. Context for Course (optional)

29. History of Course Development (optional)

Course Title

SPANISH LANGUAGE A/B (AP)

Prerequisites

By Teacher recommendation

Description of Target Group

This one year, unit course is designed for advanced language students who wish to meet college requirements for credit through the AP program and examination. The class is open to "standard" students (those who have studied Spanish only in school) and "nonstandard" students (those who have studied Spanish abroad or who have learned at home).

Purpose

The purpose of the course is to prepare students for the AP examination. Since the exam evaluates listening, reading, speaking, and writing skills the course provides instruction and practice in these areas. The course will contribute to the A-G college entrance requirements.

Content Standards

Students will be able to converse on a wide range of subjects including personal, cultural, professional, socio-political, and religio-philosophical areas.
Students will be able to read and paraphrase or summarize introductory literature.
Students will be able to respond to a wide range of pattern response drills.
Students will be able to narrate and describe, guided by oral or visual prompts.
Students will be able to understand spoken Spanish in a variety of contexts, including being read to, watching television, and listening to music.

Activities - some examples

Listening:

Transcription of songs
Summary of reading
True/False or multiple choice response to listening selections
Close activities

Reading:

In class and at home selections
Comprehension questions
Summaries and illustrations
Rewriting conclusions
Generating vocabulary lists

Speaking:
Directed response (oral and visual prompts)
Situational conversation cards
Singing - memorization of songs, poetry
Review of weekend activities
Role playing
Production of music video
Writing:
Journal - 3 entries per week
Essays - creative, directed, various formats
Workbook - short answer, practice of structure and syntax
Summaries or retellings of reading
Transcription of personal tape recordings

Assessment

College Board rubrics for the AP Exam will be applied to all formal oral presentations and written work.

The California Oral Competency Interview will be administered to all students at least twice a year.

Discrete item quizzes will evaluate progress in areas of structure, syntax, and orthography.

Informal daily evaluation of oral participation will be used throughout the program.

Instructional Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District.

Curriculum Framework

In today's global community, competence in more than one language is an essential part of communication and cultural understanding. Study of another language not only provides individuals with the ability to express thoughts and ideas for their own purposes but also provides them with access to perspectives and knowledge that are only available through the language and culture. Advanced language learning offers social, cultural, academic, and workplace benefits that will serve students throughout their lives. The proficiencies acquired through the study of languages and literatures endow language learners with cognitive, analytical, and communication skills that carry over into many other areas of their academic studies.

The three modes of communication (Interpersonal, Interpretive, and Presentational) defined in the *Standards for Foreign Language Learning in the 21st Century* are foundational to the AP Spanish Language and Culture course. The AP course provides students with opportunities to demonstrate their proficiency in each of the three modes in the Intermediate to Pre-Advanced range as described in the *ACTFL Performance Guidelines for K–12 Learners*. As such, the AP Spanish Language and Culture course has been designed to provide advanced high school students with a rich and rigorous opportunity to study the language and culture of the Spanish-speaking world that is approximately equivalent to an upper-intermediate college or university Spanish course. It is expected that this course will be offered as the first step in the study of college-level Spanish after approximately three to five years of language study for classroom learners. For native and heritage speakers, there may be a different course of study that leads to the AP Spanish Language and Culture course. Students who are successful in this course and exam may continue their study of college-level Spanish by taking the AP Spanish Literature and Culture course and exam, as well.

The AP Spanish Language and Culture course takes a holistic approach to language proficiency and recognizes the complex interrelatedness of comprehension and comprehensibility, vocabulary usage, language control, communication strategies, and cultural awareness. Students should learn language structures in context and use them to convey meaning. In standards-based world language classrooms, the instructional focus is on function and not the examination of irregularity and complex grammatical paradigms about the target language. Language structures should be addressed inasmuch as they serve the communicative task and not as an end goal unto themselves. The AP Spanish Language and Culture course strives to promote both fluency and accuracy in language use and not to

© 2013 The College Board.

overemphasize grammatical accuracy at the expense of communication. In order to best facilitate the study of language and culture, the course is taught in the target language.

The AP Spanish Language and Culture course engages students in an exploration of culture in both contemporary and historical contexts. The course develops students' awareness and appreciation of products, both tangible (e.g., tools, books) and intangible (e.g., laws, conventions, institutions); practices (patterns of social interactions within a culture); and perspectives (values, attitudes, and assumptions that underlie both practices and products).

Structure of the Curriculum Framework

This curriculum framework begins by outlining the *learning objectives* and the *achievement level descriptions* that define student performance across five levels.

Tools for instructional design come next: *themes* to integrate language, content, and culture into an interrelated series of lessons and activities; *recommended contexts* for exploring each theme; and *overarching essential questions* to engage learners and to guide classroom investigations, learning activities, and performance assessments.

The following graphic illustrates how the components of the curriculum framework relate to how a teacher designs and delivers instruction.

Learning Objectives and Achievement Level Descriptions

At the core of the AP Spanish Language and Culture course are six groups of *learning objectives* identifying what students should know and be able to do across the three modes of communication. These objectives outline expectations of student abilities in the following areas:

Spoken Interpersonal Communication
Written Interpersonal Communication
Audio, Visual, and Audiovisual Interpretive Communication
Written and Print Interpretive Communication
Spoken Presentational Communication
Written Presentational Communication

The degree to which student performance meets the *learning objectives* in each area is articulated in the *achievement level descriptions*, which clearly define how well students at each level perform. Because of the interrelated nature of the modes of communication, all the *achievement level descriptions* work in concert with one another and should be considered holistically. While references to levels 1–5 cannot precisely predict a student's ultimate AP Exam score, AP teachers can use this information to develop better insight into individual student performance and adjust the curriculum and instruction throughout the course.

Overarching Premise

When communicating, students in the AP Spanish Language and Culture course demonstrate an understanding of the culture(s), incorporate interdisciplinary topics (Connections), make comparisons between the native language and the target language and between cultures (Comparisons), and use the target language in real-life settings (Communities).

© 2013 The College Board.

Interpersonal Communication

The Interpersonal Mode is characterized by active negotiation of meaning among individuals. Participants observe and monitor one another to see how their meanings and intentions are being communicated. Adjustments and clarifications can be made accordingly.

Learning Objectives for Spoken Interpersonal Communication

Primary Objective: The student engages in spoken interpersonal communications.

- The student engages in the oral exchange of information, opinions, and ideas in a variety of time frames in formal situations.
- The student engages in the oral exchange of information, opinions, and ideas in a variety of time frames in informal situations.
- The student elicits information and clarifies meaning by using a variety of strategies.
- The student states and supports opinions in oral interactions.
- The student initiates and sustains interaction through the use of various verbal and nonverbal strategies.
- The student understands a variety of vocabulary, including idiomatic and culturally appropriate expressions.
- The student uses a variety of vocabulary, including idiomatic and culturally appropriate expressions on a variety of topics.
- The student self-monitors and adjusts language production.
- The student demonstrates an understanding of the features of target culture communities (e.g., geographic, historical, artistic, social, or political).
- The student demonstrates knowledge and understanding of content across disciplines.

Achievement Level Descriptions for Spoken Interpersonal Communication

Achievement Level 5

(a) **Interaction.** Students at Achievement Level 5 initiate, maintain, and close conversations on familiar topics in a culturally appropriate manner most of the time. They understand and usually use culturally appropriate expressions and gestures.
(b) **Strategies.** Students at this level use a variety of communication strategies as necessary to maintain communication (e.g., circumlocution, paraphrasing, requesting clarification or information). They often use questions to maintain the conversation and use context to deduce meaning of unfamiliar words. They often recognize errors and self-correct.
(c) **Opinions.** They state opinions and demonstrate some ability to support opinions on topics of personal interest.
(d) **Language structures.** These students use a variety of simple and compound sentences and some complex sentences on familiar topics, and they narrate and describe in all time frames, with a few errors that do not impede comprehensibility.
(e) **Vocabulary.** They understand and use vocabulary on a variety of familiar topics, including some beyond those of personal interest.
(f) **Register.** Their choice of register is usually appropriate for the audience, and its use is consistent despite occasional errors.
(g) **Pronunciation.** Their pronunciation and intonation patterns, pacing, and delivery are comprehensible to an audience unaccustomed to interacting with language learners; their pronunciation is consistent, with few errors that do not impede comprehensibility.
(h) **Cultures, connections, and comparisons.** These students identify the relationships among products, practices, and perspectives in the target culture(s) and compare them with their own culture. They compare and contrast a variety of geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 4

(a) **Interaction.** Students at Achievement Level 4 initiate, maintain, and close conversations on familiar topics. They usually interact in a culturally appropriate manner and may understand and use culturally appropriate expressions and gestures.
(b) **Strategies.** These students use some communication strategies to maintain communication (e.g., circumlocution, paraphrasing, restatement, asking for clarification or information). They use context to deduce meaning of unfamiliar words. They recognize some errors and self-correct.

© 2013 The College Board.

(c) **Opinions.** They provide opinions on familiar topics with limited ability to provide support.
(d) **Language structures.** They use simple and compound sentences and a few complex sentences with some accuracy. They narrate and describe in all time frames, demonstrating the most accuracy in present time and some accuracy in the past and future.
(e) **Vocabulary.** These students understand and use vocabulary on a variety of familiar topics, including some culturally appropriate and idiomatic expressions related to topics of personal interest.
(f) **Register.** Their choice of register is usually appropriate for the situation, yet some shifts between formal and informal registers occur.
(g) **Pronunciation.** Their pronunciation and intonation are comprehensible to an audience accustomed to interacting with language learners; errors do not impede comprehensibility.
(h) **Cultures, connections, and comparisons.** These students describe in some detail products or practices of the target culture(s) and may identify perspectives of the target culture(s) with some inaccuracies. They compare and contrast some geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 3

(a) **Interaction.** Students at Achievement Level 3 initiate, maintain, and close conversations on familiar topics and sometimes interact in a culturally appropriate manner.
(b) **Strategies.** These students occasionally use communication strategies, such as circumlocution and paraphrasing. Students at this level of achievement often seek clarification of meaning by asking for repetition. They use context to deduce meaning of unfamiliar words. Students may recognize errors; attempts at correction are only occasionally successful.
(c) **Opinions.** These students state opinions on topics of personal interest, and they understand and respond to questions and statements on familiar topics.
(d) **Language structures.** Their narrations and descriptions are characterized by strings of simple sentences and a few compound sentences, with the most accuracy in the present time and some accuracy in other time frames.
(e) **Vocabulary.** They understand and use vocabulary from familiar thematic word groups, including occasionally some culturally appropriate and idiomatic expressions.
(f) **Register.** Choice of register may be inappropriate for the intended audience, and shifts between formal and informal registers occur.

Return to the Table of Contents
© 2013 The College Board.

(g) **Pronunciation.** Their pronunciation and intonation are comprehensible to an audience accustomed to interacting with language learners, yet errors occasionally impede comprehensibility.
(h) **Cultures, connections, and comparisons.** They identify some cultural products or practices of the target culture(s) and may identify a few common perspectives. They identify some geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 2

(a) **Interaction.** Students at Achievement Level 2 initiate and close conversations on topics of personal interest and maintain them by making basic statements. Comprehension of messages on familiar topics is limited, and they have little ability to interact in a culturally appropriate manner. Their communication often requires intervention from others to attain comprehensibility.
(b) **Strategies.** They may seek clarification by asking for basic information or repetition. They seldom recognize errors, and attempts at self-correction usually fail.
(c) **Opinions.** When stating opinions, they are limited to expressing likes and dislikes.
(d) **Language structures.** These students produce simple sentences with some accuracy in the present time.
(e) **Vocabulary.** They understand and use a limited range of vocabulary from familiar thematic word groups, including memorized phrases and a few idiomatic expressions.
(f) **Register.** These students communicate mainly using the familiar register.
(g) **Pronunciation.** Their pronunciation and intonation are mostly comprehensible to an audience accustomed to interacting with language learners; errors impede comprehensibility.
(h) **Cultures, connections, and comparisons.** These students identify a few common cultural products or practices and a few geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 1

Students at Achievement Level 1 demonstrate performances that are less proficient than those outlined for Level 2.

© 2013 The College Board.

Learning Objectives for Written Interpersonal Communication

Primary Objective: The student engages in written interpersonal communications.

- The student engages in the written exchange of information, opinions, and ideas in a variety of time frames in formal situations.
- The student engages in the written exchange of information, opinions, and ideas in a variety of time frames in informal situations.
- The student writes formal correspondence in a variety of media using appropriate formats and conventions.
- The student writes informal correspondence in a variety of media using appropriate formats and conventions.
- The student elicits information and clarifies meaning by using a variety of strategies.
- The student states and supports opinions in written interactions.
- The student initiates and sustains interaction during written interpersonal communication in a variety of media.
- The student understands a variety of vocabulary, including idiomatic and culturally appropriate expressions.
- The student uses a variety of vocabulary, including idiomatic and culturally appropriate expressions on a variety of topics.
- The student self-monitors and adjusts language production.
- The student demonstrates an understanding of the features of target culture communities (e.g., geographic, historical, artistic, social, or political).
- The student demonstrates knowledge and understanding of content across disciplines.

Achievement Level Descriptions for Written Interpersonal Communication

Achievement Level 5

(a) **Interaction.** Students at Achievement Level 5 initiate, maintain, and close written exchanges in formal and informal communications with good control of culturally appropriate conventions. They understand and respond to questions on familiar topics with some elaboration and detail.
(b) **Strategies.** These students use a variety of communication strategies as necessary in order to maintain communication (e.g., circumlocution, paraphrasing, requesting clarification or information). They use context to deduce meaning of unfamiliar words and often recognize errors and self-correct.
(c) **Opinions.** They state opinions and demonstrate some ability to support opinions on topics of personal interest.
(d) **Language structures.** These students use a variety of simple and compound sentences and some complex sentences on familiar topics, and they narrate and describe in all time frames, with a few errors that do not impede comprehensibility. They use transitional phrases and cohesive devices.
(e) **Writing conventions.** Their writing is marked by consistent use of standard conventions of the written language (e.g., capitalization, orthography, accents) as appropriate for the medium of communication (e.g., online chat, email, letters, blogs, bulletin boards).
(f) **Vocabulary.** They understand and use vocabulary on a variety of familiar topics, including some beyond those of personal interest. They understand and use some culturally appropriate vocabulary and idiomatic expressions.
(g) **Register.** Their choice of register is usually appropriate for the audience, and its use is consistent despite occasional errors.
(h) **Cultures, connections, and comparisons.** These students identify the relationships among products, practices, and perspectives in the target culture(s) and compare them with their own culture. They compare and contrast a variety of geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 4

(a) **Interaction.** Students at Achievement Level 4 initiate, maintain, and close written exchanges in formal and informal communications, although control of culturally appropriate conventions is inconsistent. They understand and respond to questions and statements on familiar topics with some elaboration and detail.

© 2013 The College Board.

(b) **Strategies.** These students use communication strategies (e.g., circumlocution, paraphrasing, asking for clarification or information) to maintain communication. They use context to deduce meaning of unfamiliar words. They recognize some errors and self-correct.
(c) **Opinions.** They provide opinions on familiar topics with limited ability to provide support.
(d) **Language structures.** They are usually accurate when writing about familiar topics using a variety of simple, compound, and a few complex sentences in all time frames, demonstrating the most accuracy in present time and some accuracy in the past and future. They use some transitional phrases and cohesive devices.
(e) **Writing conventions.** Their writing is generally consistent in the use of standard conventions of the written language (e.g., capitalization, orthography, accents) as appropriate for the medium of communication (e.g., online chat, email, letters, blogs, bulletin boards).
(f) **Vocabulary.** These students understand and use vocabulary on a variety of familiar topics, including some culturally appropriate and idiomatic expressions related to topics of personal interest.
(g) **Register.** Their choice of register is usually appropriate for the situation, yet some shifts between formal and informal registers occur.
(h) **Cultures, connections, and comparisons.** These students describe in some detail products or practices of the target culture(s) and may identify perspectives of the target culture(s) with some inaccuracies. They compare and contrast some geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 3

(a) **Interaction.** Students at Achievement Level 3 initiate, maintain, and close written exchanges on familiar topics. They understand and respond to questions and statements on familiar topics.
(b) **Strategies.** These students occasionally use communication strategies (e.g., circumlocution, restatement, requesting clarification or information) when interacting on familiar topics, and they occasionally use context to deduce meaning of unfamiliar words. They often seek clarification of meaning by asking for repetition. They may recognize errors; attempts at self-editing are occasionally successful.
(c) **Opinions.** They state opinions on topics of personal interest.
(d) **Language structures.** They produce strings of simple sentences and a few compound sentences, with the most accuracy in the present time and some accuracy in other time frames.

Return to the Table of Contents
© 2013 The College Board.

(e) **Writing conventions.** Their writing shows inconsistent use of standard conventions of the written language (e.g., capitalization, orthography, accents) as appropriate for the medium of communication (e.g., online chat, email, letters, blogs, bulletin boards) that sometimes interferes with meaning.
(f) **Vocabulary.** These students understand and use vocabulary from familiar thematic word groups and occasionally incorporate some culturally appropriate and idiomatic expressions.
(g) **Register.** Their choice of register may be inappropriate for the intended audience, and shifts between formal and informal registers occur.
(h) **Cultures, connections, and comparisons.** These students identify some cultural products or practices of the target culture(s) and may identify a few common perspectives. They identify some geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 2

(a) **Interaction.** Students at Achievement Level 2 respond to questions and statements on topics of personal interest in written exchanges.
(b) **Strategies.** These students may seek clarification by asking for basic information. They seldom recognize errors, and attempts at self-editing usually fail.
(c) **Opinions.** When stating opinions, they are limited to expressing likes and dislikes.
(d) **Language structures.** They produce simple sentences with some accuracy in the present time. There is inconsistent control of basic structures.
(e) **Writing conventions.** Their writing shows little use of standard conventions of the written language (e.g., capitalization, orthography, accents) as appropriate for the medium of communication (e.g., online chat, email, letters, blogs, bulletin boards).
(f) **Vocabulary.** They understand and use a limited range of vocabulary from familiar thematic word groups, including memorized phrases and a few idiomatic expressions.
(g) **Register.** These students communicate mainly using the familiar register.
(h) **Cultures, connections, and comparisons.** These students identify a few common cultural products or practices and a few geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 1

Students at Achievement Level 1 demonstrate performances that are less proficient than those outlined for Level 2.

© 2013 The College Board.

Interpretive Communication

The Interpretive Mode is characterized by the appropriate cultural interpretation of meanings that occur in written and spoken form where there is no recourse to the active negotiation of meaning with the writer or speaker.

Learning Objectives for Audio, Visual, and Audiovisual Interpretive Communication

Primary Objective: The student synthesizes information from a variety of authentic audio, visual, and audiovisual resources.

- The student demonstrates comprehension of content from authentic audio resources.
- The student demonstrates comprehension of content from authentic visual resources.
- The student demonstrates comprehension of content from authentic audiovisual resources.
- The student demonstrates understanding of a variety of vocabulary, including idiomatic and culturally authentic expressions.
- The student understands the purpose of a message and the point of view of its author.
- The student identifies the distinguishing features (e.g., type of resource, intended audience, purpose) of authentic audio, visual, and audiovisual resources.
- The student demonstrates critical viewing or listening of audio, visual, and audiovisual resources in the target cultural context.
- The student monitors comprehension and uses other sources to enhance understanding.
- The student examines, compares, and reflects on products, practices, and perspectives of the target culture(s).
- The student evaluates similarities and differences in the perspectives of the target culture(s) and his or her own culture(s) as found in audio, visual, and audiovisual resources.
- The student demonstrates an understanding of the features of target culture communities (e.g., geographic, historical, artistic, social, or political).
- The student demonstrates knowledge and understanding of content across disciplines.

Achievement Level Descriptions for Audio, Visual, and Audiovisual Interpretive Communication

Achievement Level 5

(a) **Comprehension of content.** When listening to or viewing a variety of authentic audio, visual, and audiovisual resources, students at Achievement Level 5 identify main ideas, some significant details, and the intended audience on a range of topics. These students use context to deduce the meaning of unfamiliar words and usually infer implied meanings.
(b) **Critical viewing and listening.** These students identify significant distinguishing features (e.g., type of resource, intended audience, purpose) of authentic audio, visual, and audiovisual resources.
(c) **Vocabulary.** They comprehend a variety of vocabulary, including culturally appropriate vocabulary and some idiomatic expressions related to topics of personal interest and limited unfamiliar topics.
(d) **Cultures, connections, and comparisons.** These students identify the relationship among products, practices, and perspectives in the target culture(s) and demonstrate understanding of most of the content of familiar interdisciplinary topics presented in the resource material. They compare and contrast geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 4

(a) **Comprehension of content.** When listening to or viewing a variety of authentic audio, visual, and audiovisual resources, students at Achievement Level 4 identify most main ideas and some significant details on familiar topics. These students use context to deduce the meaning of unfamiliar words and make some inferences.
(b) **Critical viewing and listening.** They identify some distinguishing features (e.g., type of resource, intended audience, purpose) of authentic audio, visual, and audiovisual resources.
(c) **Vocabulary.** These students comprehend most vocabulary, including some culturally appropriate and idiomatic expressions related to topics of personal interest.
(d) **Cultures, connections, and comparisons.** These students identify the products, practices, and some perspectives of the target culture(s) and demonstrate understanding of some content of familiar interdisciplinary topics presented in the resource material. They compare and contrast some geographic, historical, artistic, social, or political features of target culture communities.

© 2013 The College Board.

Achievement Level 3

(a) **Comprehension of content.** When listening to or viewing a variety of authentic audio, visual, and audiovisual resources, students at Achievement Level 3 identify some main ideas and details on familiar topics. They respond accurately to basic information questions (e.g., Who? What? When? Where?) and can sometimes use context to deduce meaning of unfamiliar words and make limited inferences.
(b) **Critical viewing and listening.** They identify a few distinguishing features (e.g., type of resource, intended audience, purpose) of authentic audio, visual, and audiovisual resources.
(c) **Vocabulary.** They comprehend a variety of vocabulary on topics of personal interest.
(d) **Cultures, connections, and comparisons.** These students are able to identify the cultural products and practices and demonstrate understanding of basic content of familiar interdisciplinary topics presented in the resource material. They are also able to identify a few geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 2

(a) **Comprehension of content.** When listening to or viewing a variety of authentic audio, visual, and audiovisual resources, students at Achievement Level 2 identify a few main ideas or details and are sometimes unable to respond to basic information questions.
(b) **Critical viewing and listening.** These students identify few distinguishing features (e.g., type of resource, intended audience, purpose) of authentic audio, visual, and audiovisual resources.
(c) **Vocabulary.** They understand a limited range of vocabulary from familiar thematic word groups, including memorized phrases and a few idiomatic expressions.
(d) **Cultures, connections, and comparisons.** These students identify a few common cultural products or practices of the target culture(s) and demonstrate limited understanding of the basic content of familiar interdisciplinary topics presented in the resource material. They are able to identify a few geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 1

Students at Achievement Level 1 demonstrate performances that are less proficient than those outlined for Level 2.

Learning Objectives for Written and Print Interpretive Communication

Primary Objective: The student synthesizes information from a variety of authentic written and print resources.

- The student demonstrates comprehension of content from authentic written and print resources.
- The student demonstrates understanding of a variety of vocabulary, including idiomatic and culturally authentic expressions.
- The student understands the purpose of a message and the point of view of its author.
- The student identifies the distinguishing features (e.g., type of resource, intended audience, purpose) of authentic written and print resources.
- The student demonstrates critical reading of written and print resources in the target cultural context.
- The student monitors comprehension and uses other sources to enhance understanding.
- The student examines, compares, and reflects on products, practices, and perspectives of the target culture(s).
- The student evaluates similarities and differences in the perspectives of the target culture(s) and his or her own culture(s) as found in written and print resources.
- The student demonstrates an understanding of the features of target culture communities (e.g., geographic, historical, artistic, social, or political).
- The student demonstrates knowledge and understanding of content across disciplines.

Achievement Level Descriptions for Written and Print Interpretive Communication

Achievement Level 5

(a) **Comprehension of content.** When reading a variety of authentic written and print resources, students at Achievement Level 5 identify main ideas and supporting details on a range of topics. They use context to deduce the meaning of unfamiliar words and usually infer implied meanings.
(b) **Critical reading.** They demonstrate critical reading skills and usually differentiate facts from opinions. These students identify the intended audience, source, and purpose and describe the basic context of the resource material.
(c) **Vocabulary.** These students comprehend a variety of vocabulary, including culturally appropriate vocabulary and some idiomatic expressions related to topics of personal interest and limited unfamiliar topics.
(d) **Cultures, connections, and comparisons.** These students identify the relationship among products, practices, and perspectives in the target culture(s) and demonstrate understanding of most of the content of the interdisciplinary topics presented in the resource material. They also compare and contrast geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 4

(a) **Comprehension of content.** When reading a variety of authentic written and print resources, students at Achievement Level 4 identify most main ideas and some supporting details on familiar topics. They use various reading strategies to aid in the literal comprehension of the text. These students make some inferences and use context to deduce the meaning of unfamiliar words.
(b) **Critical reading.** These students identify the intended audience, source, and purpose of the resource.
(c) **Vocabulary.** They comprehend most vocabulary, including some culturally appropriate and idiomatic expressions related to topics of personal interest.
(d) **Cultures, connections, and comparisons.** These students identify the products, practices, and some perspectives of the target culture(s) and demonstrate understanding of some content of the interdisciplinary topics presented in the resources. They compare and contrast some geographic, historical, artistic, social, or political features of target culture communities.

Return to the Table of Contents

Achievement Level 3

(a) **Comprehension of content.** When reading a variety of authentic written and print resources, students at Achievement Level 3 identify some main ideas and supporting details on familiar topics. They respond accurately to basic information questions (e.g., Who? What? When? Where?), make limited inferences, and use contextual clues to assist in the literal comprehension. They can sometimes use context to deduce meaning of unfamiliar words.
(b) **Critical reading.** These students identify the source and purpose of the resource.
(c) **Vocabulary.** They comprehend a variety of vocabulary on topics of personal interest.
(d) **Cultures, connections, and comparisons.** They are able to identify the products and practices of the target culture(s) and demonstrate understanding of basic content of familiar interdisciplinary topics presented in the resource material. They are also able to identify a few geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 2

(a) **Comprehension of content.** When reading a variety of authentic written and print resources, students at Achievement Level 2 identify some main ideas and details, but they are sometimes unable to respond to basic information questions. They occasionally use contextual clues for basic comprehension.
(b) **Critical reading.** They identify the source of the resource.
(c) **Vocabulary.** They understand a limited range of vocabulary from familiar thematic word groups, including memorized phrases and a few idiomatic expressions.
(d) **Cultures, connections, and comparisons.** These students identify a few common cultural products or practices of the target culture(s) and demonstrate limited understanding of basic content of familiar interdisciplinary topics presented in the resource material. They are able to identify a few geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 1

Students at Achievement Level 1 demonstrate performances that are less proficient than those outlined for Level 2.

Presentational Communication

The Presentational Mode is characterized by the creation of messages in a manner that facilitates interpretation by members of the target culture where no direct opportunity for the active negotiation of meaning exists.

Learning Objectives for Spoken Presentational Communication

Primary Objective: The student plans, produces, and presents spoken presentational communications.

- The student produces a variety of creative oral presentations (e.g., original story, personal narrative, speech, performance).
- The student retells or summarizes information in narrative form, demonstrating a consideration of audience.
- The student creates and gives persuasive speeches.
- The student expounds on familiar topics and those requiring research.
- The student uses reference tools, acknowledges sources, and cites them appropriately.
- The student self-monitors and adjusts language production.
- The student demonstrates an understanding of the features of target culture communities (e.g., geographic, historical, artistic, social, or political).
- The student demonstrates knowledge and understanding of content across disciplines.

Achievement Level Descriptions for Spoken Presentational Communication

Achievement Level 5

(a) **Discourse and development.** When planning, producing, and presenting spoken presentational communications, students at Achievement Level 5 use paragraph-length discourse with mostly appropriate use of cohesive devices to report, explain, and narrate on a range of familiar topics. They develop ideas by showing evidence of synthesis and interpretation of background information.
(b) **Strategies.** These students employ a variety of strategies to clarify and elaborate content of presentation; self-correction is mostly successful.
(c) **Language structures.** These students use a variety of simple and compound sentences and some complex sentences in major time frames. Errors do not impede comprehensibility.
(d) **Vocabulary.** These students use vocabulary on a variety of familiar topics, including some beyond those of personal interest. They use some culturally appropriate vocabulary and idiomatic expressions.
(e) **Pronunciation.** Their pronunciation and intonation patterns, pacing, and delivery are comprehensible to an audience unaccustomed to interacting with language learners.
(f) **Register.** Their choice of register is usually appropriate for the audience, and its use is consistent despite occasional errors.
(g) **Cultures, connections, and comparisons.** These students identify the relationship among products, practices, and perspectives in the target culture(s) and demonstrate understanding of most of the content of the interdisciplinary topics presented in the resource material. They also compare and contrast geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 4

(a) **Discourse and development.** When planning, producing, and presenting spoken presentational communications, students at Achievement Level 4 use mostly paragraph-length discourse with appropriate use of some cohesive devices to explain, express opinions, describe, and narrate on familiar topics. Their work shows some evidence of ideas that are developed and supported with examples.
(b) **Strategies.** These students may employ some communication strategies appropriately, such as paraphrasing and clarification; self-correction is often successful.
(c) **Language structures.** They use simple and compound sentences and a few complex sentences with some accuracy; errors do not impede comprehensibility.

© 2013 The College Board.

(d) **Vocabulary.** They use vocabulary on a variety of familiar topics, including some culturally appropriate and idiomatic expressions related to topics of personal interest.
(e) **Pronunciation.** Their pronunciation, intonation, pacing, and delivery are mostly comprehensible to an audience accustomed to interacting with language learners; errors do not impede comprehensibility.
(f) **Register.** Their choice of register is usually appropriate for the audience, yet some shifts between formal and informal registers occur.
(g) **Cultures, connections, and comparisons.** These students describe, in some detail, products or practices of the target culture(s), yet they may identify perspectives of the target culture(s) with some inaccuracies. They may compare and contrast some geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 3

(a) **Discourse and development.** When planning, producing, and presenting spoken presentational communications, students at Achievement Level 3 use strings of sentences and a few basic cohesive devices to express personal opinions, describe, and narrate on familiar topics. They show evidence of some development of ideas and basic structural organization (introduction, argument, and conclusion).
(b) **Strategies.** These students employ limited communication strategies, such as repetition and emphasis; self-correction is occasionally successful.
(c) **Language structures.** They produce simple and compound sentences with the most accuracy in the present time and some accuracy in other time frames. Errors may impede comprehensibility.
(d) **Vocabulary.** These students use vocabulary from familiar thematic word groups and occasionally incorporate some culturally appropriate and idiomatic expressions.
(e) **Pronunciation.** Their pronunciation and intonation are comprehensible to an audience accustomed to interacting with language learners, yet errors occasionally impede comprehensibility.
(f) **Register.** Their choice of register may be inappropriate for the intended audience, and shifts between formal and informal registers occur.
(g) **Cultures, connections, and comparisons.** They identify some cultural products and practices of the target culture(s) and may identify a few common perspectives. They are also able to identify a few geographic, historical, artistic, social, or political features of target culture communities.

Return to the Table of Contents
© 2013 The College Board.

Achievement Level 2

(a) **Discourse and development.** When planning, producing, and presenting spoken presentational communications, students at Achievement Level 2 use strings of sentences to express personal opinions, describe, and narrate on topics of personal interest. There is little evidence of development of ideas, and structural organization may be lacking.
(b) **Strategies.** They seldom recognize errors, and attempts at self-correction usually fail.
(c) **Language structures.** They produce simple sentences with some accuracy in the present time. Their control of basic structures is inconsistent; errors impede comprehensibility.
(d) **Vocabulary.** Students at this level use vocabulary from familiar thematic word groups, including memorized phrases and a few idiomatic expressions.
(e) **Pronunciation.** Their pronunciation and intonation are mostly comprehensible to an audience accustomed to interacting with language learners; errors impede comprehensibility.
(f) **Register.** These students communicate mainly using the familiar register.
(g) **Cultures, connections, and comparisons.** These students identify a few common cultural products or practices and a few geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 1

Students at Achievement Level 1 demonstrate performances that are less proficient than those outlined for Level 2.

Learning Objectives for Written Presentational Communication

Primary Objective: The student plans and produces written presentational communications.

- The student produces a variety of creative writings (e.g., original story, personal narrative, script).
- The student retells or summarizes information in narrative form, demonstrating a consideration of audience.
- The student produces persuasive essays.
- The student produces expository writing, including researched reports.
- The student uses reference tools, acknowledges sources, and cites them appropriately.
- The student self-edits written work for content, organization, and grammar.
- The student demonstrates an understanding of the features of target culture communities (e.g., geographic, historical, artistic, social, or political).
- The student demonstrates knowledge and understanding of content across disciplines.

Achievement Level Descriptions for Written Presentational Communication

Achievement Level 5

(a) **Discourse and development.** When planning, producing, and presenting written presentational communications, students at Achievement Level 5 use paragraph-length discourse with mostly appropriate use of cohesive devices to report, explain, and narrate on a range of familiar topics. They integrate content from multiple sources to support their presentation.
(b) **Strategies.** These students employ a variety of strategies to clarify and elaborate the content of the presentation; self-correction is mostly successful.
(c) **Language structures.** These students use a variety of simple and compound sentences and some complex sentences in major time frames. Errors do not impede comprehensibility.
(d) **Vocabulary.** These students use vocabulary on a variety of familiar topics, including some beyond those of personal interest. They use some culturally appropriate vocabulary and idiomatic expressions.
(e) **Writing conventions.** They demonstrate consistent use of standard conventions of the written language (e.g., capitalization, orthography, accents). Errors do not impede comprehensibility.
(f) **Register.** Their choice of register is appropriate for the audience, and its use is consistent despite occasional errors.
(g) **Cultures, connections, and comparisons.** These students identify the relationship among products, practices, and perspectives in the target culture(s) and demonstrate understanding of most of the content of the interdisciplinary topics presented in the resource material. They also compare and contrast geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 4

(a) **Discourse and development.** When planning, producing, and presenting written presentational communications, students at Achievement Level 4 use mostly paragraph-length discourse with appropriate use of some cohesive devices to explain, express opinions, describe, and narrate on familiar topics. They summarize multiple sources with limited integration of content to support their presentation.
(b) **Strategies.** These students employ some communication strategies appropriately, such as paraphrasing and clarification; self-editing is often successful.
(c) **Language structures.** They use simple and compound sentences and a few complex sentences with some accuracy; errors do not impede comprehensibility.

© 2013 The College Board.

(d) **Vocabulary.** They use vocabulary on a variety of familiar topics, including some culturally appropriate and idiomatic expressions related to topics of personal interest.
(e) **Writing conventions.** They demonstrate generally consistent use of standard conventions of the written language (e.g., capitalization, orthography, accents); errors do not impede comprehensibility.
(f) **Register.** Errors in choice of register are infrequent, yet shifts between formal and informal registers may occur.
(g) **Cultures, connections, and comparisons.** They describe in some detail products or practices of the target culture(s), yet they may identify perspectives of the target culture(s) with some inaccuracies. They may compare and contrast some geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 3

(a) **Discourse and development.** When planning, producing, and presenting written presentational communications, students at Achievement Level 3 use strings of sentences and a few basic cohesive devices to express personal opinions, describe, and narrate on familiar topics. They summarize content from sources to support their presentation.
(b) **Strategies.** These students may employ some communication strategies appropriately, such as paraphrasing and clarification; self-editing is occasionally successful.
(c) **Language structures.** They produce simple and compound sentences with the most accuracy in the present time and some accuracy in other time frames. Errors may impede comprehensibility.
(d) **Vocabulary.** These students use vocabulary from familiar thematic word groups and occasionally incorporate some culturally appropriate and idiomatic expressions.
(e) **Writing conventions.** Their use of standard conventions of the written language (e.g., capitalization, orthography, accents) is inconsistent, which may cause confusion for the reader.
(f) **Register.** Their choice of register may be inappropriate for the intended audience, and shifts between formal and informal registers occur.
(g) **Cultures, connections, and comparisons.** They identify some cultural products and practices of the target culture(s) and may identify a few common perspectives. They are also able to identify a few geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 2

(a) **Discourse and development.** When planning, producing, and presenting written presentational communications, students at Achievement Level 2 use strings of sentences to express personal opinions, describe, and narrate on topics of personal interest. They summarize sources without supporting the presentation.
(b) **Strategies.** These students employ limited presentational strategies to clarify meaning; efforts at self-editing usually fail.
(c) **Language structures.** They produce simple sentences with some accuracy in the present time. Their control of basic structures is inconsistent; errors impede comprehensibility.
(d) **Vocabulary.** Students at this level use vocabulary from familiar thematic word groups, including memorized phrases and a few idiomatic expressions.
(e) **Writing conventions.** Their writing shows little use of standard conventions of the written language (e.g., capitalization, orthography, accents).
(f) **Register.** These students communicate mainly using the familiar register.
(g) **Cultures, connections, and comparisons.** These students identify a few common cultural products or practices and a few geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 1

Students at Achievement Level 1 demonstrate performances that are less proficient than those outlined for Level 2.

Course Themes

Designing the AP Spanish Language and Culture course around themes creates an interesting, meaningful context in which to explore a variety of language concepts. Themes help teachers integrate language, content, and culture into an interrelated series of lessons and activities that promote the use of the language in a variety of contexts. A theme may be used to plan a brief unit of study, a comprehensive unit spanning a greater period of time, or to connect with courses in other disciplines.

The AP Spanish Language and Culture course is structured around six themes:

© 2013 The College Board.

Recommended Contexts and Essential Questions

Each theme includes a number of *recommended contexts* for exploration. Teachers are encouraged to engage students in the various themes by considering historical, contemporary, and future perspectives as appropriate. Teachers should assume complete flexibility in resource selection and instructional exploration of the six themes. The recommended contexts are not intended as prescriptive or required, but rather they serve as suggestions for addressing the themes.

One way to design instruction with the themes is to identify *overarching essential questions* to motivate learners and to guide classroom investigations, learning activities, and performance assessments. Essential questions are designed to spark curiosity and engage students in real-life, problem-solving tasks. They allow students to investigate and express different views on real world issues, make connections to other disciplines, and compare aspects of the target culture(s) to their own. Essential questions also lend themselves well to interdisciplinary inquiry, asking students to apply skills and perspectives across content areas while working with content from language, literature, and cultures of the Spanish-speaking world.

Integrating Themes, Recommended Contexts, and Essential Questions

AP Spanish Language and Culture teachers are encouraged to consider the interconnectedness of the themes. A unit on environmental issues (Global Challenges) might, for example, touch upon recommended contexts from more than one theme. Students might study inventions as catalysts of change (Science and Technology), influences from religious beliefs or social values (Personal and Public Identities), or the aesthetics of eco-friendly architecture (Beauty and Aesthetics).

The recommended contexts for exploring a theme can be varied depending on available authentic materials, teacher-developed resources, and commercially produced materials, as well as teacher creativity and student interest. The design of the course should include essential questions that will capture students' interest, engaging authentic materials, and learning activities that help students consider themes across time and across cultures.

It should be noted that literature is not merely a recommended context for one of the course themes (Beauty and Aesthetics) but should serve as a powerful vehicle for delivering content to address all of the themes. Literary works may be incorporated throughout the AP Spanish Language and

Return to the Table of Contents

Culture course in relation to a variety of themes, such as the environment (Global Challenges), rites of passage (Contemporary Life), or issues of cultural assimilation (Personal and Public Identities).

Themes, Recommended Contexts, and Overarching Essential Questions

Theme: Global Challenges / *Los desafíos mundiales*

Recommended Contexts:

- Economic Issues / *Los temas económicos*
- Environmental Issues / *Los temas del medio ambiente*
- Philosophical Thought and Religion / *El pensamiento filosófico y la religión*
- Population and Demographics / *La población y la demografía*
- Social Welfare / *El bienestar social*
- Social Conscience / *La conciencia social*

Overarching Essential Questions:

- What environmental, political, and social issues pose challenges to societies throughout the world? / *¿Cuáles son los desafíos sociales, políticos y del medio ambiente que enfrentan las sociedades del mundo?*
- What are the origins of those issues? / *¿Cuáles son los orígenes de esos desafíos?*
- What are possible solutions to those challenges? / *¿Cuáles son algunas posibles soluciones a esos desafíos?*

Theme: Science and Technology / *La ciencia y la tecnología*

Recommended Contexts:

- Access to Technology / *El acceso a la tecnología*
- Effects of Technology on Self and Society / *Los efectos de la tecnología en el individuo y en la sociedad*
- Health Care and Medicine / *El cuidado de la salud y la medicina*
- Innovations / *Las innovaciones tecnológicas*
- Natural Phenomena / *Los fenómenos naturales*
- Science and Ethics / *La ciencia y la ética*

© 2013 The College Board.

Overarching Essential Questions:

- How do developments in science and technology affect our lives? / *¿Qué impacto tiene el desarrollo científico y tecnológico en nuestras vidas?*
- What factors have driven innovation and discovery in the fields of science and technology? / *¿Qué factores han impulsado el desarrollo y la innovación en la ciencia y la tecnología?*
- What role does ethics play in scientific advancement? / *¿Qué papel cumple la ética en los avances científicos?*

Theme: Contemporary Life / *La vida contemporánea*

Recommended Contexts:

- Education and Careers / *La educación y las carreras profesionales*
- Entertainment / *El entretenimiento y la diversión*
- Travel and Leisure / *Los viajes y el ocio*
- Lifestyles / *Los estilos de vida*
- Relationships / *Las relaciones personales*
- Social Customs and Values / *Las tradiciones y los valores sociales*
- Volunteerism / *El trabajo voluntario*

Overarching Essential Questions:

- How do societies and individuals define quality of life? / *¿Cómo definen los individuos y las sociedades su propia calidad de vida?*
- How is contemporary life influenced by cultural products, practices, and perspectives? / *¿Cómo influyen los productos culturales, las prácticas y las perspectivas de la gente en la vida contemporánea?*
- What are the challenges of contemporary life? / *¿Cuáles son los desafíos de la vida contemporánea?*

Theme: Personal and Public Identities / *Las identidades personales y públicas*

Recommended Contexts:

- Alienation and Assimilation / *La enajenación y la asimilación*
- Heroes and Historical Figures / *Los héroes y los personajes históricos*
- National and Ethnic Identities / *La identidad nacional y la identidad étnica*
- Personal Beliefs / *Las creencias personales*

Return to the Table of Contents

© 2013 The College Board.

- Personal Interests / *Los intereses personales*
- Self-Image / *La autoestima*

Overarching Essential Questions:

- How are aspects of identity expressed in various situations? / *¿Cómo se expresan los distintos aspectos de la identidad en diversas situaciones?*
- How do language and culture influence identity? / *¿Cómo influyen la lengua y la cultura en la identidad de una persona?*
- How does one's identity develop over time? / *¿Cómo se desarrolla la identidad de una persona a lo largo del tiempo?*

Theme: Families and Communities / *Las familias y las comunidades*

Recommended Contexts:

- Customs and Values / *Las tradiciones y los valores*
- Education Communities / *Las comunidades educativas*
- Family Structure / *La estructura de la familia*
- Global Citizenship / *La ciudadanía global*
- Human Geography / *La geografía humana*
- Social Networking / *Las redes sociales*

Overarching Essential Questions:

- What constitutes a family in different societies? / *¿Cómo se define la familia en distintas sociedades?*
- How do individuals contribute to the well-being of communities? / *¿Cómo contribuyen los individuos al bienestar de las comunidades?*
- How do the roles that families and communities assume differ in societies around the world? / *¿Cuáles son las diferencias en los papeles que asumen las comunidades y las familias en las diferentes sociedades del mundo?*

Theme: Beauty and Aesthetics / *La belleza y la estética*

Recommended Contexts:

- Architecture / *La arquitectura*
- Defining Beauty / *Definiciones de la belleza*
- Defining Creativity / *Definiciones de la creatividad*
- Fashion and Design / *La moda y el diseño*

© 2013 The College Board.

- Language and Literature / *El lenguaje y la literatura*
- Visual and Performing Arts / *Las artes visuales y escénicas*

Overarching Essential Questions:

- How are perceptions of beauty and creativity established? / *¿Cómo se establecen las percepciones de la belleza y la creatividad?*
- How do ideals of beauty and aesthetics influence daily life? / *¿Cómo influyen los ideales de la belleza y la estética en la vida cotidiana?*
- How do the arts both challenge and reflect cultural perspectives? / *¿Cómo las artes desafían y reflejan las perspectivas culturales?*

Glossary of Key Terms

Achievement level descriptions: Descriptions of student performance at levels 1–5. AP teachers can use this information to develop better insight into individual student performance and adjust curriculum and instruction.

Communication strategies: Techniques used to clarify meaning or confirm comprehension, such as restatement, asking questions for clarification, circumlocution, and gestures.

Critical viewing/listening/reading: To analyze, react to, and explore audio, visual, audiovisual, print, or written resources in order to better understand meaning and purpose.

Features of target culture communities: Various products, practices, and perspectives of target culture(s), such as television and film, education, customs and traditions, and beliefs and values, including geographic, historical, artistic, social, or political influences.

Learning objectives: Clear, detailed, and finite articulation of what students will know and be able to do.

Perspectives: Values, attitudes, and assumptions that underlie both practices and products but that are less readily evident to the observer.

Practices: Patterns of social interactions within a culture.

Products: Both tangible (e.g., tools, books) and intangible (e.g., laws, conventions, institutions) items.

Reference tools: Items such as a dictionary, a guide to language structure, or a thesaurus.

© 2013 The College Board.

Course Title

SPANISH LANGUAGE A/B (AP)

Prerequisites

By Teacher recommendation

Description of Target Group

This one year, unit course is designed for advanced language students who wish to meet college requirements for credit through the AP program and examination. The class is open to "standard" students (those who have studied Spanish only in school) and "nonstandard" students (those who have studied Spanish abroad or who have learned at home).

Purpose

The purpose of the course is to prepare students for the AP examination. Since the exam evaluates listening, reading, speaking, and writing skills the course provides instruction and practice in these areas. The course will contribute to the A-G college entrance requirements.

Content Standards

Students will be able to converse on a wide range of subjects including personal, cultural, professional, socio-political, and religio-philosophical areas.
Students will be able to read and paraphrase or summarize introductory literature.
Students will be able to respond to a wide range of pattern response drills.
Students will be able to narrate and describe, guided by oral or visual prompts.
Students will be able to understand spoken Spanish in a variety of contexts, including being read to, watching television, and listening to music.

Activities - some examples

Listening:

Transcription of songs
Summary of reading
True/False or multiple choice response to listening selections
Close activities

Reading:

In class and at home selections
Comprehension questions
Summaries and illustrations
Rewriting conclusions
Generating vocabulary lists

Speaking:
Directed response (oral and visual prompts)
Situational conversation cards
Singing - memorization of songs, poetry
Review of weekend activities
Role playing
Production of music video
Writing:
Journal - 3 entries per week
Essays - creative, directed, various formats
Workbook - short answer, practice of structure and syntax
Summaries or retellings of reading
Transcription of personal tape recordings

Assessment

College Board rubrics for the AP Exam will be applied to all formal oral presentations and written work.

The California Oral Competency Interview will be administered to all students at least twice a year.

Discrete item quizzes will evaluate progress in areas of structure, syntax, and orthography.

Informal daily evaluation of oral participation will be used throughout the program.

Instructional Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District.

Curriculum Framework

In today's global community, competence in more than one language is an essential part of communication and cultural understanding. Study of another language not only provides individuals with the ability to express thoughts and ideas for their own purposes but also provides them with access to perspectives and knowledge that are only available through the language and culture. Advanced language learning offers social, cultural, academic, and workplace benefits that will serve students throughout their lives. The proficiencies acquired through the study of languages and literatures endow language learners with cognitive, analytical, and communication skills that carry over into many other areas of their academic studies.

The three modes of communication (Interpersonal, Interpretive, and Presentational) defined in the *Standards for Foreign Language Learning in the 21st Century* are foundational to the AP Spanish Language and Culture course. The AP course provides students with opportunities to demonstrate their proficiency in each of the three modes in the Intermediate to Pre-Advanced range as described in the *ACTFL Performance Guidelines for K–12 Learners*. As such, the AP Spanish Language and Culture course has been designed to provide advanced high school students with a rich and rigorous opportunity to study the language and culture of the Spanish-speaking world that is approximately equivalent to an upper-intermediate college or university Spanish course. It is expected that this course will be offered as the first step in the study of college-level Spanish after approximately three to five years of language study for classroom learners. For native and heritage speakers, there may be a different course of study that leads to the AP Spanish Language and Culture course. Students who are successful in this course and exam may continue their study of college-level Spanish by taking the AP Spanish Literature and Culture course and exam, as well.

The AP Spanish Language and Culture course takes a holistic approach to language proficiency and recognizes the complex interrelatedness of comprehension and comprehensibility, vocabulary usage, language control, communication strategies, and cultural awareness. Students should learn language structures in context and use them to convey meaning. In standards-based world language classrooms, the instructional focus is on function and not the examination of irregularity and complex grammatical paradigms about the target language. Language structures should be addressed inasmuch as they serve the communicative task and not as an end goal unto themselves. The AP Spanish Language and Culture course strives to promote both fluency and accuracy in language use and not to

© 2013 The College Board.

overemphasize grammatical accuracy at the expense of communication. In order to best facilitate the study of language and culture, the course is taught in the target language.

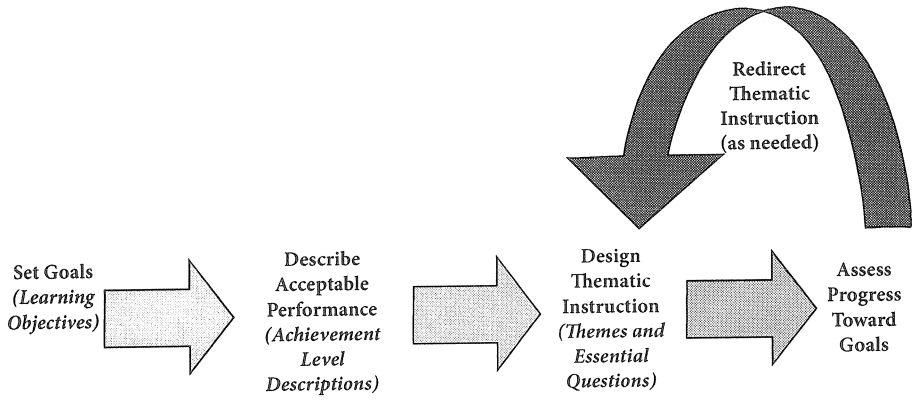
The AP Spanish Language and Culture course engages students in an exploration of culture in both contemporary and historical contexts. The course develops students' awareness and appreciation of products, both tangible (e.g., tools, books) and intangible (e.g., laws, conventions, institutions); practices (patterns of social interactions within a culture); and perspectives (values, attitudes, and assumptions that underlie both practices and products).

Structure of the Curriculum Framework

This curriculum framework begins by outlining the *learning objectives* and the *achievement level descriptions* that define student performance across five levels.

Tools for instructional design come next: *themes* to integrate language, content, and culture into an interrelated series of lessons and activities; *recommended contexts* for exploring each theme; and *overarching essential questions* to engage learners and to guide classroom investigations, learning activities, and performance assessments.

The following graphic illustrates how the components of the curriculum framework relate to how a teacher designs and delivers instruction.



Return to the Table of Contents

© 2013 The College Board.

Learning Objectives and Achievement Level Descriptions

At the core of the AP Spanish Language and Culture course are six groups of *learning objectives* identifying what students should know and be able to do across the three modes of communication. These objectives outline expectations of student abilities in the following areas:

Spoken Interpersonal Communication
Written Interpersonal Communication
Audio, Visual, and Audiovisual Interpretive Communication
Written and Print Interpretive Communication
Spoken Presentational Communication
Written Presentational Communication

The degree to which student performance meets the *learning objectives* in each area is articulated in the *achievement level descriptions*, which clearly define how well students at each level perform. Because of the interrelated nature of the modes of communication, all the *achievement level descriptions* work in concert with one another and should be considered holistically. While references to levels 1–5 cannot precisely predict a student's ultimate AP Exam score, AP teachers can use this information to develop better insight into individual student performance and adjust the curriculum and instruction throughout the course.

Overarching Premise

When communicating, students in the AP Spanish Language and Culture course demonstrate an understanding of the culture(s), incorporate interdisciplinary topics (Connections), make comparisons between the native language and the target language and between cultures (Comparisons), and use the target language in real-life settings (Communities).

© 2013 The College Board.

Interpersonal Communication

The Interpersonal Mode is characterized by active negotiation of meaning among individuals. Participants observe and monitor one another to see how their meanings and intentions are being communicated. Adjustments and clarifications can be made accordingly.

Learning Objectives for Spoken Interpersonal Communication

Primary Objective: The student engages in spoken interpersonal communications.

- The student engages in the oral exchange of information, opinions, and ideas in a variety of time frames in formal situations.
- The student engages in the oral exchange of information, opinions, and ideas in a variety of time frames in informal situations.
- The student elicits information and clarifies meaning by using a variety of strategies.
- The student states and supports opinions in oral interactions.
- The student initiates and sustains interaction through the use of various verbal and nonverbal strategies.
- The student understands a variety of vocabulary, including idiomatic and culturally appropriate expressions.
- The student uses a variety of vocabulary, including idiomatic and culturally appropriate expressions on a variety of topics.
- The student self-monitors and adjusts language production.
- The student demonstrates an understanding of the features of target culture communities (e.g., geographic, historical, artistic, social, or political).
- The student demonstrates knowledge and understanding of content across disciplines.

Achievement Level Descriptions for Spoken Interpersonal Communication

Achievement Level 5

(a) **Interaction.** Students at Achievement Level 5 initiate, maintain, and close conversations on familiar topics in a culturally appropriate manner most of the time. They understand and usually use culturally appropriate expressions and gestures.
(b) **Strategies.** Students at this level use a variety of communication strategies as necessary to maintain communication (e.g., circumlocution, paraphrasing, requesting clarification or information). They often use questions to maintain the conversation and use context to deduce meaning of unfamiliar words. They often recognize errors and self-correct.
(c) **Opinions.** They state opinions and demonstrate some ability to support opinions on topics of personal interest.
(d) **Language structures.** These students use a variety of simple and compound sentences and some complex sentences on familiar topics, and they narrate and describe in all time frames, with a few errors that do not impede comprehensibility.
(e) **Vocabulary.** They understand and use vocabulary on a variety of familiar topics, including some beyond those of personal interest.
(f) **Register.** Their choice of register is usually appropriate for the audience, and its use is consistent despite occasional errors.
(g) **Pronunciation.** Their pronunciation and intonation patterns, pacing, and delivery are comprehensible to an audience unaccustomed to interacting with language learners; their pronunciation is consistent, with few errors that do not impede comprehensibility.
(h) **Cultures, connections, and comparisons.** These students identify the relationships among products, practices, and perspectives in the target culture(s) and compare them with their own culture. They compare and contrast a variety of geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 4

(a) **Interaction.** Students at Achievement Level 4 initiate, maintain, and close conversations on familiar topics. They usually interact in a culturally appropriate manner and may understand and use culturally appropriate expressions and gestures.
(b) **Strategies.** These students use some communication strategies to maintain communication (e.g., circumlocution, paraphrasing, restatement, asking for clarification or information). They use context to deduce meaning of unfamiliar words. They recognize some errors and self-correct.

© 2013 The College Board.

(c) **Opinions.** They provide opinions on familiar topics with limited ability to provide support.
(d) **Language structures.** They use simple and compound sentences and a few complex sentences with some accuracy. They narrate and describe in all time frames, demonstrating the most accuracy in present time and some accuracy in the past and future.
(e) **Vocabulary.** These students understand and use vocabulary on a variety of familiar topics, including some culturally appropriate and idiomatic expressions related to topics of personal interest.
(f) **Register.** Their choice of register is usually appropriate for the situation, yet some shifts between formal and informal registers occur.
(g) **Pronunciation.** Their pronunciation and intonation are comprehensible to an audience accustomed to interacting with language learners; errors do not impede comprehensibility.
(h) **Cultures, connections, and comparisons.** These students describe in some detail products or practices of the target culture(s) and may identify perspectives of the target culture(s) with some inaccuracies. They compare and contrast some geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 3

(a) **Interaction.** Students at Achievement Level 3 initiate, maintain, and close conversations on familiar topics and sometimes interact in a culturally appropriate manner.
(b) **Strategies.** These students occasionally use communication strategies, such as circumlocution and paraphrasing. Students at this level of achievement often seek clarification of meaning by asking for repetition. They use context to deduce meaning of unfamiliar words. Students may recognize errors; attempts at correction are only occasionally successful.
(c) **Opinions.** These students state opinions on topics of personal interest, and they understand and respond to questions and statements on familiar topics.
(d) **Language structures.** Their narrations and descriptions are characterized by strings of simple sentences and a few compound sentences, with the most accuracy in the present time and some accuracy in other time frames.
(e) **Vocabulary.** They understand and use vocabulary from familiar thematic word groups, including occasionally some culturally appropriate and idiomatic expressions.
(f) **Register.** Choice of register may be inappropriate for the intended audience, and shifts between formal and informal registers occur.

Return to the Table of Contents
© 2013 The College Board.

(g) **Pronunciation.** Their pronunciation and intonation are comprehensible to an audience accustomed to interacting with language learners, yet errors occasionally impede comprehensibility.
(h) **Cultures, connections, and comparisons.** They identify some cultural products or practices of the target culture(s) and may identify a few common perspectives. They identify some geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 2

(a) **Interaction.** Students at Achievement Level 2 initiate and close conversations on topics of personal interest and maintain them by making basic statements. Comprehension of messages on familiar topics is limited, and they have little ability to interact in a culturally appropriate manner. Their communication often requires intervention from others to attain comprehensibility.
(b) **Strategies.** They may seek clarification by asking for basic information or repetition. They seldom recognize errors, and attempts at self-correction usually fail.
(c) **Opinions.** When stating opinions, they are limited to expressing likes and dislikes.
(d) **Language structures.** These students produce simple sentences with some accuracy in the present time.
(e) **Vocabulary.** They understand and use a limited range of vocabulary from familiar thematic word groups, including memorized phrases and a few idiomatic expressions.
(f) **Register.** These students communicate mainly using the familiar register.
(g) **Pronunciation.** Their pronunciation and intonation are mostly comprehensible to an audience accustomed to interacting with language learners; errors impede comprehensibility.
(h) **Cultures, connections, and comparisons.** These students identify a few common cultural products or practices and a few geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 1

Students at Achievement Level 1 demonstrate performances that are less proficient than those outlined for Level 2.

© 2013 The College Board.

Learning Objectives for Written Interpersonal Communication

Primary Objective: The student engages in written interpersonal communications.

- The student engages in the written exchange of information, opinions, and ideas in a variety of time frames in formal situations.
- The student engages in the written exchange of information, opinions, and ideas in a variety of time frames in informal situations.
- The student writes formal correspondence in a variety of media using appropriate formats and conventions.
- The student writes informal correspondence in a variety of media using appropriate formats and conventions.
- The student elicits information and clarifies meaning by using a variety of strategies.
- The student states and supports opinions in written interactions.
- The student initiates and sustains interaction during written interpersonal communication in a variety of media.
- The student understands a variety of vocabulary, including idiomatic and culturally appropriate expressions.
- The student uses a variety of vocabulary, including idiomatic and culturally appropriate expressions on a variety of topics.
- The student self-monitors and adjusts language production.
- The student demonstrates an understanding of the features of target culture communities (e.g., geographic, historical, artistic, social, or political).
- The student demonstrates knowledge and understanding of content across disciplines.

Return to the Table of Contents

Achievement Level Descriptions for Written Interpersonal Communication

Achievement Level 5

(a) **Interaction.** Students at Achievement Level 5 initiate, maintain, and close written exchanges in formal and informal communications with good control of culturally appropriate conventions. They understand and respond to questions on familiar topics with some elaboration and detail.
(b) **Strategies.** These students use a variety of communication strategies as necessary in order to maintain communication (e.g., circumlocution, paraphrasing, requesting clarification or information). They use context to deduce meaning of unfamiliar words and often recognize errors and self-correct.
(c) **Opinions.** They state opinions and demonstrate some ability to support opinions on topics of personal interest.
(d) **Language structures.** These students use a variety of simple and compound sentences and some complex sentences on familiar topics, and they narrate and describe in all time frames, with a few errors that do not impede comprehensibility. They use transitional phrases and cohesive devices.
(e) **Writing conventions.** Their writing is marked by consistent use of standard conventions of the written language (e.g., capitalization, orthography, accents) as appropriate for the medium of communication (e.g., online chat, email, letters, blogs, bulletin boards).
(f) **Vocabulary.** They understand and use vocabulary on a variety of familiar topics, including some beyond those of personal interest. They understand and use some culturally appropriate vocabulary and idiomatic expressions.
(g) **Register.** Their choice of register is usually appropriate for the audience, and its use is consistent despite occasional errors.
(h) **Cultures, connections, and comparisons.** These students identify the relationships among products, practices, and perspectives in the target culture(s) and compare them with their own culture. They compare and contrast a variety of geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 4

(a) **Interaction.** Students at Achievement Level 4 initiate, maintain, and close written exchanges in formal and informal communications, although control of culturally appropriate conventions is inconsistent. They understand and respond to questions and statements on familiar topics with some elaboration and detail.

© 2013 The College Board.

(b) **Strategies.** These students use communication strategies (e.g., circumlocution, paraphrasing, asking for clarification or information) to maintain communication. They use context to deduce meaning of unfamiliar words. They recognize some errors and self-correct.
(c) **Opinions.** They provide opinions on familiar topics with limited ability to provide support.
(d) **Language structures.** They are usually accurate when writing about familiar topics using a variety of simple, compound, and a few complex sentences in all time frames, demonstrating the most accuracy in present time and some accuracy in the past and future. They use some transitional phrases and cohesive devices.
(e) **Writing conventions.** Their writing is generally consistent in the use of standard conventions of the written language (e.g., capitalization, orthography, accents) as appropriate for the medium of communication (e.g., online chat, email, letters, blogs, bulletin boards).
(f) **Vocabulary.** These students understand and use vocabulary on a variety of familiar topics, including some culturally appropriate and idiomatic expressions related to topics of personal interest.
(g) **Register.** Their choice of register is usually appropriate for the situation, yet some shifts between formal and informal registers occur.
(h) **Cultures, connections, and comparisons.** These students describe in some detail products or practices of the target culture(s) and may identify perspectives of the target culture(s) with some inaccuracies. They compare and contrast some geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 3

(a) **Interaction.** Students at Achievement Level 3 initiate, maintain, and close written exchanges on familiar topics. They understand and respond to questions and statements on familiar topics.
(b) **Strategies.** These students occasionally use communication strategies (e.g., circumlocution, restatement, requesting clarification or information) when interacting on familiar topics, and they occasionally use context to deduce meaning of unfamiliar words. They often seek clarification of meaning by asking for repetition. They may recognize errors; attempts at self-editing are occasionally successful.
(c) **Opinions.** They state opinions on topics of personal interest.
(d) **Language structures.** They produce strings of simple sentences and a few compound sentences, with the most accuracy in the present time and some accuracy in other time frames.

Return to the Table of Contents
© 2013 The College Board.

(e) **Writing conventions.** Their writing shows inconsistent use of standard conventions of the written language (e.g., capitalization, orthography, accents) as appropriate for the medium of communication (e.g., online chat, email, letters, blogs, bulletin boards) that sometimes interferes with meaning.
(f) **Vocabulary.** These students understand and use vocabulary from familiar thematic word groups and occasionally incorporate some culturally appropriate and idiomatic expressions.
(g) **Register.** Their choice of register may be inappropriate for the intended audience, and shifts between formal and informal registers occur.
(h) **Cultures, connections, and comparisons.** These students identify some cultural products or practices of the target culture(s) and may identify a few common perspectives. They identify some geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 2

(a) **Interaction.** Students at Achievement Level 2 respond to questions and statements on topics of personal interest in written exchanges.
(b) **Strategies.** These students may seek clarification by asking for basic information. They seldom recognize errors, and attempts at self-editing usually fail.
(c) **Opinions.** When stating opinions, they are limited to expressing likes and dislikes.
(d) **Language structures.** They produce simple sentences with some accuracy in the present time. There is inconsistent control of basic structures.
(e) **Writing conventions.** Their writing shows little use of standard conventions of the written language (e.g., capitalization, orthography, accents) as appropriate for the medium of communication (e.g., online chat, email, letters, blogs, bulletin boards).
(f) **Vocabulary.** They understand and use a limited range of vocabulary from familiar thematic word groups, including memorized phrases and a few idiomatic expressions.
(g) **Register.** These students communicate mainly using the familiar register.
(h) **Cultures, connections, and comparisons.** These students identify a few common cultural products or practices and a few geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 1

Students at Achievement Level 1 demonstrate performances that are less proficient than those outlined for Level 2.

Interpretive Communication

The Interpretive Mode is characterized by the appropriate cultural interpretation of meanings that occur in written and spoken form where there is no recourse to the active negotiation of meaning with the writer or speaker.

Learning Objectives for Audio, Visual, and Audiovisual Interpretive Communication

Primary Objective: The student synthesizes information from a variety of authentic audio, visual, and audiovisual resources.

- The student demonstrates comprehension of content from authentic audio resources.
- The student demonstrates comprehension of content from authentic visual resources.
- The student demonstrates comprehension of content from authentic audiovisual resources.
- The student demonstrates understanding of a variety of vocabulary, including idiomatic and culturally authentic expressions.
- The student understands the purpose of a message and the point of view of its author.
- The student identifies the distinguishing features (e.g., type of resource, intended audience, purpose) of authentic audio, visual, and audiovisual resources.
- The student demonstrates critical viewing or listening of audio, visual, and audiovisual resources in the target cultural context.
- The student monitors comprehension and uses other sources to enhance understanding.
- The student examines, compares, and reflects on products, practices, and perspectives of the target culture(s).
- The student evaluates similarities and differences in the perspectives of the target culture(s) and his or her own culture(s) as found in audio, visual, and audiovisual resources.
- The student demonstrates an understanding of the features of target culture communities (e.g., geographic, historical, artistic, social, or political).
- The student demonstrates knowledge and understanding of content across disciplines.

Return to the Table of Contents

Achievement Level Descriptions for Audio, Visual, and Audiovisual Interpretive Communication

Achievement Level 5

(a) **Comprehension of content.** When listening to or viewing a variety of authentic audio, visual, and audiovisual resources, students at Achievement Level 5 identify main ideas, some significant details, and the intended audience on a range of topics. These students use context to deduce the meaning of unfamiliar words and usually infer implied meanings.
(b) **Critical viewing and listening.** These students identify significant distinguishing features (e.g., type of resource, intended audience, purpose) of authentic audio, visual, and audiovisual resources.
(c) **Vocabulary.** They comprehend a variety of vocabulary, including culturally appropriate vocabulary and some idiomatic expressions related to topics of personal interest and limited unfamiliar topics.
(d) **Cultures, connections, and comparisons.** These students identify the relationship among products, practices, and perspectives in the target culture(s) and demonstrate understanding of most of the content of familiar interdisciplinary topics presented in the resource material. They compare and contrast geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 4

(a) **Comprehension of content.** When listening to or viewing a variety of authentic audio, visual, and audiovisual resources, students at Achievement Level 4 identify most main ideas and some significant details on familiar topics. These students use context to deduce the meaning of unfamiliar words and make some inferences.
(b) **Critical viewing and listening.** They identify some distinguishing features (e.g., type of resource, intended audience, purpose) of authentic audio, visual, and audiovisual resources.
(c) **Vocabulary.** These students comprehend most vocabulary, including some culturally appropriate and idiomatic expressions related to topics of personal interest.
(d) **Cultures, connections, and comparisons.** These students identify the products, practices, and some perspectives of the target culture(s) and demonstrate understanding of some content of familiar interdisciplinary topics presented in the resource material. They compare and contrast some geographic, historical, artistic, social, or political features of target culture communities.

© 2013 The College Board.

Achievement Level 3

(a) **Comprehension of content.** When listening to or viewing a variety of authentic audio, visual, and audiovisual resources, students at Achievement Level 3 identify some main ideas and details on familiar topics. They respond accurately to basic information questions (e.g., Who? What? When? Where?) and can sometimes use context to deduce meaning of unfamiliar words and make limited inferences.
(b) **Critical viewing and listening.** They identify a few distinguishing features (e.g., type of resource, intended audience, purpose) of authentic audio, visual, and audiovisual resources.
(c) **Vocabulary.** They comprehend a variety of vocabulary on topics of personal interest.
(d) **Cultures, connections, and comparisons.** These students are able to identify the cultural products and practices and demonstrate understanding of basic content of familiar interdisciplinary topics presented in the resource material. They are also able to identify a few geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 2

(a) **Comprehension of content.** When listening to or viewing a variety of authentic audio, visual, and audiovisual resources, students at Achievement Level 2 identify a few main ideas or details and are sometimes unable to respond to basic information questions.
(b) **Critical viewing and listening.** These students identify few distinguishing features (e.g., type of resource, intended audience, purpose) of authentic audio, visual, and audiovisual resources.
(c) **Vocabulary.** They understand a limited range of vocabulary from familiar thematic word groups, including memorized phrases and a few idiomatic expressions.
(d) **Cultures, connections, and comparisons.** These students identify a few common cultural products or practices of the target culture(s) and demonstrate limited understanding of the basic content of familiar interdisciplinary topics presented in the resource material. They are able to identify a few geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 1

Students at Achievement Level 1 demonstrate performances that are less proficient than those outlined for Level 2.

Return to the Table of Contents

Learning Objectives for Written and Print Interpretive Communication

Primary Objective: The student synthesizes information from a variety of authentic written and print resources.

- The student demonstrates comprehension of content from authentic written and print resources.
- The student demonstrates understanding of a variety of vocabulary, including idiomatic and culturally authentic expressions.
- The student understands the purpose of a message and the point of view of its author.
- The student identifies the distinguishing features (e.g., type of resource, intended audience, purpose) of authentic written and print resources.
- The student demonstrates critical reading of written and print resources in the target cultural context.
- The student monitors comprehension and uses other sources to enhance understanding.
- The student examines, compares, and reflects on products, practices, and perspectives of the target culture(s).
- The student evaluates similarities and differences in the perspectives of the target culture(s) and his or her own culture(s) as found in written and print resources.
- The student demonstrates an understanding of the features of target culture communities (e.g., geographic, historical, artistic, social, or political).
- The student demonstrates knowledge and understanding of content across disciplines.

© 2013 The College Board.

Achievement Level Descriptions for Written and Print Interpretive Communication

Achievement Level 5

(a) **Comprehension of content.** When reading a variety of authentic written and print resources, students at Achievement Level 5 identify main ideas and supporting details on a range of topics. They use context to deduce the meaning of unfamiliar words and usually infer implied meanings.
(b) **Critical reading.** They demonstrate critical reading skills and usually differentiate facts from opinions. These students identify the intended audience, source, and purpose and describe the basic context of the resource material.
(c) **Vocabulary.** These students comprehend a variety of vocabulary, including culturally appropriate vocabulary and some idiomatic expressions related to topics of personal interest and limited unfamiliar topics.
(d) **Cultures, connections, and comparisons.** These students identify the relationship among products, practices, and perspectives in the target culture(s) and demonstrate understanding of most of the content of the interdisciplinary topics presented in the resource material. They also compare and contrast geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 4

(a) **Comprehension of content.** When reading a variety of authentic written and print resources, students at Achievement Level 4 identify most main ideas and some supporting details on familiar topics. They use various reading strategies to aid in the literal comprehension of the text. These students make some inferences and use context to deduce the meaning of unfamiliar words.
(b) **Critical reading.** These students identify the intended audience, source, and purpose of the resource.
(c) **Vocabulary.** They comprehend most vocabulary, including some culturally appropriate and idiomatic expressions related to topics of personal interest.
(d) **Cultures, connections, and comparisons.** These students identify the products, practices, and some perspectives of the target culture(s) and demonstrate understanding of some content of the interdisciplinary topics presented in the resources. They compare and contrast some geographic, historical, artistic, social, or political features of target culture communities.

Return to the Table of Contents
© 2013 The College Board.

Achievement Level 3

(a) **Comprehension of content.** When reading a variety of authentic written and print resources, students at Achievement Level 3 identify some main ideas and supporting details on familiar topics. They respond accurately to basic information questions (e.g., Who? What? When? Where?), make limited inferences, and use contextual clues to assist in the literal comprehension. They can sometimes use context to deduce meaning of unfamiliar words.
(b) **Critical reading.** These students identify the source and purpose of the resource.
(c) **Vocabulary.** They comprehend a variety of vocabulary on topics of personal interest.
(d) **Cultures, connections, and comparisons.** They are able to identify the products and practices of the target culture(s) and demonstrate understanding of basic content of familiar interdisciplinary topics presented in the resource material. They are also able to identify a few geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 2

(a) **Comprehension of content.** When reading a variety of authentic written and print resources, students at Achievement Level 2 identify some main ideas and details, but they are sometimes unable to respond to basic information questions. They occasionally use contextual clues for basic comprehension.
(b) **Critical reading.** They identify the source of the resource.
(c) **Vocabulary.** They understand a limited range of vocabulary from familiar thematic word groups, including memorized phrases and a few idiomatic expressions.
(d) **Cultures, connections, and comparisons.** These students identify a few common cultural products or practices of the target culture(s) and demonstrate limited understanding of basic content of familiar interdisciplinary topics presented in the resource material. They are able to identify a few geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 1

Students at Achievement Level 1 demonstrate performances that are less proficient than those outlined for Level 2.

Presentational Communication

The Presentational Mode is characterized by the creation of messages in a manner that facilitates interpretation by members of the target culture where no direct opportunity for the active negotiation of meaning exists.

Learning Objectives for Spoken Presentational Communication

Primary Objective: The student plans, produces, and presents spoken presentational communications.

- The student produces a variety of creative oral presentations (e.g., original story, personal narrative, speech, performance).
- The student retells or summarizes information in narrative form, demonstrating a consideration of audience.
- The student creates and gives persuasive speeches.
- The student expounds on familiar topics and those requiring research.
- The student uses reference tools, acknowledges sources, and cites them appropriately.
- The student self-monitors and adjusts language production.
- The student demonstrates an understanding of the features of target culture communities (e.g., geographic, historical, artistic, social, or political).
- The student demonstrates knowledge and understanding of content across disciplines.

Return to the Table of Contents

© 2013 The College Board.

Achievement Level Descriptions for Spoken Presentational Communication

Achievement Level 5

(a) **Discourse and development.** When planning, producing, and presenting spoken presentational communications, students at Achievement Level 5 use paragraph-length discourse with mostly appropriate use of cohesive devices to report, explain, and narrate on a range of familiar topics. They develop ideas by showing evidence of synthesis and interpretation of background information.
(b) **Strategies.** These students employ a variety of strategies to clarify and elaborate content of presentation; self-correction is mostly successful.
(c) **Language structures.** These students use a variety of simple and compound sentences and some complex sentences in major time frames. Errors do not impede comprehensibility.
(d) **Vocabulary.** These students use vocabulary on a variety of familiar topics, including some beyond those of personal interest. They use some culturally appropriate vocabulary and idiomatic expressions.
(e) **Pronunciation.** Their pronunciation and intonation patterns, pacing, and delivery are comprehensible to an audience unaccustomed to interacting with language learners.
(f) **Register.** Their choice of register is usually appropriate for the audience, and its use is consistent despite occasional errors.
(g) **Cultures, connections, and comparisons.** These students identify the relationship among products, practices, and perspectives in the target culture(s) and demonstrate understanding of most of the content of the interdisciplinary topics presented in the resource material. They also compare and contrast geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 4

(a) **Discourse and development.** When planning, producing, and presenting spoken presentational communications, students at Achievement Level 4 use mostly paragraph-length discourse with appropriate use of some cohesive devices to explain, express opinions, describe, and narrate on familiar topics. Their work shows some evidence of ideas that are developed and supported with examples.
(b) **Strategies.** These students may employ some communication strategies appropriately, such as paraphrasing and clarification; self-correction is often successful.
(c) **Language structures.** They use simple and compound sentences and a few complex sentences with some accuracy; errors do not impede comprehensibility.

© 2013 The College Board.

(d) **Vocabulary.** They use vocabulary on a variety of familiar topics, including some culturally appropriate and idiomatic expressions related to topics of personal interest.
(e) **Pronunciation.** Their pronunciation, intonation, pacing, and delivery are mostly comprehensible to an audience accustomed to interacting with language learners; errors do not impede comprehensibility.
(f) **Register.** Their choice of register is usually appropriate for the audience, yet some shifts between formal and informal registers occur.
(g) **Cultures, connections, and comparisons.** These students describe, in some detail, products or practices of the target culture(s), yet they may identify perspectives of the target culture(s) with some inaccuracies. They may compare and contrast some geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 3

(a) **Discourse and development.** When planning, producing, and presenting spoken presentational communications, students at Achievement Level 3 use strings of sentences and a few basic cohesive devices to express personal opinions, describe, and narrate on familiar topics. They show evidence of some development of ideas and basic structural organization (introduction, argument, and conclusion).
(b) **Strategies.** These students employ limited communication strategies, such as repetition and emphasis; self-correction is occasionally successful.
(c) **Language structures.** They produce simple and compound sentences with the most accuracy in the present time and some accuracy in other time frames. Errors may impede comprehensibility.
(d) **Vocabulary.** These students use vocabulary from familiar thematic word groups and occasionally incorporate some culturally appropriate and idiomatic expressions.
(e) **Pronunciation.** Their pronunciation and intonation are comprehensible to an audience accustomed to interacting with language learners, yet errors occasionally impede comprehensibility.
(f) **Register.** Their choice of register may be inappropriate for the intended audience, and shifts between formal and informal registers occur.
(g) **Cultures, connections, and comparisons.** They identify some cultural products and practices of the target culture(s) and may identify a few common perspectives. They are also able to identify a few geographic, historical, artistic, social, or political features of target culture communities.

Return to the Table of Contents
© 2013 The College Board.

Achievement Level 2

(a) **Discourse and development.** When planning, producing, and presenting spoken presentational communications, students at Achievement Level 2 use strings of sentences to express personal opinions, describe, and narrate on topics of personal interest. There is little evidence of development of ideas, and structural organization may be lacking.
(b) **Strategies.** They seldom recognize errors, and attempts at self-correction usually fail.
(c) **Language structures.** They produce simple sentences with some accuracy in the present time. Their control of basic structures is inconsistent; errors impede comprehensibility.
(d) **Vocabulary.** Students at this level use vocabulary from familiar thematic word groups, including memorized phrases and a few idiomatic expressions.
(e) **Pronunciation.** Their pronunciation and intonation are mostly comprehensible to an audience accustomed to interacting with language learners; errors impede comprehensibility.
(f) **Register.** These students communicate mainly using the familiar register.
(g) **Cultures, connections, and comparisons.** These students identify a few common cultural products or practices and a few geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 1

Students at Achievement Level 1 demonstrate performances that are less proficient than those outlined for Level 2.

Learning Objectives for Written Presentational Communication

Primary Objective: The student plans and produces written presentational communications.

- The student produces a variety of creative writings (e.g., original story, personal narrative, script).
- The student retells or summarizes information in narrative form, demonstrating a consideration of audience.
- The student produces persuasive essays.
- The student produces expository writing, including researched reports.
- The student uses reference tools, acknowledges sources, and cites them appropriately.
- The student self-edits written work for content, organization, and grammar.
- The student demonstrates an understanding of the features of target culture communities (e.g., geographic, historical, artistic, social, or political).
- The student demonstrates knowledge and understanding of content across disciplines.

Achievement Level Descriptions for Written Presentational Communication

Achievement Level 5

(a) **Discourse and development.** When planning, producing, and presenting written presentational communications, students at Achievement Level 5 use paragraph-length discourse with mostly appropriate use of cohesive devices to report, explain, and narrate on a range of familiar topics. They integrate content from multiple sources to support their presentation.
(b) **Strategies.** These students employ a variety of strategies to clarify and elaborate the content of the presentation; self-correction is mostly successful.
(c) **Language structures.** These students use a variety of simple and compound sentences and some complex sentences in major time frames. Errors do not impede comprehensibility.
(d) **Vocabulary.** These students use vocabulary on a variety of familiar topics, including some beyond those of personal interest. They use some culturally appropriate vocabulary and idiomatic expressions.
(e) **Writing conventions.** They demonstrate consistent use of standard conventions of the written language (e.g., capitalization, orthography, accents). Errors do not impede comprehensibility.
(f) **Register.** Their choice of register is appropriate for the audience, and its use is consistent despite occasional errors.
(g) **Cultures, connections, and comparisons.** These students identify the relationship among products, practices, and perspectives in the target culture(s) and demonstrate understanding of most of the content of the interdisciplinary topics presented in the resource material. They also compare and contrast geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 4

(a) **Discourse and development.** When planning, producing, and presenting written presentational communications, students at Achievement Level 4 use mostly paragraph-length discourse with appropriate use of some cohesive devices to explain, express opinions, describe, and narrate on familiar topics. They summarize multiple sources with limited integration of content to support their presentation.
(b) **Strategies.** These students employ some communication strategies appropriately, such as paraphrasing and clarification; self-editing is often successful.
(c) **Language structures.** They use simple and compound sentences and a few complex sentences with some accuracy; errors do not impede comprehensibility.

© 2013 The College Board.

(d) **Vocabulary.** They use vocabulary on a variety of familiar topics, including some culturally appropriate and idiomatic expressions related to topics of personal interest.
(e) **Writing conventions.** They demonstrate generally consistent use of standard conventions of the written language (e.g., capitalization, orthography, accents); errors do not impede comprehensibility.
(f) **Register.** Errors in choice of register are infrequent, yet shifts between formal and informal registers may occur.
(g) **Cultures, connections, and comparisons.** They describe in some detail products or practices of the target culture(s), yet they may identify perspectives of the target culture(s) with some inaccuracies. They may compare and contrast some geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 3

(a) **Discourse and development.** When planning, producing, and presenting written presentational communications, students at Achievement Level 3 use strings of sentences and a few basic cohesive devices to express personal opinions, describe, and narrate on familiar topics. They summarize content from sources to support their presentation.
(b) **Strategies.** These students may employ some communication strategies appropriately, such as paraphrasing and clarification; self-editing is occasionally successful.
(c) **Language structures.** They produce simple and compound sentences with the most accuracy in the present time and some accuracy in other time frames. Errors may impede comprehensibility.
(d) **Vocabulary.** These students use vocabulary from familiar thematic word groups and occasionally incorporate some culturally appropriate and idiomatic expressions.
(e) **Writing conventions.** Their use of standard conventions of the written language (e.g., capitalization, orthography, accents) is inconsistent, which may cause confusion for the reader.
(f) **Register.** Their choice of register may be inappropriate for the intended audience, and shifts between formal and informal registers occur.
(g) **Cultures, connections, and comparisons.** They identify some cultural products and practices of the target culture(s) and may identify a few common perspectives. They are also able to identify a few geographic, historical, artistic, social, or political features of target culture communities.

Return to the Table of Contents
© 2013 The College Board.

Achievement Level 2

(a) **Discourse and development.** When planning, producing, and presenting written presentational communications, students at Achievement Level 2 use strings of sentences to express personal opinions, describe, and narrate on topics of personal interest. They summarize sources without supporting the presentation.
(b) **Strategies.** These students employ limited presentational strategies to clarify meaning; efforts at self-editing usually fail.
(c) **Language structures.** They produce simple sentences with some accuracy in the present time. Their control of basic structures is inconsistent; errors impede comprehensibility.
(d) **Vocabulary.** Students at this level use vocabulary from familiar thematic word groups, including memorized phrases and a few idiomatic expressions.
(e) **Writing conventions.** Their writing shows little use of standard conventions of the written language (e.g., capitalization, orthography, accents).
(f) **Register.** These students communicate mainly using the familiar register.
(g) **Cultures, connections, and comparisons.** These students identify a few common cultural products or practices and a few geographic, historical, artistic, social, or political features of target culture communities.

Achievement Level 1

Students at Achievement Level 1 demonstrate performances that are less proficient than those outlined for Level 2.

Course Themes

Designing the AP Spanish Language and Culture course around themes creates an interesting, meaningful context in which to explore a variety of language concepts. Themes help teachers integrate language, content, and culture into an interrelated series of lessons and activities that promote the use of the language in a variety of contexts. A theme may be used to plan a brief unit of study, a comprehensive unit spanning a greater period of time, or to connect with courses in other disciplines.

The AP Spanish Language and Culture course is structured around six themes:

© 2013 The College Board.

Recommended Contexts and Essential Questions

Each theme includes a number of *recommended contexts* for exploration. Teachers are encouraged to engage students in the various themes by considering historical, contemporary, and future perspectives as appropriate. Teachers should assume complete flexibility in resource selection and instructional exploration of the six themes. The recommended contexts are not intended as prescriptive or required, but rather they serve as suggestions for addressing the themes.

One way to design instruction with the themes is to identify *overarching essential questions* to motivate learners and to guide classroom investigations, learning activities, and performance assessments. Essential questions are designed to spark curiosity and engage students in real-life, problem-solving tasks. They allow students to investigate and express different views on real world issues, make connections to other disciplines, and compare aspects of the target culture(s) to their own. Essential questions also lend themselves well to interdisciplinary inquiry, asking students to apply skills and perspectives across content areas while working with content from language, literature, and cultures of the Spanish-speaking world.

Integrating Themes, Recommended Contexts, and Essential Questions

AP Spanish Language and Culture teachers are encouraged to consider the interconnectedness of the themes. A unit on environmental issues (Global Challenges) might, for example, touch upon recommended contexts from more than one theme. Students might study inventions as catalysts of change (Science and Technology), influences from religious beliefs or social values (Personal and Public Identities), or the aesthetics of eco-friendly architecture (Beauty and Aesthetics).

The recommended contexts for exploring a theme can be varied depending on available authentic materials, teacher-developed resources, and commercially produced materials, as well as teacher creativity and student interest. The design of the course should include essential questions that will capture students' interest, engaging authentic materials, and learning activities that help students consider themes across time and across cultures.

It should be noted that literature is not merely a recommended context for one of the course themes (Beauty and Aesthetics) but should serve as a powerful vehicle for delivering content to address all of the themes. Literary works may be incorporated throughout the AP Spanish Language and

Culture course in relation to a variety of themes, such as the environment (Global Challenges), rites of passage (Contemporary Life), or issues of cultural assimilation (Personal and Public Identities).

Themes, Recommended Contexts, and Overarching Essential Questions

Theme: Global Challenges / *Los desafíos mundiales*

Recommended Contexts:

- Economic Issues / *Los temas económicos*
- Environmental Issues / *Los temas del medio ambiente*
- Philosophical Thought and Religion / *El pensamiento filosófico y la religión*
- Population and Demographics / *La población y la demografía*
- Social Welfare / *El bienestar social*
- Social Conscience / *La conciencia social*

Overarching Essential Questions:

- What environmental, political, and social issues pose challenges to societies throughout the world? / *¿Cuáles son los desafíos sociales, políticos y del medio ambiente que enfrentan las sociedades del mundo?*
- What are the origins of those issues? / *¿Cuáles son los orígenes de esos desafíos?*
- What are possible solutions to those challenges? / *¿Cuáles son algunas posibles soluciones a esos desafíos?*

Theme: Science and Technology / *La ciencia y la tecnología*

Recommended Contexts:

- Access to Technology / *El acceso a la tecnología*
- Effects of Technology on Self and Society / *Los efectos de la tecnología en el individuo y en la sociedad*
- Health Care and Medicine / *El cuidado de la salud y la medicina*
- Innovations / *Las innovaciones tecnológicas*
- Natural Phenomena / *Los fenómenos naturales*
- Science and Ethics / *La ciencia y la ética*

© 2013 The College Board.

Overarching Essential Questions:

- How do developments in science and technology affect our lives? / *¿Qué impacto tiene el desarrollo científico y tecnológico en nuestras vidas?*
- What factors have driven innovation and discovery in the fields of science and technology? / *¿Qué factores han impulsado el desarrollo y la innovación en la ciencia y la tecnología?*
- What role does ethics play in scientific advancement? / *¿Qué papel cumple la ética en los avances científicos?*

Theme: Contemporary Life / *La vida contemporánea*

Recommended Contexts:

- Education and Careers / *La educación y las carreras profesionales*
- Entertainment / *El entretenimiento y la diversión*
- Travel and Leisure / *Los viajes y el ocio*
- Lifestyles / *Los estilos de vida*
- Relationships / *Las relaciones personales*
- Social Customs and Values / *Las tradiciones y los valores sociales*
- Volunteerism / *El trabajo voluntario*

Overarching Essential Questions:

- How do societies and individuals define quality of life? / *¿Cómo definen los individuos y las sociedades su propia calidad de vida?*
- How is contemporary life influenced by cultural products, practices, and perspectives? / *¿Cómo influyen los productos culturales, las prácticas y las perspectivas de la gente en la vida contemporánea?*
- What are the challenges of contemporary life? / *¿Cuáles son los desafíos de la vida contemporánea?*

Theme: Personal and Public Identities / *Las identidades personales y públicas*

Recommended Contexts:

- Alienation and Assimilation / *La enajenación y la asimilación*
- Heroes and Historical Figures / *Los héroes y los personajes históricos*
- National and Ethnic Identities / *La identidad nacional y la identidad étnica*
- Personal Beliefs / *Las creencias personales*

Return to the Table of Contents

© 2013 The College Board.

- Personal Interests / *Los intereses personales*
- Self-Image / *La autoestima*

Overarching Essential Questions:

- How are aspects of identity expressed in various situations? / *¿Cómo se expresan los distintos aspectos de la identidad en diversas situaciones?*
- How do language and culture influence identity? / *¿Cómo influyen la lengua y la cultura en la identidad de una persona?*
- How does one's identity develop over time? / *¿Cómo se desarrolla la identidad de una persona a lo largo del tiempo?*

Theme: Families and Communities / *Las familias y las comunidades*

Recommended Contexts:

- Customs and Values / *Las tradiciones y los valores*
- Education Communities / *Las comunidades educativas*
- Family Structure / *La estructura de la familia*
- Global Citizenship / *La ciudadanía global*
- Human Geography / *La geografía humana*
- Social Networking / *Las redes sociales*

Overarching Essential Questions:

- What constitutes a family in different societies? / *¿Cómo se define la familia en distintas sociedades?*
- How do individuals contribute to the well-being of communities? / *¿Cómo contribuyen los individuos al bienestar de las comunidades?*
- How do the roles that families and communities assume differ in societies around the world? / *¿Cuáles son las diferencias en los papeles que asumen las comunidades y las familias en las diferentes sociedades del mundo?*

Theme: Beauty and Aesthetics / *La belleza y la estética*

Recommended Contexts:

- Architecture / *La arquitectura*
- Defining Beauty / *Definiciones de la belleza*
- Defining Creativity / *Definiciones de la creatividad*
- Fashion and Design / *La moda y el diseño*

© 2013 The College Board.

- Language and Literature / *El lenguaje y la literatura*
- Visual and Performing Arts / *Las artes visuales y escénicas*

Overarching Essential Questions:

- How are perceptions of beauty and creativity established? / *¿Cómo se establecen las percepciones de la belleza y la creatividad?*
- How do ideals of beauty and aesthetics influence daily life? / *¿Cómo influyen los ideales de la belleza y la estética en la vida cotidiana?*
- How do the arts both challenge and reflect cultural perspectives? / *¿Cómo las artes desafían y reflejan las perspectivas culturales?*

Glossary of Key Terms

Achievement level descriptions: Descriptions of student performance at levels 1–5. AP teachers can use this information to develop better insight into individual student performance and adjust curriculum and instruction.

Communication strategies: Techniques used to clarify meaning or confirm comprehension, such as restatement, asking questions for clarification, circumlocution, and gestures.

Critical viewing/listening/reading: To analyze, react to, and explore audio, visual, audiovisual, print, or written resources in order to better understand meaning and purpose.

Features of target culture communities: Various products, practices, and perspectives of target culture(s), such as television and film, education, customs and traditions, and beliefs and values, including geographic, historical, artistic, social, or political influences.

Learning objectives: Clear, detailed, and finite articulation of what students will know and be able to do.

Perspectives: Values, attitudes, and assumptions that underlie both practices and products but that are less readily evident to the observer.

Practices: Patterns of social interactions within a culture.

Products: Both tangible (e.g., tools, books) and intangible (e.g., laws, conventions, institutions) items.

Reference tools: Items such as a dictionary, a guide to language structure, or a thesaurus.

Course Title

Spanish Literature A/B (AP)

Description of Target Group

This course is designed as an elective class for juniors and seniors (others with permission from instructor) that meets the foreign language admission requirements for the CSU and UC university system.

Purpose

The purpose of Spanish Literature A/B, AP is to prepare students to take the Spanish Literature Advanced Placement examination. Successful completion of this examination will qualify students to receive college credit for comparable college level courses without matriculation in such courses. Students will be introduced to select works from the literature of Spain and Spanish America with particular emphasis on works by the required authors, Jorge Luis Borges, Federico García Lorca, Gabriel García Márquez, Ana María Matute, and Miguel de Unamuno.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. The ability to comprehend formal and informal spoken Spanish.
2. The ability to compose expository passages.
3. The ability to express ideas orally with accuracy and fluency.
4. To understand a lecture in Spanish and to participate actively in discussions on literary topics in Spanish.
5. To do a close reading of Hispanic literary texts in all genres.
6. To analyze critically the form and content of literary works orally and in writing using appropriate terminology.

Instructional Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

1. Lectures
2. Class participation
3. Demonstration
4. Audio-visual materials
5. Field Trips
6. Small group activities
7. Outside resource people

Spanish Literature A/B (AP) (continued)

Assessments

Teacher observations of student action, speaking demonstrations, and other oral presentations.
Student depictions of concepts via drawings, markings, posters, collages, and video projects.
Student or teacher generated (planned or impromptu) role-play or real life situations.
Written student work including but not limited to exercises, worksheets, compositions, portfolios, notebooks, or projects.
Summative written tests and quizzes based on teacher generated criteria.
Student work in computer files.
Student generated book presentations utilizing oral reports, storyboards, elements of drama, and reader's theater.
Student oral and written interpretation of video generated thematic units.
Group presentations of thematic units including dramatic reenactment.
Student created new endings to stories.
Student participation in quackery reading.
Student participation in contrasting and dialoguing poetry.
Student participation in the accused bench or the hot chair activity.
Student composed letters to the characters in a story.
Student use of symbolization and picture graphs.
Student composed Venn diagram.
Student reflections and personal responses in journals or writing logs.
Student use of creative imitation.

Curriculum Framework

The AP® Spanish Literature and Culture course is designed to provide students with a learning experience equivalent to that of an introductory college course in literature written in Spanish. The course introduces students to the formal study of a representative body of texts from Peninsular Spanish, Latin American, and U.S. Hispanic literature. The course provides opportunities for students to demonstrate their proficiency in Spanish across the three modes of communication (interpersonal, interpretive, and presentational) and the five goal areas (communication, cultures, connections, comparisons, and communities) outlined in the *Standards for Foreign Language Learning in the 21st Century*. The overarching aims of the course are to provide students with ongoing and varied opportunities to further develop their proficiencies across the full range of language skills — with special attention to critical reading and analytical writing — and to encourage them to reflect on the many voices and cultures included in a rich and diverse body of literature written in Spanish.

The inclusion of "and Culture" in the title of the course reflects a purposeful alignment of the course to a standards-based Spanish curriculum. In particular, the course reflects a meaningful integration of the cultures, connections, and comparisons goal areas of the *Standards*. Emphasis is placed on approaching the study of literature through global, historical and contemporary cultural contexts. Teachers and students are encouraged to make interdisciplinary connections and explore linguistic and cultural comparisons. A key objective of the course is to encourage students not only to understand and retell the content of the texts they read but also to relate that content to literary, historical, sociocultural, and geopolitical contexts in Spanish.

In order to promote depth of student understanding and contextual knowledge, and especially to relieve pressure to cover a considerable breadth of material in one academic year, the required reading list for the course is reduced. With a reading list that is shorter — but certainly no less linguistically and thematically challenging — the course affords greater flexibility in instructional design and allows for more time to be dedicated to incorporating art and other media into the study of literature, and developing students' critical reading, analytical writing, and research skills in Spanish.

The course aims to help students progress beyond reading comprehension to read with critical, historical and literary sensitivity. This is an ambitious goal, but it is hoped that when exposed to the methods of literary analysis, with its rigorous attention to linguistic detail coupled with critical interpretation and analysis, students will be able to apply the skills they acquire in this course to many other areas of learning and life.

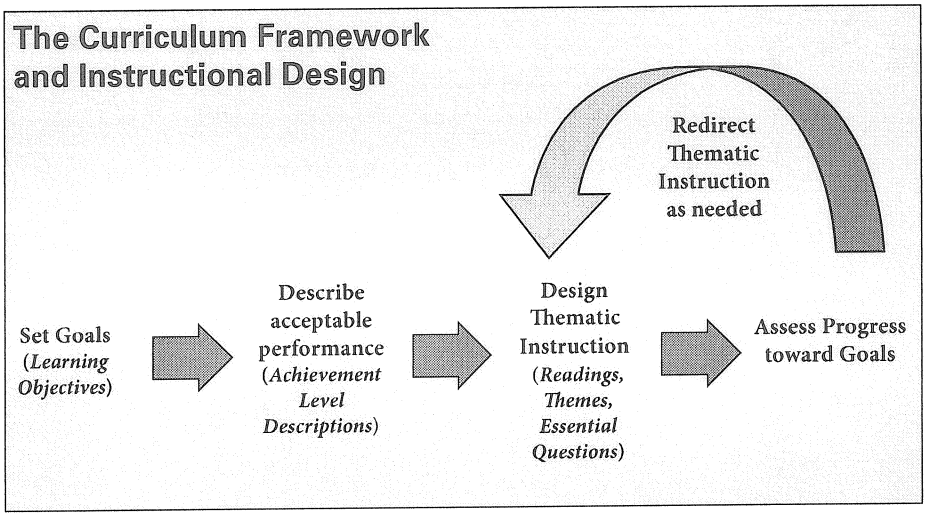
© 2012 The College Board.

Structure of the Curriculum Framework

This curriculum framework begins by outlining the *learning objectives* and the *achievement level descriptions* that define student performance across five levels.

Tools for instructional design come next: the *readings* that compose the required list of literary works to be studied in the course; *literary terminology* that students learn and apply to their study of the required readings; *themes* for making contextual connections among works from different periods and genres; *organizing concepts* for exploring each theme; and *essential questions* with which to engage learners and guide classroom investigations, learning activities, and assessments.

The following graphic illustrates how the components of the curriculum framework relate to how a teacher designs and delivers instruction:



Return to the Table of Contents

Learning Objectives and Achievement Level Descriptions

At the core of the AP Spanish Literature and Culture course are the *learning objectives* that identify what students should know and be able to do as a result of taking the AP course. These objectives outline expectations of student abilities according to the five goal areas (the "five C's") of the *Standards*, and to language usage in support of literary analysis.

The "Five C's" and the Learning Objectives

Communication	Learning Objectives for Interpersonal Communication Learning Objectives for Interpretive Communication Learning Objectives for Presentational Communication
Cultures, Connections, Comparisons, Communities	Learning Objectives for Cultures, Connections, Comparisons, and Communities
Language Usage in Support of Literary Analysis	Learning Objectives for Language Usage in Support of Literary Analysis

The degree to which student performance meets the learning objectives in each area is articulated in the *achievement level descriptions*, which define how well students at each level perform. Due to the interrelated nature of the "five C's," all the *achievement level descriptions* work in concert with one another and should be considered holistically. While references to levels 1–5 cannot precisely predict a student's ultimate AP Exam score, AP teachers can use this information to develop better insight into individual student performance and adjust curriculum and instruction throughout the course.

Two categories of learning objectives apply only to the AP course and will not be assessed on the AP Exam: Interpersonal Communication and Communities. Achievement level descriptions are not provided for Communities; however, they are provided for Interpersonal Communication so that teachers may use them as a guide to assess student participation in class discussions.

© 2012 The College Board.

Interpersonal Communication

Interpersonal Communication is characterized by active negotiation of meaning among individuals. Participants observe and monitor one another to see how their meanings and intentions are being communicated. Adjustments and clarifications can be made accordingly. Students in the AP Spanish Literature and Culture course discuss texts and contexts in a variety of interactive oral and written formats in Spanish. Whether in an online discussion group or an in-class debate, students formulate and respond to questions, connect personal observations to those of their classmates and teacher, and state and support their opinions. They also apply a variety of literary and analytical terms in Spanish to the oral and written discussion of texts and contexts.

Learning Objectives for Interpersonal Communication

- The student discusses texts and contexts in a variety of interactive oral formats in the target language.
- The student discusses texts and contexts in a variety of interactive written formats in the target language.
- The student uses a variety of literary and critical terminology in oral and written discussions of texts in the target language.

Achievement Level Descriptions for Interpersonal Communication

Achievement Level 5

Students at Achievement Level 5 engage fully in oral and written discussions of texts and contexts, connecting personal observations to those of their classmates and providing insightful comments and questions. They formulate and respond appropriately to critical and analytical questions about texts and contexts. In oral and written discussions they are able to interpret and analyze texts and contexts, supporting their opinions with textual evidence.

Achievement Level 4

Students at Achievement Level 4 participate in oral and written discussions on texts and contexts by asking probing or follow-up questions and providing answers that elaborate on main points. They formulate interpretive questions about textual details and respond appropriately, though perhaps not fully, to critical and analytical questions about texts and contexts. Their participation in oral and

Return to the Table of Contents

© 2012 The College Board.

written discussions goes beyond providing information about texts; they are able to interpret texts and contexts, and state and support their opinions with some textual details.

Achievement Level 3

Students at Achievement Level 3 participate in oral and written discussions by asking and answering questions about texts and some contexts. They formulate factual questions and respond to interpretive questions about textual details. Their participation in oral and written discussions consists mainly of providing information about texts. While they are able to state their opinions related to texts, they may struggle to support them with textual details.

Achievement Level 2

Students at Achievement Level 2 participate in oral and written discussions by answering direct, factual questions about texts. They are generally not able to sustain discussions by elaborating on main points or providing information about contexts. They may commit errors in using basic literary terms to discuss texts.

Achievement Level 1

Students at Achievement Level 1 participate at a level not consistent with the criteria outlined for Level 2, or produce no measurable performance at all (i.e., off-task).

Interpretive Communication

Interpretive communication is characterized by the appropriate cultural interpretation of meanings that occur in written or spoken form where there is no recourse to the active negotiation of meaning with the writer or speaker. Students in the AP Spanish Literature and Culture course use their interpretive communication skills to demonstrate understanding of both texts and contexts.

Students demonstrate their understanding of texts by analyzing main ideas and supporting details, the relationship between the structure of a text and its content, and the significance of rhetorical figures, points of view, and stylistic features. They also analyze themes and features of artistic representations, audiovisual materials, and audio sources in Spanish that are related to texts.

Students demonstrate their understanding of contexts by explaining how the content of texts relates to issues of politics, economics, religion, gender, social class and ethnicity in both historical and contemporary time frames. They associate language usage found in texts to age, gender, and social class, and associate features of individual texts with broader literary genres, periods, and movements.

© 2012 The College Board.

Learning Objectives for Interpretive Communication

- The student reads and comprehends literary and related written texts in the target language.
- The student listens to and comprehends spoken target language related to literary content.
- The student analyzes literary and related texts in the target language.
- The student differentiates between personal and critical reactions in the target language.
- The student identifies rhetorical figures used in target language texts.
- The student analyzes the significance of rhetorical figures in target language texts.
- The student identifies points of view in target language texts.
- The student analyzes the significance of points of view in target language texts.
- The student identifies stylistic features of target language texts.
- The student analyzes the significance of stylistic features of target language texts.
- The student identifies literary genres, periods, and movements and their characteristics in target language texts.
- The student relates target language texts to genres, periods and movements.
- The student identifies sociocultural contexts in target language texts.
- The student relates target language texts to sociocultural contexts.
- The student situates textual language and registers within historical, social, and geopolitical contexts.
- The student relates artistic representations and audiovisual materials, including films and music, to literary course content.
- The student relates secondary texts to primary texts in support of textual analysis in the target language.
- The student uses authorized reference tools for interpreting texts in the target language.

Return to the Table of Contents

© 2012 The College Board.

Achievement Level Descriptions for Interpretive Communication

Achievement Level 5

Students at Achievement Level 5 demonstrate an understanding of oral and written texts by analyzing main ideas and supporting details, the relationship between the structure of a text and its content, and the effect of word choice, symbolism and imagery in texts. They analyze stylistic features and make distinctions between narrative voices and the author's perspective in order to establish differences in meaning. They explain how the content and stylistic features of texts relate to genres and major cultural movements. They analyze themes and features of artistic representations, audiovisual materials, and spoken target language sources in relation to literary texts. They accurately use a wide variety of relevant literary terms to analyze texts, with very few errors that do not detract from the quality of their written and oral work (see Literary Terminology section).

Achievement Level 4

Students at Achievement Level 4 demonstrate an understanding of oral and written texts by interpreting main ideas and supporting details, and by explaining the relationship between the structure of a text and its content. They explain how a text's content relates to sociocultural contexts, and how features of texts are characteristic of particular literary periods or movements. They make distinctions between stylistic features and between narrative voices in texts in order to establish differences in meaning. They identify the movement(s) to which a text belongs. They connect themes and features of artistic representations, audiovisual materials, and spoken target language sources to literary texts. They accurately use a variety of relevant literary terms to analyze texts, with occasional errors that generally do not detract from the quality of their written and oral work (see Literary Terminology section).

Achievement Level 3

Students at Achievement Level 3 demonstrate an understanding of oral and written texts by summarizing main ideas and supporting details, and distinguishing arguments (based on textual examples) from opinions (based on personal beliefs). They connect ideas and themes to characters and describe some stylistic features related to literary content. They identify features of literary periods, movements, and sociocultural contexts related to course content, as well as the use of language registers to reflect social relationships in texts. They identify themes and features of artistic representations, audiovisual materials, and spoken target language sources related to literary texts. Though the identifications and connections they

© 2012 The College Board.

make are at times too superficial to support textual analysis, students at this level are able to use that information to answer interpretive questions about texts. They accurately use some relevant literary terms to analyze texts, though with more frequent errors that occasionally detract from the quality of their written and oral work (see Literary Terminology section).

Achievement Level 2

Students at Achievement Level 2 demonstrate an understanding of oral and written texts by summarizing and paraphrasing main ideas. They describe basic elements of literary texts such as setting, main characters, and plot. They identify features associated with broad literary genres and examples of formal and informal language used in texts. Students at this level generally do not interpret or analyze texts, but rather describe and summarize them. They use only a limited range of relevant literary terms with accuracy; errors in using terminology are more pervasive and often detract from the quality of their written and oral work.

Achievement Level 1

Students at Achievement Level 1 demonstrate an understanding of oral and written texts that is not consistent with the criteria outlined for Level 2, or produce no measurable performance at all (i.e., off-task).

Presentational Communication

Presentational Communication is characterized by the creation of messages in a manner that facilitates interpretation by the audience where no direct opportunity exists for the active negotiation of meaning. Students in the AP Spanish Literature and Culture course create and deliver oral presentations related to course content in a variety of formats in Spanish. They also write analytical compositions in Spanish that are organized around a topic and an explicit statement of purpose (thesis), and have a coherent structure and a cohesive, logical progression of ideas. Students incorporate information from secondary sources related to texts into their oral and written work, and use authorized reference materials and cite them appropriately.

Return to the Table of Contents

© 2012 The College Board.

Learning Objectives for Presentational Communication

- The student organizes information, concepts, and ideas in oral and written presentations in the target language.
- The student presents information in a descriptive form in the target language.
- The student writes analytical compositions related to literary texts in the target language.
- The student creates and delivers oral presentations related to course content in a variety of formats in the target language.
- The student incorporates information from secondary sources related to texts in oral and written presentations in the target language.
- The student uses authorized reference materials in oral and written presentations.
- The student acknowledges sources and cites them appropriately.

Achievement Level Descriptions for Presentational Communication

Achievement Level 5

Students at Achievement Level 5 produce and deliver oral and written presentations that are analytical in nature. Oral and written presentations have an explicit statement of purpose (thesis), a coherent structure, a cohesive and logical progression, and insight into the topic. Students support literary analysis by making interdisciplinary connections or cultural comparisons that demonstrate understanding of contexts. They integrate specific, well-chosen textual examples into their presentations, including references to secondary texts and brief discussions of historical and cultural contexts.

Achievement Level 4

Students at Achievement Level 4 produce and deliver oral and written presentations that are fundamentally analytical in nature; description and narration are present but do not outweigh analysis. Oral and written presentations have an explicit statement of purpose (thesis), a coherent structure, and a logical progression of ideas. Students support literary analysis by citing and discussing appropriate textual examples. They facilitate comprehension of their oral and written work by using rhetorical markers, transitions, and/or visual materials. At this level, students are

© 2012 The College Board.

able to refer to selected secondary texts and place texts in their historical and cultural contexts in oral and written presentations.

Achievement Level 3

Students at Achievement Level 3 produce and deliver oral and written presentations that feature conscious efforts to analyze texts; however, these attempts may not be successful. In general, description and narration outweigh analysis. Oral and written presentations have a statement of purpose, evidence of organization (i.e., a stated topic, an introduction and a conclusion), and a logical progression of ideas. Students can elaborate on their main points and support their observations by citing examples, but these examples may not always be clear and relevant.

Achievement Level 2

Students at Achievement Level 2 produce and deliver oral and written presentations that are descriptive or narrative in nature by summarizing or paraphrasing texts. They do not clearly state a purpose or organize presentations around a topic. Oral and written work is supported by describing basic elements of texts. Students at this level present main points and some details about a topic, but mostly produce plot summary and do not support an argument with textual examples.

Achievement Level 1

Students at Achievement Level 1 produce and deliver oral and written presentations that are not consistent with the criteria outlined for Level 2, or produce no measurable performance at all (i.e., off-task).

Cultures, Connections, Comparisons, and Communities

The Cultures goal area of the *Standards* focuses on students gaining knowledge and understanding of the relationships between products, practices, and perspectives of the cultures studied. Students in the AP Spanish Literature and Culture course relate texts to products, practices and perspectives found in a variety of media from the target cultures. Cultural *products* may be tangible artifacts created by humans (e.g., a monument, a garment) or they may be intangible results of human work or thought (e.g., an oral tale, a law). Cultural *practices* are patterns of behavior accepted by a society (e.g., rites of passage, child rearing, use of linguistic register, and forms of address in a conversation). Cultural *perspectives* are the underlying beliefs and values of a society. These ideas and attitudes serve as a base from which cultural practices are derived; they also justify the presence of cultural products.

Return to the Table of Contents

© 2012 The College Board.

Students analyze the roles of personal assumptions and cultural beliefs in the interpretation of texts. They situate texts within literary and artistic heritages of the target cultures and relate literary movements to cultural contexts. They also analyze how texts reinforce or challenge perceptions of a majority culture.

The Connections goal area of the *Standards* focuses on students reinforcing and furthering their knowledge of other disciplines and their awareness of distinctive viewpoints by acquiring information available in the target language. Students in the AP Spanish Literature and Culture course make interdisciplinary connections to support textual analysis. They relate texts to literary, historical, and cultural contexts, and to contemporary global issues. They use information available in Spanish to support the interpretation of texts and to compare distinctive cultural viewpoints.

The Comparisons goal area of the *Standards* focuses on students developing insight into the nature of language and culture. Students in the AP Spanish Literature and Culture course compare textual language and literary features of target language texts produced in different historical, social, and geopolitical contexts. They compare representations of key events produced through a variety of cultural perspectives. They also compare cultural products, practices, and perspectives found in texts to their own cultures.

The Communities goal area of the *Standards* focuses on students participating in multilingual communities at home and around the world. Students in the AP Spanish Literature and Culture course deepen and reinforce their understanding of literary texts through activities in the target language within and beyond the classroom setting. They also share their knowledge of literature and culture with communities beyond the classroom setting.

© 2012 The College Board.

Learning Objectives for Cultures, Connections, Comparisons, and Communities

- The student analyzes the relationship between products (both tangible and intangible) and perspectives of target cultures as manifested in target language texts.
- The student relates texts to products and perspectives found in a variety of media from the target cultures.
- The student analyzes the relationships between practices and perspectives of target cultures as manifested in target language texts.
- The student relates texts to practices and perspectives found in a variety of media from the target cultures.
- The student analyzes the role of personal assumptions and cultural beliefs in the interpretation of target language texts.
- The student situates texts within literary and artistic heritages of the target cultures.
- The student relates literary movements to cultural contexts.
- The student analyzes how texts reinforce or challenge perceptions of a majority culture.
- The student relates texts to their contexts (literary, historical, sociocultural, geopolitical) in the target language.
- The student makes interdisciplinary connections to support analysis of literary and related texts.
- The student relates texts to contemporary global issues using the target language.
- The student uses information available in the target language and culture to support the interpretation of texts and compare distinctive viewpoints.
- The student compares literary features of target language texts to those of other texts.
- The student compares textual language and registers in target language texts produced in different historical, social, and geopolitical contexts.
- The student compares cultural products, practices, or perspectives portrayed in texts to his or her own.
- The student compares representations of key events produced through a variety of cultural perspectives.
- The student deepens and reinforces understanding of literary texts through activities in the target language within and beyond the classroom setting.
- The student shares knowledge of literature and culture with communities beyond the classroom setting.

Return to the Table of Contents

© 2012 The College Board.

Achievement Level Descriptions for Cultures, Connections, and Comparisons

Achievement Level 5

Students at Achievement Level 5 analyze how cultural beliefs and attitudes affect textual interpretation. They explain the role of cultural stereotypes in texts, and how behavior and attitudes present in texts reflect sociocultural contexts. They explain how literary movements reflect cultural change. They make connections between primary and secondary texts and apply information from other disciplines to support textual analysis. They analyze the functions of structural features and the effects of rhetorical features in texts related by period, genre or theme. They analyze representations of key events in different texts and how representations of cultural products, practices, and perspectives in literary texts compare to their own culture.

Achievement Level 4

Students at Achievement Level 4 explain how personal beliefs and attitudes affect textual interpretation. They connect literary movements to cultural perspectives and can describe cultural products and practices that relate to cultural perspectives present in texts. They explain the relationship between themes found in texts and contemporary or global issues in order to enhance understanding of the texts. They apply information from other disciplines to the analysis of texts. They connect textual information to sociocultural contexts, and linguistic changes to historical and geopolitical contexts. They compare representations of key events in different texts and compare distinct points of view from target texts and cultures to points of view from their own culture.

Achievement Level 3

Students at Achievement Level 3 identify cultural practices and perspectives found in oral and written texts, songs, visuals, or other artifacts. They apply information from other disciplines to aid their comprehension of texts. They identify themes found in target texts that are relevant to contemporary society. They identify structural and rhetorical features in texts of the same period or genre, as well as linguistic features representative of the time and place in which texts were written.

Achievement Level 2

Students at Achievement Level 2 identify cultural products in oral and written texts, and songs, visuals, or other artifacts. They identify some cultural practices found in written texts or visuals. They identify information from other disciplines that relates to course content, as well as main themes or events found in different texts, but they generally do

© 2012 The College Board.

not apply that information to the interpretation of texts or to making interdisciplinary connections and cultural comparisons

Achievement Level 1

Students at Achievement Level 1 demonstrate an understanding of cultural and interdisciplinary information in texts at a level not consistent with the criteria outlined for Level 2, or produce no measurable performance at all (i.e., off-task).

Language Usage in Support of Literary Analysis

The AP Spanish Literature and Culture course does not represent an endpoint of students' study of the Spanish language. On the contrary, course work in literary analysis reinforces the continued emphasis on developing proficiency across the full range of language skills, with special attention to critical reading and analytical writing. Students learn and use a variety of vocabulary appropriate to literary analysis, and they continue to develop a sophisticated array of grammatical and syntactic structures. They produce comprehensible oral and written presentations that show attention to pronunciation and pace, as well as standard writing conventions of the Spanish language.

Learning Objectives for Language Usage in Support of Literary Analysis

- The student uses a variety of vocabulary appropriate to literary analysis.
- The student uses a variety of grammatical and syntactic structures.
- The student produces comprehensible written work by observing writing conventions of the target language.
- The student uses pronunciation that is comprehensible to the audience in oral communications.
- The student self-monitors and adjusts language production in oral and written communications.

Return to the Table of Contents

© 2012 The College Board.

Achievement Level Descriptions for Language Usage in Support of Literary Analysis

Achievement Level 5

Students at Achievement Level 5 use language that is varied and appropriate to the text(s) being analyzed. They use language that presents main ideas and supporting details, and communicates some nuances of meaning. Students at this level demonstrate very good control of grammatical and syntactic structures. Their use of verb tenses and moods is generally accurate, word order and formation are accurate, and their use of cohesive devices or transitional elements is appropriate to guide the reader's understanding. Students at this level are accurate in their spelling, placement of accents, punctuation and paragraphing, with only sporadic errors. They show grouping and progression of ideas through paragraphing.

Achievement Level 4

Students at Achievement Level 4 use language that is appropriate to the text(s) being analyzed. They use language that presents main ideas and supporting details. Students at this level demonstrate good control of grammatical and syntactic structures; occasional errors in the use of verb tenses and moods do not detract from understanding, and word order and formation are mostly accurate. Students at this level are generally accurate in their spelling, placement of accents, punctuation and paragraphing. They may commit patterned errors, but these are infrequent and do not detract from the reader's understanding. They show grouping and progression of ideas through paragraphing.

Achievement Level 3

Students at Achievement Level 3 use language that is appropriate to the text(s) being analyzed, but their vocabulary may be limited to presenting main ideas. Students at this level demonstrate adequate control of grammatical and syntactic structures; errors in the use of verb tenses and moods may be frequent but do not detract from overall understanding, and word order and formation are generally accurate. Students at this level are sometimes accurate in their spelling, accents, punctuation, and paragraphing. They commit patterned errors that may become frequent but do not detract from the reader's overall understanding. They show grouping of ideas through paragraphing.

© 2012 The College Board.

Achievement Level 2

Students at Achievement Level 2 use language that at times is inapplicable to the text(s) being analyzed, and that forces the reader to supply inferences. Students at this level demonstrate inadequate control of grammatical and syntactic structures; errors in verb forms, word order and formation are frequent and serious enough to impede comprehension at times. Students at this level are generally inaccurate in their spelling, placement of accents, punctuation, and paragraphing. They commit numerous errors that impede comprehension at times, and they do not show grouping of ideas through paragraphing.

Achievement Level 1

Students at Achievement Level 1 use language in a manner not consistent with the criteria outlined for Level 2, or produce no measurable performance at all (i.e., off-task).

Return to the Table of Contents

Required Reading List

The required reading list for the course has been reduced to 38 titles in order to promote depth of student understanding and contextual knowledge. In revising the reading list, it was considered highly desirable to retain as many works as possible from the existing AP Spanish Literature required reading list while keeping the overall length manageable so that teachers would not feel that their efforts to prepare the current course had been wasted, or feel overtaxed in having so many new texts to prepare. Thus, in total this required reading list has been reduced by more than 30 percent, with just 15 percent of the titles being new additions.

Study of the AP Spanish Literature and Culture curriculum requires that only unabridged, full text, Spanish language versions of the required readings be used.

The new works and chapter additions are in **boldface**.

Isabel Allende, "Dos palabras"

Anónimo, "Romance de la pérdida de Alhama"

Anónimo, *Lazarillo de Tormes* (**Prólogo**; Tratados 1, 2, 3, 7)

Gustavo Adolfo Bécquer, Rima LIII ("Volverán las oscuras golondrinas")

Jorge Luis Borges, "Borges y yo"

Jorge Luis Borges, "El Sur"

Julia de Burgos, "A Julia de Burgos"

Miguel de Cervantes, *Don Quijote* (Primera parte, capítulos 1–5, 8 y 9; **Segunda parte, capítulo 74**)

Julio Cortázar, "La noche boca arriba"

Hernán Cortés, "Segunda carta de relación" (selecciones)

Sor Juana Inés de la Cruz, "Hombres necios que acusáis"

Rubén Darío, "A Roosevelt"

Don Juan Manuel, *Conde Lucanor*, Exemplo XXXV ("De lo que aconteció a un mozo que casó con una mujer muy fuerte y muy brava")

Osvaldo Dragún, *El hombre que se convirtió en perro*

Carlos Fuentes, "Chac Mool"

Federico García Lorca, *La casa de Bernarda Alba*

Federico García Lorca, "Prendimiento de Antoñito el Camborio en el camino de Sevilla"

Gabriel García Márquez, "El ahogado más hermoso del mundo"

© 2012 The College Board.

Gabriel García Márquez, "La siesta del martes"

Garcilaso de la Vega, Soneto XXIII ("En tanto que de rosa y azucena")

Luis de Góngora, Soneto CLXVI ("Mientras por competir con tu cabello")

Nicolás Guillén, "Balada de los dos abuelos"

José María Heredia, "En una tempestad"

Miguel León-Portilla, *Visión de los vencidos* (dos secciones: "Los presagios, según los informantes de Sahagún" y "Se ha perdido el pueblo mexica")

Antonio Machado, "He andado muchos caminos"

José Martí, "Nuestra América"

Rosa Montero, "Como la vida misma"

Nancy Morejón, "Mujer negra"

Pablo Neruda, "Walking around"

Emilia Pardo Bazán, "Las medias rojas"

Francisco de Quevedo, Salmo XVII ("Miré los muros de la patria mía")

Horacio Quiroga, "El hijo"

Tomás Rivera, *... y no se lo tragó la tierra* (dos capítulos: "...y no se lo tragó la tierra" y "La noche buena")

Juan Rulfo, "No oyes ladrar los perros"

Alfonsina Storni, "Peso ancestral"

Tirso de Molina, *El burlador de Sevilla y convidado de piedra*

Sabine Ulibarrí, "Mi caballo mago"

Miguel de Unamuno, *San Manuel Bueno, mártir*

Literary Terminology

This section of the curriculum framework is designed to show the range of literary terms used in the course. The lists provided contain a representative selection of terms that are used both in AP classes at the secondary level, and in college and university courses in Introduction to Literary Analysis and surveys of Peninsular and Latin American literatures. The list is neither prescriptive nor exhaustive; teachers are welcome to supplement the list as they wish for their own classroom instruction. Rather, the list is intended to set a baseline expectation with regard to the terms that students should learn and apply to their study of the texts on the required reading list.

Three groups of literary terms represent a general progression in ability to interpret and analyze literary texts. Within each group of terms, six categories are outlined: (1) general terms, (2) terms that relate to narrative genres, (3) terms that relate to poetic genres, (4) terms that relate to dramatic genres, (5) rhetorical figures, and (6) literary historical terms.

Throughout the AP course, students at Achievement Level 5 would accurately use a wide variety of these literary terms, as relevant to the texts being analyzed, though with occasional errors. However, those errors would not detract from the quality of their work, and it is not expected that students would memorize and use without error every term on the list in order to demonstrate performance at Achievement Level 5. Similarly, students at Achievement Level 4 would accurately use a variety of these terms, perhaps with a few more errors, but again those errors generally would not detract from the quality of their oral or written work in the AP course. Students at Achievement Level 3 would accurately use some of these terms in their work; errors would be more frequent and occasionally would detract from the quality of the work. Students at Achievement Levels 2 and 1 would use only a limited range of terms with accuracy; errors would be more pervasive and more often than not would detract from the quality of their work.

© 2012 The College Board.

Progression of Literary Terms (from basic to advanced)

General: género: narrativa, poesía, drama, ensayo; ambiente, argumento, ficción, figura retórica, héroe, imagen, lector, personaje, protagonista, público, suspenso, tema

Narrativa: autor, narrador; cuento, novela; prosa

Poesía: poema, poeta, voz poética; verso, estrofa; ritmo, métrica: rima consonante, rima asonante

Drama: acto, escena, escenario; comedia, tragedia; diálogo, monólogo; teatro

Figuras retóricas: metáfora, símil; aliteración, hipérbole, onomatopeya, personificación

General: ambigüedad, analogía, antagonista, antihéroe, arquetipo, atmósfera, *carpe diem*, desenlace, fábula, *in medias res*, ironía, *memento mori*, símbolo, tono, trama

Narrativa: crónica, *flashback*, fluir de conciencia, narrador omnisciente, narrador limitado o narrativa en primera persona, prefiguración, punto de vista o perspectiva

Poesía: heptasílabo, octosílabo, endecasílabo, alejandrino; arte menor, arte mayor; encabalgamiento, estribillo, lírica, poema épico, redondilla, romance, sinalefa, soneto, verso agudo, verso esdrújulo, verso llano

Drama: acción dramática: exposición, nudo o clímax, desenlace; acotaciones, aparte, comedia del Siglo de Oro, dramaturgo, teatro del absurdo

Figuras retóricas: anáfora, antítesis, apóstrofe, circunlocución o perífrasis, elipsis, enumeración, eufemismo, gradación, hipérbaton

Historia literaria: Barroco, Boom, colonial, Edad Media (medieval), Generación del 98, libro de caballerías, modernismo, naturalismo, novela picaresca, pícaro, realismo, realismo mágico, Renacimiento, romanticismo, Siglo de Oro

General: alegoría, apología, caricatura, cromatismo o simbolismo cromático, desdoblamiento, leitmotivo, meta- (e.g., metaficción, metateatro), parodia, sátira

Narrativa: narrativa epistolar, narrador fidedigno, narrador no fidedigno, narrador testigo, narratario, parábola

Poesía: diéresis, hiato, sinéresis; verso blanco o suelto, verso libre; cesura, hemistiquio; polifonía, polimetría; silva

Drama: anagnórisis, catarsis, falla trágica, ironía dramática, pathos, tres unidades

Figuras retóricas: asíndeton, cacofonía, epíteto, metonimia, paradoja, polisíndeton, sinécdoque, sinestesia, retruécano

Historia literaria: conceptismo, culteranismo, costumbrismo, existencialismo, neoclasicismo, postmodernismo, surrealismo, vanguardia

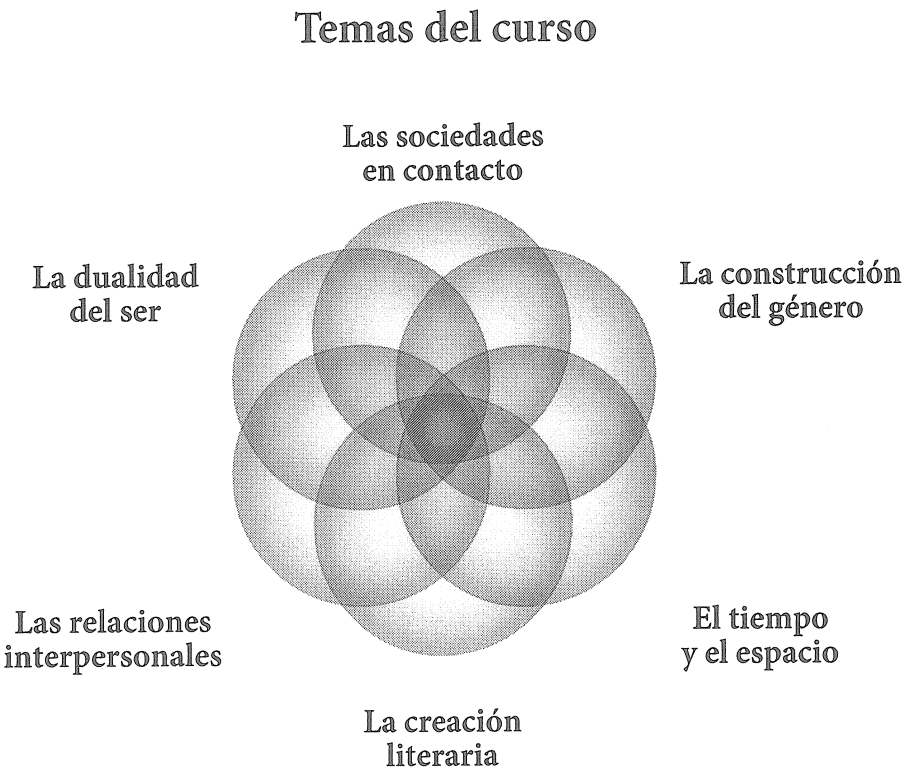
Course Themes

Incorporating themes into the design of the AP Spanish Literature and Culture course makes the literature of both distant and nearby places, and of the past and present, relevant to the interests and experiences of students taking their first literature course. Themes provide a meaningful basis for making contextual connections among works of different genres, periods and movements, and allow for interdisciplinary teaching methods through the introduction of theories from different subject areas. In addition, themes facilitate the incorporation of other art forms such as painting, photography, cinema, and music into the teaching of literature. And, perhaps most important, the use of themes in instructional design stimulates students to appreciate the potential of literature to comment on and enlighten their own life experiences, thus increasing their interest not only in reading but also in writing and speaking about literature in the target language.

The AP Spanish Literature and Culture course features six themes. Teachers who organize their current AP course syllabi by genres or by chronology are encouraged to see the themes as opportunities to make connections between works, rather than a mandate to teach the works on the required reading list strictly in thematic units.



© 2012 The College Board.

Organizing Concepts and Essential Questions

Each theme is supplemented by a number of *organizing concepts* for making contextual connections among works on the required reading list. The organizing concepts are not intended to be prescriptive or required; they merely serve as suggestions for working with the themes and the required readings.

One way to design instruction with themes is to identify *essential questions* to motivate learners and guide classroom investigations, learning activities and assessments. Essential questions are designed to spark curiosity and encourage students to consider how the content of the course relates to larger questions and issues in the study of literature and the humanities in general. Essential questions allow students to investigate and express different views on issues, make connections to other disciplines, and compare products, practices, and perspectives of target cultures to their own.

Here are the essential questions that apply to the AP Spanish Literature and Culture course as a whole:

- ¿Cómo revelan las obras literarias las perspectivas y costumbres de una cultura en un período determinado?
- ¿De qué manera afecta el contexto literario, histórico, sociocultural y geopolítico la creación de las obras literarias de determinada época?
- ¿Qué preguntas y dilemas presentes en obras literarias de diferentes autores y en diferentes épocas y culturas, son relevantes aún en la actualidad?
- ¿Qué contribuye el estudio de la literatura escrita en español al estudio del idioma?
- ¿Qué preguntas plantea la literatura acerca de la literatura misma y las demás artes?

Integrating Themes, Organizing Concepts, Essential Questions, and Required Readings

In order to promote an integrated approach to exploring the themes, lists of organizing concepts, essential questions, and sample groupings of works from the required reading list are provided below for each of the six course themes.

Return to the Table of Contents

© 2012 The College Board.

Teachers are especially encouraged to consider the interrelatedness of the themes, which, with the reduction of the required reading list, will present opportunities to study texts more than once in the AP course, bringing out different thematic connections and contexts for analysis each time. For example, one can work with Julia de Burgos' poem "A Julia de Burgos" to address the theme of **La construcción del género** and then take it up again to consider theme of **La dualidad del ser** — perhaps in relation to Borges' "Borges y yo." García Márquez's "La siesta del martes" can be read with attention to **Las sociedades en contacto** or **Las relaciones interpersonales.** Cortázar's "La noche boca arriba" can be studied in a unit on **El tiempo y el espacio**, and then again in relation to **La dualidad del ser.** And so it is with many of the required readings: the themes, organizing concepts, and essential questions afford teachers considerable flexibility to combine readings and design instructional units in ways that suit their interests and the needs of their students.

Theme: Las sociedades en contacto

Organizing Concepts:

- La asimilación y la marginación
- La diversidad
- Las divisiones socioeconómicas
- El imperialismo
- El nacionalismo y el regionalismo

Essential Questions:

- ¿De qué manera las perspectivas de una cultura afectan la representación de eventos históricos?
- ¿Cómo los miembros de una minoría cultural se resisten (o se asimilan) a las costumbres y las perspectivas de la mayoría dominante?
- ¿Cómo se representan en obras literarias de distintos períodos y diversas culturas las relaciones entre grupos socioculturales (clases sociales, grupos étnicos, etc.)?

Sample Groupings of Required Readings:

- Anónimo, *Lazarillo de Tormes*; Dragún, *El hombre que se convirtió en perro* (Las divisiones socioeconómicas)

© 2012 The College Board.

- Cortés, "Segunda carta de relación"; León-Portilla, *Visión de los vencidos*; Martí, "Nuestra América"; Darío, "A Roosevelt" (El imperialismo)

Theme: La construcción del género

Organizing Concepts:

- El machismo
- Las relaciones sociales El sistema patriarcal
- La sexualidad
- La tradición y la ruptura

Essential Questions:

- ¿Cómo revela la literatura los cambios en la percepción de los géneros masculino y femenino?
- ¿De qué manera han servido los factores socioculturales como instrumentos de cambios (o no) en la representación de los géneros?
- ¿Cómo ha cambiado la representación de lo femenino (voces femeninas, personajes femeninos) a lo largo de la historia de la literatura?

Sample Groupings of Required Readings:

- Pardo Bazán, "Las medias rojas"; Burgos, "A Julia de Burgos"; Morejón, "Mujer negra"; Allende, "Dos palabras" (La tradición y la ruptura)
- Sor Juana, "Hombres necios que acusáis"; Storni, "Peso ancestral" (El sistema patriarcal)

Theme: El tiempo y el espacio

Organizing Concepts:

- El *carpe diem* y el *memento mori*
- El individuo en su entorno
- La naturaleza y el ambiente
- La relación entre el tiempo y el espacio
- El tiempo lineal y el tiempo circular

Return to the Table of Contents

© 2012 The College Board.

- La trayectoria y la transformación

Essential Questions:

- ¿Cómo presentan las literaturas de distintas culturas los conceptos del tiempo y el espacio?
- ¿De qué manera los autores se valen del tiempo y el espacio para construir una variedad de estados de ánimos o sentimientos (p. ej. la desorientación, la nostalgia, el remordimiento)?
- ¿Cómo se relacionan la representación del espacio y el manejo del tiempo en una obra literaria?

Sample Groupings of Required Readings:

- Quevedo, "Miré los muros de la patria mía"; Machado, "He andado muchos caminos"; Neruda, "Walking around" (El individuo en su entorno)
- Garcilaso, Soneto XXIII ("En tanto que de rosa y azucena"); Góngora, Soneto CLXVI ("Mientras por competir con tu cabello"); Bécquer, Rima LIII ("Volverán las oscuras golondrinas") (El *carpe diem* y el *memento mori*; La trayectoria y la transformación)

Theme: Las relaciones interpersonales

Organizing Concepts:

- La amistad y la hostilidad
- El amor y el desprecio
- La comunicación o falta de comunicación
- El individuo y la comunidad
- Las relaciones de poder
- Las relaciones familiares

Essential Questions:

- ¿De qué manera se transforma el/la protagonista de una obra a consecuencia de sus relaciones con otros personajes?
- ¿De qué manera los individuos contribuyen o perjudican al bienestar de la familia o la comunidad?
- ¿Cómo influye el contexto sociocultural en el desarrollo de las relaciones interpersonales?

© 2012 The College Board.

Sample Groupings of Required Readings:

- Quiroga, "El hijo"; Rulfo, "No oyes ladrar los perros" (Las relaciones familiares)
- García Lorca, *La casa de Bernarda Alba*; Rivera, *... y no se lo tragó la tierra* (Las relaciones de poder; La comunicación o la falta de comunicación)

Theme: La dualidad del ser

Organizing Concepts:

- La construcción de la realidad
- La espiritualidad y la religión
- La imagen pública y la imagen privada
- La introspección
- El ser y la creación literaria

Essential Questions:

- ¿Qué preguntas plantea la literatura acerca de la realidad y la fantasía?
- ¿Cómo influye el contexto sociocultural o histórico en la expresión de la identidad?
- ¿Cuál es el significado de la vida (para un personaje, para un autor) y cómo se relaciona esto con las creencias o ideas en cuanto a la muerte?

Sample Groupings of Required Readings:

- Borges, "Borges y yo"; Unamuno, *San Manuel Bueno, mártir* (La imagen pública y la imagen privada)
- Cervantes, *Don Quijote*; Cortázar, "La noche boca arriba"; García Márquez, "El ahogado más hermoso del mundo" (La construcción de la realidad)

Theme: La creación literaria

Organizing Concepts:

- La intertextualidad
- La literatura autoconsciente

Return to the Table of Contents

© 2012 The College Board.

- El proceso creativo
- El texto y sus contextos

Essential Questions:

- ¿Qué factores motivan a los escritores a crear sus obras literarias?
- ¿De qué manera la intertextualidad contribuye al significado de una obra literaria?
- ¿Cómo influye en la experiencia de los lectores la presencia de la literatura misma como tema de una obra literaria?

Sample Groupings of Required Readings:

- Don Juan Manuel, *Conde Lucanor*, Exemplo XXXV ("De lo que aconteció a un mozo que casó con una mujer muy fuerte y muy brava"); Anónimo, *Lazarillo de Tormes* (La literatura autoconsciente)
- Borges, "Borges y yo"; Cervantes, *Don Quijote* (El proceso creativo)

© 2012 The College Board.

Glossary of Key Terms

The following definitions are offered in order to facilitate understanding of key concepts in the curriculum framework.

Achievement level descriptions: The *achievement level descriptions* provide detailed explanations of student performance at AP score points 5, 4, 3, 2 and 1. AP teachers can use this information to develop better insight into individual student performance and make appropriate adjustments to curriculum and instruction.

Analytical compositions: Students in the AP course write *analytical compositions* related to course content (e.g., textual analyses, brief research reports) that have an explicit statement of purpose (thesis), a coherent structure, and a cohesive and logical progression. In these written presentations, students elaborate on their main points and support their arguments by citing and discussing specific, well-chosen textual examples. In order to write analytical compositions, students must go beyond summarizing what a text says; rather, they are to explain the significance of specific features of the text and the significance of the historical and cultural contexts in which the text was written.

Communities: The communities goal area of the *Standards for Foreign Language Learning in the 21st Century* focuses on students participating in multilingual communities at home and around the world. Students deepen and reinforce their understanding of literary texts through activities in the target language within and beyond the classroom setting. They share their knowledge of literature and culture with communities beyond the classroom setting.

Comparisons: The *comparisons* goal area of the *Standards* focuses on students developing insight into the nature of language and culture. Students compare linguistic and literary features of texts produced in different historical, social, and geopolitical contexts. They compare representations of key events produced through a variety of cultural perspectives. They also compare cultural products, practices, and perspectives found in texts to their own cultures.

Connections: The *connections* goal area of the *Standards* focuses on students reinforcing and furthering their knowledge of other disciplines and awareness of distinctive viewpoints by acquiring information available in the target language. Students make interdisciplinary connections between literature and history, literature and the arts, or literature and politics in order to support textual analysis. They use information available in Spanish to support the interpretation of texts and to compare distinctive cultural viewpoints.

Return to the Table of Contents

© 2012 The College Board.

Context: A *context* of a literary work or historical event is a set of circumstances or facts surrounding it that influences its meaning or effect. Students demonstrate their understanding of contexts by explaining how texts relate to issues of politics, economics, religion, gender, social class, and ethnicity (to name a few possibilities) in both historical and contemporary time frames.

Critical reading: Students in the AP course read a literary text not just to comprehend what it says but also to understand how the text portrays its subject matter, and to consider how that portrayal can lead to a particular interpretation of the text. Goals of *critical reading* in the AP course (e.g., understanding the purpose of a text, recognizing bias, understanding the effects of rhetorical figures, and stylistic elements in conveying a message) are accomplished by sustained efforts to develop students' abilities to make inferences based on textual evidence.

Cultures: The *cultures* goal area of the *Standards* focuses on students gaining knowledge and understanding of the relationships between products, practices, and perspectives of the cultures studied. Students relate texts to products, practices and perspectives found in a variety of media from the target cultures. They situate texts within literary and artistic heritages of the target cultures and relate literary movements to cultural contexts. They also analyze how texts reinforce or challenge perceptions of a majority culture.

> **Products:** Cultural *products* may be tangible artifacts created by humans (e.g., a monument, a garment) or they may be intangible results of human work or thought (e.g., an oral tale, a law). Products reflect the beliefs and values (*perspectives*) of a culture.
>
> **Practices:** Cultural *practices* are patterns of behavior accepted by a society (e.g., rites of passage, child rearing, use of linguistic register and forms of address in a conversation). They represent the knowledge of "what to do, when, and where" in a society.
>
> **Perspectives:** Cultural *perspectives* are the underlying beliefs and values of a society. These ideas and attitudes serve as a base from which cultural practices are derived; they also justify the presence of cultural products.
>
> Example: The beliefs and values of a culture concerning interpretations of death (*perspectives*) influence how members of that culture mourn the loss of a loved one (*practices*) and the artifacts (e.g., an obituary) that are created to mark the passing or commemorate the life of that person (*products*).

© 2012 The College Board.

Essential questions: One way to approach instructional design with course themes is to identify *essential questions* that guide classroom investigations, learning activities and performance assessments. Essential questions allow students to investigate and express different views on issues, make connections to other disciplines, and compare products, practices, and perspectives of target cultures to their own. In this document, essential questions are provided for the course as a whole (e.g., "¿Qué preguntas y dilemas presentes en obras literarias de diferentes autores y en diferentes épocas y culturas, son relevantes aún en la actualidad?") and for each of the course themes (e.g., "¿Cómo revela la literatura los cambios en la percepción de los géneros masculino y femenino?" for the theme **La construcción del género**). AP teachers are welcome to use the essential questions presented in this document, and they may design their own as well.

Interpersonal communication: Communication in the *interpersonal* mode is characterized by active negotiation of meaning among individuals. Students develop their Interpersonal Communication skills by discussing texts and contexts in a variety of interactive oral formats (e.g. in-class discussions, debates) and interactive written formats (online discussion boards and blogs, emails to classmates and the instructor) in Spanish.

Interpretive communication: Communication in the *interpretive* mode is characterized by the appropriate cultural interpretation of meanings that occur in written and spoken form where there is no recourse to the active negotiation of meaning with the writer or speaker. Students use their Interpretive Communication skills to demonstrate understanding of texts (by analyzing themes, main ideas and supporting details, structural and stylistic features) and contexts (by relating the content of texts to issues of politics, economics, religion, gender, social class, and ethnicity, and by associating features of texts with broader genres, periods, or movements).

Learning objective: A *learning objective* is a specific statement about what students should know and be able to do as a result of taking the AP course. "The student" is the subject of each objective, e.g., "The student analyzes the significance of rhetorical figures in target language texts," "The student relates target language texts to sociocultural contexts."

Organizing concepts: Each of the course themes is supplemented by approximately a half-dozen recommended *organizing concepts* for addressing the theme and grouping literary works into thematic units. The organizing concepts can be thought of as "sub-themes" that provide different approaches to a course theme. For example, in order to address the course theme **Las sociedades en contacto**, an AP teacher may choose one or more of the organizing concepts to build a thematic unit: "La asimilación y la marginación," "La diversidad," "Las divisiones socioeconómicas," "El imperialismo," "El nacionalismo y el regionalismo."

Return to the Table of Contents

© 2012 The College Board.

The organizing concepts are not intended as prescriptive or required; they merely serve as suggestions for working with the course themes and the required readings.

Personal and critical reactions. As students develop their critical thinking skills in the course, they become more able to distinguish between *personal reactions* based on their own attitudes and beliefs, and *critical reactions* expressed in arguments and justified with textual evidence. A key objective of the course is to develop the students' own abilities to create and present evidence-based arguments about texts and contexts.

Presentational communication. Communication in the *presentational* mode is characterized by the creation of messages in a manner that facilitates interpretation by the audience where no direct opportunity for the active negotiation of meaning exists. Students create and deliver oral presentations that are related to course content in a variety of formats in Spanish. They also write analytical compositions in Spanish that are organized around a topic and an explicit statement of purpose (thesis), and have a coherent structure, and a cohesive, logical progression of ideas.

American Sign Language I

Grades: 9,10,11,12

Length: Full Year

Environment: Classroom-based

Honors: None

Subject: Language Other than English (E)

Discipline: LOTE Level 1

Institution: Santa Maria Joint Union High School District

Course Overview

This course will teach basic signs, grammar, fingerspelling, and the cultural aspects of Deafness. Students will learn basic communication. Total participation is mandatory in order to properly learn the language. Activities will include: students working in pairs or groups, role playing, skits, songs, and impromptu presentations. In addition to written homework, students are expected to study/practice outside the classroom on a daily basis. Students will also be required to complete a poster on a famous Deaf person and attend one out-of-class function. This course may not be repeated for credit.

1. Develop receptive skills 2. Develop delivery skills 3. Develop skills in reading the specialized written form of American Sign Language 4. Develop skills in writing the specialized written form of American Sign Language 5. Develop an understanding of the necessary structure basic to the American Sign Language sentence. 6. Acquire a basic functional vocabulary in American Sign Language 7. Become familiar with the Deaf Culture 8. Develop a fluent style of delivery, including a knowledge of all handshapes. 9. Demonstrate the use of critical-thinking skills throughout the course curriculum.

Unit One: Greetings and Farewells

1. To learn proper greetings and farewells in ASL

2. To introduce yourself and Others

3. To learn Basic ASL sentence structure

4. To ask and answer questions

5. To learn how to interact appropriately with Deaf people

6. To learn the role of facial Expressions and non-manual signals

Assignments

1. Take the Unit One Exam
2. Create a signed presentation with a partner for their expressive evaluation

Unit Two: Basic Conversation

1. To ask for help and Clarification
2. To engage in basic conversation on a variety of topics
3. To understand the cultural view of Deafness
4. To improve familiarity with ASL grammar and structure
5. To learn and apply WH-signs and facial expressions
6. To understand iconic and non-iconic signs

Assignments

1. Take the Unit Two Exam
2. Create a signed presentation with a partner for their expressive evaluation

Unit Three: ASL Skills

1. To expand ASL skills and topics of conversation
2. To understand topic-comment structure
3. To incorporate numbers into conversation
4. To understand how ASL name signs are made
5. To use possessive signs and deixis appropriately
6. To talk about favorites

Assignments

1. Take the Unit Three Exam

2. Create a signed presentation with a partner for their expressive evaluation

3. Share a dialogue to incorporate numbers in a conversation.

Unit Four: Gender Distinction

1. To recognize and use gender distinction in ASL

2. To understand and use contrastive structure

3. To gain exposure to Deaf art

4. To sign about family, friends and relationships

5. To use pronoun signs appropriately

Assignments

1. Take the Unit Four Exam

2. Create a signed presentation with a partner for their expressive evaluation

3. Describe a Deaf art piece.

Unitv Five: Conversational Skills

1. To improve conversational skills

2. To sign about school and school life

3. To identify and use the Agent Marker appropriately

4. To understand contemporary Deaf education options

5. To understand and use these classifiers ^, 1, 3

6. To tell time and sign about time-related issues

Assignments

1. Take the Unit Five Exam

2. Create a signed presentation with a partner for their expressive evaluation

Unit Six: Sign about Sports

1. To sign about sports
2. To understand the Five Parameters of ASL
3. To understand the different types of ASL literature
4. To expand classifier skills
5. To use the past, present, and future tenses
6. To understand and use the Rule of 9

Assignments

1. Take the Unit Six Exam
2. Create a signed presentation with a partner for their expressive evaluation

Unit Seven: Daily Routines and Activities

1. To sign about daily routines and activities
2. To identify and understand noun-verb pairs in ASL
3. To describe clothing
4. To learn and use spatial organization
5. To apply turn-taking strategies in conversations
6. To understand the sign language continuum

Assignments

1. Take the Unit Seven Exam
2. Create a signed presentation with a partner for their expressive evaluation

Unit Eight: People's Physical Appearance

1. To describe people’s physical appearances
2. To describe personality traits and characteristics
3. To improve ASL narrative skills
4. To learn about Deaf-Blind communication

5. To discuss health issues

6. To describe the natural world and environment

Assignments

1. Take the Unit Eight Exam

2. Create a signed presentation with a partner for their expressive evaluation

Unit Nine: Home and Community

1. To describe your home and community

2. To sign money using the Money Spot and Dollar Twise

3. To describe objects using spatialization techniques

4. To understand and give street directions

5. To understand how social changes affect the Deaf World

6. To learn and apply non-manual signals

Assignments

1. Take the Unit Nine Exam

2. Create a signed presentation with a partner for their expressive evaluation

Unit Ten: Occupations and Fields of Study

1. To converse about occupations and fields of study

2. To use become and to be in conversation

3. To discuss food

4. To describe animals and a trip to the zoo

5. To expand visualization and description skills using classifiers

Assignments

1. Take the Unit Ten exam

2. Create a signed presentation with a partner for their expressive evaluation

Assessments

1. Students will complete a 100 point exam (receptive) after each unit.

2. Students will create a dialogue (expressive exam) based on guidelines that is given out in class after completing each unit. This exam is worth 100 points.

3. Students will complete a binder which will includes all the notes, quizzes, exams, handouts, and the class syllabus.

Assignments

1. Students will create a poster on a Famous Deaf person and include several facts such as: name of Famous Deaf person, year of birth/year of death, history of his/her family, occupation, and why he/she was famous.

2. Students will present their poster in ASL.

Reception

Students will:

1. Demonstrate good comprehension of a short passage, dialogue or conversation

2. Describe the characters, situation and action after viewing a lecture

3. Indicate accurate responses after viewing a videotape and question its contents

4. Discriminate among the different handshapes of ASL Delivery Students will:

5. sign dialogues as naturally as possible, including handshapes, facial expressions, and rhythm.

6. Answer questions that demonstrate comprehension of what is presented in the dialogue.

7. Prepare and give a speech on a given topic.

8. Give an impromptu talk on a given topic.

9. Sign the finger alphabet fluently.

10. Participate effectively in class discussion and conversation, demonstrating the ability to initiate conversation and pose questions.

11. Prepare and conduct an interview with another student.

12. Talk about themselves using the grammatical structures and vocabulary of the basic passages

in each chapter. Reading Students will:

13. Understand the written form of ASL, including all coded markers.

14. Given a written text, translate that into signing using all coded markers.

15. Identify correctly and incorrectly used coded markers given a set of circumstances.

16. Discriminate among similar coded markers of implied meaning.

Writing Students will:

17. Write basic dialogues.

18. Write accurate dictations in coded ASL and conversational English translations.

Grammar Skills Students will:

19. Identify correct topic-comment sentence structure.

20. Correctly use pronominalizations.

21. Demonstrate the difference among types of questions.

22. Explain the subtle difference between delivery of a noun sign and its verb counterpart.

23. Deliver both directional and nondirectional verbs. 24. Recognize conditional components of a sentence.

Assignments

Critical Thinking Skills Students will:

1. Expand their cognitive abilities in writing, reading, receiving, and delivering in the following cognitive domains: a. comparison and contrast b. analysis c. synthesis d. evaluation Testing Skills Students will:

2. Demonstrate their testing taking skills by: a. viewing and following directions b. finger spelling correctly c. learning to work within a time limit d. applying use of context clues e. Recognizing the value of test items and pacing self accordingly.

		Cine y Teatro B	IL6901

Title:	Cine y Teatro
Length of course:	Full Year
Subject area:	Language Other than English ("e") / LOTE Level 4+ Spanish
UC honors designation?	No
Prerequisites:	Spanish for Spanish Speakers One, Spanish for Spanish Speakers 2 , Spanish 1, Spanish 2, Spanish 3 (Required)
Co-requisites:	None
Integrated (Academics / CTE)?	No
Grade levels:	10th, 11th, 12th

Course Description

Course overview:

Students will explore issues of race, ethnicity, gender, sexuality and class through critical analysis of film and theater in order to promote a greater sense of self identity, as well as respect for self and others, and cultivate the idea of responsibility toward the common good. Students will examine how film and theater often reflect the times and conditions in which they are made and conversely how they sometimes help shape social attitudes and values. Students will recognize the purpose of the work, the subtext, the technical and artistic factors that contribute to the work. They will develop 21st Century Learning skills such as collaboration, communication, creativity, and critical thinking. They will develop critical reading, writing, listening and speaking skills in Spanish. This course will provide a forum in which grammar and vocabulary will be taught in the context of film, media, Latin American and Mexican American culture and history. Discussion and written assignments in the course will be entirely in Spanish.

Course content:

Unit 1: Introduction to Film Analysis and Cultural Themes

Students will explore how films can convey meaning. They will learn the vocabulary of film analysis including literary and rhetorical devices. Students will explore the differences between a critical analysis of a film (essay) versus a film review. They will consider the possibility of how a film explores a current cultural theme which may reflect values, beliefs or events and provide the opportunity to develop understanding of a particular perspective. Students will view various films or clips from films which may include Fresa y Chocolate (2009), Aun la lluvia (2012), Bendiceme Ultima (2013), Tortilla Soup (2002), A Million to Juan (1994), Como Agua para Chocolate (2011) The Milagro Beanfield War (2005), Quinceanera (2006). All have cultural themes. Students will reflect informally in small talking circles on the themes reflected in the films, they will build key vocabulary words in an on going list of new words which will be utilized throughout the course. They will continually journal their reflections on the films and work to compile a list of recurring themes in the movies. They will conduct on line research to find and read critical analysis of some of the movies they have seen in preparation for the key assignment.

Key Assignment: Write a film analysis focused on cultural themes in the movie Mi Familia (1995)

Students will first become familiar with a list of key terms around film analysis through class discussion and several basic techniques for learning new vocabulary such as the use of on line vocabulary builders Quizlet.com and Kahoot.it. After viewing the film My Family/Mi Familia (1995) in class, students will research 3 pieces of critical writing about it and compose a

short one paragraph summary of each. After that, through participation in a round table discussion, students will elaborate their ideas on how the film reflects current cultural themes and poses a political or theoretical viewpoint. Finally students will write a 350 word critical review which will analyze one aspect of the film, citing at least 2 sources to strengthen their argument.

Grammar Focus: Review the division of syllables and rules of accentuation

💻 Unit Assignment(s):

Key Assignment: Write a film analysis focused on cultural themes in the movie Mi Familia (1995)

Students will first become familiar with a list of key terms around film analysis through class discussion and several basic techniques for learning new vocabulary such as the use of on line vocabulary builders Quizlet.com and Kahoot.it. After viewing the film My Family/Mi Familia (1995) in class, students will research 3 pieces of critical writing about it and compose a short one paragraph summary of each. After that, through participation in a round table discussion, students will elaborate their ideas on how the film reflects current cultural themes and poses a political or theoretical viewpoint. Finally students will write a 350 word critical review which will analyze one aspect of the film, citing at least 2 sources to strengthen their argument.

Grammar Focus: Review the division of syllables and rules of accentuation

Unit 2: The Formation of Personal Identity

Students will read and discuss the poem "Yo soy Joaquin" By Rodolfo Corky Gonzalez. They will understand the historical significance of the poem within the Chicano movement of the 1970s from a traditional masculine perspective. They will then view the film version of the poem, Yo Soy Joaquin, I am Joaquin (1972) to compare the written and film version. Subsequently they will view Chicana, (1979) by Sylvia Morales to understand her reaction to the poem from a female perspective. Students will compare and contrast the differing male and female viewpoints.

Key Assignment: Students will compose a creative piece either visual or written to discover their identity

Students may choose to write an "I am" testimonial poem or create a piece of artwork that explains their identity and how they are influenced by dominant societal structures. They will consider the possibility of their own personal narrative in this work and make formal speaking presentations in small groups.

Grammar Focus: review nouns, adjectives, gender and number, the present indicative, the verbs ser/estar/haber, and making comparisons

Unit Assignment(s):

Key Assignment: Students will compose a creative piece either visual or written to discover their identity

Students may choose to write an "I am" testimonial poem or create a piece of artwork that explains their identity and how they are influenced by dominant societal structures. They will consider the possibility of their own personal narrative in this work and make formal speaking presentations in small groups.

Grammar Focus: review nouns, adjectives, gender and number, the present indicative, the verbs ser/estar/haber, and making comparisons

Unit 3: Intersections of Race, Gender, Class and Identity

In this unit students explore how the theme of personal identity may be expressed by analyzing the play Real Women Have Curves by Josefina Lopez and its film adaptation. They will discover how the film version of a piece of literature may alter or enhance a playwright's ideas. This unit will help students to learn how literature and film may be used to spotlight how race, class, and gender can form an individual's point of view and identity. They will learn to express their thoughts in greater detail through oral interview for an intellectual audience using key vocabulary terms previously introduced.

Key Assignment: Interview between the experts on Race, Gender, Class and Identity

Through close reading, students will explore the play Real Women Have Curves by Josefina Lopez (2002), while reading, students will highlight key points and annotate their observations. They will participate in small group discussions in Socratic seminar and make written reflections in a journal which will be continued through this course to discover how language is used to express a character's identity and perspective. Students will then view the film version of the play, read and summarize 3 critical analysis papers on the movie, and culminate the unit by conducting an oral interview with a partner for a television talk show audience for National Public Television, where they represent two PhD candidates in the field of Ethnic and Gender Studies at Stanford and Harvard University. Through a video taped discussion with each other they will explore themes of race, gender, class and identity as shown through plot, imagery, setting, rhetorical devices and figurative language comparing both the movie version and the play.

Grammar Focus: review possessive adjectives, possessive pronouns, preterite and imperfect tenses

Unit Assignment(s):

Key Assignment: Interview between the experts on Race, Gender, Class and Identity

Through close reading, students will explore the play Real Women Have Curves by Josefina Lopez (2002), while reading, students will highlight key points and annotate their observations. They will participate in small group discussions in Socratic seminar and make written reflections in a journal which will be continued through this course to discover how language is used to express a character's identity and perspective. Students will then view the film version of the play, read and summarize 3 critical analysis papers on the movie, and culminate the unit by conducting an oral interview with a partner for a television talk show audience for National Public Television, where they represent two PhD candidates in the field of Ethnic and Gender Studies at Stanford and Harvard University. Through a video taped discussion with each other they will explore themes of race, gender, class and identity as shown through plot, imagery, setting, rhetorical devices and figurative language comparing both the movie version and the play.

Grammar Focus: review possessive adjectives, possessive pronouns, preterite and imperfect tenses

Unit 4: Immigration Stories, What it Means to Be an American

Straddling cultures and beginning with ancient oral traditions, telling stories is an innately human experience that connects us with others and creates a sense of belonging. Hearing another person's perspective is also a key component of empathy. Finally, writing family immigration stories -- no matter how distant or recent -- helps students read, reflect upon, and empathize with the common threads and variations of American narratives.

Students will view from among these films with themes on immigration:La Bestia (2011), El Norte , The Other Side of Immigration (2010), Sin Nombre (2008), Entre Nos (2009), Which Way Home (2011), The Harvest (2011), Bajo la Misma Luna (2008)

Key Assignment: Oral History Interview and Digital Story

Using digital storytelling to capture immigration stories creates opportunities for empathetic moments among students. Digital storytelling builds writing skills, targets multiple learning styles, and authentically engages learners as they connect to diverse peoples' histories.

Students will discover methods of preparing questions that illicit detailed answers in an effort to conduct an oral history interview with an immigrant to Santa Maria about their home country, their migration experiences, and their life in Santa Maria. Ideally this is a family member, but may be a community member. They will record the interview and later use creative license to transcribe roughly the main contents of the interview, create a poem or narrative focused around the questions "What it means to be an American." This poem or story will incapsulate the essence of the interview.

Students will learn the methods of Digital Story Telling. They will work in groups to develop a multimedia presentation including animation, voice over, text, music, photos and related video clips that incorporate the oral histories of their families and place them in the broader context of immigration movements.

Grammar Focus: contrast the use of the preterite and the imperfect tenses through a narration of the past

💻 Unit Assignment(s):

Key Assignment: Oral History Interview and Digital Story

Using digital storytelling to capture immigration stories creates opportunities for empathetic moments among students. Digital storytelling builds writing skills, targets multiple learning styles, and authentically engages learners as they connect to diverse peoples' histories.

Students will discover methods of preparing questions that illicit detailed answers in an effort to conduct an oral history interview with an immigrant to Santa Maria about their home country, their migration experiences, and their life in Santa Maria. Ideally this is a family member, but may be a community member. They will record the interview and later use creative license to transcribe roughly the main contents of the interview, create a poem or narrative focused around the questions "What it means to be an American." This poem or story will incapsulate the essence of the interview.

Students will learn the methods of Digital Story Telling. They will work in groups to develop a multimedia presentation including animation, voice over, text, music, photos and related video clips that incorporate the oral histories of their families and place them in the broader context of immigration movements.

Grammar Focus: contrast the use of the preterite and the imperfect tenses through a narration of the past

Unit 5: Gender

Through reading The Beauty Myth, by Naomi Wolfe and The Gendered Society by Michael Kimmel and screening the films Still Killing Us Softly (1999) and Tough Guise (1999), as well as the short clip The Genderbread Person by National Geographic (2017) students will explore the question of what gender is and how we are gendered by society. They will explore differing ideas regarding what is masculine and what is feminine, and what the connection is between sexuality and gender.

Key Assignment: Students will write a 350 word personal reflection on how they are gendered.

They will respond to the question, how did your family, community and culture give you the idea of gender? They will connect their thoughts to the readings and films. They will quote the text and analyze how/why issues of gender are complicated. Students will share in small talking circles.

Grammar Focus: review the future and conditional tenses, direct and indirect object pronouns

Unit Assignment(s):

Key Assignment: Students will write a 350 word personal reflection on how they are gendered.

They will respond to the question, how did your family, community and culture give you the idea of gender? They will connect their thoughts to the readings and films. They will quote the text and analyze how/why issues of gender are complicated. Students will share in small talking circles.

Grammar Focus: review the future and conditional tenses, direct and indirect object pronouns

Unit 6: Controlling Images and Stereotypes

Building on sociologist Patricia Hill Collin's notion of controlling images, this unit explores the role of stereotypes in exacerbating racism and sexism. Students will learn to deconstruct these images and to understand how power relations shape them. The unit examines the ways that groups have sought to counter such images.

Key Assignment: Using photographs to show gender bias.

Show one photograph of a woman in a stereotypical fashion, and another photo that counters that stereotype. An example of two photos would be a female secretary at work, dressed in tight clothing and heavy make up, versus an image of Rosie the Riveter from the 1940s wearing coveralls and showing her muscle. Explain that photographs can either reinforce stereotypes or dispel them, and recognizing how stereotypes are perpetuated is a useful skill since stereotypical images continue to appear in the popular media. Elaborate further by telling students the following: "Finding images that counter those stereotypes is also important, so that you (and others) can be clear that stereotypes are not accurate reflections of individuals or groups of people."

Have students practice these skills by working with the same partner to find or make their own pairs of photos of people similar to this pair. (They can use magazines or the Internet to find images.) Remind all that that one photograph should show a person in a stereotypical fashion, and the other photo should counter that stereotype. Ask students to display their photos side by side and write a caption for each photo. In the caption, ask them to analyze the photo in the same way they analyzed the two photos in this activity. For the stereotypical image, have them explain what the stereotype is and how the photograph works to maintain that stereotype. For the second photo, ask them to explain how it counters the stereotype, including the techniques that the photo uses. Students will create a multimedia presentation (Prezi, Powerpoint, i movie, pod cast) that demonstrates the origins and impact of controlling images that exacerbate racism or sexism.

Grammar Focus: formal and informal commands, verbs like gustar

Unit Assignment(s):

Key Assignment: Using photographs to show gender bias.

Show one photograph of a woman in a stereotypical fashion, and another photo that counters that stereotype. An example of two photos would be a female secretary at work, dressed in tight clothing and heavy make up, versus an image of Rosie the Riveter from the 1940s wearing coveralls and showing her muscle. Explain that photographs can either reinforce stereotypes or dispel them, and recognizing how stereotypes are perpetuated is a useful skill since stereotypical images continue to appear in the popular media. Elaborate further by telling students the following: "Finding images that counter those stereotypes is also important, so that you (and others) can be clear that stereotypes are not accurate reflections of individuals or groups of people."

Have students practice these skills by working with the same partner to find or make their own pairs of photos of people similar to this pair. (They can use magazines or the Internet to find images.) Remind all that that one photograph should show a person in a stereotypical fashion, and the other photo should counter that stereotype. Ask students to display their photos side by side and write a caption for each photo. In the caption, ask them to analyze the photo in the same way they analyzed the two photos in this activity. For the stereotypical image, have them explain what the stereotype is and how the photograph works to maintain that stereotype. For the second photo, ask them to explain how it counters the stereotype, including the techniques that the photo uses. Students will create a multimedia presentation (Prezi, Powerpoint, i movie, pod cast) that demonstrates the origins and impact of controlling images that exacerbate racism or sexism.

Grammar Focus: formal and informal commands, verbs like gustar

Unit 7: Considering issues of LGBTQ Identities

Students will deepen their understanding of how popular media may portray LGBTQ people in ways which simplify and stereotype their identity. Students will gain a more complex understanding of a broad range of issues with affect the lives of LGBTQ people. They will be exposed to ideas which challenge them to think beyond tolerance and move toward understanding and acceptance of the diversity which exists in our world. Students will screen the film XXY (2007) by Lucia Puenzo and Ma Vie en Rose (1997) by Alain Berliner. They will read excerpts from Stone Butch Blues by Leslie Feinberg and the article, Brandon Teena's Mom: We've come a Long Way by Nicholas Bergin, they watch clips from Boys Don't Cry (1999) by Kimberly Pierce and *TransGeneration mini series(2005) by* Katherine A. Baker, Lucas Cheadle, Andrea Gabrielle Gibson, Staci Ignacio, Bryce Abelson, Marci Bowers, Dillon Caulkins

Key assignment: Prior to viewing the films and doing the readings, students will view as a class images that have appeared recently in the popular media which depict trans people. They will use the think, pair, share method to communicate with a partner regarding the images they have found. They will do a quick write of 150 words in their journals on how they may perceive trans people based on these images alone. They will then explore together how gender and trans identity are portrayed through a round table discussion centered around the question of what it means to be trans. This will be a share out of five to fifteen minutes as a pre reading activity.

They will next read the Feinberg and Bergin excerpts. For each work they will annotate their text, and write a journal entry of 200 words addressing how the readings may have changed the way they perceive LGBTQ people. Then they will form small groups to discuss their reflections on the readings, followed by whole group share out.

At this point they will watch the clips from Transgeneration and Boys Don't Cry. They will discuss the questions: What did we learn by watching these clips? How are hormones and surgeries portrayed as "essential" for trans people? Are they? Why or why not? These discussions will lead to a deeper understanding of the complexity of issues faced by transgender people.

Grammar Focus: review the present perfect tense, review the subjunctive mood

Unit Assignment(s):

Key assignment: Prior to viewing the films and doing the readings, students will view as a class images that have appeared recently in the popular media which depict trans people. They will use the think, pair, share method to communicate with a partner regarding the images they have found. They will do a quick write of 150 words in their journals on how they may perceive trans people based on these images alone. They will then explore together how gender and trans identity are portrayed through a round table discussion centered around the question of what it means to be trans. How are hormones and surgeries portrayed as "essential" for trans people? Are they? Why or why not? These discussions will lead to a deeper understanding of the complexity of issues faced by transgender people.

Grammar Focus: review the present perfect tense, review the subjunctive mood

Unit 8: Ideas of Identity and the formation of Community, Power and Privilege, Narratives and Counter Narratives in the Community

This unit explores the factors that shape identities and communities and builds on ideas that have been addressed in previous units. It examines the way that dominant groups shape the history and telling of the past in ways that often erase the histories, cultures , and contributions of marginalized and oppressed peoples. It explores the history of community memory and counter narratives that exists in communities of color that challenge the dominant narrative and forge community. Students will view several films to critically analyze the ways in which

figurative language and rhetoric are used to develop the theme of resistance to tyranny. Students will evaluate and interpret how minority groups began to resist oppression and stereotypes. They will consider the question of what defines a heroic act, how those acts are valued by certain communities and how they reflect the values of the larger community. Students will respond to the films by creating flow charts, making posters, fish bowl discussion, think pair share activities, brainstorming, interactive group discussion, informal writing and essay writing.

To examen these issues students will view from among these films: Romero (1989), Los Graduados (2013), When the Mountains Tremble (1983), A Day Without a Mexican (2004), Walk Out (2006), Cesar Chavez (2014).

Key Assignment:

Students will prepare a presentation after doing research on 4 social justice organizations to discover what they do to create positive change in our community, what notable work they have already accomplished and provide ideas for how students in our class can get involved. Students will then pick which social justice organization they are most interested in and organize a fundraiser for their cause.

Grammar Focus: contrast the indicative tense with the subjunctive mood

💻 Unit Assignment(s):

Students will then pick which social justice organization they are most interested in and organize a fundraiser for their cause.

Grammar Focus: contrast the indicative tense with the subjunctive mood

Unit 9: Youth Action Research Project

Action Research to Service (6 weeks)

Students will engage in youth-led participatory action research, building their tools of academic research, while gathering data that is immediately actionable for individual, interpersonal, and institutional change.

Key Assignment: Students will be expected to collectively determine a school or community issue, research the issue, with assistance from the teacher, and plan, implement and assess prototype programs which could help alleviate the problems. Steps of the YPAR project will be documented through written reflections, as well as multiple media. Assignment: Youth Participatory Action Research (need-finding and data collection, analysis paper, presentation of proposed solution prototypes).

Resources used may include:

- Youth Research Hub (online)
- The Long Haul (Myles Horton)
- Design Thinking Bootcamp (d. school)
- Student inquiry-led and independent readings on institutional racism, sexism, school to prison pipeline, significant disproportionality, restorative practices, etc.
- Reading Our Histories, Understanding Our Cultures (Kathleen McCormick)

Grammar Focus: using the subjunctive to express emotional reactions and opinions

- Reading Our Histories, Understanding Our Cultures (Kathleen McCormick)

Grammar Focus: using the subjunctive to express emotional reactions and opinions

Unit 10: Building Community Through Theater

In this unit, students will read several short plays for critical analysis. They will discover how each play reflects on the topics covered during the class and choose one play which addresses some of the issues in our community to put on stage. Students will learn to express themselves more effectively while they engage creatively with one another to bring to life issues of race, gender, ethnicity and culture. They will provide our community with the opportunity to look at itself in the mirror and examine some of the complex issues we face. Plays may include Heroes and Saints and Other Plays by Cherrie Moraga, The Fat Free Chicana and the Snow Cap Queen by Elaine Romero, How Else Am I Supposed to Know I'm Still Alive by Evelina Fernandez, La Gringa by Carmen Rivera, Ana en el tropico by Nilo Cruz, Confessions of Women From East L.A. by Josefina Lopez, Simply Maria, Or the American Dream by Josefina Lopez, Detained in the Desert and Other Plays by Josefina Lopez, The Panza Monologues by Virginia Grise and Irma Mayorga.

Key assignment:

As a final project, students will form small groups and choose a short play to put on for the community. They will choose the role they wish to take on. Some possibilities include director, to audition actors; actors to play out the scenes; set designer, to decide on sets; costume designer to create the costumes; sound technician to add nuance and transition to the scenes; props manager to handle stage props; publicity officer to promote the show; house manager in charge of ticket sales and seating; snack bar sales manager; clean up crew or other additional roles as needed to support the production. Students may work in collaboration with members of the school drama club if possible. Subsequently, students will guide a discussion with the audience to receive feedback on the performance and understand some of the impact they may have had.

Grammar Focus: expanded uses of the subjunctive

Course Title

French 4 A

Description of Target Group

French 4 A is the first semester of the fourth year in French designed as an elective for students at all grade levels who have completed French 3B or demonstrated proficiency at that level.

Purpose

French 4A is designed to give the student continued and advanced training in foreign language. It is designed to permit students to appreciate and respect other people and cultures; gain communication skills in French; and become familiar with the culture of the French-speaking people. Credit earned will meet the foreign language requirement for college entrance.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Further develop listening comprehension of native speakers.
2. Enhance ability to imitate French sounds with appropriate pronunciation, intonation, and fluency.
3. Communicate orally and in written form about information dealing with students, others in the class, and student's family.
4. Read text with acceptable pronunciation, intonation, and rhythm.
5. Participate in activities involving the culture of French-speaking people.
6. Review and expand grammatical concepts and vocabulary, within the limits of the texts used.
7. Read, comprehend, and respond orally and in written form to more complex reading selections.
8. Write compositions based upon the topics studied.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Activities may include but are not limited to: listening to native speakers, oral and written grammar exercises; compositions; brief lectures, exposure to French songs, films, art, and music as part of the culture of French-speaking people; participation in self-generated role-plays, conversations, and real-life communication situations; more advanced readings in the areas of culture, society, and literature of French speaking peoples.

Assessments

Teacher observation of student actions, speaking demonstrations, and other oral presentations.
Student depictions of concepts via drawings, markings, posters, collages, and video projects.
Students sorting and/or showing realia.
Student or teacher generated (planned or impromptu) role-play or real life situations.
Written student work including, but not limited to, exercises, worksheets, compositions, portfolios, notebooks or projects.
Summative written tests and quizzes based on teacher generated criteria.
Student work in computer files.
Student generated logs and journals.

Course Title

French 4 B

Description of Target Group

French 4B is the second semester of the fourth year in French designed as an elective for students at all grade levels who have completed French 4A or demonstrated proficiency at that level.

Purpose

French 4B is designed to give the student continued and advanced training in foreign language. It is designed to permit students to appreciate and respect other people and cultures; gain communication skills in French; write in French; and become familiar with the culture of the French-speaking people. Credit earned will meet the foreign language requirement for college entrance.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Further develop listening comprehension of native speakers.
2. Enhance ability to imitate French sounds with appropriate pronunciation, intonation, and fluency.
3. Communicate orally and in written form about information dealing with students, others in the class, and student's family.
4. Read text with acceptable pronunciation, intonation, and rhythm.
5. Participate in activities involving the culture of French-speaking people.
6. Increase vocabulary and expand grammatical concepts, within the limits of the texts used.
7. Recognize in context the passé simple.
8. Recognize and respond to the subjunctive.
9. Read, comprehend, and respond orally and in written form to more complex reading selections.
10. Write compositions based upon the topics studied.

French 3 B or better or teacher permission

17. Co-Requisites

18. Is this course a resubmission? ☐ Yes ☒ No

If yes, date(s) of previous submission? _____

Title of previous submission? _____

19. Brief Course Description

AP Placement French Language is designed to prepare students to take the Advanced Placement test in Language. It encompasses aural/oral skills, reading comprehension, grammar, and compositions. The course seeks to develop language skills that are useful in themselves and that can be applied to various activities and disciplines rather than to the mastery of any specific subject matter. Extensive training in the organization and writing of compositions must be an integral part of an AP French Language course. Student who enroll must already have a good command of French grammar and vocabulary and have competency in listening, comprehension, speaking, reading and writing.

B. COURSE CONTENT

Please refer to instructions

20. Course Goals and/or Major Student Outcomes

The purpose of the course is to increase students' competency in written and spoken French, and to prepare students for the AP examination. The course will contribute to the A-G college entrance requirements. The length of the course will be 2 terms, with 10 units of credit.

21. Course Objectives

1. The ability to understand spoken French in various contexts.
2. The ability to converse on a wide range of topics.
3. A sufficient vocabulary in French to understand non-technical writings such as newspapers and magazine articles and pieces of literature.
4. The ability to read, respond to, and discuss non-technical writings such as those listed above.
5. The ability to express themselves in both written and in spoken French with reasonable fluency and accuracy.

22. Outline of content and time allotment

Throughout the year teaches will vary the course by interweaving activities and exercises to help the students master listening, speaking ,reading, grammar and writing skills. Teachers will provide extensive training in all areas so that students are prepared to take the AP exam when offered.

23. Instructional Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria High School District.

24. Key assignments

Course content will include current events, the arts, literature, and sports. It will also include audio and visual recordings, newspapers and magazines. The course seeks to develop language skills (reading, writing, listening and speaking) that can be used in various activities and disciplines.

Extensive training in the development and writing of compositions will be emphasized. Less formal writing tasks will include responses to reading or to audio-visual materials, journal entries, and summaries of instruction. Grammar will be one component of the writing skills that will be worked on.

Reading will include introductory literature, current events, history, and articles from popular culture, such as magazines.

Listening will be practiced with various audio and audiovisual materials, including news, films and tapes.

Speaking will be integrated into all classroom activities.

25. Instructional methods

The course seeks to develop language skills that can be used in various activities and disciplines rather than to cover any body of subject matter. In addition to the basic text, a variety of materials will be sued to meet the needs of the students including:

- Dictation
- Student taping of selected readings
- Oral discussions
- Formal and informal discussions
- Grammar review
- Vocabulary review and enrichment
- Storyline pictures
- Listening drills
- Practice AP exams
- A special emphasis on the organization and writing of compositions

26. Assessment methods and/or tools

College Board rubrics for the AP exam will be applied to formal oral presentation and written work.
Discrete item quizzes will evaluate progress in areas of structure, syntax and orthography.
Student journals, projects and presentations.
Oral assessments, both formal (e.g., the COCI) and informal.

C. HONORS COURSES ONLY

Please refer to instructions

27. Indicate how this honors course is different from the standard course.

D. OPTIONAL BACKGROUND INFORMATION

Please refer to instructions

28. Context for Course (optional)

29. History of Course Development (optional)

Submitted to UC 2/28/06
Pending Approval: E/Language Other Than English

Course Title

French 1A

Description of Target Group

French 1A is the first semester of a two-semester course designed as an elective for students of all grade levels.

Purpose

French 1A is designed to enable students to communicate in French, to appreciate and respect other people; gain self respect; gain communication and writing skills in French; and become familiar with the cultures of French speaking peoples. Credit earned will contribute to the college entrance foreign language requirement as required by the A-F university requirements.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Develop listening comprehension in French.
2. Imitate French sentences with appropriate pronunciation, intonation, and fluency.
3. Communicate orally and in written form about simple personal information dealing with the student, others in the class, and the student's family.
4. Answer questions based on oral and written selections.
5. Write French correctly.
6. Learn the meanings of and be able to use in questions and answers the following topics:
    a. Objects in the classroom
    b. Numbers, currency
    c. Days of week, months of year, dates, time
    d. Food
    e. Nationalities
    f. Weather
7. Demonstrate the ability to use orally and in written form the following grammatical concepts:
    a. Definite and indefinite articles
    b. Gender and number
    c. Present indicative of the irregular verbs "avoir", "aller" and "être" in the affirmative, negative and interrogative forms
    d. Pronouns – subject, disjunctive (stress)
    e. Grammatical concepts within the limits of the textbook
8. Maintain a French notebook.

Instruction Materials

Text and Supplementary Materials

Refer to: Secondary Adopted texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Activities may include but are not limited to: listening to native speakers on tapes; oral and written grammar exercises; exposure to French songs, films, art and music as part of the culture of French-speaking people; participation in self-generated conversations, dialogues, role-plays, and life-like situations involving the use of simple, everyday communication skills.

Assessments

Teacher observation of student actions, speaking demonstrations, and other oral presentations.
Student depictions of concepts via drawings, markings, posters, collages, and video projects.
Student sorting and/or showing realia.
Student or teacher generated (planned or impromptu) role-play or real life situations.
Written student work including, but not limited to, exercises, worksheets, compositions, portfolios, notebooks or projects.
Summative written tests and quizzes based on teacher generated criteria.
Student work in computer files.
Student generated logs and journals.

Course Title

French 1B

Description of Target Group

French 1B is the second semester of a two-semester course designed as an elective for students of all grade levels who have completed French 1A or demonstrated proficiency at that level.

Purpose

French 1B is designed to enable students to appreciate and respect other people; gain self respect; gain communication skills in French; write in French; and become familiar with the cultures of French-speaking peoples. Credit earned will contribute to the college entrance foreign language requirement as required by the A-F university requirements.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Develop listening comprehension in French
2. Imitate French sentences with appropriate pronunciation, intonation, and fluency.
3. Communicate orally and in written form about simple personal information dealing with the student, others in the class, and the student's family.
4. Write French correctly.
5. Answer questions based on oral and written selections.
6. Learn the meanings of and be able to use in questions and answers the following topics:
    a. Colors
    b. Modes of transportation
    c. Idiomatic expressions with avoir
    d. Sports, hobbies
    e. School subjects
7. Demonstrate the ability to use orally and in written form the following grammatical concepts:
    a. Present indicative of regular –er verbs, recognize finir and répondre, and specific irregular verbs in the affirmative, negative, and interrogative forms (être, avoir, aller, faire)
    b. Questions using "est-ce que" and inversion
    c. Idiomatic expression "il y a" in the affirmative and negative
    d. "Futur proche" using the verbe "aller" plus the infinitive
    e. Passé composé of regular verbs with "avoir"
    f. Grammatical concepts within the limits of the textbook, including possessives, prepositions, and adjectives.
    g. Maintain a French notebook

Students sorting and/or showing realia.
Student or teacher generated (planned or impromptu) role-play or real life situations.
Written student work including, but not limited to, exercises, worksheets, compositions, portfolios, notebooks, or projects.
Summative written tests and quizzes based on teacher generated criteria.
Student work in computer files.
Student generated logs and journals.

Course Title

French 4 A

Description of Target Group

French 4 A is the first semester of the fourth year in French designed as an elective for students at all grade levels who have completed French 3B or demonstrated proficiency at that level.

Purpose

French 4A is designed to give the student continued and advanced training in foreign language. It is designed to permit students to appreciate and respect other people and cultures; gain communication skills in French; and become familiar with the culture of the French-speaking people. Credit earned will meet the foreign language requirement for college entrance.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Further develop listening comprehension of native speakers.
2. Enhance ability to imitate French sounds with appropriate pronunciation, intonation, and fluency.
3. Communicate orally and in written form about information dealing with students, others in the class, and student's family.
4. Read text with acceptable pronunciation, intonation, and rhythm.
5. Participate in activities involving the culture of French-speaking people.
6. Review and expand grammatical concepts and vocabulary, within the limits of the texts used.
7. Read, comprehend, and respond orally and in written form to more complex reading selections.
8. Write compositions based upon the topics studied.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Activities may include but are not limited to: listening to native speakers, oral and written grammar exercises; compositions; brief lectures, exposure to French songs, films, art, and music as part of the culture of French-speaking people; participation in self-generated role-plays, conversations, and real-life communication situations; more advanced readings in the areas of culture, society, and literature of French speaking peoples.

Assessments

Teacher observation of student actions, speaking demonstrations, and other oral presentations.
Student depictions of concepts via drawings, markings, posters, collages, and video projects.
Students sorting and/or showing realia.
Student or teacher generated (planned or impromptu) role-play or real life situations.
Written student work including, but not limited to, exercises, worksheets, compositions, portfolios, notebooks or projects.
Summative written tests and quizzes based on teacher generated criteria.
Student work in computer files.
Student generated logs and journals.

Course Title

French 4 B

Description of Target Group

French 4B is the second semester of the fourth year in French designed as an elective for students at all grade levels who have completed French 4A or demonstrated proficiency at that level.

Purpose

French 4B is designed to give the student continued and advanced training in foreign language. It is designed to permit students to appreciate and respect other people and cultures; gain communication skills in French; write in French; and become familiar with the culture of the French-speaking people. Credit earned will meet the foreign language requirement for college entrance.

18. Brief Course Description

French IV A/B (Honors) is a two semester course designed to give students advanced training in the language. Reading would include selections in French literature and other authentic sources, including those on the web. Writing would include using the narrative and descriptive formats in guided activities. Also, students would be expected to paraphrase and summarize introductory literature. Students would be required to memorize poems, analyze songs, and view films in French. There would be improvement of comprehension by listening to advanced level recordings, both conversational and literary. There would be review and expansion of advanced grammar. Work would also include demonstrations of speaking ability and the ability to respond verbally to current events or general topics. Students would also be expected to demonstrate their understanding of French culture and other cultures of the French-speaking world. Students would participate in activities that assist them in understanding the history and traditions of other cultures. A research project will be necessary in each semester. Students would connect their learning to other curricular areas in the high school and increase their awareness to the advantages or bilingualism or multilingualism. A proficiency exam will be given to the end of each term to determine the progress in mastering the above skills.

Item # 26 honors courses

This course is much more rigorous than the requirements necessary in the current French IV level. Although students work to improve all four skills in French IV, there is no requirement to use authentic materials. The French IV A/B Honors requires more advanced thinking ability because students are required to analyze works and complete independent research. The level of performance required of the student is much more demanding. Two other factors are also very important. First, this course would only be open to higher achieving students and secondly, this could not be a III/IV level combined class.

Please find and review the attached course description.

Course Title

French IV A (Honors)

Description of Target Group

French IV A (Honors) is the first semester of a year long course designed as an elective for junior or senior students (or students with permission from the instructor), who have completed a level three course with a B or better average. Honors credit is only awarded when a section of French IV A is held in isolation of French IIIA.

Purpose

French IV A (Honors) is designed to give students advanced training in the language. Students will receive instruction (including, but not limited to) through the following strategies: communication-based instruction, literature-based instruction, student individual and group projects, and multi-media approaches that incorporate the national standards of comparisons, connections, and communities. Students will gain understanding and increased skills in speaking, reading, comprehension, and writing French. Students will also increase their appreciation and understanding of French culture and history, as well as the other cultures and nations within the French-speaking world. Credit earned will contribute to the A-F college entrance requirements.

Content Standards

Upon completion of the course the students will be able to successfully demonstrate the following skills:

1. Improvement in reading and understanding authentic works from French literature.
2. Readings from short stories, magazines, newspapers and other selected texts.
3. Improvement of comprehension by listening to advanced level recordings and other selections from a wide range of subjects.
4. Enhancement of their ability to analyze and discuss literary texts and to paraphrase or summarize introductory literature.
5. Utilization of the Internet to access and utilize information in French.
6. Drawing comparisons within a cultural context of different French speaking peoples and their own culture.
7. Connecting their learning to other curricular areas in high school and beyond.

8. Reviewing and expanding advanced grammar.
9. Development of career awareness in terms of bilingualism.
10. Increase ability to write using the narrative, descriptive format in guided activities.
11. Ability to respond verbally or in writing to current events or general topics.
12. Increased comprehension from listening to poems, songs and viewing films.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Activities include, but are not limited to: aural and oral practice, oral journaling, small group activities, individual projects, role plays, songs, films, poetry, other literature selections, research specific and general topics, planning and making presentations on a variety of topics and formats, peer-editing, focused discussions, compositions, and research on the Internet. Use of a workbook will be included along with true/false or multiple choice to listening selections. Also, activities will include summaries of readings, comprehension questions, short essays, and directed response using oral or visual prompts.

Assessments

Teacher observation of student actions, oral presentations, and speaking demonstrations.
Multi-media group or individual performance/demonstrations evaluated with rubics
Written student work-projects, notebooks, worksheets, essays, etc.
Formative self-analysis by students.
Summative exams with teacher generated criteria.
Homework completion and correction.
Performance in role plays, and other “real-life” activities.

Course Title

French IV B (Honors)

Description of Target Group

Title:	Identity and Culture for Spanish Speakers 3
Length of course:	Full Year
Subject area:	Language Other than English ("e") / LOTE Level 3 Spanish
UC honors designation?	No
Prerequisites:	Introduction to Spanish for Spanish Speakers (Recommended) Spanish for Spanish Speakers 1 (Recommended)
Co-requisites:	None
Integrated (Academics / CTE)?	No
Grade levels:	9th, 10th, 11th, 12th

Course Description

Course overview:

In this course students will further develop their language skills in reading, writing, listening, and speaking Spanish. This course will provide a forum in which grammar and vocabulary will be taught in the context of interpretation and analysis of current events, Spanish literature, film, media, culture, immigration, and Latin American history. By studying the histories of Latinos in the United States, students will cultivate respect and empathy for individuals and solidarity with groups of people locally, nationally, and globally so as to foster active social engagement and community building. In addition, students will be able to discuss their identities, including race, ethnicity, culture, and gender.

Course content:

Identidad

Description: This unit explores the factors that shape identities and communities. It first examines the ways that dominant groups shape the history and telling of the past in ways that often erase the histories, cultures, and contributions of subjected and oppressed peoples. It then explores the long history of community memory and counter-narratives that exist in communities of color that challenge the dominant narrative and forges community.

Grammar Focus: Students will review syllabic division and be introduced to accentuation rules.

Assignment: Students will develop an "I am" testimonial poem or artwork that explains their identities and how they are influenced by societal structures.

Unit Assignment(s):

Assignment: Students will develop an "I am" testimonial poem or artwork that explains their identities and how they are influenced by societal structures.

La comunidad Chicana

Description: In this unit, students will explore local issues that they encounter on a daily basis. They will reflect on the history of the Mexican immigrant in the United States, and discuss the present and future economic and cultural situation of this group. Students will familiarize themselves with organizations that defend the rights of immigrants. They will reflect about their own feelings towards immigration, and discuss the effects of immigrants in the American economy.

Grammar Focus: Students will review the preterite and imperfect tense with emphasis on irregular verbs.

Key Assignment: Students will complete the following:

- Students will investigate both sides of the topic of immigration, those in favor, and those against immigration. Students will then hold a debate, arguing the pros and cons of the issue. Students will learn that there are two sides to every issue, and that becoming informed is key to making a decision.
- Students will conduct an oral history interview with an immigrant in our community about their home country, their migration experience and their life in the United States. After transcribing the interview, students will write an essay about the person's experience.

💻 Unit Assignment(s):

Key Assignment: Students will complete the following:

- Students will investigate both sides of the topic of immigration, those in favor, and those against immigration. Students will then hold a debate, arguing the pros and cons of the issue. Students will learn that there are two sides to every issue, and that becoming informed is key to making a decision.
- Students will conduct an oral history interview with an immigrant in our community about their home country, their migration experience and their life in the United States. After transcribing the interview, students will write an essay about the person's experience.

La comunidad puertorriqueña

Description: Students will study the history of Puerto Rico, and the immigration of Puerto Ricans to the United States. They will reflect on the importance of cultural identity, and learn about the current situation that this U.S. territory faces in regards to its independency. Students will familiarize themselves with the Puerto Rican culture through literature, articles, and other authentic sources. Students will learn about which states have the most Puerto Rican influence, and their contributions to the community.

Grammar Focus: Students will be introduced to the present perfect tense, its form and functions.

Key Assignment: Students will work in groups to do an online investigation on one of the following

options:

- Read and analyze a poem by a Puerto Rican author.
- Read and analyze a short story by a Puerto Rican author.
- Listen to and analyze a Puerto Rican song.
- Find and prepare a recipe of a traditional Puerto Rican dish.
- Read a biography of a Puerto Rican-American.

Students will present their findings to the class in a visual form, and share what they have learned. This assignment will broaden the students' knowledge of the Puerto Rican culture.

💻 Unit Assignment(s):

Key Assignment: Students will work in groups to do an online investigation on one of the following options:

- Read and analyze a poem by a Puerto Rican author.
- Read and analyze a short story by a Puerto Rican author.
- Listen to and analyze a Puerto Rican song.
- Find and prepare a recipe of a traditional Puerto Rican dish.
- Read a biography of a Puerto Rican-American.

Students will present their findings to the class in a visual form, and share what they have learned. This assignment will broaden the students' knowledge of the Puerto Rican culture.

La comunidad cubana

Description: Students will familiarize themselves with the history of Cuban-Americans, and their successes in this country. They will learn about the current economic and political situation in Cuba. Students will learn about the food-rationing in Cuba, and explore the current changes that the country is undergoing. They will learn how the termination of the "Wet feet, dry feet" policy affected their opportunities to migrate to the United States and gain legal status.

Grammar Focus: Students will broaden their understanding of the future tense.

Key Assignment: Students will investigate how much money a Cuban family earns, and how their money is earned, and compare it to the average middle-class American family. Students will use resources from their textbook, the Internet, and newspapers to obtain accurate information. They will write an essay describing their findings, and create a visual aid to show the difference.

💻 Unit Assignment(s):

Key Assignment: Students will investigate how much money a Cuban family earns, and how their money is earned, and compare it to the average middle-class American family. Students will use resources from their textbook, the Internet, and newspapers to obtain accurate information. They will write an essay describing their findings, and create a visual aid to show the difference.

La comunidad centroamericana

Description: Students will learn about the civil wars that affected Central America in the eighties and how those conflicts forced many central Americans to migrate to the United States. They will identify the factors that contributed to such conflicts and their consequences on Central America, as well as the United States. Students will reflect on the violence in our society and how it affects us. They will explore organizations (Red Hand Campaign) that aim to decrease violence, and propose ideas for interventions to prevent violence among youth. Students will learn about the presence of violence in our local communities and its impact. Students will discuss the importance of education as an empowerment tool to fight violence and bring about healing to our communities.

Grammar Focus: Students will broaden their understanding of the conditional tense.

Key Assignment: Students will form committees, and pretend that they have been granted money to create a program to prevent youth violence. Students will identify and describe the main factors that contribute to youth violence. They will then write a proposal outlining the steps they will follow to deal with a negative situation in a non-violent way, as well as create prevention activities they can present to junior high students in our community.

💻 **Unit Assignment(s):**

Key Assignment: Students will form committees, and pretend that they have been granted money to create a program to prevent youth violence. Students will identify and describe the main factors that contribute to youth violence. They will then write a proposal outlining the steps they will follow to deal with a negative situation in a non-violent way, as well as create prevention activities they can present to junior high students in our community

Las clases sociales

Description: Students will discuss the differences of social classes and talk about the injustices that can be suffered from belonging to a specific ethnicity, gender or social class. This unit explores the role of stereotypes in exacerbating racism, sexism, and other forms of discrimination. Students will learn to deconstruct these images and to understand how power relations shape them. In addition, the unit examines the ways that groups have sought to counter such images.

Grammar Focus: Students will broaden their understanding of the present subjunctive.

Key Assignment: In groups of 3, students will create a multi-media presentation that demonstrates the origins and impact of one controlling images that exacerbates racism, sexism and other forms of discrimination. They will present their finding to the class.

Unit Assignment(s):

Key Assignment: In groups of 3, students will create a multi-media presentation that demonstrates the origins and impact of one controlling images that exacerbates racism, sexism and other forms of discrimination. They will present their finding to the class.

La libertad de expresión

Description: Students will learn about "el franquismo" in Spain that began in the 1930s. They will learn about different types of censorship, and its consequences. They will learn about the censorship and repression that exists or have existed in Latin America.

Grammar Focus: Students will further practice the use of the imperfect and preterite tense.

Key Assignment: Students will do a research project about a historical event in Latin America where the rights of citizens were violated with acts of repression, torture or death.

Unit Assignment(s):

Key Assignment: Students will do a research project about a historical event in Latin America where the rights of citizens were violated with acts of repression, torture or death.

Los movimientos sociales

Description: This unit centers around the ways in which the Civil Rights Movement and others, sought to dismantle racism, sexism, class, and homophobia. Specific attention will be paid to the various strategies that movements have used, their impact, and the extent to which they have transformed U.S. society. Students will also learn the circumstances behind confrontations between students and the Mexican government in 1968. This unit will also explore the impact of these movements in contemporary struggles.

Grammar Focus: Students will review and expand their knowledge of the uses and forms of the present subjunctive tense.

Key Assignment: Students will write a letter to a social movement leader, a student, a parent, or a government official expressing his or her opinion regarding the role played by such person in a specific protest or march. Our focus will be on the 1968 student movement that culminated in a massacre of students by the government.

9. Subject Area

- ☐ History/Social Science
- ☐ English
- ☐ Mathematics
- ☐ Laboratory Science
- ☒ Language other than English
- ☐ Visual & Performing Arts
  - ☐ Intro ☐ Advanced
- ☐ College Prep Elective

10. Grade Level(s) for which this course is designed
9 , 10

11. Seeking "Honors" Distinction?
No

12. Unit Value

- ☐ 0.5 (half year or semester equivalent)
- ☒ 1.0 (one year equivalent)
- ☐ 2.0 (two year equivalent)
- ☐ Other: _____

13. Is this an Internet-based course? No

If "Yes", who is the provider? ☐ UCCP ☐ PASS/Cyber High ☐ Other _____

14. Complete outlines are not needed for courses that were previously approved by UC. If course was previously approved, indicate in which category it falls.

- ☐ A course reinstated after removal within 3 years. Year removed from list? _____
  - Same course title? ☐ Yes ☐ No
  - If no, previous course title? _____
- ☐ An identical course approved at another school in same district. Which school? _____
  - Same course title? ☐ Yes ☐ No
  - If no, course title at other school? _____
- ☐ Year-long VPA course replacing two approved successive semester courses in the same discipline
- ☐ Approved Advanced Placement (AP) or International Baccalaureate (IB) course
- ☐ Approved UC College Prep (UCCP) Online course
- ☐ Approved CDE Agricultural Education course
- ☐ Approved P.A.S.S./Cyber High course
- ☐ Approved ROP/C course. Name of ROP/C? _____
- ☐ Approved A.V.I.D. course
- ☐ Approved C.A.R.T. course
- ☐ Approved Project Lead the Way course
- ☐ Other. Explain: _____

15. Is this course modeled after an UC-approved course from another school outside your district? No

If so, which school(s)? _____

Course title at other school _____

16. Pre-Requisites

Understand, speak and be able to read basic sentence structure in Spanish or permission from instructor.

17. Co-Requisites

This class is not intended for students who understand, speak, read, and write Spanish fluently.

18. Is this course a resubmission? No

If yes, date(s) of previous submission? _____

Title of previous submission? _____

19. Brief Course Description

An intensive introduction to Spanish, emphasizing auditory and oral skills with secondary practice in reading and writing Spanish. Pronunciation, intensive oral practice, dialogue and drills. Along with a study of the Spanish speaking culture. The course is designated to provide a more challenging program aimed specifically at the numerous language problems encountered by persons of this area with a Spanish speaking background. This will provide more opportunity to participate in a bilingual-bicultural environment and work place. This course will also enhance the student's own understanding of his or her intra-cultural richness, diversity, and historical origins of the Mexican, Chicano, and other Latin American cultures.

INTRODUCTION TO SPANISH SPEAKERS
COURSE CONTENT

20. Course goals and/or major student outcomes

a) Acquire and use new vocabulary presented through reading materials.
b) Demonstrates awareness of the history and culture of specific Spanish speaking communities.
c) Ask and answer questions orally and in writing based on materials read and on radio and television presentations.
d) After listening and/or reading a short story, the student will answer questions orally about the main characters and give a summary of the plot, and demonstrate complete comprehension.
e) Use language for personal communication needs, ask and answer questions and request clarification as needed
f) . Write complete sentences that are free of major errors, such as verb tense, gender, and number agreement.
g) Write compositions without major error.

21. Course Objectives

a) Students will be able to present dialogues in Spanish using vocabulary learned.
b) Students will write daily journals to practice various sentence structures.
c) Students will prepare a written research report showing their understanding about the culture, traditions, and idiomatic expressions used in a Spanish speaking country.
d) Students will read short descriptive paragraphs to demonstrate correct pronunciation of the Spanish language.

22. Course Outline

Readings:

Viajes by Julio Cortázar
El nacimiento by Carmen Kurtz

Los juegos de Lilus by Elena Poniatowska
Tiempo libre by Guillermo Samperio
Enero: Tortas de navidad by Laura Esquivel
El hijo by Horacio Quiroga
A Julia de Burgos by Julia de Burgos
Don Quijote de la Mancha by Miguel de Cervantes

Grammar:

Synonyms/Antonyms
Present tense
Adjectives
Present progressive
Present perfect
Comparatives
Preterite tense
Imperfect tense
Indirect and direct object pronouns
Future tense
Conditional tense
Reflexive verbs
Cognates
Commands

Culture:

A Colombian legend
The media in Spanish speaking countries
Rhythm and folklore of the Hispanic world
The three wise men
The family
Geographical diversity of the Hispanic world
Soccer
Architecture of the Hispanic world
Culinary flavor of the Hispanic world
The Spanish language
The day of the book
Art of the Hispanic world: Muralism

23. Texts and supplemental Instructional Materials

Nuevas Vistas: Curso de introduccion (Advanced Spanish)
Author: Maria Elena Alvarado et. al.
Publisher: Holt Rinehart Winston
Copyright date: 2006

24. Key assignments

Assignment	Activity	Objective
Formal dialogue	Write and present a formal dialogue using basic vocabulary and sentence structures	To practice oral skills
Interviews	Interview in partners about personal information and interests	To practice communication skills
Autobiography	Write an autobiography	To increase writing abilities from paragraph to essay
Research report	Write a research report about a Spanish speaking country	To learn how to research information and expand their understanding of different cultures
Spanish literature	Read and interpret beginning level Spanish literature	To learn the literary elements (e.g. plot, argument, point of view, theme, etc.)

25. Instructional Methods and/or Strategies

- lectures
- class participation
- demonstrations
- audio-visual materials
- small group activities
- outside resource people
- readings
- projects
- library/internet research
- interviews
- oral presentations

26. Assessment Methods and/or Tools

a) Teacher observations of student action, speaking demonstrations, and other oral presentations.
b) Student depictions of concepts via drawings, markings, posters, colleges, and video projects.
c) Student or teacher generated (planned or impromptu) role play or real life situations.
d) Written student work including but not limited to exercises, worksheets, compositions, portfolios, notebooks, or projects.
e) Summative written tests and quizzes based on teacher generated criteria.
f) Student generated book presentations utilizing oral reports, story boards, elements of drama, and reader's theater.
g) Student oral and written interpretation of video generated thematic units.
h) Group presentations of thematic units including dramatic reenactment.
i) Student created new endings to stories.
j) Student participation in the accused bench or the hot chair activity.
k) Student composed letters to the characters in a story.
l) Student use of symbolization and picture graphs.
m) Student composed Venn diagram.
n) Student reflections and personal responses in journals or writing logs.
o) Student use of creative imitation.
p) Spelling quizzes.
q) Oral exams.
r) Grammar and vocabulary tests.

Course Title

INTRODUCTORY SPANISH 1A

Description of Target Group

Introductory Spanish 1A is the second semester of a two-semester course designed as an elective for non-college prep students of all grade levels.

Purpose

Introductory Spanish 1A is designed to enable students to appreciate and respect other people, gain self-respect, gain skills in understanding and speaking, gain limited skills in reading and writing, and learn the history of Spanish-speaking people. Credit earned will not contribute to college entrance requirements.

Standards of Expected Student Achievement

Upon Completion of this course, students will be able to successfully demonstrate the following skills.

1. Recognize the sounds of Spanish phonemes.
2. Recite the Spanish alphabet and be able to spell orally in the target language.

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District.

Activities

Imitation of teacher's pronunciation through tapes, lectures, and presentations, brief lectures, videos, written and oral/aural tests, dramatization of student composed dialogues and speeches, small group activities, manipulatives, and resource persons.

Assessments

Teacher observation of student actions, speaking demonstrations, and other oral presentations.
Student depictions of concepts via drawings, markings, posters, collages, and video projects.
Students sorting and/or showing realia.
Student or teacher generated (planned or impromptu) role play or real life situations.
Written student work including but limited to, exercises, worksheets, compositions, portfolios, notebooks or projects.
Summative written tests and quizzes based on teacher generated criteria.
Student work in computer files.
Student generated logs and journals.

Portuguese 2 B

Description of Target Group

Portuguese 2B is the first semester course of a two semester course designed as an elective for students of all grade levels who have successfully completed Portuguese 2A or demonstrated proficiency at that level.

Purpose

Portuguese 2B is designed to enable students to appreciate and respect other people; gain self-respect; gain skills in understanding, speaking, reading, and writing Portuguese; and learn the history of Portuguese speaking people. Credit earned will contribute to the college entrance foreign language requirement as required by the A-F university requirements.

Standards of Expected Student Achievement

Upon completion of the course, students will be able to successfully demonstrate the following skills:

1. Recognize the sounds of Portuguese phonemes.
2. Recite the Portuguese phonemes, intonation, and rhythm patterns.
3. Imitate the Portuguese phonemes, intonation, and rhythm patterns, so as to be understood on an intermediate level by a native speaker of Portuguese.
4. Further develop listening comprehension.
5. Further develop communicative competency through oral practice.
6. Orally get into and out of basic role play situations in Portuguese.
7. Read orally from a Portuguese text with acceptable and understandable pronunciation, intonation and rhythm.
8. Ask questions in Portuguese that relate to everyday life situations.
9. Answer questions orally and in writing that pertain to topics presented in the class.
10. Maintain a Portuguese notebook.
11. Participate in cultural activities presented in class.
12. Write from dictation any sentence taken from familiar subject matter.
13. Demonstrate the ability to use orally and in written form the following elements of Portuguese:
    a. Verb tenses as required by the text and real to life situations.
    b. Subjunctive and indicative mood.
    c. Proper gender and number agreement.
    d. Adjectives and adverbs; number, position, and agreement.
    e. Subject, possessive, relative, and demonstrative pronouns.
    f. Contractions as presented by the text.
    g. Articles, all.
    h. Commands, direct and indirect.
    i. Prepositions as presented by the text.
    j. Comparison with adjectives and adverbs.
    k. Personal infinitive.

l. Verbs with special uses and idiomatic expressions.
m. Passive voice.
n. Past definite tense versus imperfect tense usage.
o. Object pronouns.

14. Develop vocabulary pertaining to:
    a. Idiomatic expressions.
    b. Cognates.
    c. Shopping for more than necessities.
    d. More Complex social situations.
    e. Leisure time activities.
    f. Extended family.
    g. Expanding previously learned vocabulary topics.
    h. Topics presented in the text.

15. Communicate in Portuguese so that a native speaker can understand what the student is saying without strain.

12. Brief Course Description

Student Academic Achievement Seminar (SAAS) 9-10 is designed as a behavioral and academic support system for Long Term English Learners (LTELs)--students who have been enrolled in U.S Schools for 6 or more years-- and is centered on personalized academic guidance that involves teachers, administrators, counselors and student advocates who regularly monitor student academic progress related to graduation requirements and preparation for career and postsecondary education. SAAS is intended to provide a safe, culturally and linguistically responsive environment that nurtures strong teacher/student/parent relationships. Through explicit instruction in the advantages of a •growth mindsetŽand its relationship to success, students learn to persist and persevere in challenging situations while developing self efficacy strategies and academic mindsets necessary for long-term success. A focus on literacy, language

16. Co-Requisites

None

17. Brief Course Description

This course is designed as an elective for students of any grade level who have fluency in the Spanish language and have completed Spanish for the Spanish Speaking 1 or received permission from the instructor. The purpose of Spanish for Spanish Speakers 2AB is to improve the Spanish Speaking, reading and writing skills of Spanish speaking students, and to provide a forum in which grammar can be taught in the context of interpretation and analysis of Spanish language literature. Exposure to Spanish language literature from the Spanish speaking world will stimulate interest and pride in the students' heritage and foster an appreciation in the students of the many cultures from which they come and among which they live. Also, the course will provide opportunities to develop literary analytical skills. The course will contribute to the A-F college entrance requirements.

B. COURSE CONTENT

Please refer to instructions

18. Course Goals and/or Major Student Outcomes

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Read selected materials from the newspaper, magazines, short stories, novels, etc.
2. Write from dictation materials with which the student is unfamiliar.
3. Understand the readings in literature in both prose and poetry.
4. Acquire and use new vocabulary presented through reading materials.
5. Express thoughts and ideas in correct idiomatic language.
6. Discuss ideas found in literature and defend one's own ideas.
7. Analyze and criticize a short story.
8. Listen well and respect ideas of others.
9. Demonstrate awareness of the contemporary Spanish speaker.
10. Demonstrate awareness of the history and culture of specific Spanish speaking communities.
11. After reading an editorial comment or listening to an idea expressed in the media, the student will answer questions and discuss the content, the arguments supportive of the position taken then give his/her opinion on the matter.

12. After hearing a report on a historical event, the student will analyze its causes and its effects on present-day events.
13. After doing research on trades and professions, the student will give a report on career options and prerequisites.
14. Given a contemporary problem of political or economic significance to Spanish speaking countries, the class will arrive at a feasible solution through discussion, analysis, and consensus.
15. After researching a subject of current interest, the student will participate in a debate, supporting his/her position with facts.
16. The student will help plan and carry out a group activity, such as making a relief map of Latin America or presenting a short play.
17. As part of the study of a particular poet or of a literary epoch, the student will recite a poem and then indicate the imagery, symbols or metaphors used by the poet.
18. Using a prepared outline on plot, locate, characterization, and point-of-view, the student will report on a book read outside of class.
19. After reading a literary work, the student will discuss the motivation of a character, the style and the author's message as revealed directly or through the use of symbols.
20. Given several short stories to read, the student will analyze and discuss the types of conflict present in them, that is: man against nature, man against society, or man against himself.
21. As part of the study of a poet or literary period, the student will compare and comment on poems with different themes and styles.
22. After doing research on the subject, the student will give a report on the relationship between a poet's life and his/her poems, including considerations of historical events that affected the author's life and works.
23. After reading a book or periodical, the student will write a three-to-six page report on the effect that military coup has had on the economy of a particular Hispanic country, the attitude that the United States government has taken towards a particular Hispanic leader currently in the news, or the growing importance of Latin American oil supplies.
24. The student will write a biographical resume or anecdote about a famous Hispanic figure.
25. After reading several poems of a particular literary period, such as Romanticism, the student will write two, then four line of original poetry in the same style as that of poetry being studied.
26. The student will write examples of different types of paragraphs, such as descriptive, narrative, expository, persuasive.
27. The student will write an essay comparing the personality, behavior or outlook on life of two characters taken from a story, novel or play.

19. Course Objectives

The purpose of Spanish for Spanish Speakers 2AB is to improve the Spanish Speaking, reading and writing skills of Spanish speaking students, and to provide a forum in which grammar can be taught in the context of interpretation and analysis of Spanish language literature. Exposure to Spanish language literature from the Spanish speaking world will stimulate interest and pride in the students' heritage and foster an appreciation in the students of the many cultures from which they come and among which they live. Also, the course will provide opportunities to develop literary analytical skills. The course will contribute to the A-F college entrance requirements.

Summative written tests and quizzes based on teacher generated criteria.
Student work in computer logs.
Student generated logs and journals.

Course Title

Spanish 2 A

Description of Target Group

Spanish 2A is the first semester of the second year in Spanish designed as an elective for students of all grade levels who have completed Spanish 1B or demonstrated proficiency to that level.

Purpose

Spanish 2A is designed to give the student continued and advanced training in foreign language. It is designed to permit students to appreciate and respect other people and cultures; gain self respect; gain skills in understanding, speaking, reading and writing Spanish emphasizing a communicative approach; and gain appreciation of the history and culture of the Spanish-speaking people. Credit earned will meet the foreign language requirement for college entrance.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Enhance ability to imitate Spanish phonemes, intonation, and rhythm patterns.
2. Develop more listening comprehension.
3. Read from the text or other sources with acceptable pronunciation, intonation, and rhythm.
4. Produce in oral and in written form the vocabulary sentences that relate to the topics of the text.
5. Write from dictation with accurate spelling and punctuation any sentences or related vocabulary covered in the text.
6. Ask and answer questions orally and in writing, based on topical vocabulary and themes covered in the text.
7. Participate in activities involving the culture of Spanish speaking people.
8. Develop ability to use a Spanish dictionary as well as a Spanish-English dictionary.
9. Increase vocabulary levels relating to: idiomatic expressions, cognates, shopping, family, daily life, excursions, trips, careers, furniture, and home and topics presented in class.
10. Review and expand basic grammatical concepts and vocabulary introduced in Spanish
11. Demonstrate the ability to use orally and in writing the following grammatical concepts:

Spanish 2 A (continued)

a. Pronouns - direct and indirect - reflexive, prepositional
b. Present progressive tense
c. Past progressive tense
d. Imperfect forms
e. Demonstrative adjectives and pronouns
f. Possessive adjectives and pronouns
g. Capitalization
h. Preterit versus imperfect
i. Comparatives
j. Superlatives

12. Produce orally or in written form compositions based on the special chapter themes.
13. Maintain a Spanish notebook.

Course Title

Spanish 4 A/B (Honors)

Description of Target Group

Spanish 4A (H) and Spanish 4B (H) are each a semester (two term) course designed as an elective for junior and senior students (or students with permission from the instructor), who have completed level three course with a B or better average. Honors credit is only awarded when a section of Spanish 4A, 4B is held in isolation of Spanish 3A, 3B.

Purpose

Spanish 4A and Spanish 4B are designed to give the students advanced training in the language. Students will receive instruction (including, but not limited to) through the following strategies, communication based instruction, literature based instruction, student individual and group projects, and multi-media approaches that incorporate the national standards of comparisons, connections, and communities. Students will also gain skills in understanding, speaking, reading, and writing Spanish; gain respect for other people and cultures; and gain an appreciation of the history of Spanish speaking peoples. Special emphasis will be placed on the history, culture, and literature in Spanish.

Standards of Expected Achievement

Upon completion of the course the students will be able to successfully demonstrate the following skills:

1. Improvement of reading, writing, listening, and speaking skills.
2. Reading and understanding selected literary texts.
3. Enhancement of their ability to analyze literary texts.
4. Drawing comparisons within a cultural context of different Spanish speaking peoples and their own culture.
5. Utilization of the Internet to access and utilize information in Spanish that is unable to access otherwise.
6. Interaction with the Spanish speaking community of Santa Maria, in order to draw on the rich resources at hand.
7. Connecting their learning to other curricular areas in high school and beyond.
8. Reviewing and expanding advanced grammar.
9. Development of career awareness in terms of bilinguals.
10. Communicating in complex real-life situations.
11. Write effectively in narrative on general and specific topics

Spanish 4 A/B (continued)

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Activities include, but are not limited to: aural and oral practice, oral journalizing, small group activities, individual projects, role plays, songs or other musical presentations, films, poetry, other literature selections, research specific and general topics, planning and making presentations on a variety of topics and formats, peer editing, field trips, individual interactions with Spanish speakers, focused discussions, compositions, and presentations by resource persons.

Assessments

Teacher observation of student actions, oral presentations, and speaking demonstrations. Student depictions of concepts via visual and/or performing arts. Multi-media group or individual performances/demonstrations evaluated with rubrics, student and/or teacher designed. Students work in computer files. Written student work-projects, notebooks, worksheets, essays, etc. Formative self-analysis by student. Summative exams with teacher generated criteria. Homework completion and correction. Performance in role plays, and other real life situations.

Course Title

Spanish Enrichment A/B

Description of Target Group

This course is designed as an elective for students who understand spoken Spanish.

Purpose

The purpose of Spanish Literacy Enrichment is to develop speaking, reading, and writing skills in students who already understand spoken Spanish. The course is designed to provide a more challenging program aimed specifically at the numerous language problems encountered by persons of this area with a Spanish-speaking background. Acquiring a better command of the spoken language and reading and writing skills will heighten historical and cultural awareness. This will provide more opportunity to participate in a bilingual-bicultural environment and work place. This course will also enhance the student's own understanding of his or her intra-cultural richness, diversity, and historical origins of the Mexican, Chicano, and other Latin American cultures. Credit earned will contribute to the college entrance requirements as defined by the A-F requirements.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Use standard Spanish in oral and written work.
2. Read small amounts of material with complete comprehension.
3. Recognize proper spelling and identify common errors.
4. Read aloud, communicating meanings and interest.
5. Write complete sentences that are free of major errors, such as verb tense, gender, and number agreement.
6. Recognize the correlation between the classroom and the world of work.
7. Write compositions without major error.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Lectures, class participation, demonstrations, audio-visual materials, field trips, small group activities, outside resource people.

Assessments

Teacher observation of student actions, speaking demonstrations, and other oral presentations.
Student depictions of concepts via drawings, markings, posters, collages, and video projects.
Students sorting and/or showing realia.
Student or teacher generated (planned or impromptu) role play or real life situations.
Written student work including but not limited to, exercises, worksheets, compositions, portfolios, notebooks, or projects.
Summative written tests and quizzes based on teacher generated criteria.
Student work in computer files.
Student generated logs and journals.

Course Title

Spanish for Spanish Speakers - 1A/B

Description of Target Group

This course is designed as an elective for students of any grade level who understand, speak, and read the Spanish language or received permission from the instructor.

Purpose

The purpose of Spanish for Spanish Speakers 1 is to improve the Spanish speaking, reading and writing skills of Spanish speaking students and to provide a forum in which grammar can be taught in the context of interpretation and analysis of Spanish language literature. Exposure to Spanish language literature from the Spanish speaking world will stimulate interest and pride in the students' heritage and foster an appreciation in the students of the many cultures from which they come and among which they live. Credit will constitute the A-F college entrance requirements.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Read selected materials from newspapers, magazines simplified short stories, etc.
2. Ask and answer questions orally and in writing based on materials read and on radio and television presentations.
3. Write from dictation materials with which the student in unfamiliar.
4. Develop ability to use Spanish language dictionaries and encyclopedias.
5. Understand readings in literature in both prose and poetry.
6. Acquire and use new vocabulary presented through reading materials.
7. Express thoughts and ideas in correct idiomatic language.
8. The student will listen to and recite a short poem by a well-known Spanish speaking poet in appropriate declamatory style.
9. After listening to a short play, the student will answer questions orally about the main characters or the credibility of the presentation and give a summary of the plot.
10. After reading and listening to various short plays, students will write and present a short play based on a situation similar to those of the plays studied in class.
11. After watching videotapes of cultural events, plays, or current events, the student will answer questions orally about the causes and significance of the event or the plot of the play.
12. After doing research on trades and professions, the student will give a report on career options and prerequisites.
13. After doing research on trades and professions, the student will give a report on career options and prerequisites.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Lectures, class participation, demonstrations, audio-visual materials, field trips, small group activities, outside resource people.

Assessments

Teacher observations of student action, speaking demonstrations, and other oral presentations.
Student depictions of concepts via drawings, markings, posters, colleges, and video projects.
Student or teacher generated (planned or impromptu) role play or real life situations.
Written student work including but not limited to exercises, worksheets, compositions, portfolios, notebooks, or projects.
Summative written tests and quizzes based on teacher generated criteria.
Student work in computer files.
Student generated book presentations utilizing oral reports, story boards, elements of drama, and reader's theater.
Student oral and written interpretation of video generated thematic units.
Group presentations of thematic units including dramatic reenactment.
Student created new endings to stories.
Student participation in quackery reading.
Student participation in contrasting and dialoguing poetry.
Student participation in the accused bench or the hot chair activity.
Student composed letters to the characters in a story.
Student use of symbolization and picture graphs.
Student composed Venn diagram.
Student reflections and personal responses in journals or writing logs.
Student use of creative imitation.

Course Title

Spanish for Spanish Speakers 2A/B (Honors)

Description of Target Group

This course is designed as an elective for students of any grade level who have fluency in the Spanish language and have completed Spanish for the Spanish Speaking 1 and received permission from the instructor.

Prerequisites: Completion of Spanish for Spanish Speakers level 1 with a grade of "A" or "B" or permission from the instructor

Purpose

The purpose of Spanish for Spanish Speakers 1 is to improve the Spanish speaking, reading, and writing skills of Spanish speaking students, and to provide a forum in which grammar can be taught in the context of interpretation and analysis of Spanish language literature. Exposure to Spanish language literature from the Spanish speaking world will stimulate interest and pride in the students' heritage and foster an appreciation in the students of the many cultures from which they come and among which they live. Also, the course will provide opportunities to develop literary analytical skills. The course will contribute to the A-F college entrance requirements.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Read selected materials from newspaper, magazines, short stories, novels, etc.
2. Write from dictation materials with which the student is unfamiliar.
3. Understand readings in literature in both prose and poetry.
4. Acquire and use new vocabulary presented through reading materials.
5. Express thoughts and ideas in correct idiomatic language.
6. Discuss ideas found in literature and defend one's own ideas.
7. Analyze and criticize a short story.
8. Listen well and respect ideas of others.
9. Demonstrate awareness of the contemporary Spanish speaking.
10. Demonstrate awareness of the history and culture of specific Spanish speaking communities.
11. After reading an editorial comment or listening to an idea expressed in the media, the student will answer questions and discuss the content, the arguments supportive of the position taken then give his/her opinion on the matter.
12. After hearing a report on a historical event, the student will analyze its causes and its effects on present-day events.

13. After doing research on trades and professions, the student will give a report on career options and prerequisites.
14. Given a contemporary problem of political or economic significance to Spanish speaking countries, the class will arrive at a feasible solution through discussion, analysis, and consensus.
15. After researching a subject of current interest, the student will participate in a debate, supporting his/her position with facts.
16. The student will help to plan and carry out a group activity, such as making a relief map of Latin America or presenting a short play.
17. As part of the study of a particular poet or of a literary epoch, the student will recite a poem and then indicate the imagery, symbols or metaphors used by the poet.
18. Using a prepared outline on plot, locale, characterization, and point-of-view, the student will report on a book read outside of class.
19. After reading a literary work, the student will discuss the motivation of a character, the style and the author's message as revealed directly or through the use of symbols.
20. Given several short stories to read, the student will analyze and discuss the types of conflict present in them, that is: man against nature, man against society, or man against himself.
21. As part of the study of a poet or literary period, the student will compare and comment on poems with different themes and styles.
22. After doing research on the subject, the student will give a report on the relationship between a poet's life and his/her poems, including considerations of historical events that affected the author's life and works.
23. After reading a book or periodical, the student will write a three-to-six page report on the effect that a military coup has had on the economy of a particular Hispanic country, the attitude that the United States government has taken towards a particular Hispanic leader currently in the news, or the growing importance of Latin American oil supplies.
24. The student will write examples of different types of paragraphs, such as descriptive, narrative, expository, persuasive.
25. The student will write a biographical resume or anecdote about a famous Hispanic figure.
26. After reading several poems of a particular literary period, such as Romanticism, the student will write two, then four lines of original poetry in the same style as that of the poetry being studied.
27. The student will write an essay comparing the personality, behavior or outlook on life of two characters taken from a story, novel or play.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Lectures, class participation, demonstrations, audio-visual materials, field trips, small group activities, outside resource people.

Spanish Reading Improvement A/B

Description of Target Group

This course is designed for Spanish Speaking LEP students with reading skills at or below the 5th grade reading level who need improvement in reading and writing in order to successfully compete in their Spanish content classes.

Purpose

The purpose of this class is to help students build basic reading skills in Spanish to an appropriate grade level through identification of specific weaknesses a measured by diagnostic inventories (SABE and other assessments). Remediation in specific skills will be provided. These skills will enable the students to perform the required tasks in their Spanish taught social studies, math and science classes which require higher levels of reading and writing abilities This is an elective, two semester class and as students reach competency, they will be exited at the semester. This instruction in Spanish will also result in increased acquisition of English as a Second Language. (There is a direct correlation between the learner's level of education and the acquisition of a second language.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following:

1. Read and comprehend at or above the 6th grade level.
2. Write coherent paragraphs including a topic sentence (ten sentences minimum).
3. Know and use the necessary basic skills of language mechanics including syntax, punctuation, paragraphing etc.
4. Demonstrate study skills necessary for comprehension and content by asking/answering critical thinking questions.
5. Demonstrate study skills related to content organization (schedule, notebook organization, note taking skills, etc.).
6. Demonstrate the ability to cope with pre-tests, interim-tests, post-tests, and information related to learning modalities and behavior patterns, e.e., visual, auditory, kinesthetic.
7. Demonstrate the ability to use dictionary/thesaurus skills.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Whole language using low level, high interest literature, cooperative groupings, whole class instruction, individualized instruction, use of the Mac Lab's Spanish software, i.e., Bilingual Writing Center, Spanish dictionary, Spanish thesaurus, Clip Art File, L.E.A. (Language Experience Approach), dictation, and choral as opposed to round robin reading

Assessments

Teacher observations of student action, speaking demonstrations, and other oral presentations.
Student depictions of concepts via drawings, markings, posters, colleges, and video projects.
Student or teacher generated (planned or impromptu) role-play or real life situations.
Written student work including but not limited to exercises, worksheets, compositions, portfolios, and notebooks, of projects.
Summative written tests and quizzes based on teacher generated criteria.
Student work in computer files.
Student generated book presentations utilizing oral reports, storyboards, elements of drama, and reader's theater.
Student oral and written interpretation of video generated thematic units.
Group presentations of thematic units including dramatic reenactment.

SMJUHSD

PHYSICAL EDUCATION

Course Title

3 on 3 Basketball

Description of Target Group

Basketball is open to all10th, 11th, and 12th grade students with instructor approval and a grade of C or better in previous Physical Education classes.

Purpose

Basketball is oriented toward a recreative or competitive exercise that will help develop and maintain a healthy body and develop skills and knowledge of the game of basketball.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Demonstrate an ability to be on time, dressed appropriately and participate in the activities.
2. Demonstrate competency in the use and care of equipment.
3. Develop acceptable social attitudes and adjustments, etc. (school board student behavior policies).
4. Demonstrate skill improvement in passing the ball.
5. Demonstrate skill improvement on dribbling the ball.
6. Demonstrate skill improvement in lay-up shot.
7. Demonstrate skill improvement in the free throw.
8. Demonstrate knowledge of the rules and scoring.
9. Demonstrate skill in teamwork.
10. To be able to use the acquired knowledge and skills in a game situation.
11. Demonstrate basketball skill improvement in an advanced learning atmosphere.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union School District

Activities

Drills in passing, dribbling, free throws, and shooting; active game competition (full and half court), tournament participation, written test covering rules and skills, and ability to officiate games.

Course Title

Aerobic Dance

Description of Target Group

Open to all 10th, 11th, and 12th grade students.

Purpose

Designed to increase cardio-vascular endurance and for weight control.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Demonstrate an ability to be on time, dressed appropriately for the activity.
2. Demonstrate proper care and use of equipment.
3. Participate in vigorous exercise in order to increase cardio-vascular endurance.
4. Enjoy exercising.
5. Show knowledge that exercise will help maintain health and good appearance.
6. Demonstrate knowledge of how to lose weight and inches.
7. Learn how to take and record body measurements.
8. Work independently to achieve their personal loss goal.
9. Understand the physiological principle that allows the body to increase cardio-vascular endurance and gain strength (overload).
10. Participate in a rhythmic activity.
11. Learn new movement patterns, dance steps, etc. and increase awareness of musical phrases, tempo, etc.
12. Learn a carry-over activity.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Daily rhythmic dancing to a variety of musical backgrounds.

Course Title
Athletic Training

Description of Target Group
Open to all 10th, 11th, and 12th grade students who have a combined grade point average of 2.5 or above, have passed General Science and have the instructor's permission.

Purpose
This one-term (5-unit) course will present students with opportunities to become familiar with sports medicine terminology and actual hands-on experiences in the field of athletic training. At the present time, there is no class being offered by the Santa Maria Joint Union High School District which provides students with opportunity to learn and perform actual tasks related to sports medicine and athletic training. This course will meet part of the 20 units required for physical education, and a student can only receive credit one time for the completion of this course.
The course is designed to introduce students to basic information, procedures, and techniques related to the prevention and treatment of athletic injuries. It includes conditioning principles, emergency first aid, injury evaluation, and rehabilitation techniques.

Standards of Expected Student Achievement
Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Students will develop a working knowledge of basic anatomical terms in order to understand procedures.

    a. Introduction/review of basic human anatomy and physiology, and how they related to athletic injuries
    b. Discuss anatomical and physiological terms to better understand the course and actual injuries.
    c. Students will understand the concepts of training and conditioning techniques.

2. Students will be able to understand basic concepts, first aid requirements, methods, and taping/bandaging techniques in treating athletic injuries.

    a. Students will be able to recognize various injuries from the foot to the head, and all extremities. Students will also be able to treat minor injuries and help the certified athletic trainer and coaches
    b. Students will be able to use appropriate first aid equipment and supplies under the direct supervision of the athletic trainer.
    c. Students will be able to recognize the need for and assist with the immobilization and transportation of more serious athletic injuries.

Athletic Training, continued

3. Students will demonstrate an understanding of rehabilitation and therapy techniques.

    a. Students will be able to discuss and demonstrate appropriate rehabilitative programs involving weights, aquatic therapy, isokinetic, isometric, open and closed chain exercises, and cardio respiratory fitness.
    b. Students will understand the relationship between physician, physical therapist, and athletic trainer with the athlete.

4. Students will be exposed to various fields related to sports medicine and athletic training.

    a. Students will meet and have discussions with physicians, nurses, physical therapists, chiropractors, certified athletic trainers, emergency medical personnel such as paramedics and EMT's, and law enforcement officers.
    b. Students will understand the legal limitations of athletic trainers.

Methods of Assessment of Student Learning:
Attendance will be stressed and used as one of the primary criterion for grading along with written quizzes and formal mid-term exams. Students will also be assessed based on hands-on skills, and their knowledge and ability to use athletic training skills. Athletic training skills will include taping, bandaging, and interaction with other students and instructors.

Instructional Materials
Athletic training materials such as tape, bandages, as well as first aid materials.

Instructional Materials

Athletic training materials such as tape, bandages, as well as first aid materials.

Course Title

Badminton

Description of Target Group

10th, 11th, and 12th grade students.

Purpose

To familiarize the student with the sport of badminton and enable him to develop enough skill that will make badminton enjoyable as a carry-over activity in his future life.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Demonstrate an ability to be on time, dressed appropriately for the activity.
2. Must participate in course activities.
3. Must adhere to all school board student behavior policies.
4. Demonstrate competency on use and care of equipment.
5. Demonstrate knowledge of single and double rules, and scoring.
6. Learn and understand game strategies in single and double games.
7. Demonstrate proper deep and short serve.
8. Demonstrate drop shots, deep shots and over-head smash shots.
9. Must participate in tournaments.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Drills on serving, drops, deep base line, over-head smash, and wall hitting; single and doubles practice play, single and doubles tournaments, care of equipment, and verbal and written skills.

Course Title

Baseball, Advanced

Description of Target Group

Any 10th, 11th, or 12th grade student who can perform on an advanced level.

Purpose

To gain advanced skills, strategies and knowledge of baseball.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Must attend regularly and on time.
2. Must wear appropriate uniform.
3. Must participate in course activities.
4. Must adhere to all school board student behavior policies.
5. Develop advanced fundamentals of baseball.
6. Demonstrate the ability to perform the advanced skills.
7. Demonstrate knowledge of rules and skills.
8. Demonstrate the ability to perform in an offensive and defensive situation.
9. Be able to use the knowledge and skills in a game situation.

Activities

Drills, skill tests, games, tournaments and written tests.

Course Title

Basketball, Advanced

Description of Target Group

Any 10th, 11th, or 12th grade student who can perform on an advanced level.

Purpose

To gain advanced skills, strategies and knowledge of basketball.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Must attend regularly and on time.
2. Must wear appropriate uniform.
3. Must participate in course activities.
4. Must adhere to all school board student behavior policies.
5. Develop advanced fundamentals of basketball.
6. Demonstrate the ability to perform the advanced skills.
7. Demonstrate knowledge of rules and skills.
8. Demonstrate the ability to perform in an offensive and defensive situation.
9. Be able to use the knowledge and skills in a game situation.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Drills, skill tests, games and tournament and written test.

Course Title

Basketball

Description of Target Group

Basketball is open to all 10th, 11th, and 12th grade students.

Purpose

Basketball is oriented toward a recreative or competitive exercise that will help develop and maintain a healthy body and develop skills and knowledge of the game of basketball.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Demonstrate an ability to be on time, dressed appropriately and participate in the activities.
2. Demonstrate competency in the use and care of equipment.
3. Develop acceptable social attitudes and adjustments, etc. (school board student behavior policies).
4. Demonstrate skill improvement in passing the ball.
5. Demonstrate skill improvement on dribbling the ball.
6. Demonstrate skill improvement in lay-up shot.
7. Demonstrate skill improvement in the free throw.
8. Demonstrate knowledge of the rules and scoring.
9. Demonstrate skill in teamwork.
10. To be able to use the acquired knowledge and skills in a game situation.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Drills in passing, dribbling, free throws, and shooting; active game competition (full and half court), tournament participation, written test covering rules and skills, and ability to officiate games.

Course Title

Bicycling

Description of Target Group

Bicycling is designed for any student in the 1Oth, 11th, and 12th grade who has a three or ten speed bicycle.

Purpose

To expose the students to riding and maintaining a bicycle.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Attend regularly and on time the number of school days in the grading period, dressed appropriately for the activity.
2. Must participate in course activities.
3. Maneuver bike within defined boundaries.
4. Complete a bike route with an established degree of difficulty.
5. Demonstrate a basic knowledge of gears and shifting.
6. Exhibit a basic knowledge in the care and maintenance of the bicycle.
7. Understand how to ride on various surfaces.
8. Demonstrate knowledge of traffic laws and safety rules.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Lectures, riding and maneuvering, maintenance of bikes, and written and skills test.

Course Title

Body Mechanics and Toning

Description of Target Group

Open to all 10th, 11th, and 12th grade students

Purpose

The primary purpose of this course is to instruct students in the proper techniques involved in resistance training and to gain skills for general conditioning to be used as a lifetime fitness activity.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Develop knowledge of the relationship of resistance training with total physical fitness.
2. Demonstrate knowledge and the effects of different exercises on various muscle groups of the body.
3. Demonstrate proper body mechanics involved in performance of resistance training movements.
4. Must develop knowledge of individual level of cardiovascular development with continual jogging and aerobic development.
5. Must develop improved physical condition shown on pre/post test.

Instructional Materials

Handouts
Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District.

Activities

Daily aerobic exercises and strength training to a variety of music.

Course Title

Cross Country, Advanced

Description of Target Group

Any 10th, 11th, or 12th grade student who wishes to compete in cross country.

Purpose

To develop flexibility and strength to permit greater levels of performance and prevent muscular injuries.

Standards of Expected Student Achievement

1. An increase in strength and/or endurance of the large muscle groups of the body.
2. An increase in flexibility of the muscles, tendons and ligaments of the body.
3. A decrease in the injury rate of the athletes.
4. A closer balance between the strengths of the agonists and antagonists of the body.
5. Be on time to the class.
6. Suit up each class.
7. Do the assigned stretching, running and free weight isotonic exercises.

Activities

Weight lifting (2-3 days per week high weights and low repetitions)

1. Curls
2. Bench Presses
3. Bent Arm Pullovers
4. Lateral Raises
5. Back Raises
6. Situps
7. Leg Curls
8. Leg Extensions
9. Squats
10. Toe Curls

Cross Country, Advanced (continued)

Static Stretching (daily)

1. Grass Pickers
2. Over-Unders
3. Hurdler's Stretches (3 position, partners)
4. Back Stretches (partners)
5. Groin Stretches (partners)
6. V Stretches (partners)
7. Gastrocnemius Stretches

Running (2-3 days per week)

1. Barefoot strides on the grass
2. Kneelifts barefoot on the grass
3. Fast strides barefoot on the grass
4. Kickups barefoot on the grass
5. Easy distance barefoot on the grass

Course Title

Cheerleading / Songleading / Drill Team / Marching Band / Majorettes / Mascot / PEP

Description of Target Group

All students in the 10th, 11th, or 12th grade passing screening and/or elected the previous year.

Purpose

This course is designed to provide physical education credit for student participants during the fall semester only. Students are provided this time to prepare and practice special activities planned for fall sporting events. Stress will be placed on the creative development of activities which lead to the individual student's gain of confidence, poise, and self satisfaction through the development of school spirit.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Must attend regularly and on time.
2. Must wear appropriate uniform.
3. Must participate in course activities.
4. Must adhere to all school board student behavior policies.
5. Demonstrate knowledge of specific routines.
6. Demonstrate knowledge of individual team constitutions.
7. Participate in performances.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Learning of new routines, participation at all required games, and participation in all parades and competitions.

Course Title

Driver Education, First Aid, and Personal Safety

Description of Target Group

This course is designed for all students 15 years or older.

Purpose

This is a one-semester course, which includes Driver Education, First Aid, and Personal Safety. Driver Education concentrates on the student's responsibilities toward driving and an understanding of the legal and natural forces related to driving. First Aid and Personal Safety emphasize the basic techniques of the first aid and accident prevention.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

First Aid and Personal Safety

1. Performing basic first aid procedures related to hemorrhage control, treatment of poisoning and other accident situations.
2. Performing resuscitation techniques including cardiopulmonary resuscitation, when equipment is available.
3. Recognizing sound fire prevention methods and methods for protection and conservation of resources including the protection of our environment.
4. Recognize need for personal safety at home, work and in all other areas.

Driver Education

1. Pass a standardized test with a grade of 70 percent showing an understanding of the natural forces affecting driving.
2. Pass a test with a grade of 70 percent showing an understanding of the theory of starting and maneuvering a car.
3. Pass a test with a score of 70 percent of better showing an understanding of the principles of defensive driving.
4. Pass a test with a score of 70 percent showing an understanding of the principle of how a car operates, buying, insuring, and maintaining an automobile.
5. Pass a test with a score of 70 percent showing an understanding of the principles of motorcycle riding.
6. Achieve a grade of 80 percent of better on the California Student Driver Examination of the California Vehicle Code.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

First Aid and Personal Safety activities will include film and filmstrips (county and district); lectures, discussions, demonstrations, student reports and committee work; guest speakers; and practical work (first aid treatment). Driver Education activities will include films and filmstrips, lectures, and discussions, student reports, and committee work guest speakers, quizzes and tests.

Course Title

Elementary Physical Education

Description of Target Group

This course is open to 10th, 11th and 12th grade students.

Purpose

The purpose of this one-term (5-unit) course is to introduce teaching occupations as a possible career path. Students will be taught how to organize Physical Education/Recreational activities so they can eventually practice teaching elementary students at our feeder schools.

Standards of Expected Student Achievements

Upon completion of this course, students will be able to successfully:

1. Organize Elementary Physical Education/Recreation Activities
   - A. Learn rules & regulations
   - B. Arrange for prizes and do record keeping
   - C. Tournament design and organization
   - D. Write lesson plans and block plans
   - E. Be able to demonstrate basic skills of throwing, catching, etc.
   - F. Lead students in exercises and warm-ups
   - G. Be responsible for set-up and put away equipment

2. Research Occupations
   - A. Written project on Career Path
   - B. "Shadow" a person in their desired career
   - C. Student teach at the elementary level
   - D. Organize speakers to address the class

Instructional Materials

None

Activities

Teaching to their peers
Teaching at Feeder Schools
Demonstration/Explanation
Lab Examination
Written exam on rules and regulations
Guest lecturers

Course Title

Field Hockey

Description of Target Group

Open to all 10th, 11th, and 12th grade students.

Purpose

Develop ability to play in a popular recreative sport.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Demonstrate ability to be on time and dressed appropriately for the activity and participate actively.
2. Demonstrate competency in the use and care of equipment.
3. Demonstrate ability to understand and play various positions.
4. Develop knowledge of the rules and regulations of field hockey.
5. Demonstrate proper fundamentals for dribbling, passing, and tackling in field hockey.
6. Develop a knowledge and application of the fundamentals of team play and strategy.
7. Develop an awareness of the importance of safety in field hockey.

Instructional Materials

Text and Supplementary Materials
Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Lectures on rules and regulations, drills, in passing, dribbling, tackling, etc.; and actual game playing.

Course Title

Football, Advanced

Description of Target Group

This course is designed for any 10th, 11th, and 12th grade student who can perform on the advanced level.

Purpose

This course will help students to develop the advanced skills and knowledge to safely and competitively participate in high school football.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills and knowledge:

1. The ability to perform the following advanced skills:
   a. shoulder block
   b. shoulder tackle
   c. throwing and catching a football
   d. kicking a football
   e. 3 and 4 point stance
   f. proper “get off" - explosive start
   g. proper running form
2. Knowledge of the rules, procedures and strategies involved with the game of football.
3. Knowledge of the physical dangers involved with contact sports and an appreciation for proper techniques.
4. An understanding for the individual responsibilities of each position and their relationship to the total team effort.
5. A knowledge of the value of proper training:
   a. diet and rest
   b. cardiovascular conditioning
   c. weight training
6. The knowledge of the value of team sports and the commitment required of an individual to the team.
7. The characteristics of good sportsmanship and fairplay.
8. Be able to recognize, identify, and verbally call out various types of offensive and defensive alignments.
9. Be able to identify and call out the different types of offensive plays as they develop at the snap of the ball.

Football, Advanced (continued)

Activities

1. Practice the individual skills associated with the various positions in football.
2. Develop and maintain the strength and flexibility within the muscle groups necessary to participate in the sport of football.
3. Study game and training films to correct improper techniques and reinforce proper applications.
4. Written and verbal testing to evaluate the knowledge of the rules, procedures, strategies, and responsibilities involved with the game of high school football.

Course Title

Football (flag, touch, etc.)

Description of Target Group

A11 10th, 11th, and 12th grade students.

Purpose

The primary aim for students enrolled in this class is to instruct them in the basics of football in order that their physical needs are improved and at the same time help them to become more knowledgeable spectators of football.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Must be in regular attendance.
2. Must wear appropriate uniform, and be on time.
3. Must participate in course activities, with a knowledge of care and use of equipment.
4. Demonstrate a basic knowledge of the rules and regulations of football.
5. Develop skills involving passing, kicking, catching and running with the football.
6. Must adhere to all school board student behavior policies.
7. Demonstrate a knowledge of the various positions for both offensive and defensive players.
8. Develop good sportsmanship through participation in a team sport.
9. Develop physical fitness through participation in football.
10. Demonstrate a knowledge of both offensive and defensive football strategies.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Discussion of rules and regulations of football, discuss the basic strategy involved in offensive and defensive football, participate in one football contest each day, and discuss the characteristics of each of the offensive and defensive positions of football.

Course Title

Golf, Advanced

Description of Target Group

Any 10th, 11th, or 12th grade student who can perform on an advanced level. Instructor's approval.

Purpose

To gain advanced skills, strategies and knowledge of golf.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Must attend regularly and on time.
2. Must wear appropriate attire.
3. Must participate in course activities.
4. Must adhere to all school board student behavior policies.
5. Develop advanced fundamentals in golf.
6. Demonstrate the ability to perform skills taught at their skill level.
7. Demonstrate knowledge of rules and skills.
8. Demonstrate knowledge of what equipment is necessary and how to use it safely.
9. Be able to use the knowledge and skills in a game situation.

Activities

Studies on rules, regulation, procedures and etiquette. Practice at the golf course.

Course Title

Golf

Description of Target Group

Open to all 10th, 11th, and 12th grade students.

Purpose

To acquaint students with a popular leisure time activity by teaching them the basic rules and techniques.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Demonstrate ability to be on time, dressed appropriately for activity and participate.
2. Demonstrate competency in the use and care of equipment.
3. Develop acceptable social attitudes and adjustments, etc.
4. Develop knowledge of what equipment is necessary and how to use it safely.
5. Demonstrate how to hold the clubs, take aim and swing with control.
6. Become acquainted with the language of the game, the rules that apply to situations you will most frequently encounter on the course, and the etiquette by which you can conduct yourself to earn respect as a courteous golfer.
7. Develop knowledge of the purpose of different clubs.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Lectures on rules, regulations, and procedures, drills, in swinging, chipping, and driving; and field trips to gulf course and driving range.

Course Title

Gymnastics

Description of Target Group

This course is open to students in the 10th, 11th, and 12th grade.

Purpose

To develop coordination and balance through specific gymnastic skills in order for the student to gain a better appreciation for gymnastics.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Demonstrate ability to be on time, dressed appropriately for the activity.
2. Demonstrate competency in the care and use of equipment.
3. Must participate in course activities.
4. Develop a knowledge of gymnastic terminology.
5. Demonstrate awareness of the safety rules and spotting as applied to self and others.
6. Demonstrate balance, poise, and body awareness.
7. Evidence an increase in physical efficiency, agility, and flexibility.
8. Demonstrate a knowledge of the skills of the activity.
9. Develop an understanding of judging techniques.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Lectures on rules, regulations, and safety; drills on various movements on the uneven bars, balance beam, horse, and floor exercise; and actual competition within the class.

Course Title

Handball

Description of Target Group

Open to all 10th, 11th, and 12th grade students.

Purpose

The basic purpose of this activity is to allow the student to develop his knowledge of handball and to increase his physical and emotional wellbeing through utilizing and developing his physical abilities.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Demonstrate ability to be on time and dressed appropriately.
2. Demonstrate proper care and use of equipment.
3. Develop knowledge of handball rules, scoring, and game strategy.
4. Show improvement in hand-eye coordination.
5. Demonstrate knowledge of proper warm-up activities.
6. Develop skills involving serving and returning.
7. Develop ambidextrous skills through utilizing both right and left hand returns.
8. Demonstrate sportsmanship while playing with others.
9. Develop physical fitness through participation in handball.
10. Develop quickness, body balance, and coordination through participation in handball.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Lectures on rules, regulations, game experience through competition in various kinds of handball games: a. singles, b. doubles, c. cut throat.

Course Title

Health Education

Description of Target Group

All ninth grade students.

Purpose

This one-semester course is designed to stress skills to enable students to help themselves, their families, and the community in relationship to drugs, communicable diseases, and develop a positive attitude toward good health. The course will include basic techniques of first aid and accident prevention.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

Health Education

1. Use basic rules of general hygiene, good nutrition, proper exercise, and mental health.
2. Recognize and practice positive family health habits.
3. Recognize and avoid the harmful effects of alcohol, narcotics, tobacco, and restricted dangerous drugs.
4. Recognize the physical, psychological, and behavioral effects of the most abused drugs in our society.
5. Describe the major communicable diseases including venereal disease and the necessary factors for the successful prevention and control of those diseases.
6. Understand the basic principles of consumer health.
7. Practice accident prevention basic rules and measures.
8. Practice methods for protection and conservation of resources including the protection of our environment.
9. Perform basic first aid procedures related to hemorrhage control, treatment of poisoning, and other accident situations.
10. Perform resuscitation techniques including cardiopulmonary resuscitation, when equipment is available.

Instructional Materials

Text and Supplementary materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Health Education activities will include; use of county and district films; lectures, discussions, demonstrations, student reports and committee work; guest speakers; role playing; field trips; quizzes and tests.

Course Title

Jogging and Body Mechanics

Description of Target Group

Open to all 10th, 11th, and 12th grade students.

Purpose

To gain skills appropriate for general conditioning as well as potential use as a lifetime sport.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Must attend at least 51% of the number of school days.
2. Must wear appropriate uniform.
3. Must participate in course activities.
4. Must adhere to all school board student behavior policies.
5. Must demonstrate proper heel-toe striking position of feet.
6. Must develop knowledge of individual level of cardio-vascular development for pacing.
7. Must demonstrate proper arm-carriage technique for jogging.
8. Must demonstrate proper breathing techniques for maximum comfort.
9. Must develop improved physical condition shown on pre-post test.
10. Must demonstrate proper head/shoulder carriage in form running.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa. Maria Joint Union High School District

Activities

Students will participate in cross-country course development, cardio-vascular testing for grouping, timed course run, both pre and post testing; and in helping time either cross country or track meet.

19. Brief Course Description

This course will provide a foundation in water safety, individual & dual activities, dance and fitness.

B. COURSE CONTENT

Please refer to instructions

20. Course Goals and/or Major Student Outcomes

A. Students demonstrate knowledge of and competency in motor skills, movement patterns, and strategies needed to perform a variety of physical activities.
B. Students achieve a level of physical fitness for health and performance while demonstrating knowledge of fitness concepts, principles, and strategies.
C. Students demonstrate knowledge of psychological and sociological concepts, principles, and strategies that apply to the learning and performance of physical activity.

21. Course Objectives

A. Students will combine and apply movement patterns, simple to complex, in aquatic, rhythms/dance, and individual and dual activities.
B. Students will demonstrate proficient movement skills in aquatic, rhythms/dance, and individual and dual activities.
C. Students will create or modify practice/training plans based on evaluative feedback of skill acquisition and performance in aquatic, rhythms/dance, and individual and dual activities.
D. Students will analyze situations and determine appropriate strategies for improved performance in aquatic, rhythms/dance, and individual and dual activities.
E. Students will participate in moderate to vigorous physical activity at least four days each week.
F. Students will participate in enjoyable and challenging physical activities that develop and maintain the five components of physical fitness.
G. Students will meet health-related physical fitness standards established by a scientifically based health-related fitness assessment.
H. Students will accept personal responsibility to create and maintain a physically and emotionally safe and nonthreatening environment for physical activity.
I. Students will act independently of negative peer pressure during physical activity.
J. Students will develop personal goals to improve one's performance in physical activities.
K. Students will analyze the role that physical activity plays in social interaction and cooperative opportunities in the family and the workplace.
L. Students will and evaluate the role of cooperation and positive interactions with others when participating in physical activity.
M. Students will identify and utilize the potential strengths of each individual in physical activities.

22. Course Outline

PE Course 1 will provide a foundation for high school instruction. Students develop proficient movement skills in each area of physical education; they expand their capabilities for independent learning; and they examine practices that allow for sound decision making to enhance successful participation in movement activities. This course will concentrate on individual and dual activities such as: orienteering/outdoor adventure, cycling, tennis, badminton/speedminton, track & field, golf/frisbee golf, handball/racquetball and a fitness lab. The areas of fitness, aquatics and rhythm/dance will be included as well.

23. Texts & Supplemental Instructional Materials

C. Students demonstrate knowledge of psychological and sociological concepts, principles, and strategies that apply to the learning and performance of physical activity.

21. Course Objectives

A. Students will demonstrate advanced knowledge and skills in two or more aerobic activities.
B. Students will apply previously learned movement concepts and principles to the learning and development of the motor skills required for successful participation in aerobic activities.
C. Students will list the safety equipment required for participation in aerobic activities; describe and demonstrate the use of such equipment.
D. Students will engage independently in physical activity that increases aerobic capacity.
E. Students will evaluate goal-setting and other strategies as effective tools for maintaining and increasing adherence to a personal physical activity program.
F. Students will identify and explain the positive effects of participation in aerobic activity on personal health.
G. Students will develop personal goals to improve performance in aerobic activities
H. Students will evaluate the risks and safety factors that may affect participation in aerobic activities throughout a lifetime.
I. Students will explain how to select and modify aerobic activities to allow for participation by younger children, the elderly, and individuals with special needs.

22. Course Outline

PE Course 3 – Aerobic Activities is an elective class designed to be taken after successful completion of PE Course 1 & 2. This course will provide students with the opportunity to further explore a physical activity in search of one they can enjoy and participate in for a lifetime. Students will expand their capabilities for independent learning; and they examine practices that allow for sound decision making to enhance successful participation in movement activities. This course will concentrate in the area of aerobic activities (i.e. aerobic dance, cycling, running, walking, etc.).

C. Students will list the safety equipment required for participation in dance activities; describe and demonstrate the use of such equipment.
D. Students will participate in dance activities that improve health-related physical fitness.
E. Students will analyze the effects of dance activities on a personal physical fitness program and personal levels of health-related physical fitness.
F. Students will explain the relationship between participation in dance activities and indicators of good health.
G. Students will develop personal goals to improve performance in dance activities
H. Students will evaluate the risks and safety factors that may affect participation in dance activities throughout a lifetime.
I. Students will explain how to select and modify dance activities to allow for participation by younger children, the elderly, and individuals with special needs.

22. Course Outline

PE Course 3 – Dance Activities is an elective class designed to be taken after successful completion of PE Course 1 & 2. This course will provide students with the opportunity to further explore a physical activity in search of one they can enjoy and participate in for a lifetime. Students will expand their capabilities for independent learning; and they examine practices that allow for sound decision making to enhance successful participation in movement activities. This course will concentrate in the area of dance activities (i.e. ballet, social, square, folk, etc.).

19. Brief Course Description

This course will concentrate in the area of adventure and outdoor activities (i.e. orienteering, camping, cycling, etc.).

B. COURSE CONTENT

Please refer to instructions

20. Course Goals and/or Major Student Outcomes

A. Students demonstrate knowledge of and competency in motor skills, movement patterns, and strategies needed to perform a variety of physical activities.
B. Students achieve a level of physical fitness for health and performance while demonstrating knowledge of fitness concepts, principles, and strategies.
C. Students demonstrate knowledge of psychological and sociological concepts, principles, and strategies that apply to the learning and performance of physical activity.

21. Course Objectives

A. Students will demonstrate advanced knowledge and skills in two or more adventure/outdoor activities.
B. Students will apply previously learned movement concepts and principles to the learning and development of the motor skills required for successful participation in adventure/outdoor pursuits and activities.
C. Students will list the safety equipment required for participation in outdoor pursuits and adventures; describe and demonstrate the use of such equipment.
D. Students will participate in adventure/outdoor activities that improve health-related physical fitness.
E. Students will analyze the effects of adventure/outdoor activities on a personal physical fitness program and personal levels of health-related physical fitness.
F. Students will explain the relationship between participation in adventure/outdoor activities and health.
G. Students will develop personal goals to improve performance in adventure/outdoor activities.
H. Students will evaluate the risks and safety factors that may affect participation in adventure/outdoor activities throughout a lifetime.

22. Course Outline

PE Course 3 – Adventure/Outdoor Activities is an elective class designed to be taken after successful completion of PE Course 1 & 2. This course will provide students with the opportunity to further explore a physical activity in search of one they can enjoy and participate in for a lifetime. 19. Brief Course Description

This course is a continuation of Course 3 Dance Activities and is intended to give a student intensive experience.

B. COURSE CONTENT

Please refer to instructions

20. Course Goals and/or Major Student Outcomes

A. Students demonstrate knowledge of and competency in motor skills, movement patterns, and strategies needed to perform a variety of physical activities.
B. Students achieve a level of physical fitness for health and performance while demonstrating knowledge of fitness concepts, principles, and strategies.
C. Students demonstrate knowledge of psychological and sociological concepts, principles, and strategies that apply to the learning and performance of physical activity.

21. Course Objectives

A. Students will demonstrate expertise in two or more dance activities.
B. Students will create or modify practice/training plans based on evaluative feedback from skill acquisition and performance of dance activities.
C. Students will practice dance activities in real-world settings.
D. Students will demonstrate skills in choreography.
E. Students will design personal physical fitness program to be completed in a home or gym and that will be consistent with the demands of a dance activity.
F. Students will adjust personal fitness goals on the basis of fitness assessment measures to improve performance in dance activities.
G. Students will set personal goals for improved performance and enjoyment of dance activities.

22. Course Outline

PE Course 4 – Advanced Dance is designed as an elective class and a continuation of Course 3. It is intended for students who have completed Course 3 and who want an intensive experience in an activity that they may wish to participate in for years to come. Students will expand their capabilities for independent learning and examine practices that allow for sound decision making to enhance successful participation in movement activities.

Course Title

PEP Squad

Description of Target Group

All students in the 10th, 11th, or 12th grade passing screening and/or elected the previous year.

Purpose

This course is designed to provide physical education credit for student participants during the fall semester only. Students are provided this time to prepare and practice special activities planned for fall sporting events. Stress will be placed on the creative development of activities which lead to the individual student's gain of confidence, poise, and self satisfaction through the development of school spirit.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Must attend regularly and on time.
2. Must wear appropriate uniform.
3. Must participate in course activities.
4. Must adhere to all school board student behavior policies.
5. Demonstrate a knowledge of specific routines.
6. Demonstrate a knowledge of individual team constitutions.
7. Participate in performances.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Learning of new routines, participation at all required games, and participation in all parades and competitions.

Comments:

Course Purpose: *What is the purpose of this course?*

This course is for the advanced Physical Education student that has completed course I and II. Students will be involved in setting up and collecting equipment in the activity area, as well as assisting the instructor and students with skills and activities during class. This includes but is not limited to handing out and collecting P.E. clothing, equipment maintenance, laundering clothing and recording scores and grades.

B. COURSE CONTENT

Course Outline: A *detailed descriptive summary of all topics covered. All historical knowledge is expected to be empirically based, give examples. (i.e. California State Standards).*

Course Goals and/or Major Student Outcomes

Physical Education Lab Techs will:
- Be able to set up equipment needed for the class activity
- Be able to record time, scores and grades
- Assist other students during the activity
- Assist instructor with duties needed

Course Objectives

Physical Education Lab Tech will:

- Assist the instructor in setting up facilities with the necessary equipment needed for the class activity
- Inventory, maintain, and organize equipment
- Demonstrate knowledge of skills and rules to assist instructor in class activities in Course I, II and III classes
- Assist the instructor during demonstrations
- Assist the instructor during demonstrations and in helping the other students

Course Outline

Students will know the following duties as a Physical Education Lab Tech:

- Demonstrate knowledge of all activities and skill to assist instructor in course I, II and III classes
- Be responsible for helping maintain, clean and organize equipment used in Physical Education
- Assist in giving out, collecting and laundering Physical Education clothing
- Know and understand how to set up, demonstrate and use equipment in the Physical Education classes

Course Title

P.E., 9th Grade

Description of Target Group

All ninth grade students.

Purpose

9th Grade P.E. is designed to familiarize ninth grade students with various P.E. exercises and game activities including rules, regulations, and fundamentals appropriate to each activity. Stress is placed on personal disciplines necessary to gain success in physical activities. Activities will be grouped in clusters of two or three per semester and will be selected from the approved courses of study list developed for the area of physical education.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Must attend regularly and on time.
2. Must wear appropriate uniform.
3. Must participate in course activities.
3. Must adhere to all school board student behavior policies.
4. Demonstrate skills in the various activities offered.
5. Demonstrate a knowledge of the activities offered.
6. Demonstrate a knowledge of the rules of various activities.
8 Demonstrate good sportsmanship.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Participation in activities and written tests.

Course Title

P.E., 10th, 11th, 12th Grade

Description of Target Group

All 10th, 11th, and 12th grade students.

Purpose

10th, 11th, and 12th grade P.E. is designed to introduce all students to the concept of coeducational physical education. Appropriate activities will be selected and will include P.E. exercises, review of rules and regulations, and fundamentals necessary for each activity. Stress will be placed on techniques which will develop skills, attitudes of good sportsmanship, and appreciation of carry-over activities which promote coeducational participation. Activities will be grouped in clusters of two or three per semester and will be selected from the approved courses of study list developed for the area of physical education. 10th, 11th, and 12th grade students will not participate in ninth grade offerings.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Must attend regularly and on time.
2. Must wear appropriate uniform.
3. Must participate in course activities.
4. Must adhere to all school board student behavior policies.
5. Demonstrate skills in the various activities offered.
6. Demonstrate a knowledge of the activities offered.
7. Demonstrate a knowledge of the rules of various activities.
8. Demonstrate good sportsmanship.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Participation in activities and written tests.

Course Title

Racquetball

Description of Target Group

This course is open to all 10th, 11th, and 12th grade students.

Purpose

To familiarize the students with the sport of racquetball and enable them to develop enough skill that will make racquetball enjoyable as a carry-over activity in their future life.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Attend at least 51% of the number of school days in the grading period.
2. Wear appropriate uniform.
3. Participate in course activities.
4. Abide by all school board student policies.
5. Knowledge of proper scoring.
6. Attain physical skills necessary to successfully participate in a game situation.
7.

Instructional Materials

Refer to: Secondary Adopted Texts and Approved Supplementay Books Used in the Santa Maria Joint Union High School District

Activities

1. Discussions on courtesy and care of equipment.
2. Discussions on proper scoring for singles and doubles games.
3. Participation on at least one tournament.
4. One written test at the end of the semester.

Course Title

Recreational Occupations/Intramurals Program

Description of Target Group

This course is open to 10th, 11th, and 12th grade students.

Purpose

The purpose of this one-year (10 unit) course is to introduce recreational occupations as a possible career path. Students will be taught how to organize recreational activities so they can eventually be in charge of the noon-tune program at Santa Maria High School. Expansion will occur as we branch out to organize programs for our feeder schools.

Standards of Expected Student Achievements

Upon completion of this course, students will be able to successfully:

1. Organize Recreational Activities.
   - A. Learn rules & regulations
   - B. Officiating protocol
   - C. Sponsor tournaments as projects
   - D. Arrange for prizes and do record keeping
   - E. Different tournament bracketing
   - F. Arrange facility use and supervision
   - G. Tournament design and organization
2. Research Occupations
   - A. Written project on Career Path
   - B. "Shadow" a person in their desired career
   - C. Student teach at the elementary level
   - D. Organize speakers to address the class

Instructional Materials

None

Activities

Demonstration/Explanation
Lab Examination
Written exam on rules and regulations
Guest lecturers

Course Title

Roller Skating

Description of Target Group

This course is open to all 10th, 11th, and 12th grade students.

Purpose

To develop skill in an activity that will be a lifetime sport.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Must attend at least 51% of the number of school days.
2. Must wear appropriate uniform.
3. Must participate in course activities.
4. Must adhere to all school board student behavior policies.
5. Demonstrate knowledge of the skills involved.
6. Demonstrate the ability to perform skills taught at their skill level.
7. Demonstrate the ability to perform one dance.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Skills taught according to ability level, games, dances, skill tests and written tests.

Course Title

Self Defense

Description of Target Group

This course is open to all 9th, 10th, 11th, and 12th.

Purpose

The purpose of this course is to teach them how to recognize and avoid danger, to properly defend themselves against some common forms of attack, to know the laws for certain crimes and to protect personal property.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully:

1. Demonstrate basic self defense skills.
    a. Mental Preparedness
    b. Physical Conditioning
    c. Screams
    d. Thumb Gouge
    e. Groin Pull
    f. Finger Jab
    g. Knee Lift
    h. Double-Hand Blow
    i. Kicks
    j. Knee Break
    k. Single-Wrist Maneuver
    l. Double-Wrist Maneuver
    m. Rear Choke Maneuver
    n. Front Choke Maneuver
    o. Hair Release
    p. Ground Maneuver
    q. Double-Knee Drop
2. Demonstrate a knowledge of self defense concepts.
    a. Rules of Personal Safety
    b. Tactics for Defense
    c. Ingredients for a Successful Attack
    d. Defense in Dangerous Situations
    e. Rape

Self Defense (continued)

Instructional Materials

Text and Supplementary Materials

Refer to: Every Woman Can by Mary Conroy, Ed.D. and Edward Ritvo, M.D.

Activities

Conditioning Exercises
Demonstration/Explanation
Individual Skill Practice
Skill Tests
Written Test
Skill Combination Attacks
Practical Exam/ Attack Stimulation

Course Title

Soccer, Advanced

Description of Target Group

Any 9th, 10th, 11th, and 12th grade student who can perform the basic skills on an advanced level.

Purpose

This course is designed to develop advanced levels of strength, flexibility, and any skills which will increase all levels of performance and conditioning.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Develop and increase strength and flexibility of the muscles, tendons, and ligaments of the body joints and muscle groups.
2. Demonstrate the knowledge and skill necessary to perform at an advanced level in he sport of soccer.
3. Demonstrate the knowledge of advanced rules and regulations in the sport of soccer.
4. Develop and demonstrate acceptable social attitudes and standards outlined in the school board student behavior policies.
5. Develop an individual understanding of the value of proper training and conditioning to include: (A) rest and diet; (B) endurance
6. Develop and demonstrate the value of individual commitment to a team sport.

Activities

1. Develop, demonstrate and practice individual soccer skills.
2. Demonstrate and perform all necessary soccer skills, skill tests and games.
3. Pass a written test on the rules of the game.
4. Demonstrate an understanding of all responsibilities and strategies of the game of soccer.

Instructional Materials

Rules of the game and supplementary materials.

Course Title

Softball, Advanced

Description of Target Group

This course is designed for 9th, 10th, 11th, and 12th grade students with advanced skills in softball.

Purpose

This course will help students to develop more advanced skills and knowledge so that they can competitively participate in high school softball.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. An advanced level of fundamental skills to be used in competitive game situations.
2. The ability to perform defensive strategies and skills needed in game situations and in practices.
3. An awareness of softball on a competitive level as compared to a recreational game.
4. An understanding of the rules of the game and be able to use this knowledge in game situations and practices.
5. An awareness of the physical, psychological, emotional and mental aspects involved in preparing for a game.
6. An understanding of score keeping.
7. The advanced skills of batting, base running and fielding.

Activities

Games, tournaments, drills, weight training, exercise program.

Course Title

Step Aerobics

Description of Target Group

Open to all 10-12-grade students

Purpose

Designed to increase cardio-vascular endurance with use of special equipment i.e. step.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Regular attendance and appropriately dressed for the activity.
2. Demonstrate proper care and use of equipment.
3. Participate in vigorous exercise in order to increase cardio-vascular endurance.
4. Work independently to achieve their personal goal!
5. Learn movement patterns using step and increase awareness of musical tempo.
6. Enjoy exercising.
7. Learn how to take heart rate and understand importance of working within their target heart rate zone.

Instructional Materials

Handouts
Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District.

Activities

Daily stepping and strength training to a variety of music.

Course Title

Swimming and Diving, Advanced

Description of Target Group

This course is designed for 10th, 11th, and 12th grade students with advanced skills in swimming.

Purpose

This course will help students develop more advanced swimming skills so that they can competitively participate in high school swimming and diving.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. A knowledge of the rules relating to each event in a swimming meet.

2. Show proficiency in the following skills:

    a. Freestyle
    b. Butterfly
    c. Breaststroke
    d. Backstroke
    e. Starts for each stroke
    f. Turns for each stroke

Activities

Swimming
- daily workout sessions
- lectures on technique of each stroke
- lectures on turns and starts

Diving
- supervision by diving coach
- lectures on technique, approach, take-off and entry for each dive
- lectures on mechanics of each dive

Course Title

SWIMMING

Description of Target Group

This course is designed for 10th, 11th, and 12th grade students.

Purpose

The purpose of this course is for the students to develop their swimming ability.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Must attend regularly and on time.
2. Must wear appropriate uniform.
3. Must participate in course activities.
4. Must abide by all school board student behavior policies.
5. Develop survival skills in the water.
6. Develop skills in five strokes.
7. Develop skills in diving.
8. Understand the basic rules of the swimming pool.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Swimming, diving, treading water.

Course Title

Tennis, Advanced

Description of Target Group

Any 10th, 11th, or 12th grade student who can perform on an advanced level.

Purpose

To gain advanced skills, strategies and knowledge of tennis.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Must attend regularly and on time.
2. Must wear appropriate uniform.
3. Must participate in course activities.
4. Must adhere to all school board student behavior policies.
5. Develop advanced fundamentals in tennis.
6. Demonstrate the ability to perform skills taught at their skill level.
7. Demonstrate a knowledge of rules and skills.
8. Demonstrate the ability to perform in an offensive and defensive situation.
9. Be able to use the knowledge and skills in a game situation.

Activities

Drills, skill tests, games, tournaments and written tests.

Course Title

Tennis

Description of Target Group

Open to all 10th, 11th, and 12th grade students.

Purpose

This course is designed to assist students in developing tennis knowledge and agility in order to use tennis as a leisurely activity and/or exercise.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Demonstrate competency in the use and care of equipment.
2. Demonstrate ability to be on time, dressed appropriately for activity and participate in course activities.
3. Demonstrate tennis etiquette.
4. Demonstrate skill improvement in forehand drive.
5. Demonstrate skill improvement in backhand drive.
6. Demonstrate skill improvement in serve.
7. Demonstrate knowledge of rules and scoring.
8. Demonstrate knowledge of the singles and doubles game.
9. Demonstrate knowledge of volley, lob, and smash.
10. Demonstrate skill in understanding court strategy.
11. Must adhere to all school board student behavior policies.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Lectures on rules and regulations, drills in backhand, forehand, lob, smash, and volley; game competition in singles and doubles, skill testing, and conditioning.

Course Title

Track & Field

Description of Target Group

Open to all 10th, 11th, and 12th grade students

Purpose

This class is designed to teach all students the various events in track and field and to make them more knowledgeable in the areas of track and field.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Demonstrate ability to be on time, dressed appropriately for activity and participate in course activities.
2. Demonstrate competency in the use and care of equipment.
3. Develop acceptable social attitudes and adjustments, etc.
4. Develop strength and endurance.
5. Develop coordination and agility.
6. Improve cardio-vascular and pulmonary functions.
7. Learn how to properly warm-up to prevent injuries.
8. Demonstrate a knowledge of the rules in track and field events; and become familiar with track and field from a spectator's standpoint for carry over enjoyment.
9. Learn techniques in racing, sprinting, hurdles, long jump, high jump, discus, and shot put.
10. Must adhere to all school board student behavior policies.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Lectures on rules and regulations, and procedures for various field events; demonstrations and drills, actual participation in all events, and written and skill test.

Course Title

Track and Field, Advanced

Description of Target Group

Any 10th, 11th, or 12th grade student who wishes to compete in cross country.

Purpose

To develop flexibility and strength to permit greater levels of performance and prevent muscular injuries.

Standards of Expected Student Achievement

1. An increase in strength and/or endurance of the large muscle groups of the body.
2. An increase in flexibility of the muscles, tendons and ligaments of the body.
3. A decrease in the injury rate of the athletes.
4. A closer balance between the strengths of the agonists and antagonists of the body.
5. Be on time to the class.
6. Suit up each class.
7. Do the assigned stretching, running and free weight isotonic exercises.

Activities

Weight Lifting (2-3 days per week, high weights and low repetitions)

1. Curls
2. Bench Presses
3. Bent Arm Pullovers
4. Lateral Raises
5. Back Raises
6. Sit-ups
7. Leg Curls
8. Leg Extensions
9. Squats
10. Toe Curls

Static Stretching (daily)

1. Grass Pickers
2. Over-Unders
3. Hurdler's Stretches (3 position, partners)
4. Back Stretches (partners)
5. Groin Stretches (partners)
6. V Stretches (partners)
7. Gastrocnemius Stretches

Running (2-3 days per week)

1. Barefoot strides on the grass
2. Kneelifts barefoot on the grass
3. Fast strides barefoot on the grass
4. Kickups barefoot on the grass
5. Easy distance barefoot on the grass

Course Title

Upper Division Weight Training

Description of Target Group

Open to 10th-12th graders who have passed Physical Education with a grade of C or better. They must also have the instructor's approval.

Purpose

It is designed to increase one's knowledge of the human body in conjunction with the principles of strength, endurance, cardiovascular fitness, and diet.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Demonstrate the acute awareness of the human body and anatomical structure.
2. Demonstrate the ability to isolate specific exercises for specific body parts and functions.
3. Demonstrate the ability to identify muscle groups that are being used in specific exercises.
4. Demonstrate the ability to differentiate between correct techniques in power lifting, bench, squat, and power clean lifts.
5. Demonstrate exercise in power lifting and Olympic lifting.
6. Demonstrate knowledge and understanding of the foundation of proper diet nutrition, rest, and how these components apply to increase muscular strength and endurance.

Instructional Materials

Handouts
Written tests

Refer to: Secondary Adopted Texts and Approved Supplementary Books used in the Santa Maria Joint Union High School District

Activities

Daily lifting, demonstrations, lectures, aerobic activities and individualized programs will be developed to build the physique desired

Course Title

Volleyball, Advanced

Description of Target Group

This course is designed for 10th, 11th, and 12th grade students with advanced skills in volleyball.

Purpose

This course will help students develop more advanced skills and knowledge so that they can competitively participate in high school volleyball.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. An advanced level of fundamental skills to be used in competitive game situations.
2. The advanced skills of serving, bumping, setting, spiking, blocking, digging, drinking, soft hits and net play involved in competitive volleyball game situations.
3. The ability to execute offensive strategies of: 4-2; 5-1; or 6-0 in competitive game situations and in practices.
4. The ability to perform defensive strategies and skills needed in game situations and in practices.
5. An awareness of volleyball on a competitive level as compared to a recreational game.
6. An understanding of the rules of the game and be able to use this knowledge in game situations and practices.
7. An awareness of the physical, psychological, emotional and mental aspects involved in preparing for a game.
8. An understanding of the nutritional needs of the human body associated with competitive sports.
9. A stable attitude of conduct associated with representing a school when traveling to another school for competitive games.
10. Advanced volleyball skills in both 2-man and 6-man competitive game situations.

Activities

Games, tournaments, drills, skills tests, written tests, jump and reach test, weight training, exercise program, video tapes, films, filmstrips and nutrition log.

Course Title

Volleyball

Description of Target Group

This course is open to 10th, 11th, and 12th grade students.

Purpose

To teach students the basic rules, strategies, and skills involved in volleyball; develop interest in a carry-over activity.

Standards of Expected Student Achievement

1. Demonstrate ability to be on time, dressed appropriately for activity and participate in course activities.

2. Demonstrate competency in the use and care of equipment.

3. Develop acceptable social attitudes and adjustments, etc.

4. Develop a working knowledge of the rules of volleyball.

5. Develop a knowledge and the application of the fundamentals of the serve, bump, and spike.

6. Develop a knowledge and application of the fundamentals of team play and strategy. Demonstrating at least one type of offensive formation.

7. Demonstrate an interest in playing the game of volleyball as a leisure time activity as observed.

Instructional Materials

Text and Supplementary Materials
Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Lectures on rules and regulations, demonstrations on various techniques and movements, game experience, written test, tournament play, and drills: serving, bumping, spiking, and setting.

Course Title

Water Polo, Advanced

Description of Target Group

This course is designed for 10th, 11th, and 12th grade students with advanced swimming skills.

Purpose

This course will help students gain advanced skill, strategies and knowledge in the sport of water polo.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. A knowledge of the rules of the game.

2. Proficiency in the following skills and techniques:
   a. ball handling
   b. passing and shooting
   c. dribbling the ball
   d. extra man situations
   e. counter-attack
   f. zone defenses
   g. pressing defenses
   h. picks

Activities

1. Swimming drills.
2. Passing drills.
3. Counter attack drills.
4. Shooting drills.
5. Lectures and demonstrations on defensive and offensive skills.

Course Title

Weight Training

Description of Target Group

Open to all 10th, 11th, and 12th grade students.

Purpose

The primary purpose of this course is to instruct students in the proper techniques involved in weight training and to assist them in developing their muscle structure and overall physical fitness.

Standards of Expected Student Achievement

1. Demonstrate ability to be on time, dressed appropriately for activity and participate.
2. Demonstrate competency in the use and care of equipment.
3. Develop acceptable social attitudes and adjustments, etc.
4. Develop knowledge of the relationship of weight training with total physical fitness.
5. Demonstrate knowledge and of the effects of different lifts on various muscle groups of the body.
6. Demonstrate proper techniques involves in performance of weight training movements.
7. Develop an awareness of the importance of safety in the use of weights.
8. Evidence knowledge of the various types of weights, of weight lifting programs, and their specific purposes (heavy weights training for building size and strength, speed lifting for building strength, definition and stamina).

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Lectures on rules and regulations, demonstrations for safety purposes and for exercise purposes, and movement from station-to-station for exercising.

Course Title

Wrestling, Advanced

Description of Target Group

Open to all 10th, 11th, and 12th grade students.

Purpose

Body conditioning and development necessary for competition in wrestling.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Must attend regularly and on time.
2. Must wear appropriate uniform.
3. Must participate in course activities.
4. Must adhere to all school board student behavior policies.
5. Must demonstrate a knowledge of rules of wrestling.
6. Must demonstrate a high degree of skill in performing all phases of wrestling maneuvers.
7. Must demonstrate a knowledge of exercises and conditioning relating to body development.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Weight training, running, demonstration and participation in skills of wrestling.

Course Title

Wrestling

Description of Target Group

Open to all 10th, 11th, and 12th grade students.

Purpose

To develop strength and agility through exercise.

Standards of Expected Student Achievement

1. Demonstrate ability to be on time, dressed appropriately for the activity.
2. Demonstrate competency in the care and use of equipment.
3. Improve body strength and endurance.
4. Must participate in course activities.
5. List the basic rules in wrestling.
6. Perform fundamental skills in wrestling.
7. Demonstrate a knowledge of match and team scoring.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Lectures on rules, regulations, safety and techniques; demonstrations, and actual competition.

Name of Career Pathway:

* Brief Course Description
(If school has a catalog enter the description that is in the catalog.)

This is a two semester college preparatory laboratory science course designed to teach students about Earth space science. Students will learn about the tectonic processes that shape the Earth, how the tectonic processes are the driving forces of the Earthâ□™s resources including the formation of fossil fuels and gold deposition, and how those resources are affected by different geologic hazards. Students will use their knowledge of chemistry and build upon this when looking at the physical and chemical properties of rocks, minerals and the Explosivity of volcanoes. Students will learn how to read interpret both geologic maps and cross-sections in order to successfully complete the given projects. There will also be a unit that will cover space science including the big bang theory, stellar evolution including how elements on the periodic table were formed and planetary geology. Hands-on activities labs occupy approximately 40% of the given class time are designed to reinforce student understanding of scientific investigation experimentation within the realm of geologic science.

Pre-Requisites

Successful completion of two years college prepara ◉ Required ○ Recommended

Co-Requisites

None ○ Required ○ Recommended

Supplemental Instructional Materials (please describe)

Title: Simon Schusterâ☐™s Guide to Rocks Minerals- Students use this for their rock mineral ID Authors: A. Mottana, R. Crespi, G. Liborio Publishers: Simon Schuster Title: Geology of National Parkâ☐”Students use this for their various research projects Authors: A.Harris, E. Tuttle, S. Tuttle Publishers: Kendall/Hunt Publishing Co. Various videos on earthquakes, volcanoes, the rock cycle, etc. Movie: Contact Movie: Danteâ☐™s Peak Video: Collapse! Video: Discoveryâ☐”Loma Prieta Quake Video: Discoveryâ☐”Mexico City Quake Video: Discoveryâ☐”Kobe, Japan Quake

* Course Purpose

What is the purpose of this course? Please provide a brief description of the goals and expected outcomes. Note: More specificity than a simple recitation of the State Standards is needed.

At the completion of the course, Advanced Geology students will be able to do the following: 1) Students will be able to think critically in order to solve real-world problems by completing standards-based group and individual projects, laboratory experiments and assignments. 2) Students will be able to determine areas which may be threatened by natural disasters, by using learned geologic concepts, when looking for places to live in later life. 3) Students will be able to explain the physical and historical geology of an area around the world whether for school projects or individual vacations.

* Course Outline

Detailed description of topics covered. Show examples of how the text or readings are incorporated into the topics covered.

General Science: Observation vs. Inference **Students to watch and take notes on the video, Collapse. **Students will then write an inference as to why collapses occurred. **Students are to observe coprolites, fossilized poop, and infer how the poop became fossilized and what they can figure out about the animal that left it behind. Metric Conversions **Students will be taking notes on how to do both metric-metric conversions metric-English conversions. **Students will do a lab--How big is our room. During this lab students will create a 1:40 scale model of the classroom and figure out if a 1:40 scale model of a dinosaur could fit in it. **Students will create a 1:20 scale model of their room as a homework assignment. **Students will use their knowledge of metric-English conversions to complete a Dinosaur Dimensional Analysis assignment. **Students will take a quiz on both type of conversions. Density **Students will take notes on density work density math problems. **Students will do a density lab, finding the density of different items. **As a class, we will do a demo on density salinity. Based on this information, students will complete a reproducible lab about density salinity. Astronomy: Stellar Evolution **Although students will be covering stellar evolution during the large standards-based astronomy research project, students will also be doing a stellar evolution comic strip project with this. Standards-based astronomy unit including: Students will be doing an standards-based astronomy project using their book and the internet to research their topic. The topic are from the California State Astronomy Standards. Each group of 3-4 students will research their particular astronomy standard and put together a PowerPoint presentation that is presented to the class. After these, students will put together an individual portfolio of what

theyâ☐™ve learned. Their nightly homework assignments that were done using their textbook are also included in these. Students will use these portfolios to study for their written standards-based astronomy exam. Nuclear fusion, the Sun the formation of the solar system how the earthâ☐™s atmosphere has changed over time. Including how asteroid impacts have had an impact on extinctions throughout geologic time. Galaxies, quasars, black holes, Einsteinâ☐™s Theory of General Special Relativity. **Learning about this concept, students will also learn about: how the Big Bang Theory caused hydrogen, helium lithium formed and about the background radiation of the universe. **Students will also learn that the elements on the periodic table formed through novas supernovas. Formation of the Solar System **Students will take notes about the nebular theory. **Students will read about this concept in their book and use it to help them with the given labs. **Students will create a scaled model of the solar system. Eclipses Phases of the moon **Students will do an eclipse lab and a lab that includes tides phases of the moon. **Watch Contact. Students to observe discrimination/conflicts in movie relate these to their lives. Students to write a 2-3 page, typed paper on discussing this. Constellations Myths **Creating a constellation myth writing. Earth Science Minerals **Give a review of chemistry, especially the Periodic Table of the Elements, Ionic Covalent Bonding, along with physical chemical properties of chemistry. **Review the elements on the Periodic Table of the Elements atomic structures. **Students will use these chemistry concepts to show how a mineral is formed how the crystalline structure of a mineral is associated with this. **Students will complete a crystallography lab and learn how a mineralâ☐™s crystal lattice structure gives metals physical properties such as malleability, fracture cleavage. Physical Chemical Properties of Minerals **Give students notes on minerals, Bowens Reaction Series the Fractionation process. **Students will be reading using their textbooks to understand about minerals, Mohs Hardness Scale and cleavage through reading and written homework assignments. **Students will put minerals in order with Bowens Reaction Series. They will look at the mineralsâ☐™ silica iron content. Students will write down observations of different minerals such as: color, physical characteristics, density, hardness cleavage. Mohs Hardness Scale Cleavage **Students will take notes on the Mohs Hardness Scale, do a homework assignment in their book associated with this concept and do a lab about the hardness of different minerals. **Students will identify minerals using their book and other supplemental mineral classification books. **Students will do a written performance exam on minerals mineral identification. Minerals associated with economic resources **Students are to research the minerals associated with the California gold rush and put that information together with the history of the gold rush in California. **Students will take the information learned about the gold rush and write a paper on how the economic resources have shaped the history of California. Volcanoes **Demo: Viscosity of water,

warm honey cold honey. **Notes: Viscosity **Students will take notes on volcano explosivity the viscosity. **Students will take notes on the different types of volcanoes around the world. **Students will read the section about volcano in their book and do associated questions from it. **Students will watch videos about the Hawaiian hot spot and the Yellowstone hot spot. Students will compare these hot spots and explain how scientists can figure out plate movements velocities from these areas. **Students will watch explosive non-explosive volcano videos. They will compare the two and determine that the difference is due to the different viscosities their iron silica content. **Students will explain for homework the following: The difference of density of basaltic rock itâ☐™s iron rich nature vs. the granitic rock and itâ☐™s silica rich nature. Students will use their knowledge of types of magma learned during the Bowens Reaction Series unit. **Students will get into groups of 3-4 and research a volcano around the world to present to the class as a PowerPoint presentation. Students will use their book, the internet and other resources to due the project. **Students will use the information the learned from the volcano presentations to study and take a written exam about the different types of volcanoes, the igneous rocks associated with them, and their viscosities. **Students will watch the movie, Danteâ☐™s Peak, and write a 2-3 page paper to explain the tectonic boundary represented in the movie, geologic features associated, type of volcano and type of igneous intrusive extrusive rocks in the movie. Plate Tectonics: **Students will take notes on continental drift seafloor spreading. **Students will do given questions associated with the given notes about seafloor spreading how paleomagnetics work. **Students will do a lab on paleomagnetics. **Students will take notes on the different types of plate boundaries. (Divergent, convergent transform boundaries) **Students will read the section in their book about plate tectonics and do the given questions pertaining to the reading. **Students will learn about the difference in plate densities and how this determines which plate will be subducted and the type of magma that will form. (The elements iron silica determine plate density) **Students will do a lab using their knowledge of the different boundaries, a world map and a plate map to show different geologic features around the world due to plate tectonics. **Students will do a lab showing cross-sections of different locations around the world. Students will be able to use these cross-sections on the written plate tectonics exam. **Students will take a written exam on plate tectonics. Earthquakes **Students will take notes on San Andreas Fault how itâ☐™s a tranform boundary. **Students will look at our local mountains and talk about why they are east-west trending. We talk about why they are there and how they are affected by the San Andreas Fault. We will make a note to come back to this when we get to oil deposition in the Santa Maria area. **Students will watch a three different movies on three different areas around the world that have large earthquakes: 1995 Kobe, Japan Quake; 1985 Mexico City Quake; 1989

Loma Prieta Quake. Students will write a paper explaining the different types of tectonic boundaries associated with each. **Students will watch a video on earthquake preparedness. Students will then put together their own earthquake preparedness plans for their homes. **Students will assess the schoolâ☐™s earthquake preparedness plans. We will do an actual earthquake drill as a class and evacuate the building. We will also assess possible school evacuation problems along with looking through the schoolâ☐™s disaster preparedness supplies. **Students will take notes on earthquakes including key words such as epicenters, hypocenters, focus, and earthquake waves. **Students will read the section in their book about earthquakes and do the given questions pertaining to this reading. **Students will use their book to help them with the given finding the epicenter of an earthquake lab where they will be using triangulation. **Students will use all their knowledge of plate tectonics, volcanoes and earthquakes to do a large project with an earthquake table. Students will draw a scaled floor plan on an earthquake proof building. Students will also build a building for my earthquake table. They need to create a building that could withstand a 7.0 magnitude earthquake given the socioeconomic status of their given area. (Students buy supplies based on the socioeconomics of the area. Poor areas WILL fail!) Faulting Folding **Students will take notes on the different types of faults. **Students will be able to explain the difference between a footwall and a hanging wall. **Students will read about faulting folding in their book. They will answer the given questions pertaining to their reading. **Students will do a faulting lab where they will create 3-dimensional fault block models and answer the given lab questions. **Students will take notes on anticlines synclines along with the geology of oil deposits oil traps. **Students will take notes on the geology of oil deposits in Santa Barbara County. **Students will do a lab about anticlines synclines where they will create 3-dimensional models. They will answer lab questions pertaining to those models. **Students will answer questions pertaining to where oil comes from. They will have to explain the specific events that have occurred in our area (including the bend along the San Andreas Fault) giving way to this economic resource. **Students will take a written exam on earthquakes, faults, folds and oil deposition in our area. Rock Cycle **Review the water cycle. Have students draw the water cycle and the following questions: 1) How does the water cycle work? 2) Where does our water come from in Santa Barbara County. 3) Why is water such a big issue in California? **Students will watch a video about the rock cycle. **Students will take notes on the different environments rocks are deposited in. **Students will do a lab about the rock cycle called the rock cycle roulette. **Students will do a book activity about depositional erosional environments. They will answer the given questions pertaining to these. **Students will look for erosional problems around town as a homework assignment. **Students will do a lab about cave formation and look at how

solutes solvents work to create both primary secondary cave formations. **Students will do a lab about acid rain and itâ☐™s effects on our environment. **Students will take a written and performance exam on rocks the rock cycle. They will look at the given rock clues draw a picture of environments each specific rock formed in. Include what occurred during erosion deposition. Rocks--Igneous **Students will take notes about igneous intrusive extrusive rocks. **Students will do a lab using their books given hand-outs to observe the properties of igneous intrusive extrusive rocks. **Students will do a lab identifying igneous rocks and how they are associated to the Bowens Reaction Series. **Students will identify igneous rocks. Rocksâ☐”Sedimentary **Students will take notes about sedimentary rocks. **Students will read about sedimentary rocks in their textbook do homework based on their reading. **Students will do a lab about sand vs. sandstone. **Students will do a lab using their books given hand-outs to identify sedimentary rocks. Rocksâ☐”Metamorphic **Students will take notes about the different types of metamorphic rocks. They will also learn the difference between a foliated non-foliated metamorphic rocks. **Students will do a lab where they look at the properties of metamorphic rocks. **Students will identify metamorphic rocks. Geologic Laws Unconformities **Students will take notes on geologic laws such as the law of superposition, the law of original horizontality, the law of cross-cutting relations. Students will also take notes on the principle of uniformitarianism unconformities. **Students will read about the laws of geology in their book and do the associated questions. **Students will do a lab on cross-cutting relations and be able to explain when each rock bed was deposited based on their knowledge of the given geologic laws. **Students will create 3-dimensional models showing the different types of unconformities and describe how each unconformity was formed. Historical Geology **Students will learn about the geologic time and take a quiz on the geologic timescale. **Students will watch the video, â☐œWalking with Dinosaursâ☐☐, and write a paper showing why dinosaurs went extinct. **Students will get into a group of 2-3 and research a fossil. They need to draw a picture of the fossil and the environment in lives in. They also need to include whether their fossil was affected by the Paleozoic or Mesozoic mass extinction. Geological Investigation **Students will learn how to read interpret topographic maps. **Students will learn how to create interpret cross-sections from geologic maps.

* Laboratory Activities

Acceptable courses include hands-on scientific activities that are directly related to and support the other classwork, and that involve inquiry, observation, analysis, and write-up. These hands-on activities should account for at least 20% of class time, and should be listed and described in detail. Please itemize and describe the laboratory activities in detail.

Laboratory Objectives Overviews for Advanced Geology Course Topic: Metrics Density Lab: Metric System--Length Lab Overview: This is a hands-on laboratory. Students will use their knowledge of metric conversions to complete the given lab. Students will measure items around the classroom such as a microscope slide, the room, their desks, the walls, the door, etc. Students will take these measurements and practice metric conversions. Lab Objective: This lab will reinforce how to do metric conversions. Science uses the metric system exclusively so itâ☐™s important that this becomes second nature for the students. Lab: How big is our room? Lab Overview: This is a hands-on laboratory. Students will measure the room in meters. They will then use their metric system knowledge to convert the meters into centimeters. Given the lesson on maps and scale given in class, students will take their measurements and create a 1:40 scale model of the classroom. Once this is done, students will take their assigned 1:40 scale dinosaur and answer questions in their lab write-ups that pertain to their data. Lab Objective: This lab will reinforce the idea of scale. Scale is important in geology because geologists use the idea of scale in mapping. This also gives students practice with their metric to metric conversions. Lab: Density Lab Overview: This lab helps students understand the concept of density. Students are to measure different materials such as aluminum bars, aluminum cubes, metal spheres, glass spheres and minerals. Students will find their mass by using a balance. They will then find the volume of the different materials by either using volume equations or by measuring the displacement of water in a graduated cylinder. They will then find the density by using the density equation. Students will finish the lab write-up by answering the conclusion questions. Lab Objective: Density is a concept that is VERY important in geology and in chemistry. In geology, we need to understand the difference in plate densities so we can understand why plates subduct under other plates. Students need a strong understanding of density in order to understand many of upcoming concepts of the class. We will hit upon this concept time and time again throughout the course. Lab: Salinity Reproducible Labs Lab Overview: Students will be given a real life situation to answer in class: â☐œHow could a fisherman fishing in the Gulf of Mexico drink a cup of seawater without having kidney failureâ☐☐. This starts a good conversation about salinity and density. Itâ☐™s a stepping stone to the real lab: Create a reproducible lab write-up that will help a freshmen in my general science class get 4 different colors of water in one piece of straw. That is all the guidance given. Students must use their knowledge of density to solve the problem. First they must solve the problemâ☐”getting all 4 colors in the straw. Then they must complete a detailed lab write-up that can be reproducible. (The freshman general science class grades these labs.) Lab Objective: Any scientist knows the importance of reproducible experiments. If the experiment cannot be reproduced the scientist wonâ☐™t get published and if they canâ☐™t be published they wonâ☐™t get

more funding for future projects. Students by the end of this lab understand this concept very well. They must problem solve based on their basic knowledge of density and then create a really good lab write-up. If the lab cannot be reproduced by anyone else, they get a zero. Topic: Astronomy Unit Lab: Creating a scaled model of the solar system Lab Overview: Students will learn exactly what an astronomical unit is. Given a conversion for these astronomical units, students will create a scaled model of the solar system on a piece of register tape. Students will then complete a lab write-up, which will include questions that will use the scaled distances of the planets. For example, students will have to figure out why the outer planets could retain their original atmospheres where the inner planets could not. Students will see that the inner planets are closer to the sun so when nuclear fusion first took place the primary atmosphere was blown off whereas the outer planets are very far away and therefore werenâ□™t affected by this. Lab Objective: Students will again use the concept of scale. They will also be able to explain why the asteroid belt is located where it is and why the outer planets were able to retain their primary atmospheres while the inner planets could not. Lab: Moon Phases Tidal Affects Lab Overview: Using the notes given in class about the moon, students will create a 2-dimensional diagram showing the phases of the moon. They will also label waxing crescent, waxing gibbous, waning crescent and waning gibbous. Students will show what happens during a spring and neap tide. Lab Objective: Students will complete a diagram of the moon phases. They will explain the difference between a synodic month and a sidereal month. They will also explain the difference between a spring and neap tide. Students will also be able to define â□œmareâ□□. Lab: Eclipses and the Earth Lab Overview: Students will define words such as eclipse, umbra, penumbra, solar eclipse and lunar eclipse. The will create a diagram showing a solar eclipse and a lunar eclipse and they will answer questions pertaining to both types of eclipses in a written lab report such as: What conditions must be present for a solar eclipse? Lunar eclipse? Why man lunar eclipses last several hours compared to a very short solar eclipse? Lab Objective: Students will know the difference between a solar eclipse and a lunar eclipse. They will also be able to define the given vocabulary words. Topic: Chemistry Review Minerals Unit Lab: Overview of Chemistry Lab Overview: Students will do a series of small experiments that will help them review physical and chemical properties of chemistry. These small experiments will help them review ionic and covalent bonding although students will mostly be dealing with ionic bonding concepts during the minerals units. Some of these experiments will include flame tests, saturated vs. unsaturated solutions, making crystals and creating polymers out of alginate from seaweed (kelp ball lab). Lab Objective: The objective of this series of small experiments is to help students review chemistry before getting into ionic bonding and chemical formulas of minerals, crystal structures of minerals and melting points of minerals. Lab: Crystal Structures

Lab Overview: Students will create 3-dimensional crystal structures and compare these to minerals in their rock mineral bins. Students will create a lab write up that will show drawings of these crystal structures and relate them to the chemical and physical properties of the minerals such as melting points, crystal structures, Mohs Hardness Scale, etc. Lab Objective: Students need a good working knowledge of what determines the physical and chemical properties of the minerals. This lab shows students the correlation between crystal structure, ionic bonding and the physical and chemical properties of the different minerals. Lab: Mohs Hardness Scale Cleavage Lab Overview: Given the notes on physical chemical properties of minerals, students will complete the given Mohs Hardness Scale lab. They will also complete the given lab on cleavage in which they will CAREFULLY break apart minerals. Lab Objective: Students will know how to use Mohs Hardness Scale for the upcoming mineral identification lab. Students will also know how to identify whether a mineral has cleavage and thus use this characteristic in identifying minerals. Lab: Mineral Identification Lab Overview: Using the given mineral specimen key, students will identify the minerals in their rock and mineral specimen boxes. Students will write in key characteristics of the minerals such as hardness, cleavage and whether itâ☐™s an igneous rock forming mineral, a sedimentary rock forming mineral or whether itâ☐™s an ore or gangue mineral. Students will also write in the chemical formulas for the minerals and figure out their molecular mass. Lab Objective: Students will learn the important igneous rock forming minerals by sight. They will be able to identify minerals using the concept of cleavage and hardness. They will be using their mineral identification labs on the mineral identification exam. Topic: Igneous Rocks Volcano Unit Lab 17: Bowens Reaction and the Fractionation Process Lab Overview: Students will learn about Bowens Reaction Series and how different rocks will form out of the different elements within the magma. This will be based on what types of minerals are formed at different temperatures within the magma. Students will then get out their igneous rock forming minerals and put them in order of Bowens Reaction Series. They will then create a lab write-up that will explain which minerals will crystallize out of a magma first at the highest temperature and which ones will crystallize out last at the lowest temperature. Students will also explain why an olivine, which is found at the top of Bowens Reaction Series and quartz, which is found at the bottom of Bowens Reactions Series, can never be found in the same rock. Lab Objective: Students will learn about how crystals form out of a magma and how the chemistry of that magma changes over time. As the chemistry of the magma changes (due to the densest material crystallizing out first and falling to the bottom of the magma chamber) different igneous rocks are formed. Lab: Identifying Igneous Rocks Lab Overview: Using the idea of Bowens Reaction Series and Igneous Rocks, students will identify the igneous rocks. They will use their knowledge of minerals to identify these rocks and use their igneous rock

notes to define their texture. From these textures students will be able to tell the cooling history of the rocks. Lab Objective: Students will be able to determine the cooling history of the given igneous rocks. They will also be able to put together the concepts of the fractionation process and Bowens Reaction Series while identifying these rocks. Students will be using their igneous rock identification labs on the igneous rock identification exam. Lab: Viscosityâ□"Water, Warm Honey Cold Honey Lab Overview: Students will use household items to fully understand the concept of viscosity. Students will do a mini-lab using water, warm honey and cold honey to determine viscosity. Students will also be using the concept of viscosity when we get to the oil unit. Lab Objective: Students will be able to show which has more viscosityâ□"water, warm honey or cold honey. Based on this, they will explain how gas bubbles move through the materials. They should come up with the conclusion that cold honey has the highest viscosity therefore the air bubbles they are blowing into it cannot easily escape. This will be used as a springboard into the explosivity of volcanoes. Topic: Plate Tectonics Unit Lab: Paleomagnetics Plate Movements Lab Overview: Given the notes on paleomagnetics and seafloor spreading, students will complete first the given pre-lab on how some iron-bearing minerals line up to magnetic north while in the magma chamber. Students need to understand this concept before they can understand the concept of paleomagnetics and polar wandering. After the pre-lab, students will complete the given paleomagnetics lab and based on their given data, they will figure out the average rate of movement of the North American Plate away from the European Plate. From this, students will figure out how far Africa has split from South America from the time of Pangaea. Lab Objective: Students will use their metric to metric conversions to help them figure out plate velocities. Using real-life data, students will figure out plate velocities and will use this knowledge when looking at the current rates of motions of plates around the world today (such as India crashing into Asia at 5 cm/yr.). Students will also use this as background knowledge during the upcoming physical geography and plate tectonics of the world lab while looking at geologic areas around the world. Lab: Cross-Sections and Plate Boundaries of the World Lab Overview: This lab is a performance exam of sorts. Students will use all their knowledge of igneous rocks, viscosity, explosivity of volcanoes and plate boundaries to create detailed cross-sections of plate boundaries around the world. On their colored plates of the world map, students will note letters such as A-Aâ□™, B-Bâ□™,, C-Câ□™, etc. At these locations, students are to draw a detailed cross-section of the plate boundary. Students will name the plates, color plates according the plate densities, draw and label the types of volcanoes associated with the area and label the types of rocks that would form. Lab Objective: This is a difficult task in which students must use all their geology knowledge and their knowledge of density to create detailed cross-sections. They must also include a key that answers questions

pertaining to their cross-section. Students will be able to use this lab on the upcoming plate tectonics lab. Topic: Earthquakes, Transform Boundaries the San Andreas Fault Lab: Seismic Retrofit â□˜Râ□™Us Lab Overview: Using the concepts learned from the plate tectonics unit and from the previous video laboratory, students will, in the first part of this lab, create a scaled 13,000 square foot floor plan of an earthquake safe building. In this floor plan, they will show evacuation routes/plans, include a key showing what types of special building materials they will need to create this earthquake proof building and what furniture will be in these rooms. (Students will do this on graph paper where 1 square = 4 feet.) Students will also put together a plan view (front view) of the building. The plan view does not need to be to scale. In the second part of this lab, students will actually build an â□œearthquake proof building out of cards, masking tape and straws. The amount of money students will have to buy supplies is based on the socioeconomics of the chosen area. Students will randomly choose these earthquake prone areas from rich areas to poor areas: Los Angeles, California; San Francisco, California; Kobe, Japan; Lima, Peru; Mexico City, Mexico; Papua New Guinea; New Delhi, India. Students must build an earthquake-proof building that can withstand a 7.0 magnitude on the earthquake table. Students must also complete a write-up about the building process and include in this write-up what type of other geologic hazards are associated with their area and what type of tectonic boundary their area is found along. Lab Objective: Students will use the concept of scale again to create their floor plan. They will also use their imagination to plan an earthquake proof building. They must use their mathematics knowledge to figure out the square footage of the building. They draw upon their plate tectonics knowledge as they figure out the geologic hazards associated with their chosen area. Students will actually build their buildings in class. Because some of these buildings will fall down, student grades are based on their participation on their building but mostly on the floor plans plan view. Students will also understand why there is so much destruction associated with moderate earthquakes in third world countries. Lab: Finding the Epicenter of an Earthquake Using Triangulation Lab Overview: Given the notes on earthquakes including definitions of the focus, the epicenter, P waves and S waves, students will use given information to find the earthquake epicenter using triangulation. Students will use data received at a seismic station to determine lag time. They will then plot this data on a graph and find the distance from the epicenter. They will use compasses to find the epicenter. Lab Objective: Students will use compasses to find the epicenter of an earthquake. Students will be able to define lag time. They will also know how a seismograph works. Given the conversations that arise about the seismograph and the Richter Scale, students will be able to explain the difference between the Richter Scale and the Mercalli Scale. Topic: Faulting, Folding Oil Deposition Lab: Itâ□™s Not Your Fault Lab Overview: After taking notes on the different types of

faults, students will create 3-dimensional fault block models. Within this lab, students will create a normal, reverse and a right lateral strike-slip fault. They will create a lab write-up that will include diagrams of faults, type of stress and strain associated with each type of fault and relative movement of the hanging wall and footwall for reverse faults and normal faults. Students will also give examples of where each of these types of faults can be found. (Example: We live along the locked portion of the San Andreas Fault, which is a right lateral strike-slip fault. Due to the stress and strain associated with the locked portion, we see a lot of compression, hence the Transverse Ranges in our area and the local Santa Maria East-West trending mountains.) Lab Objectives: Students will create 3-dimensional fault block models so they can better visualize the movement of the hanging wall and the footwall. They will also be able to answer the homework assignment: Why are the mountains in Santa Maria area trending East-West when the majority of mountains around the world (due to plate tectonics) trend North-South. Students can also observe see what a fault scarp looks like and what can happen to roads, streams, railroads, etc. due to faulting. Lab: Anticlines Synclines Oil Deposition Lab Overview: Students will create 3-dimensional geo-blocks for anticlines and synclines. Within this lab, students will use their knowledge of compressional stress and strain to explain how anticlines and synclines are formed in the lab write up. (Students will have a review of covalent bonding prior to this lab. They will have a lesson on hydrocarbons and their molecular formulas. Within this lesson they will compare the chemical differences between oil coal.) Students will need to include in their lab write up how oil is formed. They must explain the specific events that must occur in oil formation and what specific events occurred in the Santa Maria area to give us oil in our area. (They need to go through the process of accumulation of phytoplankton on the ocean floor through the compression associated from the locked portion of San Andreas Fault giving our specific location oil deposits.) Lab Objective: Students will use their chemistry knowledge to help them understand how oil if formed. They will be able to explain, in detail, the process of oil formation to oil deposition within an anticline and syncline. They will understand a little more of our local historyâ□”we are on the map due to oil production in the area. Students will learn about another economic resource of Californiaâ□”Oil. Topic: Rock Cycle Unit Lab: Rock Cycle Roulette Lab Overview: After taking notes on the different types of rocks and their depositional environments, students will complete this lab. During this lab, students will move around the room at different â□œdepositional stationsâ□□. They will roll a die to find out whether they will stay for 200,000 more years or move to a different depositional environment. At the end of their trek through the rock cycle, students will create a lab write up showing their movement through the rock cycle. They will also answer the questions pertaining to the lab. Lab Objective: Students will be able to see a pattern on their trek through the rock cycle. They

will understand that rocks go through different paths through the rock cycle and that the rock cycle is always on going. Since each roll is worth 200,000 years, they can better understand the time it takes for rocks to change. Lab: Sedimentary Metamorphic Rock Identification Lab Overview: Students will identify the sedimentary metamorphic rocks that are in the rock mineral specimen bins. Students will write down their observations of what each rock looks like and the depositional environment of each. For the metamorphic rocks, students will write down what type of metamorphism occurred for each rock and what the parent rock would be. Lab Objective: Students will be able to pick up a rock and be able to determine whether it is an igneous, metamorphic or sedimentary rock. Students will be able to explain how each rock was formed. Students will know that the state mineral and state rock of California is gold serpentinite. Topic: Geologic Laws Unconformities Lab: Topographic Maps Lab Overview: Students will be able to read a topographic map during this lab. Students will first start with easy topographic maps and then they will get gradually more difficult. Students will look for different types of features on topographic maps such as hills, valleys, cliffs and depressions. Students will use this knowledge to successfully navigate the more difficult maps in order to answer the given lab questions. Lab Objective: The topographic map is a very important tool in geology. Geologists look for different geologic features within the topographic map to help them infer what occurred there geologically. Students will take the knowledge of reading the topographic map one step further in an upcoming lab when they take information from topographic maps and create cross-sections from A-Aâ□™. Lab: Over Under Lab Overview: Students will use their knowledge of topographic maps and create cross-sections from the information given on the topographic map such as strike and dip. By looking at this information, students will be able to â□œinferâ□□ what has happened geologically and will be able to create a detailed geologic cross-section. Based on this cross-section, students will be able to explain what has occurred in the area geologically, for example: anticlines, synclines, normal or reverse faulting. Lab Objective: Students will use all their knowledge of geology learned thus far for this lab. Students will be able to take information from the birds-eye view of the topographic map and create a 2-dimensional cross-section. Students will also explain what types of geologic processes would form these cross-sections. Lab: Cross-Cutting Relations Lab Overview: Students will look at the given cross-sections and determine the relative age of the given rock layers and faults. They will log the ages in a key, at the side of the cross-sections from oldest on the bottom to youngest at the top. Lab Objective: Students will interpret age dating based on their observations of the given rock layers. They will also determine how certain rock structures were formed based on their location in the rock record. For example: Breaks in the rock record are interpreted as an unconformity or a time of erosion which means those rocks

must have been located above sea level at the time. Lab: Unconformities Lab Overview: Students will create 3-dimensional models showing the different type of unconformities: Nonconformities, disconformities and angular unconformities. Students will use their knowledge of the geologic laws to infer what has happened geologically for each type of unconformity. Lab Objective: Students will be able to explain the difference between a nonconformity, disconformity, and angular unconformity. They will be able to explain how each is formed and give an example of where they could find each. Our local geology has angular unconformities and disconformities and students will be able to explain how each was formed in our local area. Lab: Geologic Timescale Lab Overview: Students will create a scaled model of the geologic timescale using register tape. Students will mark the major eras epochs on this timescale. They will draw pictures of important index fossils such as the trilobite and ammonite in the correct time of the timescale. Students will answer questions pertaining to the Paleozoic and Mesozoic mass extinctions. Lab Objective: Students will understand that the majority of geologic time is in the Precambrian. Students will be able to explain that hard parts came about in the Cambrian and this is where much of the fossil record comes into play. Students will be able to explain what happened during the Paleozoic and Mesozoic mass extinctions and how this has affected life on Earth.

* Key Assignments

Detailed descriptions of the Key Assignments including tests, and quizzes. How do assignments incorporate topics? Include all major assignments that students will be required to complete.

Assignment Objectives Overviews for Advanced Geology Course Activity: Collapse! Activity Overview: This is a video activity. Students will watch a segment of a video where a bridge collapses and where a damn breaks. Students will write down their observations of the video. When the video is stopped, they will infer why the collapses occurred. Activity Objective: This lab is meant to teach students the difference between observation and inference. In geology, this is a very important concept. Geologists must infer what occurred geologically based on their observations of an area such as type of rocks, texture of rock, structures within the rock beds (anticlines synclines) and types of fossils found in the rock record. Assignment: Dinosaur Dimensional Analysis Activity Overview: This is a mathematical assignment. Students will read a section on about dinosaurs. (Itâ☐™s real life information about the dinosaurs that were used in the â☐œHow big is our roomâ☐☐ lab.) Given the reading, students will use the given information to perform metric to English conversion problems. To make it more interesting for the students, they will be asked to draw the

environment a certain dinosaur lives in. Students MUST show all their work to get full credit for this lab. Activity Objective: The purpose of this assignment is to have students perform one and two step dimensional analysis problems based on how the dinosaurs would roam the Earth. This not only gives students dimensional analysis practice, it also educates students about dinosaurs. Assignment: Stellar Evolution Comics Lab Overview: Students will take notes on stellar evolutionâ□”the life cycle of stars. Based on this knowledge, students need to create a comic strip, storyboard or play that goes through all phases of stellar evolution. In their lab, students must correctly identify whether a star will become a white dwarf, neutron star or a black hole depending on how much mass the star starts with. Assignment Objective: This assignment is one in which students use the information given to them via notes to show what happens during the life cycle of a star. This is used as a sort of performance exam to see if the students truly understand that mass is the determining factor in which phase a star will go through in life. Assignment: Standards Based Astronomy Project (Major 3 week project!) Assignment Overview: This is a huge research project in which students will be given a topic in astronomy. Specifically, they are given one of the California State Science Standards in astronomy. Students will research this topic based on the guiding questions I have given them. They must then create a PowerPoint presentation based on their topic using the computers I acquired from a grant a few years ago. Students present their topics to the class and from these presentations students ask questions and have conversations based on astronomy. This is an important assignment because it teaches not only how the universe and solar system formed billions of years ago but it incorporates a lot of chemistry concepts in it. From these presentations students have a working knowledge of how the elements were formed on the periodic table, how the chemistry of Earthâ□™s atmosphere has changed over time and how important the process of photosynthesis is. Students will be doing 2 weeks worth of homework assignments to go along with each presentation. Assignment Objective: This assignment ties in how all branches of science are intertwined. While learning about the formation of the universe and the solar system, students gain a working knowledge of how the Earthâ□™s atmosphere has changed over time so life can be sustained on Earth. Students also get valuable experience researching their topics, putting together PowerPoint presentations, and putting together a portfolio that will help them study for the major written astronomy exam. Assignment: Astronomy homework from the textbook Assignment: Written Standards Based Astronomy Exam Study Guide Assignment: History of California the Gold Rush Assignment Overview: Students will watch a video about the gold rush. They will then research the minerals associated with the California gold rush and how the gold was mined. They will research the history of the gold rush. Students will take this information (given to them through student presentations) and write a paper on how economic

resources have shaped the history of California. Assignment Objective: Students will understand that the miners had very little information on how the gold was deposited but they figured out a way to mine it. The placement of this lab is intentionally placed before the plate tectonics unit because students need to understand that the theory of plate tectonics is a recent concept and scientists, miners and geologists didnâ☐™t have knowledge of how the economic resources were emplaced. Students will know the economic resources of California and how they have shaped Californiaâ☐™s history. This will also be a springboard into the upcoming minerals unit. Assignment: Metrics, Astronomy Igneous Rocks Final Exam Study Guide Assignment: Viscosity Explosivity of Volcanoes Assignment Overview: This is a video assignment. Students will first watch a video about the Kalapana, Hawaii (non-explosive volcanoes). In this video, they will take observation notes on the viscosity of the magma. They will note how destructive the lava flow is. They will also note whether they can see the gas bubbles escaping. (One can see them bubble out.) Students will write a conclusion putting all their observations together. They will include the difference between aa and pahoehoe, what temperature the magma would be in the magma chamber based on the type of igneous rocks formed (going back to Bowens Reaction Series) and what texture of rock was observed (aphanetic). They will also learn about the Hawaiian hot spot. They will also learn about different types of magmaâ☐”acidic, intermediate and basic. These will correlate with the different types of igneous rocks they previously learned about. The next day students watch a video about explosive volcanoes. They will take observation notes on the viscosity of the magma. They will note the destruction associated with these types of volcanoes. They will write a conclusion about the types of rocks being formed by this volcano, types of geologic features associated with the area and the destructiveness of lahars and pyroclastic flows. Assignment Objective: The objective of this video assignment is to get students to observe the different types of volcanic eruptions. They will put together that the different types of eruptions have to do with the differences in viscosity. The differences in viscosity have to do with the iron content. High iron content magma has a low viscosity and will produce non-explosive volcanoes. The minerals that are associated with this magma will crystallize out high in the Bowens Reaction Series. Low iron content magma is rich in silica. The silica makes the magma thick and sticky and has a high viscosity. As a result, students will be able to correlate the minerals from our mineral unit with Bowens Reaction Series and the igneous rocks in order to tell the explosivity of the magma. This will help them determine what types of volcanoes will be found in different types of boundaries during the plate tectonics unit. Assignment: Viscosity Quiz Assignment: Danteâ☐™s Peak Assignment Overview: This is another video assignment. Students will watch the movie, Danteâ☐™s Peak. Throughout the movie they will write clues that tell them the mountain will erupt. In the process,

they will learn about the magma source in Mammoth Mountain. (Long Valley Caldera area has forests that are dying due to too much carbon dioxide being emitted in the area. This happens in Danteâ☐™s Peak, too.) They will put all their observations/clues in a paper about the movie. They will include type of volcano Danteâ☐™s Peak, viscosity of magma and volcanic hazards associated with the area and what type of igneous intrusive and extrusive rocks that would be formed. Assignment Objective: Students will put together their knowledge of rocks, minerals volcanics to write a paper about Danteâ☐™s Peak. They will also write about the fictional components of the movie such as the characters out-driving a pyroclastic flow or the low viscosity lava scenes. (The lava associated with this type volcano in real life would be high viscosity.) Assignment: Volcanoes PowerPoint Presentations Assignment Overview: Students will create a PowerPoint Presentation on a volcano around the world. Students will research areas with explosive volcanoes (Yellowstone, Long Valley Caldera, Crater Lake, Mt. Pinatubo, Krakatau) and areas with non-explosive volcanoes (Heimey Iceland, Hawaii). In their research, students will find the eruption history, type of volcano, type of rocks associated with the volcano, and other geologic hazards associated with the area. Students will put together a PowerPoint presentation that will be presented to the class. Students will also create either a 2-dimensional cross-section or a 3-dimensional model of their volcano that is correctly labeled with igneous intrusive and extrusive rocks and the plates that are associated with this volcano. (We have not done plate tectonics at this point so this will be a challenge for students to figure out why the volcano is there.) Assignment Objective: Students will learn specific information pertaining to volcanoes around the world including number of deaths, amount of destruction and types of igneous rocks associated with the area. They will also start thinking about plate tectonics. Best of allâ☐”their cross-sections and models will be donated to a local elementary school so students there can enjoy these and have a visual for their understanding of the earth science standards. Assignment: Physical Geography Plate Tectonics of the World Assignment Overview: Students will take their colored plates of the world map and determine the types of boundaries at specific locations around the world such as the Himalayas, Red Sea, East African Rift Valley, Papua New Guinea, Italy, Aleutian Trench, Indonesia, Andes Mountains, Basin Range Topography, Reelfoot Rift etc. Students will use their knowledge of plate tectonics and plate movements to determine what specific type of plate boundary they are on. Students will then also log in the geologic features associated with the area and whether volcanoes would be found along this area. If there are areas associated with the area, students have to log in what type of viscosity it has (high or low) and whether it would be an explosive or non-explosive volcano associated with it. Assignment Objective: Students are bad at geography so this lab helps them look at the geography of the world while doing geology. Students should start to see a

pattern emerge such as the Ring of Fire where there are volcanoes and earthquakes associated with the area and that there is a tectonic boundary associated with it. Students will also use their knowledge of Bowens Reaction Series again and the viscosity of the magma. Assignment: Comparing Major Earthquakes around the World Assignment Overview: This is a video assignment. Students will watch 3 different videos on earthquakes that have occurred in recent years: The 1989 Loma Prieta Quake, The 1985 Mexico City Quake, and the 1995 Kobe, Japan Quake. Students will take observation notes on each video. They will be required to explain what type of tectonic boundary each area lies on, what types of other geologic hazards are associated with the area (liquefaction, volcanoes, pyroclastic flows, tsunamis, etc.) and how much death and destruction is associated with each. From these notes, students will be required to write a paper comparing the three areas. Assignment Objective: This video assignment gives students the opportunity to see the amount of destruction large earthquakes can produce. This is important for students to see so they can be prepared for the next big earthquake that is expected in Southern Central California. Alsoâ☐”this will give students the background knowledge needed for the upcoming Seismic Retrofit Lab. Assignment: Righetti High Schoolâ☐™s Earthquake Preparedness Creating a Personal Earthquake Preparedness Plan Assignment Overview: Students will look at all the evacuation routes for each block on campus. They will then walk the evacuation route and document possible problems with the routes. For example: Is there handicap accessibility in the route? Is there a high voltage area nearby? Is there a fire hydrant near one of the evacuation routes? Are student evacuation areas between cars in the parking lots? (They are!) Students will then go through the disaster kits located at 4 different areas on campus. Will there be enough supplies for all students during the event of a disaster? From these notes, students will create a write up that will be turned in to safety committee for administration to look over. Students will take this knowledge and create their own earthquake preparedness plan for their homes. Assignment Objective: Students will assess the evacuation plans/routes for the school. This will help the school but it will also help them with their homework assignment: Creating an earthquake evacuation plan for the home. (There is a major threat of earthquakes in Santa Maria due to the San Andreas Fault. We live near the locked portion of the fault so itâ☐™s important for students to understand the threat and know what to do during an earthquake.) Assignment: Students will read about the section on earthquakes in their book and do the given questions pertaining to it. Assignment: Students will read about the section on faulting folding in their book and do the given questions pertaining to it. Assignment: Earthquake, Faulting, Folding Oil Deposition Study Guide Exam Assignment: Students will read about the rock cycle different types of rocks in their book and answer the given questions pertaining to it. Assignment: Depositional

Environmentsâ□”Performance Exam Assignment Overview: Students will pick their assignment out of a bag. Their slip of paper will explain the assignment and give them clues about the different types of rocks that have formed in each scenario. Students will draw and label cross-sections for each depositional environment including what specific type of rock is formed. This is used as a performance exam and is a good review for the upcoming rock identification exam. Assignment Objective: Students will use their knowledge of the rock cycle to show the different depositional environments of rocks. Students will be able to explain what rocks are deposited in certain environments. They will be able to explain what types of rocks are being deposited around the world today. Students will use the geologic law of uniformitarianism, â□œThe present is the key to the pastâ□□. Assignment: Water Cycle Assignment Overview: Students will draw a detailed and labeled cross-section of the water cycle. Students will define key words in a key such as: Run-off, percolation, transpiration, evaporation, condensation, precipitation, ground water, infiltration, etc. Students will answer questions in their lab write up regarding pollution and contamination of the ground water. Students will also include in their write up why water is such a big issue in California. Assignment Objective: This assignment is designed to review phase changes and provides students with basic knowledge of the water cycle. Students will be able to have a conversation/debate in class about water contamination, the LA Aqueduct and other environmental problems associated with the water in our world today. Students will also use their knowledge of the water cycle to understand depositional and erosional environments of the rocks. Assignment: Students will read about geologic laws unconformities in their book and answer questions pertaining to it. Assignment: Quiz on geologic laws unconformities Assignment: Students will read the section on the geologic timescale in their book and answer the questions pertaining to it. Assignment: Quiz on geologic timescale Assignment: Fossil Environments Project Lab Overview: Students will chose a given fossil species to research such as: Tyrannosaurus, ammonite, conodont, mammoth, etc. Students will research what type of environment their fossil lived in, what period of time and why it went extinct. They will also include the classification taxonomy. Students will then create a poster or 3-dimensional model showing the environment the fossil lived in. In a key they will include what it ate, whether it was a herbivore or carnivore, what part of the world it lived in and what climate it lived in. Students will also type up answers to the given lab questions. Lab Objective: Students will create the environment their species lived in based on their research. This reinforces the concept of uniformitarianism. Students will be able to explain why the wooly mammoth went extinct. Students will be able to have a conversation about endangered species in our world today and the politics involved. Assignment: Walking with Dinosaurs Assignment Overview: This is a video assignment in which students will watch part of the Discovery Series,

â□œWalking with Dinosaursâ□□. Students will make observations on the types of environments dinosaurs lived in and what was happening geologically at the time, for example, the break up Pangaea during the Triassic and the volcanically active time in the Cretaceous, before the ultimate demise of the dinosaurs. Students will create a lab write up at the end, answering questions pertaining to parts of the video and the ultimate demise of the dinosaurs. Assignment Objective: Students will be able to see the different climates of the Mesozoic. Students will be able to have a discussion about the mass extinction of the dinosaurs and how this opened a niche for the evolution of mammals. Students will be able to talk further about their thoughts and feelings of species on the endangered species list in the world today. Assignment: Physical Geology Final Exam Study Guide

* Instructional Methods and/or Strategies

**Laboratory Experiences 40% **Project-Based Learning 20% **Lecture Note-taking 20% **Group Work (Including group discussions of real-world problems) 10% **Videos 5% **Library Internet Research 5%

15. Pre-Requisites

Science, Math, English GPA of 3.0 or better or teacher recommendation. Algebra II (or equivalent) completed or concurrent. It is recommended that this course follow one year of high school biology and/or chemistry.

16. Co-Requisites

17. Brief Course Description

This course is equivalent to a freshman college course in General Biology. The application of laboratory skills, including interpretation of data and the development of hypotheses, is a major component of this course. This elective college-level course is recommended for students intending to pursue a career in the biological sciences. This course prepares the student to take the College Board Advanced Placement Exam for college credit.

B. COURSE CONTENT

Please refer to instructions

18. Course Goals and/or Major Student Outcomes

Students are prepared for college biology and/or other college level science classes.

Students develop better verbal communication skills.

Students can relate the results of their lab experiments to other in a clear, concise manner.

19. Course Objectives

Upon completion of the course, students will be able to:

1. Describe the atomic structure of an atom and explain the basis of atomic reactivity.
2. Explain the role of acids, salts, and bases in biology.
3. Discuss the biologically important properties of water.
4. Name the four major classes of organic compounds and briefly discuss the general structure of each class.
5. Discuss the importance of nucleic acids in life.
6. Describe each of the four structural arrangements in proteins.
7. Discuss the historical development of the cell theory using specific names.
8. Name 10 major cell organelles, discuss the structure of each and state the role of each in the functioning of the cell.
9. Discuss the concept of the fluid-mosaic model of the cell membrane.
10. Describe the four processes by which substances enter and leave the cell.
11. Discuss the structure and function of biological catalysts.
12. Outline the events of photosynthesis.
13. Outline the events of cellular respiration and fermentation.
14. Compare and contrast the vents of photosynthesis and respiration.
15. List the stages of cell division and discuss the significant events of each stage.
16. Compare and contrast mitosis and meiosis.
17. Compare and contrast oogenesis and spermatogenesis.
18. Describe forms of sexual and asexual reproduction.
19. Compare and contrast external and internal fertilization.

20. Discuss the contributions of Gregor Mendel to the science of genetics.
21. Contrast the views of Lamarck and Darwin on evolution.
22. Explain the roof of natural selection in evolution.
23. List the sequence of events proposed for the origin of life.
24. Discuss adaptive radiation and its role in the diversity of life.
25. Outline primate evolution;
26. Describe the energy flow through an ecosystem.
27. Explain the importance of a typical food web in an ecosystem
28. List three types of symbiosis and provide an example of each.
29. Explain ecological succession.
30. Name eight major biomes.
31. List five kingdoms and the characteristics that describe each.
32. Name the major phyla within each kingdom and provide an example of each.
33. Discuss the alternation of generations in plant evolution.
34. Discuss the chemical communication in behavior.
35. Contrast monocots and dicots on the basis of structure and growth pattern.
36. Describe the internal structure of monocot and dicot roots, stems, and leaves.
37. Describe the structure of the human skeleton.
38. Describe the structure of the sarcomere and its role in contraction of muscle.
39. Discuss the role of antagonism in body movement.
40. List five basic functions of the digestive system.
41. List the sequence of digestive structures and their role in digestion.
42. Contrast open and closed circulatory systems.
43. Discuss the evolution of and function of the vertebrate heart.
44. Discuss the blood clotting mechanism in humans.
45. Discuss the role of the lymphatic system.
46. Describe the structure and function of the excretory system.
47. Explain how a nerve impulse is transmitted.
48. Describe the structure of the human nervous system.

49. Discuss the mechanisms for vision and hearing.

50. Explain the mechanism for breathing and the structures involved.

51. Describe both male and female reproductive systems and explain how they function.

52. List the endocrine glands of the body; name the hormones produced and state the general functions of each hormone

20. Course Outline

I. Molecules and Cells (25%)

A. Chemistry of Life (7%)

1. Water
2. Organic molecules in organisms
3. Free energy changes
4. Enzymes

B. Cells (10%)

1.Prokaryotic and eukaryotic cells
2. Membranes
3. Subcellular organization
4. Cell cycle and its regulation

C. Cellular Energetics (8%)

1. Coupled reactions
2. Fermentation and cellular respiration
3. Photosynthesis

II. Heredity and Evolution (25%)

A. Heredity (8%)

1. Meiosis and gametogenesis
2. Eukaryotic chromosomes
3. Inheritance patterns

B. Molecular Genetics (9%)

1. RNA and DNA structure and function
2. Gene regulation
3. Mutation
4. Viral structure and replication
5. Nucleic acid technology and applications

C. Evolutionary Biology

1. Early evolution of life
2. Evidence for evolution
3. Mechanisms of evolution

III. Organisms and Populations

A. Diversity of Organisms

1. Evolutionary patterns
2. Survey of the diversity of life
3. Phylogenetic classification
4. Evolutionary relationships

B. Structure and Function of Plants and Animals

1. Reproduction, growth, and development

2. Structural, physiological, and behavioral adaptations
3. Response to the environment

C. Ecology

1. Population dynamics
2. Communities and ecosystems
3. Global issues

22. Key Assignments

The College Board has designated 12 labs to meet the lab components of the course.

LABORATORY 1. DIFFUSION AND OSMOSIS

LABORATORY 2. ENZYME CATALYSIS

LABORATORY 3. MITOSIS AND MEIOSIS

LABORATORY 4. PLANT PIGMENTS AND PHOTOSYNTHESIS

LABORATORY 5. CELL RESPIRATION

LABORATORY 6. MOLECULAR BIOLOGY

LABORATORY 7. GENETICS OF ORGANISMS

LABORATORY 8. POPULATION GENETICS AND EVOLUTION

LABORATORY 9. TRANSPIRATION

LABORATORY 10. PHYSIOLOGY OF THE CIRCULATORY SYSTEM

LABORATORY 11. ANIMAL BEHAVIOR

LABORATORY 12. DISSOLVED OXYGEN AND AQUATIC PRIMARY PRODUCTIVITY

23. Instructional Methods and/or Strategies

Lecture
Laboratory activites
Group projects
Class presentations
Internet research
Powerpoint presentations

24. Assessment Methods and/or Tools

Tests
Quizzes
Lab reports
Group projects
Homework
Classwork

18. Brief Course Description

Advanced Placement Environmental Science is multidisciplinary; it embraces a wide variety of topics from different areas of study. It will be taught from a rigorous science perspective which stresses scientific principles and analysis, and includes a laboratory component. Environmental issues will also be studied from sociological and political perspectives. It is intended to enable students to undertake, as first-year college students, a more advanced study of topics in environmental science, or alternatively, to fulfill a basic requirement for a laboratory science and thus free time for taking other courses.

The goal of the AP Environmental Science course is to provide students with the scientific principles, concepts, and methodologies required to understand the relationships of the natural world, to identify and analyze environmental problems both natural and man-made, to evaluate the relative risks associated with these problems, and to examine alternative solutions for resolving and/or preventing them.

B. COURSE CONTENT

Please refer to instructions

19. Course Goals and/or Major Student Outcomes

The goal of the AP Environmental Science course is to provide students with the scientific principles, concepts, and methodologies required to understand the relationships of the natural world, to identify and analyze environmental problems both natural and man-made, to evaluate the relative risks associated with these problems, and to examine alternative solutions for resolving and/or preventing them.

Students will make connections between the concepts discussed and everyday life, see the importance of understanding scientific ideas, and see the interconnectedness of science and society.

Students will benefit from understanding how integral science is to society and that an educated person has knowledge about science, social science, and humanities

20. Course Objectives

A. Awareness of Human Impacts on the Environment

- The students will know behaviors of responsible consumers.
- The students will look at environmental science with a global perspective.
- The students will analyze industry practices regarding sustainability.
- The students will begin to develop personal goals regarding environmental stewardship.
- The students will employ sound scientific principles.

B. Thinking and Problem Solving Skills

- The students will exhibit critical and creative thinking.
- The students will apply numerical estimation.
- The students will apply measurement and calculations where appropriate.
- The students will recognize problem situations.
- The students will identify, locate and organize needed information or data.
- The students will propose, evaluate and select alternative solutions.

C. Employment Literacy

- The students will understand career paths and strategies for obtaining employment within the environmental field.
- The students will be familiar with environmental impacts relevant to their field.

21. Course Outline

First Term

I. The Ecosystem: interdependence of Earth's systems: fundamental principles and concepts.

- A. Energy flow
- B. Matter cycling
- C. The solid earth
- D. The atmosphere
- E. The biosphere

II. Scientific analysis: initiation of research project:

- A. development of topic
- B. research question
- C. null hypothesis
- D. research data gathering
- E. plan of action

III. Human population: dynamics.

- A. Human history--beginnings.
- B. Global distribution of population.
- C. Carrying capacity.
- D. Cultural and economic influences.

Second Term

IV. Renewable and nonrenewable resources: distribution, ownership, use, degradation

- A. Water.
- B. Minerals.
- C. Soils.
- D. Biological.
- E. Energy.
- F. Land.

V. Environmental quality.

- A. Air, water, soil: pollutants and their effects.
- B. Solid waste.
- C. Human health: impact of chemical and biological agents.

VI. Global changes and their consequences

A. changes

1. atmosphere
2. oceans
3. biota

B. Consequences

1. atmosphere
2. oceans
3. biota

VII. Environment and society: trade-offs and decision making

- A. Economic forces
- B. Cultural and aesthetic considerations
- C. Environmental ethics
- D. Environmental laws and regulations
- E. Issues and options

1. conservation, preservation, restoration
2. sustainability, mitigation, remediation

22. Texts & Supplemental Instructional Materials

Text: Wright, Richard T. *Environmental Science, Toward a Sustainable Future, Ninth Edition.* Pearson, Prentice Hall. 2005.

Supplemental Instructional Materials:

State of California Integrated Waste Management Board. *Earth Resources, A Case Study: Oil.* 2001.

Sussman, Art. *Dr. Art's Guide to Planet Earth.* Chelsea Green Publishing Co. 2000.

23. Key Assignments

Investigate a science-based societal issue through research
Possible topics: Land and water use decisions in California
Choice of energy sources
Interactive CD ROM Activities: "Global City, Environmental Science in Practice"
Understand a Pest Species Population Growth
Identify the Source of Air Pollution
Compare Risks as Global City faces a Disease Outbreak
Monitoring for Sewage Contamination
Coping with Ultraviolet Radiation
Light & Nutrients: The Controlling Factors in Marine Ecosystems

24. Instructional Methods and/or Strategies

Reading, writing, inquiry, collaboration
Critical thinking/problem solving
Lecture and interactive presentations
Think About It Labs
In-class small group activities
Individual study
Touchstones Discussions
Guest speakers
Student research
Student presentations
Social action: use of research knowledge

25. Assessment Methods and/or Tools

Class participation
Homework
Tests and quizzes
Essays
Research project: written and oral presentation to class and involved community agencies

C. HONORS COURSES ONLY

Please refer to instructions

26. Indicate how this honors course is different from the standard course.

D. OPTIONAL BACKGROUND INFORMATION

Please refer to instructions

27. Context for Course (optional)

28. History of Course Development (optional)

The course description for Advanced Placement Environmental Science from the Castro Valley Unified School District was used in the development of this course. Slight modifications to that description have been made.

Course Title:
Physics (B) A (AP)

Department:

SMHS Science

Description of Target Group:

This course is for university-bound 11th and 12th grade students who are considering an engineering, mathematics or science major including medicine. They should be planning to take the Advanced Placement exam during the spring.

Purpose:

The purpose of this course is to rigorously explore the physics of Mechanics, and Optics as well as to prepare for the A.P. exam. This one term 5 unit class will expand on the depth and sophistication of study of select topics from the general Physics class. Students who complete this course will have an excellent background enabling them to be highly competitive at a four-year university.

Course Adoption:

UC/CSU "A-G" inclusion.

Recommended Prerequisites:

A student who enrolls in A.P. Physics B (A) should have completed Chemistry and IMP3 or Algebra2, with a B grade or better.

Standards of Student Achievement:

As described by the College Board, upon completion of A.P. Physics students should have developed the abilities to:

1. Read, understand, and interpret physical information (verbal, mathematical, and graphical).
2. Describe and explain the sequence of steps in the analysis of a particular physical phenomenon or problem; that is
    a. describe the idealized model to be used in the analysis, including simplifying assumptions where necessary
    b. state the principles or definitions that are applicable
    c. specify relevant limitations on applications of these principles
    d. carry out and describe the steps of the analysis, verbally or mathematically
    e. interpret the results or conclusions, including discussion of particular cases of special interest.
3. Use basic mathematical reasoning (arithmetic, algebraic, geometric, trigonometric, or calculus, where appropriate) in a physical situation or problem.
4. Perform experiments and interpret the results of observations, including making an assessment of experimental uncertainties.

Physics (B) A (AP) – (continued)

Upon completion of A.P. Physics, students will be able to demonstrate knowledge, problem solving and laboratory analysis skills in the following content areas:

Newtonian Mechanics
One and Two Dimensional Kinematics
Newton's 2nd Law Applications
Energy, Work and Power
Circular and Rotational Motion
Oscillations and Gravitation

Waves and Optics
Wave Motion
Physical Optics
Geometric Optics

Methods of Assessment of Student Learning:

The students will be assessed through the following activities:
1. In-class problem solving
2. Individual and group laboratory work and presentations
3. Engineering projects and competitions
4. Exams (including but not limited to practice A.P. examinations)
5. Homework
6. Quizzes

Instructional Materials:

Physics textbook and supplemental materials (to be selected from College Board suggested list)
Calculus textbook
TI-83 Graphing Calculators used in conjunction with lab sensors for data acquisition and analysis in addition to computations for theoretical calculations.
PC computers and Vernier lab sensors and interfaces for computer controlled data acquisition and analysis
Conceptual Physics computer simulations

Activities:

1. Problem solving
2. Extensive laboratory investigation of all major concepts
3. Engineering design projects and competitions
4. Lecture/Discussion
5. Practice examinations
6. More problem solving

ourse Title:
Physics (B) B (AP)

Department:

SMHS Science

Description of Target Group:

This course is for university-bound 11th and 12th grade students who are considering an engineering, mathematics or science major including medicine. They should be planning to take the Advanced Placement exam during the spring.

Purpose:

The purpose of this course is to rigorously explore the physics of Electricity and Magnetism, Atoms and Nuclear Particles, as well as to prepare for the A.P. exam. This one term 5 unit class will expand on the depth and sophistication of study of select topics from the general Physics class. Students who complete this course will have an excellent background enabling them to be highly competitive at a four-year university.

Course Adoption:

UC/CSU "A-G" inclusion.

Recommended Prerequisites:

A student who enrolls in A.P. Physics B (B) should have completed Chemistry and IMP3 or Algebra2, with a B grade or better.

Standards of Student Achievement:

As described by the College Board, upon completion of A.P. Physics students should have developed the abilities to:

5. Read, understand, and interpret physical information (verbal, mathematical, and graphical).
6. Describe and explain the sequence of steps in the analysis of a particular physical phenomenon or problem; that is
    a. describe the idealized model to be used in the analysis, including simplifying assumptions where necessary
    b. state the principles or definitions that are applicable
    c. specify relevant limitations on applications of these principles
    d. carry out and describe the steps of the analysis, verbally or mathematically
    e. interpret the results or conclusions, including discussion of particular cases of special interest.
7. Use basic mathematical reasoning (arithmetic, algebraic, geometric, trigonometric, or calculus, where appropriate) in a physical situation or problem.
8. Perform experiments and interpret the results of observations, including making an assessment of experimental uncertainties.

Upon completion of A.P. Physics, students will be able to demonstrate knowledge, problem solving and laboratory analysis skills in the following content areas:

Atomic and Nuclear Physics
Atomic and Quantum Effects
Nuclear Processes

Electricity and Magnetism
Electrostatics
Electric Circuits
Magnetostatics
Electromagnetism

Methods of Assessment of Student Learning:

The students will be assessed through the following activities:
1. In-class problem solving
2. Individual and group laboratory work and presentations
3. Engineering projects and competitions
4. Exams (including but not limited to practice A.P. examinations)
5. Homework
6. Quizzes

Instructional Materials:

Physics textbook and supplemental materials (to be selected from College Board suggested list)
Calculus textbook
TI-83 Graphing Calculators used in conjunction with lab sensors for data acquisition and analysis in addition to computations for theoretical calculations.
PC computers and Vernier lab sensors and interfaces for computer controlled data acquisition and analysis
Conceptual Physics computer simulations

Activities:

1. Problem solving
2. Extensive laboratory investigation of all major concepts
3. Engineering design projects and competitions
4. Lecture/Discussion
5. Practice examinations
6. More problem solving

Course Title

Physics-C A (AP)

Department

Science

Description of Target Group

This course is for university bound 11th and 12th grade students who are considering an engineering, mathematics or science major including medicine. They should be planning to take the Advanced Placement exam during the spring.

Course Adoption

UC/CSU "A-G" inclusion

Purpose

The purpose of this course is to rigorously explore the physics of Mechanics, as well as to prepare for the A.P. exam. This two-term class will expand on the depth and sophistication of study of select topics from the general Physics class. Students who complete this course will have an excellent background enabling them to be highly competitive at a four-year university.

Prerequisites

A student who enrolls in A.P. Physics should have completed Chemistry and IMP3 or Algebra 2, with a B grade or better.

Standards of Student Achievement

As described by the College Board, upon completion of A.P. Physics students should have developed the abilities to:

1. Read, understand, and interpret physical information (verbal, mathematics, and graphical).
2. Describe and explain the sequence of steps in the analysis of a particular physical phenomenon or problem; that is
    a) describe the idealized model to be used in the analysis, including simplifying assumptions where necessary
    b) state the principles or definitions that are applicable
    c) specify relevant limitations on applications of these principles
    d) carry out and describe the steps of the analysis, verbally or mathematically
    e) Interpret the results or conclusions, including discussion of particular cases of special interest.
3. Use basic mathematical reasoning (arithmetic, algebraic, geometric, trigonometric, or calculus, where appropriate) in physical situation or problem.

4. Perform experiments and interpret the results of observations, including making an assessment of experimental uncertainties.

Upon completion of A.P. Physics, students will be able to demonstrate knowledge, problem solving and laboratory analysis skills in the following content areas:

Calculus
Differentiation of functions
Integration of functions
Determination of rates, maxima and minima of functions

Newtonian Mechanics
One and Two Dimensional Kinematics
Newton's 2nd Law Applications
Energy, Work and Power
Circular and Rotational Motion

Methods of Assessment of Student Learning

The students will be assessed through the following activities:
1. In-class problem solving
2. Individual and group laboratory work and presentations
3. Engineering projects and competitions
4. Exams (including but not limited to practice A.P. examinations)
5. Homework
6. Quizzes

Instructional Materials

Physics textbook and supplemental materials (to be selected from College Board suggested list)
Calculus textbook
TI-83 Graphing Calculators used in conjunction with lab sensors for data acquisition and analysis in addition to computations for theoretical calculations.
PC computers and Vernier Lab sensors and interfaces for computer controlled data acquisition and analysis
Conceptual Physics computer simulations

Activities

1. Problem solving
2. Extensive laboratory investigation of all major concepts
3. Engineering design projects and competitions
4. Lecture/Discussion
5. Practice examinations
6. More problem solving

Course Title

Physics-C B (AP)

Department

Science

Description of Target Group

This course is for university-bound 11th and 12th grade students who are considering an engineering, medicine, mathematics or science major. They should be planning to take the Advanced Placement exam during the spring.

Purpose

The purpose of this course is to rigorously explore the physics of Electricity and Magnetism as well as to prepare for the A.P. exam. This one term 5-unit class will expand on the depth and sophistication of study of select topics from the general Physics class. Students who complete this course will have an excellent background enabling them to be highly competitive at a four-year university.

Course Adoption

UC/CSU "A-G" inclusion.

Recommended Prerequisites

Student who enrolls in A.P. Physics C (B) should have completed Chemistry and IMP3 or Algebra 2, with a B grade or better.

Standards of Student Achievement

<u>As described by the College Board, upon completion of A.P. Physics students should have developed the abilities to:</u>

1. Read, understand, and interpret physical information (verbal, mathematical, and graphical).
2. Describe and explain the sequence of steps in the analysis of a particular physical phenomenon or problem; that is
    a. describe the idealized model to be used in the analysis, including simplifying assumptions where necessary
    b. state the principles or definitions that are applicable
    c. specify relevant limitations on applications of these principles,
    d. carry out and describe the steps of the analysis, verbally or mathematically
    e. Interpret the results or conclusions, including discussion of particular cases of special interest.
3. Use basic mathematical reasoning (arithmetic, algebraic, geometric, trigonometric, or calculus, where appropriate) in a physical situation or problem.

4. Perform experiments and interpret the results of observations, including making an assessment of experimental uncertainties.

Upon completion of A.P. Physics students will be able to demonstrate knowledge, problem solving and laboratory analysis skills in the following areas:

Calculus
Differentiation of functions
Integration of functions
Determination of rates, maxima and minima of functions

Electricity and Magnetism
Electrostatics
Electric Circuits
Magnetostatics
Electromagnetism

Methods of Assessment of Student Learning

The students will be assessed through the following activities:
1. In-class problem solving
2. Individual and group laboratory work and presentations
3. Engineering projects and competitions
4. Exams (including but not limited to practice A.P. examinations)
5. Homework
6. Quizzes

Instructional Materials

Physics textbook and supplemental materials (to be selected from College Board suggested list)
Calculus textbook
TI-83 Graphing Calculators used in conjunction with lab sensors for data acquisition and analysis in addition to computations for theoretical calculations.
PC computers and Vernier lab sensors and interfaces for computer controlled data acquisition and analysis
Conceptual Physics computer simulations

Activities

1. Problem solving
2. Extensive laboratory investigation of all major concepts
3. Engineering design projects and competitions
4. Lecture/Discussion
5. Practice examinations
6. More problem solving

9. Subject Area

- ☐ History/Social Science
- ☐ English
- ☐ Mathematics
- ☒ Laboratory Science
- ☐ Language other than English
- ☐ Visual & Performing Arts
  - ☐ Intro ☐ Advanced
- ☐ College Prep Elective

10. Grade Level(s) for which this course is designed

☐ 9 ☐ 10 ☒ 11 ☒ 12

11. Seeking "Honors" Distinction?

☒ Yes ☐ No

12. Unit Value

- ☐ 0.5 (half year or semester equivalent)
- ☒ 1.0 (one year equivalent)
- ☐ 2.0 (two year equivalent)
- ☐ Other: _____

13. Is this an Internet-based course? ☐ Yes ☒ No

If "Yes", who is the provider? ☐ UCCP ☐ PASS/Cyber High ☐ Other _____

14. Complete outlines are not needed for courses that were previously approved by UC. If course was previously approved, indicate in which category it falls.

- ☐ A course reinstated after removal within 3 years. Year removed from list? _____
  - Same course title? ☐ Yes ☐ No
  - If no, previous course title? _____
- ☐ An identical course approved at another school in same district. Which school? _____
  - Same course title? ☐ Yes ☐ No
  - If no, course title at other school? _____
- ☐ Year-long VPA course replacing two approved successive semester courses in the same discipline
- ☐ Approved Advanced Placement (AP) or International Baccalaureate (IB) course
- ☐ Approved UC College Prep (UCCP) Online course
- ☐ Approved CDE Agricultural Education course
- ☐ Approved P.A.S.S./Cyber High course
- ☐ Approved ROP/C course. Name of ROP/C? _____
- ☐ Approved A.V.I.D. course
- ☐ Approved C.A.R.T. course
- ☐ Approved Project Lead the Way course
- ☐ Other. Explain: _____

15. Is this course modeled after an UC-approved course from another school <u>outside</u> your district? ☐ Yes ☒ No

If so, which school(s)? _____

Course title at other school _____

16. **Pre-Requisites**

- Successful completion of one year of laboratory science with a "B" or better.
- Successful completion of Algebra I with a B or better.

17. Co-Requisites

None

18. Is this course a resubmission? ☐ Yes ☒ No

If yes, date(s) of previous submission? _____

Title of previous submission? _____

19. Brief Course Description

This is a two semester advanced college preparatory lab science course designed to teach students the concepts and principles of biology. Students will develop a conceptual framework for modern biology and recognize unifying themes that integrate the major topics of biology. Students will learn about the scientific process, molecules and cells, cellular reproduction and genetics, evolution, ecology, and the form and function of animals. Laboratory activities stress the development of important skills such as detailed observation, accurate recording, experimental design, and data interpretation and analysis. Students will develop critical thinking skills through research and discussions about issues relating to current advancements in Biology.

Santa Maria Joint Union High School District
Course Description

Course Title: Honors Biology A/B (P)

Department: Ernest Righetti Science

Course Length: Two Semesters, 10 units

Course Adoption: UC/CSU "a-g"

Textbook: Benjamin Cummings: *Biology Concepts & Connections* 4th Edition (2003)
Campbell, Reece, Mitchell, Taylor
Benjamin Cummings: *Laboratory Investigations for Biology* 2nd Edition (2003)
Dickey

Prerequisites: 11th & 12th graders:

- Successful completion of one year of laboratory science with a "B" or better.
- Successful completion of Algebra I with a B or better.

I. Course Description:

This is a two semester advanced college preparatory lab science course designed to teach students the concepts and principles of biology. Students will develop a conceptual framework for modern biology and recognize unifying themes that integrate the major topics of biology. Students will learn about the scientific process, molecules and cells, cellular reproduction and genetics, evolution, ecology, and the form and function of animals. Laboratory activities stress the development of important skills such as detailed observation, accurate recording, experimental design, and data interpretation and analysis. Students will develop critical thinking skills through research and discussions about issues relating to current advancements in Biology.

II . Course Goals and/or Major Student Outcomes

A. Students will develop a conceptual framework for modern biology and recognize unifying themes that integrate the major topics of biology.

B. Students will understand that scientific discovery is a process.

C. Students will develop advanced laboratory skills that require both qualitative and quantitative analysis of results.

D. Students will understand that the application of biological knowledge and critical thinking can be applied to environmental and social concerns.

III. Course Objectives

The Santa Maria Joint Union School District science courses are designed to meet or exceed the California State Science Standards. The knowledge and skills listed below are those targeted learning objectives that will be assessed in this course.

At the completion of the Honors Biology course students will:

Unit 1. The Process of Science

- Describe the goals and limits of scientific investigations.
- Define a hypothesis and compare inductive and deductive reasoning.
- Explain the differences between discovery science and hypothesis-driven science.
- Describe the scientific method.
- Explain the importance of experimental design (testable hypothesis, independent and dependent variables, controls, and sample size).
- Draw conclusions and inferences based on data interpretation and analysis.
- Explain why an understanding of biology is essential to all of our lives.
- Objectively read publications containing current science and technology topics.

Unit 2. The Molecules and Cells

- Define matter, an element, and a trace element.
- Define a compound and explain how compounds in living organisms are different from compounds in non-biological materials.
- Describe the structure of an atom.
- Define the atomic number and mass number of an atom.
- Define an isotope and explain what makes some isotopes radioactive.
- Explain why radioactive isotopes are important to biologists.
- Explain how the electron configuration of an atom influences its chemical behavior.
- Distinguish among non-polar covalent, polar covalent, and ionic bonds, noting their relative strengths and functions and the methods by which they are diagrammed.
- Describe the special properties of water that make it vital to living systems. Explain how these properties are related to hydrogen bonding.
- Define a solute, a solvent, and a solution.
- Explain how acids and bases directly or indirectly affect the hydrogen ion concentration of a solution.
- Explain the basis for the pH scale.
- Explain how buffers work.
- Describe the causes of acid precipitation and explain how it adversely affects the fitness of the environment.
- Define a chemical reaction and distinguish between the reactants and the products.
- Explain why carbon is unparalleled in its ability to form large, diverse molecules.
- Define organic compounds, hydrocarbons, a carbon skeleton, and an isomer.
- Describe the properties of and distinguish between the four functional groups of organic molecules.
- List the four classes of macromolecules and explain the relationship between monomers and polymers.
- Compare the processes of dehydration synthesis and hydrolysis.
- Describe the structures, functions, properties, and types of carbohydrate molecules.
- Describe the structures, functions, properties, and types of lipid molecules.
- Describe the structures, functions, properties, and types of proteins.
- Compare the structures and functions of DNA and RNA
- Compare the designs and images produced by a light microscope, scanning electron microscope, and transmission electron microscope.
- Distinguish between magnification and resolving power.
- Define cell theory and briefly describe the discoveries that led to its development.
- Explain why cell size and shape varies.
- Explain the relationships between nanometers, micrometers, millimeters, centimeters, and meters.
- Explain why there are both upper and lower limits to cell size.
- Distinguish between prokaryotic and eukaryotic cells.
- Explain why compartmentalization is important in eukaryotic cells.

- Compare the structures of plant and animal cells. Note the function of each cell part.
- Describe the structures and functions of the nucleus, endomembrane system, rough and smooth endoplasmic reticulum, Golgi apparatus, and lysosomes.
- Explain how impaired lysosomal function can cause the symptoms of storage diseases.
- Compare the structures and functions of mitochondria and chloroplasts.
- Compare the structures and functions of microfilaments, intermediate filaments, and microtubules.
- Explain how the structure of cilia and flagella relate to their functions.
- Compare the structures and functions of cell surfaces and intercellular junctions of plant and animal cells.
- Describe the four functional categories of eukaryotic organelles, noting which organelles are in each group.
- Define and compare kinetic energy, potential energy, chemical energy, and heat.
- Define the first and second laws of thermodynamics. Explain how the nature of energy transformations are guided by the laws of thermodynamics.
- Define and compare endergonic and exergonic reactions. Explain how cells use these reactions to survive.
- Describe the importance of energy coupling in cellular reaction.
- Explain how ATP functions as an energy shuttle.
- Explain how enzymes speed up chemical reactions.
- Describe the structure of an enzyme-substrate interaction.
- Explain how the cellular environment affects enzyme activity.
- Explain how competitive and noncompetitive inhibitors alter an enzyme's activity.
- Explain how certain pesticides and antibiotics work by inhibiting enzymes.
- Explain how membranes help organize the chemical activities of a cell.
- Relate the structure of phospholipid molecules to the structure and properties of cell membranes.
- Describe the fluid mosaic structure of cell membranes.
- Describe the diverse functions of membrane proteins.
- Describe the process of passive transport.
- Explain why osmosis is the passive transport of water.
- Distinguish between hypertonic, hypotonic, and isotonic solutions.
- Explain how plant and animal cells change when placed into a hypertonic or hypotonic solution.
- Compare the processes of facilitated diffusion and active transport.
- Distinguish between exocytosis, endocytosis, phagocytosis, pinocytosis, and receptor-mediated endocytosis.
- Describe the cause of hypercholesterolemia.
- Describe the central role of chloroplasts and mitochondria in harvesting energy and making it available for cellular work.

Unit 3. Cellular Reproduction and Genetics

- Compare the relationship between a parent and its offspring resulting from asexual versus sexual reproduction.
- Explain the significance of Virchow's principle regarding cellular reproduction.
- Explain how daughter prokaryotic chromosomes are separated from each other during binary fission.
- Compare the structure of prokaryotic and eukaryotic chromosomes.
- Describe the stages and significance of the cell cycle.
- List the phases of mitosis and describe the events that are characteristic of each phase. Recognize the phases of mitosis from diagrams and micrographs.
- Compare cytokinesis in animals and plants.
- Explain how anchorage, cell density, and growth factors control the cell cycle.
- Explain how cancerous cells are different from healthy cells; distinguish between benign and malignant tumors; and explain the strategies behind some common cancer treatments.
- Describe the functions of mitosis.
- Explain how chromosomes are paired.
- Distinguish between (a) somatic cells and gametes, (b) diploid cells and haploid cells, and (c) autosomes and sex chromosomes.
- List the phases of meiosis I and meiosis II and describe the events that are characteristic of each phase.
- Recognize the phases of meiosis from diagrams or micrographs.
- Describe key differences between mitosis and meiosis. Explain how the end result of meiosis differs from that of mitosis.

- Explain how independent orientation, crossing over, and random fertilization contribute to genetic variation in sexually reproducing organisms.
- Explain how and why karyotyping is performed.
- Describe the causes and symptoms of Down syndrome.
- Define nondisjunction and explain how it can occur.
- Describe the consequences of abnormal numbers of sex chromosomes.
- Describe the main types of chromosomal changes.
- Describe the pangenesis theory and blending hypothesis. Explain why both ideas are now rejected.
- Explain why Mendel's decision to work with peas was a good decision.
- Define and distinguish between true-breeding organisms, hybrids, the P generation, the F1 generation, and the F2 generation.
- Define and distinguish between the following pairs of terms: genotype vs. phenotype, dominant allele vs. recessive allele, and heterozygous vs. homozygous. Also define a monohybrid cross and a Punnett square.
- Explain how Mendel's principle of segregation describes the inheritance of a single characteristic.
- Describe the relationship between alleles for the same gene on separate homologous chromosomes.
- Explain how Mendel's principle of independent assortment applies to a dihybrid cross. Illustrate this principle with examples of Mendel's work with peas and recent research on Labrador Retrievers.
- Explain how a testcross is performed to determine the genotype of an organism.
- Explain when the rule of addition and the rule of multiplication should be used to determine the probability of an event. Explain why Mendel was wise to use large sample sizes in his studies.
- Explain how family pedigrees can help determine the inheritance of many human traits.
- Explain how recessive and dominant disorders are inherited. Provide examples of each.
- Compare the health risks, advantages, and disadvantages of the following forms of fetal testing: amniocentesis, chorionic villus sampling, and ultrasound imaging.
- Describe the inheritance patterns of incomplete dominance, multiple alleles, and pleiotropy.
- Define and distinguish between carrier testing, diagnostic testing, prenatal testing, newborn screening, and predictive testing.
- Explain how a single characteristic can be influenced by many genes.
- Define the chromosome theory of inheritance. Explain the chromosomal basis of the principles of segregation and independent assortment.
- Explain how linked genes are inherited differently from other, nonlinked genes.
- Describe T. H. Morgan's studies of crossing over and explain how Sturtevant created linkage maps.
- Explain how sex is genetically determined in humans and the significance of the *SRY* gene. Explain how sex is determined differently in other organisms.
- Describe the patterns of sex-linked inheritance, noting examples in fruit flies and humans.
- Describe the experiments of Griffith and Hershey and Chase, which demonstrated that DNA is the genetic material.
- Compare the structure of DNA and RNA.
- Explain how the structure of DNA facilitates its replication.
- Describe the process of DNA replication.
- Describe the locations, reactants, and products of transcription and translation.
- Explain the "languages" of DNA and RNA that are used to produce polypeptides.
- Explain how RNA is produced.
- Explain how eukaryotic RNA is processed before leaving the nucleus.
- Explain how tRNA functions in the process of translation.
- Describe the structure and function of ribosomes.
- Explain how translation begins.
- Describe the step-by-step process by which amino acids are added to a growing polypeptide chain.
- Diagram the overall process of transcription and translation.
- Describe the major types of mutations and their possible consequences.
- Compare the lytic and lysogenic reproductive cycles of a phage.
- Describe the reproductive cycle of an enveloped virus. Explain how the herpes virus is different from this cycle.
- Explain how new viruses evolve and why certain viruses emerge as major threats.
- Explain how the AIDS virus enters a host cell and reproduces.
- Differentiation yields a variety of cell types, each expressing a different combination of genes.

- Differentiated cells may retain all of their genetic potential.
- Importance of the Human Genome Project.

Unit 4. Evolution

- Briefly describe the history of evolutionary thought.
- Explain how Darwin's voyage on the *Beagle* influenced his thinking.
- Describe the ideas and events that resulted in Darwin's 1859 book.
- Explain how fossils form, noting examples of each process.
- Explain how the fossil record provides some of the strongest evidence of evolution.
- Explain how biogeography, comparative anatomy, comparative embryology, and molecular biology document evolution.
- Describe Darwin's assumptions in developing the concept of natural selection.
- Explain how artificial selection supports natural selection.
- Describe known examples of natural selection. Note key points about how natural selection works.
- Define a population and a species.
- Explain how microevolution occurs.
- Explain the significance of Hardy-Weinberg equilibrium to natural populations and in public-health science.
- Describe the five conditions required for Hardy-Weinberg equilibrium.
- Explain how the bottleneck effect, the founder effect, gene flow, and mutation influence microevolution.
- Explain how natural selection results from changes in genetic equilibrium.
- Explain why only some variation is heritable. Explain how genetic variation is measured.
- Explain how mutation and sexual recombination produce genetic variation.
- Explain how genetic variation is maintained in populations.
- Explain what is meant by neutral variation.
- Explain why genetic bottlenecks threaten the survival of certain species.
- Define Darwinian fitness.
- Describe the three general outcomes of natural selection.
- Define and compare intrasexual selection and intersexual selection.
- List four reasons why natural selection cannot produce perfection.
- Explain why antibiotic resistance has evolved.
- Compare the different definitions of a species and the usefulness of each definition.
- Describe prezygotic barriers and postzygotic barriers that prevent populations belonging to closely related species from interbreeding.
- Explain how geologic processes can fragment populations and lead to speciation.
- Define adaptive radiation and explain why the Galápagos finches are a good example.
- Explain how sympatric speciation can occur and how it typically happens in plants.
- Explain why polyploidy is important to modern agriculture.
- Explain how modern wheat evolved.
- Explain how reproductive barriers might evolve in isolated populations of animals.
- Compare the gradualist model and the punctuated equilibrium model of evolution. Explain which model best explains the fossil record.
- Describe the work and discoveries of Peter and Rosemary Grant working with Darwin's finches.

Unit 5. Ecology

- Describe the characteristics of the biosphere.
- Describe the abiotic factors that affect organisms.
- Describe the different types of aquatic biomes.
- Describe the different types of freshwater biomes.
- Describe the types of characteristics used to define terrestrial biomes.
- Define population density and describe techniques to measure it. List the main types of dispersion patterns.
- Describe and compare the exponential growth model and the logistic growth model, illustrating both with examples. Explain the concept of carrying capacity.
- Describe the factors that regulate growth in natural populations.
- Define boom-and-bust cycles, explain why they occur, and note examples.
- Explain how life tables are used to track mortality and survivorship in populations. Compare Type I, Type II, and Type III survivorship curves.

- Explain how the life history traits vary with environmental conditions and with population density. Compare *r*-selection and *K*-selection and indicate examples of each.
- Explain how the human population is changing and the impact this has had and continues to have on the Earth. Use the concept of an ecological footprint to compare the impacts of humans living in different countries.
- Define the demographic transition. Explain how the age structure of a population can be used to predict changes in population size.
- Describe the inherent problems of managing populations.
- Describe the four properties of a community.
- Describe the concepts of the "competitive exclusion principle," "resource partitioning," and an ecological "niche."
- Describe the different types of predation, define coevolution, and distinguish between Batesian and Müllerian mimicry.
- Define a keystone species and describe two examples.
- Describe the three different types of symbiotic relationships, noting examples of each.
- Explain how disturbances can be beneficial to a community. Distinguish between primary and secondary succession.
- Describe the roles of fire in shaping ecosystems.
- Describe and compare energy flow and chemical cycling in ecosystems.
- Describe the trophic structure of food chains.
- Explain how food chains interconnect to form food webs.
- Describe the movement of energy through a food chain. Explain why there are more producers than consumers and why eating meat is considered a great luxury.
- Explain how water, carbon, nitrogen, and phosphorus are cycled within ecosystems.
- Define eutrophication and explain how we learned that phosphorus is the main cause of this problem.

Unit 6. Animals: Form and Function

- Describe the levels of organization in an animal's body.
- Describe the four main tissues, noting their structures and their functions.
- Describe the structure of organs.
- Describe the general structures and functions of the twelve major organ systems in vertebrate animals.
- Describe the main components of the human alimentary canal and the associated digestive glands.
- Describe the functions of the molecules in saliva and the roles of the tongue and teeth in digestion.
- Explain how swallowing occurs and how food is directed away from the trachea.
- Explain how the structure of the esophagus functions to propel food.
- Relate the structure of the stomach to its functions.
- Describe the functions of the secretions of the stomach.
- Explain the causes of heartburn and why the stomach does not digest itself.
- Describe the most common cause of stomach ulcers and the primary forms of treatment.
- Describe the different types of chemical digestion that occur in the small intestine.
- Explain how the structure of the small intestine promotes nutrient absorption.
- Describe the structure and functions of the large intestine and rectum.
- Describe the three common nutritional needs of all animals.
- Explain why exercise and a balanced diet of 1200 kcal or more is the best way to lose weight.
- Define essential amino acids.
- Define a vitamin and distinguish between water-soluble and fat-soluble vitamins.
- Define dietary minerals and explain why they are important in the diet.
- Describe the types of information found on food labels.
- Explain how diet can influence the risks of cardiovascular disease and cancer.
- Describe the three main phases of gas exchange.
- Describe the structures and functions of a mammalian respiratory system.
- Describe the impact of smoking on human health.
- Explain how breathing is controlled in humans.
- Explain how blood transports gases between the lungs and tissues of the body.
- Describe the functions of hemoglobin.
- Describe the pathway of blood through the mammalian cardiovascular system.
- Relate the structure of blood vessels to their functions.

- Distinguish between diastole and systole. Explain what keeps blood moving in the correct direction within the heart and what causes heart “beats.”
- Explain how heartbeats are controlled.
- Define a heart attack and heart disease and explain the causes of these serious health problems.
- Explain how and why blood pressure changes as blood moves away from the heart.
- Explain how blood pressure is measured. Note normal and high blood pressure readings.
- Explain how blood flow through capillaries is regulated.
- Explain how the structure of a capillary is related to its functions.
- Describe the components of blood and their functions.
- Describe the structure, function and production of red blood cells.
- Describe the five main types of leukocytes and note their functions.
- Describe the process of blood clotting.
- Define leukemia and describe the most common forms of treatment.
- Describe the nature of nonspecific human defenses against infection.
- Describe the events of the inflammatory response and explain how it helps to prevent the spread of disease.
- Describe the structure and functions of the lymphatic system.
- Describe the specific nature of an immune system response. Define antigen, antibody, passive immunity, and active immunity.
- Describe the development and functions of B and T lymphocytes.
- Describe the nature of antigens. Explain how an antigen and its antibody interact.
- Explain how clones of the appropriate B and T cells are produced to fight an infection.
- Compare the primary and secondary immune responses. Distinguish between the functions of plasma cells and memory cells.
- Relate the specific structure of an antibody to its functions.
- Describe the effector mechanisms triggered by antibodies binding to antigens.
- Describe the production of and uses for monoclonal antibodies.
- Describe the specific functions of cytotoxic T cells and helper T cells.
- Explain how the immune system helps to fight cancer.
- Explain how the immune system identifies the body’s own molecules and how this system creates problems for organ transplantations.
- Describe the ways animals eliminate nitrogenous wastes and the advantages and disadvantages of each method.
- Describe the general and specific structure of the human kidney. Explain how this organ promotes homeostasis.
- Describe the four major processes by which the human excretory system produces and eliminates urine.
- Describe the key events in the process by which the kidneys convert filtrate into urine.
- Explain how a dialysis machine works.
- Describe the many functions of the liver.
- Define a hormone and compare the mechanisms and functions of the endocrine and nervous systems.
- Compare the two general mechanisms by which hormones trigger changes in target cells.
- Describe the different types and functions of vertebrate endocrine organs.
- Describe the functions of and interrelationships between the hypothalamus and the anterior and posterior pituitary glands.
- Describe the functions of the thyroid gland. Describe the symptoms of hypothyroidism, hyperthyroidism, and a goiter.
- Explain how insulin and glucagon work to manage blood glucose levels. Explain what occurs in the different types of diabetes.
- Compare the functions of the hormones released by the adrenal medulla and the adrenal cortex.
- Describe the three major categories of sex hormones and note their functions.
- Fertilization results in a zygote and triggers embryonic development
- Cleavage produces a ball of cells from the zygote.
- Gastrulation produces a three-layered embryo and organs start to form after gastrulation.
- Changes in cell shape, cell migration, and programmed cell death give form to the developing animal.
- The embryo and placenta take shape during the first month of pregnancy
- Human development from conception to birth is divided into three trimesters
- Describe the structural and functional subdivisions of the nervous system.

- Describe the structure and functions of neurons.
- Explain how an action potential propagates itself along a neuron.
- Compare the structures, functions, and locations of electrical and chemical synapses.
- Describe the types of inputs a single neuron can receive and note the nature of the neuron's response.
- Describe the types and functions of neurotransmitters known in humans.
- Explain how drugs can alter chemical synapses.
- Explain how muscle cells contract and describe the role of calcium in a muscle contraction.
- Distinguish between aerobic and anaerobic exercise.
- Describe the three main types of skeletons, their advantages and disadvantages.
- Describe the structure of bone and the three types of joints.
- Describe how the Integumentary system protects the internal body from mechanical injury, infection, extreme temperatures, and drying out.
- Describe the systems that help exchange materials between an animal and its environment.
- Define the concept of homeostasis and understand that homeostasis depends on negative feedback.
- Explain how thermoregulation is an example of homeostasis.

Honors Biology Course Outline	Laboratory Exercises & Supporting Activities
Unit 1. The Process of Science A. The Process of Science ▪ Goals and limits of scientific investigations ▪ Inductive and deductive reasoning: ▪ Discovery science and hypothesis-driven science B. Scientific Method ▪ Observation and questions ▪ Testable hypothesis ▪ Experimental design ▪ Independent, Dependent variables ▪ Controls ▪ Sample size ▪ Data collection and recording ▪ Data interpretation and analysis ▪ Drawing inferences C. Biology and Everyday Life ▪ Biology is essential to our lives ▪ Science and Technology ▪ Scientific publications	Ex. 1.1 The Black Box ▪ Explain and apply the scientific inquiry method. Ex. 1.2 Defining a Problem ▪ Identify questions that can be answered through scientific inquiry and explain what characterizes a good question. ▪ Identify usable hypotheses and explain what characterizes a good scientific hypothesis. Ex. 1.3 The Elements of an Experiment ▪ Define and give examples of dependent, independent, and standardized variables. ▪ Identify the variables in an experiment. ▪ Explain what control treatments are and why they are used. ▪ Explain what replication is and why it is important. Ex. 1.4 Designing an Experiment ▪ Critique the experimental design of a given proposed experiment. ▪ Design an experiment with a given method for measuring a dependent variable. Ex. 1.5 Application of Science Inquiry ▪ Evaluate research reported in the media using the criteria provided. Current Science Article I ▪ Research paper on current science topic. Video – *Collapse* ▪ Observational notes. ▪ Inferences as to why collapses occurred. Video - *History of Biology* ▪ Notes on important discoveries in Biology.
Unit 2. The Molecules and Cells A. The Chemical Basis of Life ▪ Atoms and Molecules: atomic structure; elements; covalent bonds; ionic bonds; matter; isotopes; electron configuration influence on chemical behavior; compounds in living organisms. ▪ The Properties of Water: hydrogen bonding; solute, solvent, and solution; acids and bases; the affect of hydrogen ion concentration; pH scale; buffers; acid precipitation and the environment ▪ Rearrangement of Atoms: chemical reaction; reactants and products B. Molecules of the Cell ▪ Organic Compounds and Their Polymers: organic compounds; hydrocarbons; carbon skeleton; isomers; four functional groups of organic molecules; monomers; polymers; dehydration synthesis and hydrolysis ▪ Carbohydrates: structures and functions; properties and types of carbohydrate molecules ▪ Lipids: structures and functions; properties and types of lipid molecules	Ex 2.1 Buffering Capacity ▪ Define a buffer, and explain why buffers are important to organisms. ▪ Interpret a titration curve to determine whether a solution has buffering capacity and, if so, over what pH range. ▪ Explain why some solutions have buffering capacity and others do not. Ex 3.1 Carbohydrates ▪ Define monosaccharide, disaccharide, and polysaccharide and give examples of each. ▪ Name the monosaccharide components of sucrose and starch. ▪ Describe the test that indicated the presence of most small sugars. ▪ Describe the test that indicates the presence of starch. ▪ Define hydrolysis and give an example of the hydrolysis of carbohydrates. Ex 3.2 Lipids ▪ Define lipid and give examples. ▪ Describe the test that indicates the presence of lipids. Ex 3.3 Proteins ▪ Define protein and give examples.

- Proteins: structures and functions; properties and types of proteins
- Nucleic Acids: compare the structures and functions of DNA and RNA

C. Tour of the Cell

- The Microscope: light microscope; scanning electron microscope; transmission electron microscope; distinguish between magnification and resolving power
- Prokaryotic and eukaryotic cells: cell theory; upper and lower limits to cell size; compartmentalization in eukaryotic cells; structures and functions of plant and animal cell parts
- Organelles and the Endomembrane System: structures and function of the nucleus; endomembrane system; rough and smooth endoplasmic reticulum; Golgi apparatus; lysosomes
- Energy-Converting Organelles: structures and functions of mitochondria and chloroplasts
- The Cytoskeleton and Related Structures: structures and functions of microfilaments; intermediate filaments and microtubules; how the structures of cilia and flagella relate to their functions
- Eukaryotic Cell Surfaces and Junctions: structures and functions of cell surfaces; intercellular junctions of plant and animal cells

D. The Working Cell

- Energy and the Cell: kinetic, potential, and chemical energy; heat; first and second laws of thermodynamics; endergonic and exergonic reactions in cells; energy coupling; ATP
- Enzymes: role of enzymes in chemical reactions; structure of enzyme-substrate interaction; cellular environments affects on enzyme activity; competitive and noncompetitive inhibitors; certain pesticides and antibiotics work by inhibiting enzymes
- Membrane Structure and Function: organize the chemical activities of a cell; phospholipid molecules; structure of cell membranes; membrane proteins; active and passive transport; diffusion and osmosis; plant and animal cells response to hypertonic, hypotonic and isotonic solutions; facilitated diffusion; exocytosis, endocytosis, phagocytosis and pinocytosis; receptor mediated endocytosis, hypercholesterolemia
- Cellular Respiration: chemical equation; role of mitochondria in harvesting energy for cellular work
- Photosynthesis: chemical equation; role of chloroplast in harvesting energy for cellular work

- Explain why the structure of a protein is important for its function.
- Describe the test that indicates the presence of protein.

Ex 3.4 Macromolecules In Food

- Explain how the components of butter are distributed in two fractions by the process of clarification.
- Interpret the results of tests that indicate the presence of sugar, starch, lipid, and protein in unknown samples.

Ex 3.5 DNA Extraction

- Describe how DNA can be extracted from cells.
- Form a hypothesis about the outcome of the experiment.
- Use a positive and negative control to interpret the results of experimental unknown.

Ex 4.1 The Compound Microscope

- Determine total magnification of the lenses on your microscope.
- Explain the difference between magnification and resolving power.
- Identify the parts of the compound microscope and give the function of each part.
- Describe the procedure you would follow to locate and focus on a specimen using the scanning, low-power, or high-power objective.
- Define field of view and describe how the field of view changes with magnification.
- Define depth of focus and explain how it changes with magnification and how to adjust for it when viewing specimens.

Ex 4.2 Observing Cells

- Explain what stains are and why they are often used with biological materials.
- Make a slide of an animal cell and plant cell.
- Draw an animal and plant cell and identify cell structures.

Ex 4.3 Cell Size & Diffusion

- Calculate surface-area-to-volume ratio.
- Explain the significance of the surface-area-to-volume ratio in terms of movement of materials in a cell.
- Explain how a model can be used to help illustrate the relationship between the surface area of a cell and its volume.

Ex 4.4 Chemistry of Combustion, Respiration & Photosynthesis

- Compare the equations of combustion, respiration, and photosynthesis.
- Understand structural formula and chemical bonding.
- Duplicate the chemical activities of photosynthesis and respiration with molecule sets.
- Write balanced equations for photosynthesis and respiration.

Ex 5.1 Enzyme Catalysis

- Measure the effects of changes in temperature, pH, salinity, enzyme concentration, and substrate concentration on the rate of an enzyme-catalyzed reaction.
- Explain how environmental factors affect the rate of enzyme-catalyzed reactions.

Ex 5.2 Diffusion and Osmosis

- Investigate the processes of diffusion and osmosis in a model of a membrane system.
- Investigate the effect of solute concentration on water

	potential as it related to living plant tissues. Campbell Biology CD-ROM ▪ Activity ~ *Comparing Prokaryotic and Eukaryotic Cells* ▪ Activity ~ *Prokaryotic Cell Structure and Function* ▪ Activity ~ *Animal Cell Structure and Function* ▪ Activity ~ *Plant Cell Structure and Function* Current Science Article II ▪ Research paper on current science topic. Video – *The Microscopic World*
Unit 3. Cellular Reproduction and Genetics A. Cellular Basis of Reproduction and Inheritance ▪ Cell Division and Reproduction: asexual versus sexual reproduction; Virchow's principle regarding cellular reproduction; binary fission ▪ Eukaryotic Cell Cycle and Mitosis: Prokaryotic and Eukaryotic chromosomes; stages and significance of the cell cycle; phases of mitosis and describe the events characteristics of each phase; cytokinesis in animals and plants; anchorage, cell density, and growth factors control influence the cell cycle; cancerous cells; benign and malignant tumors; strategies behind some common cancer treatments ▪ Meiosis and Crossing Over: somatic cells and gametes; diploid and haploid cells; autosomes and sex chromosomes; phases of meiosis I and meiosis II and describe events and characteristics of each phase; key differences between mitosis and meiosis; genetic variation in sexually reproducing organisms through independent orientation, crossing over, and random fertilization ▪ Alterations of Chromosome Number and Structure: karyotyping; causes and symptoms of Down syndrome; nondisjunction; consequences of abnormal number of sex chromosomes B. Patterns of Inheritance ▪ Mendel's Principles: rejection of pangenesis theory and blending hypothesis; Mendel's work with peas; true-breeding organisms; hybrids; the P generation, the F1generation, the F2 generation; genotypes and phenotypes; dominant allele vs. recessive allele; heterozygous vs. homozygous; Punnett square; monohybrid and dihybrid crosses; alleles; homologous chromosomes; Mendel's principle of independent assortment; testcrosses used to determine organism's genotype; probability rules of addition and multiplication; family pedigrees and inheritance of traits; recessive and dominant disorders; advantages and disadvantages of amniocentesis, chorionic villus sampling and ultrasound imaging ▪ Variation on Mendel's Principles: inheritance patterns of incomplete dominance; multiple	Ex 8.1 Mitosis & Meiosis ▪ Examine and compare the phases of mitosis in animal and plant cells. ▪ Determine the relative time cells spend in each phase of mitosis. ▪ Prepare microscope slides of mitotic cells using allium root tips. ▪ Follow the processes of mitosis and meiosis in the life cycle of Sordaria. ▪ Examine the arrangement of Sordaria ascospores microscopically to determine the frequency of crossing-over ▪ Calculate the distance, in map units, between a specific gene and the chromosome centromere. Ex 8.2 Model of Meiosis ▪ List in correct order and describe the steps of meiosis. ▪ Understand the role chromosomes play in the process of reproduction. ▪ Describe the effects of Independent Orientation on genetic variation. ▪ Describe the effects of Crossing Over of genetic variation. ▪ Discussion the advantages and disadvantages of using models to help explain biological events like meiosis. Ex 8.4 Human Karyotyping ▪ Describe how human karyotypes are typically prepared. ▪ Use concepts such as homologous chromosomes, centromeres, and DNA banding to help you simulate building karyotypes. ▪ Understand how human karyotypes are used to identify chromosomal problems. ▪ Recognize the differences between normal human karyotypes and those that have chromosomal abnormalities. Ex 9.1 Probability and Genetics ▪ Determine the probability for the results of tossing a single coin. ▪ Determine the probability for the results of tossing two coins at the same time. ▪ Understand and calculate percent deviation. ▪ Identify examples demonstrating the rules of probability. Ex 9.2 Genetics of Corn Kernels ▪ Use a model to illustrate Mendel's principle of segregation. ▪ Construct Punnett squares to show the results of genetic crosses. ▪ Calculate actual phenotype ratios in two stains of corn.

alleles and pleiotrophy; distinguish between carrier testing, diagnostic testing, prenatal testing, newborn screening, and predictive testing; many genes influence a single characteristic ▪ The Chromosomal Basis of Inheritance: linked genes are inherited differently; Morgan's studies of crossing over; linkage maps ▪ Sex Chromosomes and Sex-Linked Genes: sex is genetically determined in humans; significance of the SRY gene; patterns of sex-linked inheritance C. Molecular Biology of the Gene ▪ The Structure of the Genetic Material: experiments of Griffith, Hershey and Chase; compare the structure of DNA and RNA ▪ DNA Replication: structure of DNA; process of DNA replication; DNA polymerases and ligase ▪ The Flow of Genetic Information from DNA to RNA to Protein: locations and products of transcription and translation; major types of mutations and their possible consequences ▪ Viruses: lytic and lysogenic reproductive cycles; prophage; plant viruses; new viruses evolve; AIDS virus reproduction D. Control of Gene Expression ▪ Cellular Differentiation: patterns of gene expression; cloning of eukaryotes; adult stem cells; gene regulation in eukaryotes; embryonic development; genetic basis of cancer ▪ Human Genome Project: importance of sequencing genomes, telomeres	Ex 10.1 DNA Model Building and Replication of DNA ▪ Use a model to review the molecular make-up of DNA ▪ Use a model to simulate DNA replication. Ex 10.2 RNA and Protein Synthesis ▪ Use a model to review the molecular make-up of RNA ▪ Use a model to simulate transcription and translation of RNA. ▪ Use a model to simulate protein synthesis. Campbell Biology CD-ROM ▪ Activity ~ *The Cell Cycle* ▪ Activity ~ *The Hershey-Chase Experiment* ▪ Activity ~ *DNA and RNA Structure* ▪ Activity ~ *DNA Double Helix* ▪ Activity ~ *Transcription* ▪ Activity ~ *Translation* ▪ Activity ~ *The Human Genome Project: Human Chromosome 17* ▪ Thinking as a Scientist ~ *How much time do cells spend in each phase of mitosis?* ▪ Thinking as a Scientist ~ *How can the frequency of crossing over be estimated?* Current Science Article III ▪ Research paper on current science topic.
Unit 4. Evolution A. Populations ▪ Evidence of Evolution: evolutionary adaptations; descent with modification; fossils and the fossil record; biogeography; comparative anatomy of homologous structures; comparative embryology; molecular biology ▪ Darwin's Theory and the Modern Synthesis: artificial and natural selection; populations and population genetics; modern synthesis; species concept; gene pool; microevolution; Hardy-Weinberg equilibrium; genetic drift, bottleneck effect, founder effect and gene flow; mutations are rare events ▪ Variation and Natural Selection: polymorphic populations; geographic variation; genetic variation; gene diversity; nucleotide diversity of DNA sequences; sexual recombination, independents assortment, crossing over and random fertilization; "hidden" recessive alleles, heterozygote advantage; neutral variation; reduced variation in endangered species; Darwinian fitness; stabilizing, directional and diversifying selection; sexual dimorphism; antibiotic resistance in bacteria B. Origin of Species ▪ Concepts of Species: speciation; taxonomy; biological species concept; ring species;	Ex. 13.1 Population Genetics and Evolution ▪ Simulate random mating patterns and utilize the Hardy-Weinberg principle to determine allele frequencies. ▪ The effect natural selection has on allelic frequencies. ▪ How natural selection reduces the frequency of recessive traits. ▪ How the Hardy-Weinberg law of genetic equilibrium can help determine whether evolution is occurring. Ex 13.2 Human Heredity ▪ Form a pedigree of their immediate family ability to taste PTC. ▪ Determine, from their PTC pedigree and classmates pedigrees whether the gene for tasting PTC is autosomal dominant or recessive. ▪ Calculate, using class data, the frequency of the recessive gene, the dominant gene, and the genotypes in a population. ▪ Predict, using the Hardy-Weinberg equation, the frequency of the genotypes in a large population. Ex 14.1 Speciation ▪ Plot field data to create a species distribution map. ▪ Analyze and discuss the distribution of *Ensatina eschscholtzii* in California. ▪ Discuss the biological species concept, as well as other species concepts, and know how they are used to define a species. Ex 14.2 Variation

geographic barriers; morphological, genealogical and ecological species concept; reproductive barriers: prezygotic (temporal isolation, habitat isolation, behavioral isolation, mechanical isolation and gametic isolation) and postzygotic (hybrid inviability, hybrid sterility and hybrid breakdown) ▪ Mechanisms of Speciation: allopatric speciation; microevolutionary processes: mutation, genetic drift, and natural selection: geographic isolation; adaptive radiation (Darwin's finches of the Galapagos Island chain); sympatric speciation; polyploidy; reproductive barriers; gradualist model and punctuated equilibrium model of speciation	▪ Collect and plot data gathered on the variation of size in a sample population. ▪ Construct both a line and frequency distribution graph. ▪ Analyze data with mathematical treatments. ▪ Explain the concept of variation within a population. Ex 14.3 Natural Selection ~ A Simulation ▪ Successfully conduct a simulation of natural selection. ▪ Construct bar graphs and analyze collected data for trends related to natural selection. ▪ Explain the interrelationship between predators, the coloration of their prey and habitat. ▪ Give an example of natural selection in action today. Campbell Biology CD-ROM ▪ Activity ~ *Darwin and the Galapagos Islands* ▪ Activity ~ *Genetic Variation from Sexual Recombination* ▪ Activity ~ *Exploring Speciation on Islands* Current Science Article IV ▪ Research paper on current science topic. Video – *History of Evolutionary Thought*
Unit 5. Ecology A. The Biosphere ▪ Ecology: characteristics of the biosphere; organisms; populations; community; habitats; ecosystems; abiotic (solar energy, water, temperature and wind) and biotic components ▪ Aquatic biomes: ocean evaporation; photosynthesis of marine algae; estuaries and wetlands; intertidal zone and continental shelf; pelagic and benthic zones; phytoplankton and zooplanktion; photic and aphotic zones; coral reefs; freshwater biomes:lakes, ponds, rivers, and streams ▪ Terrestrial biomes: tropical forest, savannas, deserts, chaparral, temperate grasslands, temperate deciduous forests, coniferous forests, taiga, and tundra B. Population Dynamics ▪ Population structure and dynamics: populations and population density; mark-recapture method; dispersion patterns: clumped, uniform and random; mathematical equations of population growth (intrinsic rate of increase); exponential growth model, G = *rN*; population-limiting factors; logistic growth model; carrying capacity (K), G = *rN* [(K–N)/K]; limits to population growth; density dependent and independent factors; "boom-and-bust" cycles ▪ Life histories and their evolution: life tables; survivorship curves: Type I, Type II and Type III; life histories; *r*-selection and *K*-selection ▪ The human population: exponentially growth; ecological footprint; demographic transition; age structures; renewable resource management; maximum sustained yield C. Communities and Ecosystems ▪ Structural features of communities: communities; biodiversity; community stability; interspecific	Ex 35.1 Population Change ~ A Model ▪ Use a mathematical model to predict population change in hypothetical populations. ▪ Graph population growth of hypothetical populations on arithmetic and semi logarithmic graph paper and analyze. Ex 35.2 Population Change ~ Field Data ▪ Graph population data for several natural populations and determine reasons for population fluctuations. Current Science Article V ▪ Research paper on current science topic. Campbell Biology CD-ROM ▪ Activity ~ *Aquatic Biomes* ▪ Activity ~ *Terrestrial Biomes* ▪ Activity ~ *Techniques for Estimating Population Density and Size* ▪ Activity ~ *Investigating Survivorship Curves* ▪ Activity ~ *Human Population Growth* ▪ Activity ~ *Energy Flow and Chemical Cycling* ▪ Activity ~ *Food Webs* ▪ Activity ~ *Energy Pyramids* Video ~ *Human Population Growth*

competition; niche; competitive exclusion principle; resource partitioning; predation (force of evolution); coevolution; Batesian mimicry, Mullerian mimicry; keystone species; symbiotic relationship; predator, prey and parasitism; commensalisms and mutualism; disturbances in communities; ecological succession; primary and secondary succession ▪ Ecosystems structure and dynamics: ecosystem; energy flow and chemical cycling; food web and food chain; producers, primary consumers, secondary consumers, tertiary consumers, quaternary consumers, decomposer; biomass; primary production; abiotic reservoirs: water cycle, carbon cycle, nitrogen cycle, and phosphorus cycle ▪ Ecosystem alteration: zoned reserves	
Unit 6. Animals: Form and Function A. Unifying Concepts of Animals Structure and Function ▪ Structural Organization in an Animal: cells, tissues, organs, and organ systems ▪ Digestion systems: nutrition and the human digestive system ▪ Respiratory systems: mechanisms of gas exchange; transports of gases in the body ▪ Circulatory systems: mammalian cardiovascular system; structure and function of blood ▪ Lymphatic and Immune systems: nonspecific defenses against infection and specific immunity ▪ Excretory systems: structure and function ▪ Endocrine systems: structure and function ▪ Reproductive systems: embryonic development; human development ▪ Nervous systems: structure and function; nerve signals and their transmission ▪ Muscular systems: skeletal muscles provide movement; muscle cells; calcium's role in muscle contraction; aerobic and anaerobic exercise. ▪ Skeletal systems: bones and cartilage provide support and protection; movement; types of skeletons; structure of bone; types of joints ▪ Integumentary systems: skin, hair and nails; protect the internal body B. Homeostasis: ▪ negative feedback; thermoregulation; excretion; liver function; hormones	Ex 20.1 Measuring Cardiovascular Function in Humans ▪ Determine pulse rate for an individual. ▪ Determine blood pressure for an individual. ▪ Describe the cardiac cycle and how it relates to heart sounds and blood pressure. ▪ Explain how and why hypertension, atherosclerosis, and arteriosclerosis affect circulation. ▪ Design an original experiment to investigate some factor that affects pulse rate and/or blood pressure. Campbell Biology CD-ROM ▪ Activity ~ *Correlating Structure and Function of Cells* ▪ Activity ~ *Levels of Life* ▪ Activity ~ *Regulation: Negative and Positive Feedback* Seminar ▪ Students are given a topic from Unit 6 that they are responsible for researching and teaching to the class. Each topic is accompanied with specific objectives that will be addressed in the student's oral presentation. Current Science Article VI ▪ Research paper on current science topic.

V. Texts & Supplemental Instructional Materials

- Benjamin Cummings: *Biology Concepts & Connections* 4th Edition (2003) Campbell, Reece, Mitchell, Taylor
- Benjamin Cummings: *Laboratory Investigations for Biology* 2nd Edition (2003) Dickey
- Campbell Biology CD-ROM and Web Site

VI. Instructional Methods and/or Strategies

- Laboratory Investigation
- Lecture and Discussion
- Research - library and Internet
- Project-based learning
- Group Work
- Readings
- CD-ROMs
- Videos

VII. Assessment Methods

- Laboratory Reports (40%)
- Written Exams and Quizzes (30%)
- Homework Assignments (10%)
- Current Science Research Papers (5%)
- Classroom Participation (5%)
- Comprehensive Final Exam ~ including laboratory concepts (10%)

Ernest Righetti High School has set goals through our Expected School wide Learning Results, ESLR's. Both teachers and administrators at Ernest Righetti High School set these goals. All students are expected to achieve these goals before graduation. As a result, the assessment criteria for the Honors Biology course take into account for these gals and students are held accountable to achieve these goals.

These goals are:

- Students will demonstrate effective communication skills in both reading and writing.
  - Students will use reading skills to build meaning, and gather information from a variety of grade level materials.
  - Students will write text with a clear purpose, supporting evidence, using accurate punctuation, and sentence structure.
- Students will demonstrate essential mathematical skills in:
  - Statistics, Data Analysis & Probability
  - Algebra and Functions
  - Mathematical Reasoning
  - Number sense
  - Measurement & Geometry
  - Algebra 1
- Student will demonstrate critical thinking skills.
  - Can identify, define and develop solutions to problems.
  - Organize, analyze, interpret, and evaluate information.
  - Utilize acquired skills in new situations.
- Students will demonstrate goal setting skills:
  - Assessment and Research
- Students will demonstrate the ability to work cooperatively with culturally diverse groups.
  - Student involvement in divers groups.

C. HONORS COURSES ONLY

How this honors course is different from the standard course.

This Honors Biology course differs from the standard Biology course in three major ways.

- First of all, the honors course is accelerated. Students are required to complete a summer assignment. Successful completion of this work introduces the student to Unit 1 and Unit 2 (A & B) of the course. This material is then used as a foundation for the first four weeks of the course, which is entirely laboratory based. The summer assignment also serves to set the tone for the class. Students are aware that the Honors Biology course will challenge them academically and if they are to be successful they must be self-motivated.
- Secondly, the course includes laboratory experiments, some of which are recommended AP Biology Laboratories, which are not used in the standard Biology course. Laboratory topics are explored in depth and involve data analysis and research. Laboratory experiments stress the importance of detailed observation, accurate recording, experimental design, and data interpretation.
- And lastly, the course textbook, *Biology Concepts & Connections*: Campbell, Reece, Mitchell, and Taylor, is a college introductory biology text. This textbook is the corner stone of the course. The concepts and principles of biology as presented in this text serve to raise the academic bar in the Honors Biology course well above the standard Biology course.

Course requested by: Ernest Righetti High School Science Department

Contact Person: Rebecca Wingerden, Ernest Righetti Science Department

Course Title

BIOLOGY A (HONORS)

Prerequisites: Successful completion of either Introductory Physical Science with a grade "C" or better or completion of General Science with a "A" grade and teacher recommendation.

Description of Target Group

This is a two semester course recommended for students in grades 10 through 12 who wish Honors Credit in a college prep biology lab class. This class is designed to challenge students beyond college prep biology.

Purpose

To encourage a scientific viewpoint as an approach to life and the study of biology, as well as to encourage self-awareness in the student as a responsible and contributing part of the environment and to create an awareness of human dependence of immutable ecological principles for survival.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Discuss the ecological relationships of plants and animals.
2. Discuss the concepts of metabolism, biochemistry, photosynthesis, and energy cycles.
3. Discuss the concepts of cell biology and cell division.
4. Discuss the concepts of reproduction and development.
5. Discuss the concepts of genetics, heredity, and how we adapt to our changing environment.
6. Discuss taxonomy and classification.
7. Discuss basic relationships to disease and how they are spread.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Discussions, Open Ended Questions, Laboratory Exercises, Discovery Based or Open Ended Laboratory Exercises, Oral Reports, Tapes, Laser Discs, Computer Programs.

Course Title

BIOLOGY B (HONORS)

Prerequisites: Successful completion of either Introductory Physical Science with a grade "C" or better or completion of General Science with a "A" grade and teacher recommendation.

Description of Target Group

This is a two semester course recommended for students in grades 10 through 12 who wish Honors Credit in a college prep biology lab class. This class is designed to challenge students beyond college prep biology.

Purpose

To encourage a scientific viewpoint as an approach to life and the study of biology, as well as to encourage self-awareness in the student as a responsible and contributing part of the environment and to create an awareness of human dependence of immutable ecological principles for survival.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Discuss the ecological relationships of plants and animals.
2. Discuss the concepts of metabolism, biochemistry, photosynthesis, and energy cycles.
3. Discuss the concepts of cell biology and cell division.
4. Discuss the concepts of reproduction and development.
5. Discuss the concepts of genetics, heredity, and how we adapt to our changing environment.
6. Discuss taxonomy and classification.
7. Discuss basic relationships to disease and how they are spread.

Instructional Materials

Text and Supplementary Materials

Activities

Discussions, Open Ended Questions, Laboratory Exercises, Discovery Based or Open Ended Laboratory Exercises, Oral Reports, Tapes, Laser Discs, Computer Programs.

Course Title **ERHS**

Biology A/B (P)

Prerequisites: Successful completion of either General Science or Introductory Physical Science or AG 1 and AG 2 with a grade of C or better.

Description of Target Group

This two-semester course is recommended for students in grades 10 through 12, with average or above average skills in reading comprehension and writing.

Purpose

To encourage a scientific viewpoint as an approach to life and the study of biology, as well as to encourage self-awareness in the student as a responsible and contributing part of the environment and to create an awareness of human dependence on immutable ecological principles for survival.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Discuss the ecological relationships of plants and animals.
2. Discuss the concepts of metabolism, biochemistry, photosynthesis, and energy cycles.
3. Discuss the concepts of cell biology and cell division.
4. Discuss the concepts of reproduction and development.
5. Discuss the concepts of genetics, heredity, and how we adapt to our changing environment.
6. Discuss taxonomy and classification.
7. Discuss basic relationships to disease and how they are spread.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Lecture, discussion, tapes, laser discs, computer programs, laboratory exercises.

Course Title **SMHS**

Biology A (Blue) (P)

Description of Target Group

Students in Grades 9 through 12 who are planning to go on to a four-year college or university. Recommendation of C grade or better in prior science courses, average, or above average reading comprehension.

Purpose

To inculcate individual high standards of awareness in the field of biology, and provide information which will create an appreciation for the value and quality of life.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Use the scientific method.

2. Use the compound microscope, including the names and functions of the various parts, and calculations of field size and magnification.

3. List the various systems of classification of living things.

4. Identify the ways in which fossil remains have given credence to the theory of evolution.

5. Explain Darwin's theory of the means of evolution including adaptation and natural selection.

6. Explain the rise and fall of spontaneous generation and the origin of life on earth, and the people involved in developing these theories.

7. Identify conditions of earth before life began, including the chemistry of the primitive atmosphere and the formation of chemical compounds.

8. Discuss the emergence of life in ancient waters including pre-cells and energy and the transfer of material into primitive organisms.

9. Define photosynthesis, mechanisms, and machinery.

10. Identify and define oxygen and energy and the process of respiration.

Biology A (Blue) (P) (continued)

11. Identify and explain the nucleic acids and a molecular model of DNA.

12. Explain the language of life - protein synthesis and the genetic code.

13. Explain the nature of cells, cell division, and the development of the cell theory.

14. Identify multicellular organization - perform problems and solutions.

15. Identify and explain essential features of reproduction, including sexual reproduction in plants and animals, reproduction in placental mammals, and hormonal control of the reproductive system.

16. Explain development in plants and animals and variations in development.

17. Describe the work of Mendel, probability, hereditary patterns, genes and chromosomes, changes in genes, genes, and populations, origin of new types.

18. Use safely the laboratory equipment and the development of laboratory techniques, which can be of use in a variety of vocational choices.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approves Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Lecture, discussion, films, filmstrips, field trips, laboratory exercises.

Course Title **SMHS**

Biology B (Blue) (P)

Description of Target Group

Students in Grades 9 through 12 who are planning to go on to a four-year college or university. Recommendation of C grade or better in prior science courses, average, or above average reading comprehension.

Purpose

To inculcate individual high standards of awareness in the field of biology, and provide information which will create an appreciation for the value and quality of life.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Use the scientific method.

2. Use the compound microscope, including the names and functions of the various parts, and calculations of field size and magnification.

3. List the various systems of classification of living things.

4. Identify the ways in which fossil remains have given credence to the theory of evolution.

5. Explain Darwin's theory of the means of evolution including adaptation and natural selection.

6. Explain the rise and fall of spontaneous generation and the origin of life on earth, and the people involved in developing these theories.

7. Identify conditions of earth before life began, including the chemistry of the primitive atmosphere and the formation of chemical compounds.

8. Discuss the emergence of life in ancient waters including pre-cells and energy and the transfer of material into primitive organisms.

9. Define photosynthesis, mechanisms, and machinery.

10. Identify and define oxygen and energy and the process of respiration.

Biology B (Blue) (P) (continued)

11. Identify and explain the nucleic acids and a molecular model of DNA.

12. Explain the language of life - protein synthesis and the genetic code.

13. Explain the nature of cells, cell division, and the development of the cell theory.

14. Identify multicellular organization - perform problems and solutions.

15. Identify and explain essential features of reproduction, including sexual reproduction in plants and animals, reproduction in placental mammals, and hormonal control of the reproductive system.

16. Explain development in plants and animals and variations in development.

17. Describe the work of Mendel, probability, hereditary patterns, genes and chromosomes, changes in genes, genes, and populations, origin of new types.

18. Use safely the laboratory equipment and the development of laboratory techniques, which can be of use in a variety of vocational choices.

Lecture, discussion, films, filmstrips, field trips, laboratory exercises.

Course Title

Biology A/B (Green) (P)

Description of Target Group

This course is recommended for students in grades 10 through 12 with average, or above average skills in reading comprehension and writing.

Purpose

To encourage a scientific viewpoint as an approach to life and the study of biology, as well as to encourage self-awareness in the student as a responsible and contributing part of the environment and to create an awareness of human dependence on immutable ecological principles for survival.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate the following skills:

1. Discuss the ecological relationships of plants and animals.
2. Explain the complementarily of structure and function of organisms through space and time.
3. Define the basic life functions.
4. Explain cell biology.
5. Identify and use the materials and techniques of biology.
6. Define classification of organisms.
7. Use the metric system (optional).

Title: Biology: The Living Earth A/B

Length of course: Full Year

Subject area: Science (D) / Biology/Earth & Space Sciences

UC honors designation? No

Prerequisites:	None
Co-requisites:	Algebra 1 (Required) Physics of the Universe (Required)
Integrated (Academics / CTE)?	No
Grade levels:	9th, 10th, 11th, 12th

ourse Description

urse overview:

Biology: The Living Earth AB is a laboratory-based college preparatory course. This course is defined in the 2019 California Science Framework, integrating Biology and Earth and Space Science standards from the California Next Generation Science Standards (NGSS). The course is divided into seven units, the first of which is a unit that focuses on executive science skills. The following six Instructional Segments (I.S.) centered on questions about observations of a specific phenomenon. The units address the concepts of ecosystem interactions, energy flow in a system, evolution, genetics, cell theory, and climate change. Different phenomena require different amounts of classroom investigative time to explore and understand, so each Instructional Segment should take a different fraction of the school year. As students achieve the Performance Expectations (PEs) within the unit, they uncover Disciplinary Core Ideas (DCIs) from Life Science, Earth and Space Science, and Engineering. Students engage in multiple Science and Engineering Practices (SEPs) in each unit, not just those explicitly indicated in the PEs. Students also focus on one or two Crosscutting Concepts (CCCs) as tools to make sense of their observations and investigations; the CCCs are recurring themes in all disciplines of science and engineering and help tie these seemingly disparate fields together.

urse content:

0. Setting the Stage

This unit focuses on the executive science skills necessary for planning and conducting an investigation, collecting and analyzing data, using mathematics and computational thinking, and engaging in argument from evidence. Students are introduced to and connections are made between Biology and Earth & Space Science, which are anchored to Earth Spheres.

Essential Questions:

1. How do you make sense of the world around you?
2. What is biology?
3. What skills are needed to conduct biological investigations?
4. How are Scientific Questions generated and tested?
5. How can trends in data be identified, analyzed, and applied?

Performance Expectations:

- Generate scientific questions.
- Identify and measure independent and dependent variables and constants.
- Write a data collection procedure.
- Identify and analyze graphical trends and patterns.
- State a claim about the scientific question being investigated through a written Claim-Evidence-Reasoning concluding paragraph.
- Evaluate the consistency of the data and relate to sources of error.

NGSS Science and Engineering Practices (SEPs):

- Analyzing and Interpreting Data
- Using Mathematics and Computational Thinking
- Engaging in Argument from Evidence

NGSS Cross-cutting Concepts (CCCs):

- Patterns
- Scale, Proportion, and Quantity
- Structure and Function

🖳 Unit Assignment(s):

Unit Assignments:

Assignments in this unit aim to aid students in the development of scientific reasoning skills. Observing phenomena through the lenses of the SEP's and CCC's will be included. In addition, basic science skills will be reinforced through the use of a BioZone: The Living Earth resource, in which development of the SEP's are supported.

🧪 Unit Lab Activities:

Unit Lab Activities:

Mystery Tubes, Black Box, and Know Your Seed activities are used to build and reinforce science executive skills such as how to make qualitative and quantitative observation, use scientific inquiry, logic, and reasoning to answer questions about the living world. Claim, evidence, reasoning (CER) format will be used to facilitate student's development of logic and reasoning.

---

1. Ecosystem Interaction and Energy

The Ecosystem Interaction and Energy unit engages students to build an understanding of the transfer of matter, atoms and molecules, abiotic and biotic factors within ecosystems, and models of energy flow. Students use mathematical and computer models to determine and predict the effect of factors that affect the size and diversity of populations in ecosystems, including the availability of resources and interactions between organisms. Students conduct investigations to test how different parameters change population sizes, and then analyze their findings to identify the most important

factors that determine biodiversity, population numbers, and the resulting effect on carrying capacity. Students provide evidence to support an explanation for the effects of both living and nonliving factors on biodiversity and population size, as well as the interactions of ecosystems on different scales and the effects of disturbances on an ecosystems' resilience. Using the conceptual model of energy pyramids, students find that very large populations of producers are required to support much smaller populations of tertiary consumers for the ecosystem to remain stable.

Essential Questions:

1. What factors affect the size of populations within an ecosystem?
2. What are common threats to remaining natural ecosystems and biodiversity

NGSS Performance Expectations (PEs):

- **HS-LS2-1.** Use mathematical and/or computational representations to support explanations of factors that affect the carrying capacity of ecosystems at different scales.
- **HS-LS2-2.** Use mathematical representations to support and revise explanations based on evidence about factors affecting biodiversity and populations in ecosystems of different scales.
- **HS-LS2-4.** Use mathematical representations to support claims for the cycling of matter and flow of energy among organisms in an ecosystem.
- **HS-LS2-8.** Evaluate the evidence for the role of group behavior on individual and species' chances to survive and reproduce

NGSS Science and Engineering Practices (SEPs):

- Developing and Using Models
- Using Mathematics and Computational Thinking
- Engaging in Argument from Evidence

NGSS Cross-cutting Concepts (CCCs):

- Cause and Effect
- Scale, Proportion, and Quantity
- Systems and System Models
- Energy and Matter: Flows, Cycles, and Conservation

💻 Unit Assignment(s):

Unit Assignments:

In this unit, students are lead to the understanding that organisms have commonalities and differences within common groups. Students will be exposed to a variety of organisms to categorize in an activity. Then students will examine the population dynamics between wolves and moose on Isle Royale to determine how populations increase/decrease in size based on environmental variables. Further examples of factors affecting populations will be examined using *BioZone: The Living Earth* resource and computer simulations (PhET and Gizmos). This exploration will provide students with the background to derive their own conceptual model of the interactions that shape ecosystems.

🧪 Unit Lab Activities:

Unit Lab Activities:

Owl and Mice - In this activity, students play a game in which owls and mice populations are charted through successive generations as a means of acquiring an understanding of population density and predation. This activity provides a set of data students can analyze and draw conclusions to better understand the dynamics of relationships between different populations in the same environment.

Population Dynamics Case Study - Students explore population change in real populations by investigating the moose and wolves on Isle Royale. Students analyze data, read background information, and play a game to begin developing a model that helps explain the connection between the processes of birth, death, population growth, and decline. Students conduct additional research and revise their initial model ideas about what factors might be affecting the wolf population. Students then use their models to predict the behavior of moose populations over the past decade. They analyze new data, revise their model and work as a class to develop a consensus model of population regulation in the context of food webs. Students develop arguments based on evidence to make recommendations for this ecosystem and participate in a summit or debate to share their position.

---

2. History of Earth's Atmosphere: Photosynthesis and Respiration

The History of Earth's Atmosphere: Photosynthesis and Respiration unit, guides students in creating a model that links photosynthesis and respiration in organisms to cycles of energy and matter in the Earth system. They gather evidence about the linked history of Earth's biosphere and atmosphere. Students observe how the distinctive patterns of CO_2 concentrations are caused by the geographic distribution of landforms in different hemispheres across the earth. Students build upon their knowledge of energy flow as they are introduced to the two interdependent cellular processes: capturing light energy and fixing atmospheric carbon into sugar molecules that can be used for energy storage or other anabolic biosynthetic pathways. Cellular respiration is explored as a process that results in ATP production and the recycling of carbon in the global carbon cycle. Students use available data, and student-generated models of photosynthesis to construct an argument that life has been an important influence on other components of the Earth system. Finally, students investigate carbon reservoirs within the Earth system.

Essential Questions:

1. How do living things acquire energy and matter for life?
2. How do organisms store energy?
3. How are photosynthesis and cellular respiration connected?
4. How do organisms use the raw materials they ingest from the environment?
5. How has the cycling of energy and matter changed over Earth's history?

NGSS Performance Expectations (PEs):

- **HS-LS2-3.** Construct and revise an explanation based on evidence for the cycling of matter and flow of energy in aerobic and anaerobic conditions.
- **HS-LS2-5.** Develop a model to illustrate the role of photosynthesis and cellular respiration in the cycling of carbon among the biosphere, atmosphere, hydrosphere, and geosphere.
- **HS-ESS1-6.** Apply scientific reasoning and evidence from ancient Earth materials, meteorites, and other planetary surfaces to construct an account of Earth's formation and early history.
- **HS-ESS2-6.** Develop a quantitative model to describe the cycling of carbon among the hydrosphere, atmosphere, geosphere, and biosphere.
- **HS-ESS2-7.** Construct an argument based on evidence about the simultaneous coevolution of Earth's systems and life on Earth.

- **HS-ESS3-6.** Use a computational representation to illustrate the relationships among Earth systems and how those relationships are being modified due to human activity.

NGSS Science and Engineering Practices (SEPs):

- Developing and Using Models
- Using Mathematics and Computational Thinking
- Constructing Explanations (for science) and Designing Solution (for engineering)
- Engaging in Argument from Evidence

NGSS Cross-cutting Concepts (CCCs):

- Patterns
- Systems and System Models
- Energy and Matter: Flows, Cycles, and Conservation
- Stability and Change

🖳 Unit Assignment(s):

Unit Assignments:

In this unit, students are presented with information about the carbon molecule and they explore why Carbon's structure leads to this element's ability to create many different compounds that are the foundation of life on Earth. A focus on carbon dioxide gas leads to discussions on where the gas comes from, storage, and conversion of the gas through carbon sinks, aerobic respiration, and photosynthesis. Students then apply this knowledge about how carbon moves through biotic and abiotic systems to include all matter. A variety of online simulations are used to help students formulate answers to the driving question of how organisms derive and transform matter. The *BioZone: The Living Earth* resource is used to emphasize Earth's biogeochemical cycles, as well as, the co-evolution of Earth's systems. Assignments modified from ENSI, Carbon Time, and MBER are utilized as well.

🧪 Unit Lab Activities:

Unit Lab Activities:

Atmosphere-Ocean System - In this activity, students develop a simple physical model of the atmosphere-ocean system by adding a pH indicator to water in a closed container. Students use this model to investigate what happens as a plant grows, a candle burns or a person exhales through a straw into the water. They notice that pH changes as CO2 from these sources interact with the water to form carbonic acid. This same chemical reaction happens at the global scale with interactions between the atmosphere and the hydrosphere, making Earth's oceans one of the biggest reservoirs of carbon on the planet. In this activity, students engage in the scientific practices of analyzing data and arguing from evidence to build a model of the movement of carbon through Earth's systems.

Photosynthesis and Respiration Lab - In this activity, students will use models of photosynthesis and cellular respiration to predict the presence or absence of CO2 in tubes with elodea and bromothymol blue indicator. Students will observe and record the results of the exposure of elodea to the bromothymol blue indicator in the presence and absence of light. Analyzing data collected during the lab, students will explain the relationship between the two processes.

3. Evidence of Common Ancestry and Diversity

The Evidence of Common Ancestry and Diversity unit engages students to develop a model about how rock layers record evidence of evolution as fossils. Students focus on effectively communicating this evidence and relate to principles of natural selection. Students use evidence to support evolution such as fossils, homologous structures, and vestigial structures. They are also able to distinguish when analogous structures are due to convergent evolution and not common ancestry. Students apply Darwin's principles to living systems to explain the changes in populations that they observe. Students analyze DNA sequences as well as fossil evidence to determine the evolutionary relationships of various species. Students also construct an explanation that shows evolution is caused primarily by one or more of the four factors: (1) the potential for a species to increase in number, (2) the heritable genetic variation of individuals in a species due to mutation and sexual reproduction, (3) competition for limited resources, and (4) the proliferation of those organisms that are better able to survive and reproduce in the environment. Students use evidence from analyzed data sets and reasoning to support common ancestry and biological evolution.

Essential Questions:

1. How do layers of rock form and how do they contain fossils?
2. Why do we see similar fossils across the world from each other but living organisms that are very different?
3. What evidence shows that different species are related?
4. How have modern-day humans evolved?

NGSS Performance Expectations (PEs):

- **HS-LS4-1.** Communicate scientific information that common ancestry and biological evolution are supported by multiple lines of empirical evidence
- **HS-LS4-2.** Construct an explanation based on evidence that the process of evolution primarily results from four factors: (1) the potential for a species to increase in number, (2) the heritable genetic variation of individuals in a species due to mutation and sexual reproduction, (3) competition for limited resources, and (4) the proliferation of those organisms that are better able to survive and reproduce in the environment
- **HS-LS4-4.** Construct an explanation based on evidence for how natural selection leads to the adaptation of populations
- **HS-LS4-5.** Evaluate the evidence supporting claims that changes in environmental conditions may result in (1) increases in the number of individuals of some species, (2) the emergence of new species over time, and (3) the extinction of other species.
- **HS-ESS1-5.** Evaluate evidence of the past and current movements of continental and oceanic crust and the theory of plate tectonics to explain the ages of crustal rocks.
- **HS-ESS2-5.** Plan and conduct an investigation of the properties of water and its effects on Earth materials and surface processes
- **HS-ESS3-1.** Construct an explanation based on evidence for how the availability of natural resources, the occurrence of natural hazards, and changes in climate have influenced human activity
- **HS-ESS3-4.** Evaluate or refine a technological solution that reduces the impacts of human activities on natural systems.

NGSS Science and Engineering Practices (SEPs):

- Planning and Carrying Out Investigations
- Constructing Explanation (for science) and Designing Solutions (for engineering)
- Engaging in Argument from Evidence
- Obtaining, Evaluating, and Communication Information

NGSS Crosscutting Concepts (CCCs):

- Patterns
- Cause and Effect: Mechanism and Explanation
- Structure and Function
- Stability and Change

🖳 Unit Assignment(s):

Unit Assignments:

In this unit, students will utilize the fossil and DNA evidence regarding the evolution of the whale to identify patterns as well as the mechanism of evolution. From fossil evidence, students will assemble a timeline of whale structural changes supported by readings and video segments from Nova: Great Transformations. Students will compare the DNA of whales to a variety of organisms to determine closest relatives to the whales which will be compared to the movements of landmasses via Continental Drift and Theory of Plate Tectonics to help students better understand that changes in the environment create the conditions under which adaptations will occur. In addition, students will access graphs of population changes for various animals that will highlight our four Principles of Natural Selection. Videos such as “How the Earth Made Man” will be utilized to reinforce that concept as will a lab on the development of sedimentary rock. Readings and simulations on human evolution utilizing qualitative and quantitative data will allow students to better understand the modern evolution of humans through fossil evidence found in sedimentary rock.

🧪 Unit Lab Activities:

Unit Lab Activities:

The Galapagos Finch - After engaging in activities designed to demonstrate that more offspring are born than can survive and that variation occurs in a population, students take part in a hands-on investigation in which they are medium ground finches on the Galapagos island of Daphne Major. They simulate environmental conditions and collect data on the amount of food birds are able to forage and determine if those individuals who would be able to survive or not. They analyze their collected group and class data to determine which adaptations in beak size were more advantageous and enabled birds to survive and reproduce.

Stickleback Evolution Virtual Lab (HHMI) - This virtual evolution lab utilizes data collection and analysis to allow students to study evolutionary processes using modern stickleback fish and fossil specimens. Students virtually analyze the pelvic structures of the threespine stickleback fish, complete three experiments, each focusing on changes to the pelvic girdle and pelvic spines of freshwater stickleback populations. Students analyze and compare the pelvic structures of fossil stickleback specimens and analyze their data to determine the rate at which pelvic reductions evolved.

---

4. Inheritance of Traits

The Inheritance of Traits unit explores the inheritance of traits by explaining why offspring do not look exactly like their parents. Students explore the dynamics of gene expression and replication at a molecular level. This exploration provides them with a basis for examining some of the fundamental techniques of genetic engineering (including cell division), DNA replication, and protein synthesis. Students then begin their study of genetics and explore the transmission of genetic information, genetic variation, and inheritance patterns. Students will see how genetic information is passed between

generations and how this provides biological continuity for species. They study the relationship between genotype and phenotype and explore how the environment plays an important role in phenotypic expression. Students will then apply concepts of statistics and probability to support explanations that organisms with an advantageous heritable trait tend to increase in proportion to organisms lacking this trait. Students will also apply their understanding of heredity in relation to evolution by explaining why certain dominant traits such as dwarfism remain rare in a given population. Students explore relevant scientific experiments and understand how science is a human endeavor. Students use physical models of chromosomes to visualize and provide evidence for how variation happens. Using other models, such as pedigrees, allows students to look for patterns of inheritance across generations.

Essential Questions:

1. How are the characteristics of one generation passed to the next?
2. What allows traits to be transmitted from parents to offspring?
3. How does variation affect a population under selective pressures?

NGSS Performance Expectations (PEs):

- **HS-LS3-1.** Ask questions to clarify relationships about the role of DNA and chromosomes in coding the instructions for characteristic traits passed from parents to offspring.
- **HS-LS3-2.** Make and defend a claim based on evidence that inheritable genetic variations may result from: (1) new genetic combinations through meiosis, (2) viable errors occurring during replication, and/or (3) mutations caused by environmental factors.
- **HS-LS3-3.** Apply concepts of statistics and probability to explain the variation and distribution of expressed traits in a population
- **HS-LS4-2.** Construct an explanation based on evidence that the process of evolution primarily results from four factors: (1) the potential for a species to increase in number, (2) the heritable genetic variation of individuals in a species due to mutation and sexual reproduction, (3) competition for limited resources, and (4) the proliferation of those organisms that are better able to survive and reproduce in the environment.
- **HS-LS4-3.** Apply concepts of statistics and probability to support explanations that organisms with an advantageous heritable trait tend to increase in proportion to organisms lacking this trait

NGSS Science and Engineering Practices (SEPs):

- Asking Questions and Defining Problems
- Analyzing and Interpreting Data
- Constructing Explanations (for science) and Designing Solution (for engineering)
- Engaging in Argument from Evidence

NGSS Crosscutting Concepts (CCCs):

- Patterns
- Cause and Effect: Mechanisms and Explanation
- Scale, Proportion, and Quantity

⮒ Unit Assignment(s):

Unit Assignments:

In this unit students first, take a survey on human genetics in themselves and family to start to predict where traits are coming from. Students investigate the inheritance of traits using Wisconsin Fast Plants, or alternatively, the online simulation, to look for patterns in the data. Students develop explanations about the specific mechanisms that enable

parents to pass traits to their offspring. They make claims about which processes give rise to variation in DNA codes and calculate the probability that offspring will inherit traits from their parents. Using these patterns students develop a model of inheritance and use that model to predict the outcome of future genetic crosses.

Additionally, students explore the history of our current understanding of DNA and its inheritance evolved. Students use physical models of chromosomes to visualize and provide evidence for how variation happens. Using other models such as pedigrees students will look for patterns of inheritance across generations.

🧪 Unit Lab Activities:

Unit Lab Activities:

Inheritance in Fast Plants Based on Gregor Mendel's experiments, students observe the inheritance of the purple stem trait and how trait factors interact. Students then count the numbers of purple and non-purple seedlings in order to determine the ratio of purple stem seedlings to non-purple stem seedling and discover the 3:1 inheritance pattern predicted by Mendelian genetics. Students create models of inheritance with supporting claims evidence and reasoning explanation addressing the focus question.

Genetic Disorders - Students research a genetic disorder to determine actual gene proteins through HHMI activities, OMIM, or other internet databases. Students will expand upon their findings to provide the details of the disorder, pulling in concepts related to mutations, chromosomes, and genetic frequency in the human population.

PTC: The Genetics of Bitter Taste - Students will use the HHMI Biointeractive activity, "The Genetics of Bitter Taste" to examine their perception of taste. The chemical PTC will be used in order to explain the inheritance pattern of this trait. Students will collect and analyze class data of tasters vs non-tasters of the chemical PTC. Students then determine if there is a correlation between taste and the number of taste buds on the human tongue. After graphing the data collected, students develop a model to explain the relationship between the number of taste buds and the perception of the taste of bitterness. Finally, students present their models.

---

5. Structure, Function, and Growth

The Structure, Function, and Growth unit provides the opportunity for students to use models to create explanations of how DNA provides the code to construct proteins, build biomass, reproduce, and create complex multicellular organisms. Students relate the changes in the genetic code to changes in proteins that cells produce, and then to the physical features of an organism. Students also investigate how organisms maintain stability in changing environmental conditions via the function of interacting systems. Students are able to explain multicellularity in terms of the growth and reproduction of genetically identical cells and how the differentiated cells of multicellular organisms are a result of different patterns of gene expression.

Essential Questions:

1. What happens if a cell in our body dies?
2. How does the structure of DNA affect how cells look and behave?
3. How do systems work in a multi-celled organism (emergent properties) and what happens if there is a change in the system?
4. How do organisms survive even when there are changes in their environment?

NGSS Performance Expectations (PEs):

- **HS-LS1-1.** Construct an explanation based on evidence for how the structure of DNA determines the structure of proteins which carry out the essential functions of life through systems of specialized cells.
- **HS-LS1-2.** Develop and use a model to illustrate the hierarchical organization of interacting systems that provide specific functions within multicellular organisms.
- **HS-LS1-3.** Plan and conduct an investigation to provide evidence that feedback mechanisms maintain homeostasis.
- **HS-LS1-4.** Use a model to illustrate the role of cellular division (mitosis) and differentiation in producing and maintaining complex organisms.

NGSS Science and Engineering Practices (SEPs):

- Developing and Using Models
- Planning and Carrying Out Investigations
- Analyzing and Interpreting Data
- Constructing Explanations (for science) and Designing Solutions (for engineering)

NGSS Crosscutting Concepts (CCCs):

- Systems and Systems Models
- Structure and Function
- Stability and Change

💻 Unit Assignment(s):

Unit Assignments:

In this unit, students will be using online simulations and activities to understand the properties of DNA and how DNA provides traits through the process of protein synthesis. Students will learn about mitosis and meiosis as a way to understand the need for proteins in cellular processes of energy acquisition, growth, and repair. Using homeostatic simulations, students will create a conceptual model of 1) the interaction and regulation that takes place within our cells and 2) the ways in which our cells are able to maintain stability within the entire function of the human body. Students will also explore examples of what happens when homeostasis is not maintained. After developing a model comparing normal cell division to cancer cell growth and division, students will research advancements in gene therapies and cancer treatments. Students will then add new information to their model to explain how these gene therapies are being used to fight cancers.

🧪 Unit Lab Activities:

Unit Lab Activities:

Cell Size and Diffusion Lab - In this investigation, students use cubes of agar to examine how cell size impacts diffusion. By infusing cubes of agar with a pH indicator, and then soaking the treated cubes in vinegar, students model how diffusion occurs in cells. Students observe cubes of different sizes, collect and analyze diffusion data to discover why larger cells might need extra help to transport materials. Students then examine different cells and the cell organelles to draw conclusions about cell size, structure, and function.

Homeostasis and Negative Feedback - Students will begin by analyzing and discussing concepts that develop their understanding of homeostasis and negative feedback. They will examine the differences between negative and positive feedback using the respiratory and circulatory systems as examples in providing O_2 and the removal of CO_2 from cells. Finally, students formulate a question concerning the effects of exercise on breathing, design and carry out a relevant experiment, analyze and interpret their data, and relate their results to homeostasis during exercise.

6. Ecosystem Stability and the Response to Climate Change

Students use computer models to investigate how Earth's systems respond to changes, including climate change. Students use the model to identify possible negative consequences of solutions that would outweigh their benefits. Students also develop conceptual models of ecosystem changes, evaluate different claims about the impacts of a new, hypothetical change, and how populations respond to the varied stresses from human activities and climate change. Students organize data from global climate models and climate observations over time that relate to the effect of climate change on different Earth systems. Students design a solution that involves reducing the negative effects of human activities on the environment and biodiversity that relies on scientific knowledge of the factors affecting changes.

Essential Questions:

1. What factors change in ecosystems that will affect populations?
2. What are the changes that are happening in the climate and what effects are those having on life?
3. How are human activities impacting Earth's systems and how does that affect life on Earth?
4. What can humans do to mitigate their negative impact on the environment?

NGSS Performance Expectations (PEs):

- **HS-LS2-6.** Evaluate the claims, evidence, and reasoning that the complex interactions in ecosystems maintain relatively consistent numbers and types of organisms in stable conditions, but changing conditions may result in a new ecosystem.
- **HS-LS2-7.** Design, evaluate, and refine a solution for reducing the impacts of human activities on the environment and biodiversity.
- **HS-LS4-5.** Evaluate the evidence supporting claims that changes in environmental conditions may result in (1) increases in the number of individuals of some species, (2) the emergence of new species over time, and (3) the extinction of other species. **HS-LS4-6.** Create or revise a simulation to test a solution to mitigate the adverse impacts of human activity on biodiversity.
- **HS-ESS3-5.** Analyze geoscience data and the results from global climate models to make an evidence-based forecast of the current rate of global or regional climate change and associated future impacts to Earth systems [Clarification Statement: Examples of evidence, for both data and climate model outputs, are
- **HS-ESS3-6.** Use a computational representation to illustrate the relationships among Earth systems and how those relationships are being modified due to human activity.
- **HS-ETS1-1.** Analyze a major global challenge to specify qualitative and quantitative criteria and constraints for solutions that account for societal needs and wants.
- **HS-ETS1-2.** Design a solution to a complex real-world problem by breaking it down into smaller, more manageable problems that can be solved through engineering.
- **HS-ETS1-3.** Evaluate a solution to a complex real-world problem based on prioritized criteria and trade-offs that account for a range of constraints, including cost, safety, reliability, and aesthetics, as well as possible social, cultural, and environmental impacts.
- **HS-ETS1-4.** Use a computer simulation to model the impact of proposed solutions to a complex real-world problem with numerous criteria and constraints on interactions within and between systems relevant to the problem.

NGSS Science and Engineering Practices (SEPs):

- Developing and using models
- Constructing explanations and designing solutions
- Obtaining, evaluating, and communicating information.

NGSS Crosscutting Concepts (CCCs):

- Patterns
- Stability and Change
- Scale, proportion, and quantity
- Energy and Matter
- Structure and Function

🖳 Unit Assignment(s):

Unit Assignments:

In this unit, students will build an understanding of the movement of matter and energy through environments as a basis for building a conceptual model of ecosystem stability and an organism's response to changes in the climate. Students will learn of the carbon cycle, the effect on humans, other populations and the atmosphere. Students will track their carbon footprint and propose ideas for mitigation of deleterious effects of increased carbon dioxide on our Earth. As the main agent of negative environmental changes, humans' effect on climate changes will be examined in their relationship to Earth's systems and ecosystem health.

Students will research a biome, how humans have impacted the biome, and create an action plan to reduce the human impact. Students choose a biome and research the following: major geologic features (mountains, deserts, oceans), climate (rainfall, temperature), natural resources available, common adaptations of animals and plants, other interesting facts or features. They then choose and provide more information about the human impact on this biome and describe how it has affected the biome. Students then research what has been done to mitigate the human impact, describe solutions to reduce the impact, and design an action plan to enact their solution. Students write a report and present their findings and proposal to the class.

🧪 Unit Lab Activities:

Unit Lab Activities

Urban Heat Islands - In this activity, students study urban heat islands to apply their model of the Earth's energy balance. They explore how human activities can alter the local climate system and ultimately design measures to reduce that impact.

Ocean Acidification - Students work in groups to brainstorm the sources of CO_2 entering the ocean, and then create a model of the causes and effects of ocean acidification. Students work to design solutions to mitigate ocean acidification which will be presented to the class using a variety of online resources.

Grade levels:	10th, 11th, 12th

ourse Description

urse overview:

Chemistry in the Earth System AB is a laboratory-based college preparatory course. This course is defined in the 2019 California Science Framework, integrating Chemistry and Earth and Space Science standards from the California Next Generation Science Standards (NGSS). The course is divided into seven units, the first of which is a unit that focuses on executive science skills. The following six Instructional Segments (I.S.) centered on questions about observations of a specific phenomenon. The units address the concepts of combustion, heat and energy in the Earth System, atoms, elements, and molecules, chemical reactions, and the chemistry of climate change. Different phenomena require different amounts of classroom investigative time to explore and understand, so each Instructional Segment should take a different fraction of the school year. As students achieve the Performance Expectations (PEs) within the unit, they uncover Disciplinary Core Ideas (DCIs) from Physical Science, Earth and Space Science, and Engineering. Students engage in multiple Science and Engineering Practices (SEPs) in each unit not just those explicitly indicated in the PEs. Students also focus on one or two Crosscutting Concepts (CCCs) as tools to make sense of their observations and investigations; the CCCs are recurring themes in all disciplines of science and engineering and help tie these seemingly disparate fields together.

Chemistry in the Earth System AB is a "d" course and meets the District Graduation requirement for laboratory physical science.

urse content:

0. Setting the Stage

This unit focuses on the executive science skills necessary for planning and conducting an investigation, collecting and analyzing data, using mathematics and computational thinking, and engaging in argument from evidence. Students are introduced to and connections are made between the fundamentals of Chemistry which are anchored to Earth's solid geosphere, its liquid hydrosphere, and its gaseous atmosphere.

Essential Questions:

1. How do you make sense of the world around you?
2. What is chemistry?
3. What skills are needed to conduct chemistry investigations?
4. How are Scientific Questions generated and tested?
5. How can trends in data be identified, analyzed, and applied?

Performance Expectations:

- Generate scientific questions.
- Identify and measure independent and dependent variables and constants.
- Write a data collection procedure.
- Identify and analyze graphical trends and patterns.
- State a claim about the scientific question being investigated through a written Claim-Evidence-Reasoning concluding paragraph.
- Evaluate the consistency of the data and relate to sources of error.

NGSS Science and Engineering Practices (SEPs):

- Analyzing and Interpreting Data
- Using Mathematics and Computational Thinking
- Engaging in Argument from Evidence

NGSS Cross-cutting Concepts (CCCs):

- Patterns
- Scale, Proportion, and Quantity
- Structure and Function

Unit Assignment(s):

Assignments in this unit aim to aid students in the development of scientific reasoning skills. Observing phenomena through the lenses of the SEP's and CCC's will be included. In addition, basic science skills will be reinforced through the use of NGSS Chemistry resources, in which development of the SEP's are supported.

Unit Lab Activities:

Review of mass, volume, density, and measurements are used to build and reinforce science executive skills such as how to make qualitative and quantitative observation, use scientific inquiry, logic, and reasoning to answer questions about the living world. Claim, evidence, reasoning (CER) format will be used to facilitate student's development of logic and reasoning after students investigate within rotating station labs.

---

1. Combustion

In the brief introductory unit on combustion, students investigate the amount of stored chemical potential energy in food. They make observations of material properties at the bulk scale that they will later explain at the atomic scale The themes of combustion and CO_2 tie together several of the instructional segments.

Essential Questions:

1. What is energy, how is it measured, and how does it flow within a system?
2. What mechanisms allow us to utilize the energy of our foods and fuels?

NGSS Performance Expectations (PEs):

- **HS-PS1-3.** Plan and conduct an investigation to gather evidence to compare the structure of substances at the bulk scale to infer the strength of electrical forces between particles
- **HS-PS1-4.** Develop a model to illustrate that the release or absorption of energy from a chemical reaction system depends upon the changes in total bond energy.
- **HS-PS1-7.** Use mathematical representations to support the claim that atoms, and therefore mass, are conserved during a chemical reaction

NGSS Science and Engineering Practices (SEPs):

- Asking questions
- Analyzing and interpreting data
- Developing and using models

NGSS Cross-cutting Concepts (CCCs):

- Energy and Matter: Flows, Cycles, and Conservation
- Patterns
- Stability and change
- Cause and effect: Mechanism and explanation
- Systems and system models.

Unit Assignment(s):

Keep a Fire Burning - In this unit assignment, students deepen their understanding of energy and matter through the study of combustion. Students apply the laws of conservation of energy and matter as they investigate and develop system models of combustion. To fully understand the phenomenon of California Wildfires students identify factors that sustain a combustion reaction by exploring the amount of energy stored in fuel samples, students then model the changes that occur when wood is burned and relate the change in energy that occurs during combustion to the change in chemical bonds from reactants to products. They identify patterns in how matter and energy are conserved and then apply this knowledge to explain their observation in related phenomena such as the dropping rubber balls of different masses movement of a pendulum.

Unit Lab Activities:

Conservation of Mass in Chemical Reactions - In this hands on experiment, students carry out an investigation to design a system that will support their understanding that mass is conserved throughout a chemical reaction of sodium bicarbonate with acetic acid. Students are provided with the materials they will need to design and conduct this experiment. Students begin by designing their experimental procedure on a whiteboard using the criteria that their system should include all reactants and products in this chemical reaction. Students implement their experimental designs, collect data, discuss their

results, and redesign their experimental designs to improve the collection of data. This experiment concludes with students presenting their experimental design process and their analysis of collected data to the class, as well as a CER statement in answer to the question, Is your experimental design for this investigation a closed system?

---

2. Heat and Energy In the Earth System

Students develop models of energy conservation within systems and the mechanisms of heat flow They relate macroscopic heat transport to atomic scale interactions of particles, which they will apply in later units to construct models of interactions between atoms They use evidence from Earth's surface to infer the heat transport processes at work in the planet's interior.

Essential Questions:

1. How is energy transferred and conserved?.
2. How can energy be harnessed to perform useful tasks?

NGSS Performance Expectations (PEs):

- **HS-PS3-1.** Create a computational model to calculate the change in the energy of one component in a system when the change in energy of the other component(s) and energy flows in and out of the system are known.
- **HS-PS3-2.** Develop and use models to illustrate that energy at the macroscopic scale can be accounted for as a combination of energy associated with the motions of particles (objects) and energy associated with the relative position of particles (objects).
- **HS-PS3-4.** Plan and conduct an investigation to provide evidence that the transfer of thermal energy when two components of different temperatures are combined within a closed system results in a more uniform energy distribution among the components in the system (second law of thermodynamics) .
- **HS-ESS2-3.** Develop a model based on evidence of Earth's interior to describe the cycling of matter by thermal convection.
- **HS-ETS1-4**. Use a computer simulation to model the impact of proposed solutions to a complex real-world problem with numerous criteria and constraints on interactions within and between systems relevant to the problem.

NGSS Science and Engineering Practices (SEPs):

- Developing and Using Models
- Planning and Carrying Out Investigations
- Using Mathematical and Computational Thinking
- Constructing Explanations (science) and Designing Solutions (for engineering)

NGSS Cross-cutting Concepts (CCCs):

- Systems and System Models
- Energy and Matter: Flows, Cycles, and Conservation

Unit Assignment(s):

Earthquakes in My Backyard - In this unit assignment, students will have the opportunity to relate how thermal convection of materials in the mantle leads to the movement and collision of tectonic plates which result in earthquakes. This assignment begins with students researching and recording on a map the locations of the most recent earthquakes in

California. Next, students observe a convection current demo and complete a KWL chart. In the first column, students write what they know (K) about Earth's interior structure and how heat flows between different layers. In the second column, students write what they want to learn (W) about Earth's interior. In the third column, students write what they have learned so far (L) about the movement of materials through the convection current demo. Students then use GPS data to track the movement of the tectonic plates in California. They are then asked to connect the plate movements with geological events in this case California earthquake locations. Additionally, students are asked to describe, using evidence, how convection in Earth's mantle drives the movements of the tectonic plates in California resulting in earthquakes.

Unit Lab Activities:

Thermal Energy and Heat Transfer - This hands on experiment begins with the phenomena of ice melting on different materials to demonstrate how different materials can conduct thermal energy at different rates and a discussion with students to determine why they think the ice melted at such different rates. Students then carry out an investigation to evaluate the heat flow of metals using microscale calorimeters. They use the data from their investigation to calculate heat for strips of aluminum, copper, iron, and zinc. This investigation concludes with students working in their lab groups to write an argument describing to an outside party why ice melts at different rates on different materials. Students will present arguments in the form of a peer review constructed as a "boardwalk" activity to suggest edits (one similarity and one clarifying question).

---

3. Atoms, Elements, and Molecules

Students recognize patterns in the properties and behavior of elements, as illustrated on the periodic table. They use these patterns to develop a model of the interior structure of atoms and to predict how different atoms will interact based on their electron configurations They use chemical equations to represent these interactions and begin to make simple stoichiometric calculations

Essential Questions:

1. What is inside atoms and how does this affect how they interact?
2. What models can we use to predict the outcomes of chemical reactions?

NGSS Performance Expectations (PEs):

- **HS-PS1-1.** Use the periodic table as a model to predict the relative properties of elements based on the patterns of electrons in the outermost energy level of atoms.
- **HS-PS1-2**. Construct and revise an explanation for the outcome of a simple chemical reaction based on the outermost electron states of atoms, trends in the periodic table, and knowledge of the patterns of chemical properties.
- **HS-PS1-7.** Use mathematical representations to support the claim that atoms, and therefore mass, are conserved during a chemical reaction.

NGSS Science and Engineering Practices (SEPs):

- Developing and Using Models
- Using Mathematics and Computational Thinking
- Constructing Explanation (for science) and Designing Solutions (for engineering)
- Engaging in Argument from Evidence

NGSS Crosscutting Concepts (CCCs):

- Patterns
- Energy and Matter: Flows, Cycles, and Conservation

Unit Assignment(s):

Explore Atomic Particles - This unit assignment begins with students investigating the mass and relative abundance of isotopes for the “bean bag” element (symbol Bg) and calculating the atomic mass of this element to reinforce that all of these “atoms” are from the same element (beans), but that each different size of bean represents a different isotope of that element. Students then explore atomic particles by analyzing a data set to discover how the number of protons, not the number of neutrons or electrons, determines the identity of each element. They also investigate how ionic charge is determined from the relative number of protons and electrons. This assignment concludes with students using computer simulations such as PhET or GIZMOS to reinforce the different parts of an atom, the concept of isotopes and relative abundance.

Unit Lab Activities:

Elemental Metals, Nonmetals, and Metalloids - This hands on investigation begins with a brief discussion about “valuable” elements. Students are asked to name valuable elements and think about the properties of these elements and the location of these elements on the periodic table. This discussion should evolve so students are considering elements based on the property of conductivity. Students are then asked to carry out an investigation using a conductivity meter and a bar magnet to rate the conductivity of different elemental samples: aluminum strip, carbon rod, iron nail, silicon lump, sulfur lump, mossy tin. Students then use their findings to identify patterns in the periodic table which are associated with conductivity. This investigation concludes with students writing an argument in which they make a claim about the relationship between the element’s conductivity, location in the periodic table, and electron configuration.

---

4. Chemical Reactions

Students define their models of chemical bonds and chemical reactions. They compare the strength of different types of bonds and attractions and develop models of how energy is stored and released in chemical reactions.

Essential Questions:

1. What holds atoms together in molecules?
2. How do chemical reactions absorb and release energy?

NGSS Performance Expectations (PEs):

- **HS-PS1-3.** Plan and conduct an investigation to gather evidence to compare the structure of substances at the bulk scale to infer the strength of electrical forces between particles.
- **HS-PS1-4.** Develop a model to illustrate that the release or absorption of energy from a chemical reaction system depends upon the changes in total bond energy.
- **HS-PS1-5.** Apply scientific principles and evidence to provide an explanation about the effects of changing the temperature or concentration of the reacting particles on the rate at which a reaction occurs.

- **HS-PS1-7.** Use mathematical representations to support the claim that atoms, and therefore mass, are conserved during a chemical reaction.
- **HS-PS2-4.** Use mathematical representations of Newton's Law of Gravitation and Coulomb's Law to describe and predict the gravitational and electrostatic forces between objects.
- **HS-PS3-5.** Develop and use a model of two objects interacting through electric or magnetic fields to illustrate the forces between objects and the changes in energy of the objects due to the interaction.

NGSS Science and Engineering Practices (SEPs):

- Developing and Using Models
- Planning and Carrying Out Investigations
- Using Mathematical and Computational Thinking
- Constructing Explanations (for science) and Designing Solution (for engineering)

NGSS Crosscutting Concepts (CCCs):

- Patterns
- Cause and Effect
- Energy and Matter: Flows, Cycles, and Conservation

Unit Assignment(s):

Collision Theory - This unit assignment begins with a teacher-led discussion about why energy is required to light a match. To facilitate this discussion the teacher lights stick matches using a hot plate. During this demonstration, students are encouraged to call out their observations when they see changes in the match heads. This demonstration concludes with the teacher generating a visual list of the student ideas about what was happening on the molecular level to make the match heads ignite. Students then explore collision theory using a computer simulation (PhET or Gizmos). During this exploration, students will determine what leads to a successful collision between particles in a chemical reaction. Students will also determine the effect of temperature and/or the addition of a catalyst on reaction rates. This assignment concludes with students making a claim about why the match required a certain amount of energy input before the match head ignited, supported by their observations.

Unit Lab Activities:

Reaction Rates and Equilibrium - This is a summative hands on investigation in which students are asked to carry out an investigation to determine how reaction rates change based on reactant concentration and temperature. This investigation begins with the instructor demonstrating the decomposition of hydrogen peroxide. Students then design a procedure to study the effect of hydrogen peroxide concentration on reaction rate. They record their data from their trials, analyze their results, and record patterns they observed in their experiment. In the second part of this investigation, students will explore how temperature influences the solubility of sodium acetate. Students then are asked to construct an explanation of their results using the terms of Le Chatelier's principle. Student data should support these two relationships - concentration of hydrogen peroxide and reaction rates, as well as temperature of a sodium acetate solution, increases to rate of dissolution.

---

5. Chemistry of Climate Change

Students develop models of energy flow in Earth's climate. They revisit combustion reactions from IS1 to focus on emissions from fossil fuel energy sources They apply models of the structures of molecules to explain how different molecules trap heat in the atmosphere. Students evaluate different chemical engineering solutions that can reduce the impacts of climate change

Essential Questions:

1. What regulates weather and climate?
2. What effects are humans having on the climate?

NGSS Performance Expectations (PEs):

- **HS-ESS2-2**. Analyze geoscience data to make the claim that one change to Earth's surface can create feedback that causes changes to other Earth systems.
- **HS-ESS2-4.** Use a model to describe how variations in the flow of energy into and out of Earth's systems result in changes in climate.
- **HS-ESS2-6.** Develop a quantitative model to describe the cycling of carbon among the hydrosphere, atmosphere, geosphere, and biosphere.
- **HS-ESS3-2.** Evaluate competing design solutions for developing, managing, and utilizing energy and mineral resources based on cost-benefit ratios.
- **HS-ESS3-5.** Analyze geoscience data and the results from global climate models to make an evidence-based forecast of the current rate of global or regional climate change and associated future impacts to Earth systems.
- **HS-ESS3-6.** Use a computational representation to illustrate the relationships among Earth systems and how those relationships are being modified due to human activity

NGSS Science and Engineering Practices (SEPs):

- Developing and Using Models
- Analyzing and Interpreting Data
- Using Mathematics and Computational Thinking
- Engaging in Argument from Evidence

NGSS Crosscutting Concepts (CCCs):

- Cause and Effect: Mechanism and Explanation
- Systems and Systems Models
- Energy and Matter: Flows, Cycles, and Conservation
- Stability and Change

Unit Assignment(s):

Carbon Dioxide and Its Role in Climate - To prompt student discussion about the greenhouse effect, this unit assignment will begin with a discussion about why the interior of a car gets so hot if the car is parked in the sun. Students carry out an activity to lay the foundation that anthropogenic greenhouse gasses play a role in climate change. Using a direct heat source, students compare the temperature increases of a closed system with ambient air to a closed system with additional carbon dioxide as a product of antacid effervescent-tablet catabolism. Students then choose a variable to manipulate to test the closed system again and look for patterns. Students then use a Flow of Energy and Greenhouse Gases simulation to help reinforce the concepts of absorption and reflection of energy. In this simulation, students observe how energy from the sun is absorbed, radiated, and reflected in the Earth system. They investigate changes to energy inputs and outputs by exploring solar flux, human effects, and supervolcanoes. And, explore how melting polar ice caps change Earth's

temperature and how rising sea levels affect ice cover on Earth. This assignment concludes with students connecting what they learned in the virtual simulation to the data they collected in their inquiry lab to propose the relationship between greenhouse gases and Earth's temperature.

Unit Lab Activities:

Albedo and Composition of Earth's Surface - In this lab students carry out an investigation to determine how albedo and specific heat influence how fast temperature change occurs in a substance. They will measure the temperature change in several samples placed under a heat lamp and formulate a prediction for the relationship between surface substance and temperature change. Students will then design and conduct a field experiment using infrared thermometers to test their prediction. This investigation concludes with students using the data from their laboratory and field experiments to create an infographic describing their findings describing the relationship between albedo and the composition of Earth's surfaces.

---

6. Dynamics of Chemical Reactions and Ocean Acidification

Students investigate the effects of fossil fuel combustion on ocean chemistry. They develop models of equilibrium in chemical reactions and design systems that can shift the equilibrium. Students conduct original research on the interaction between ocean water and shell-building organisms.

Essential Questions:

1. How can you alter chemical equilibrium and reaction rates?
2. How can you predict the relative quantities of products in a chemical reaction?

NGSS Performance Expectations (PEs):

- **HS-PS1-5.** Apply scientific principles and evidence to provide an explanation about the effects of changing the temperature or concentration of the reacting particles on the rate at which a reaction occurs.
- **HS-PS1-6.** Refine the design of a chemical system by specifying a change in conditions that would produce increased amounts of products at equilibrium.
- **HS-PS1-7.** Use mathematical representations to support the claim that atoms, and therefore mass, are conserved during a chemical reaction.
- **HS-ESS2-2.** Analyze geoscience data to make the claim that one change to Earth's surface can create feedback that causes changes to other Earth systems.
- **HS-ESS2-6.** Develop a quantitative model to describe the cycling of carbon among the hydrosphere, atmosphere, geosphere, and biosphere.

NGSS Science and Engineering Practices (SEPs):

- Developing and Using Models
- Analyzing and Interpreting Data
- Using Mathematics and Computational Thinking
- Constructing Explanations and Designing Solutions
- Engaging in Argument from Evidence

NGSS Crosscutting Concepts (CCCs):

- Patterns
- Energy and Matter: Flows, Cycles, and Conservation
- Stability and Change

Unit Assignment(s):

Reducing Carbon Footprints - In this assignment, students calculate their personal carbon footprint using a Carbon Footprint Calculator website. Students then analyze the components of their footprint and brainstorm ways that they can reduce their personal carbon footprint. Students are then challenged to apply what they have learned about reducing their personal carbon footprint to their school or city. In order to facilitate the idea that this is a local and personal issue, students pick one component of a carbon footprint to research then write a persuasive letter to the school board or city council proposing carbon footprint reduction ideas. The letter will include a clear explanation of the problem and their solution supported by evidence from their research.

Unit Lab Activities:

Calcium Carbonate and Shell Production - In this investigation, students evaluate how different concentrations of hydrochloric acid affect the time it takes to dissolve calcium carbonate. They record data on the volume of gas produced and the different concentrations of hydrochloric acid at various times. They identify patterns in how the change in concentration of hydrochloric acid affects the gas production by the calcium carbonate. Students identify the gas being produced in the reaction. They draw conclusions on how this relates to calcifying organisms and ocean acidification. Students construct an explanation about how the amount of available calcium carbonate could affect the ocean food web system and humans. Students then use the virtual lab, *The Effect of Ocean Acidification on Shells*, to explore how ocean pH and temperatures are expected to change if global CO_2 emissions do not change. Students analyze and interpret their findings from this virtual lab and add this understanding to their model of the impacts of ocean acidification. Students then work to design solutions to mitigate ocean acidification which are presented to the class.

Course Title

Chemistry A (Honors)

Description of Target Group

This is the first semester of a one-year course designed for 11th and 12th grade students who plan to be science or engineering majors in college. Students must have had top grads on IPS or Biology Blue, Algebra 1 and Geometry and should at least, be in Algebra 2 and preferable in Math Analysis.

Standards of Expected Student Achievement

Students will demonstrate, through testing, problem solving and laboratory work, at least, a reasonable mastery of the following topics:

I. Structure of Matter

A. Atomic Theory and Atomic Structure
1. Atomic Theory
2. Atomic weights determination by chemical and laboratory (physical) means
3. Atomic number and mass number; isotopes and mass spectroscopy
4. Electron energy levels; atomic spectra, quantum numbers, atomic orbitals
5. Periodic relationships, i.e. atomic radii, ionization energies, electron affinities, oxidation states

B. Chemical Bonding
1. Binding Forces
   a. Types: ionic, covalent, metallic, hydrogen bonding, Van der Waals
   b. Relationships to states, structure, and properties of matter
   c. Polarity of bonds, dipoles, electronegativity
2. Geometry of molecules, ions, and coordination complexes; structural isomerism; dipole moments of molecules, vectors relations; relations or properties to structure

3. Molecular models
   a. Valence bond theory; hybridization of orbitals, resonance, sigma and pi bonds
   b. Molecular orbitals

C. Nuclear Chemistry; nuclear equations, half-lives, radioactivity; chemical applications.

II. States of Matter

A. Gases
1. Laws of gases, including ideal gas law; equations
2. Kinetic-molecular Theory
a. Interpretation of ideal gas law
b. Avogadro's Hypothesis and the mole concept
c. Kinetic energy and temperature; Boltzmann distribution
d. Deviations from ideal gas law

B. Liquids and Solids
1. Liquids and solids from kinetic energy viewpoint
2. Phase diagrams or one-component systems
3. Changes of state, critical phenomena
4. Crystal structure

C. Solutions
1. Types of solutions and factors affecting solubility
2. Methods of expressing concentrations (molarity, etc.)
3. Colligative properties, i.e. Raoult's Law
4. Effect of interionic attraction of colligative properties and solubility

III. Reactions

A. Stoichiometry
1. Ionic and molecular species present in chemical systems; ionic and new ionic equations
2. Balancing of equations including those for redox reactions
3. Weight and volume relations with emphasis on the mole concept.

B. Equilibrium
1. Concept of dynamic equilibrium, physical and chemical; Le Chatelier's; equilibrium constants; deviations from ideality

Instructional Material

Test and Supplementary Materials

Audio-visual materials: filmstrips, films, videocassettes, and records

Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

Course Title **ERHS**

Chemistry A (AP)

Description/ Target group

This is two-semester laboratory course of inorganic chemistry, designed for college bound students entering the fields of science and engineering, family health and human resources. This course is intended to be a second year chemistry course.

All students are expected to take the College Board Advanced Placement Exam for Chemistry in May.

Course Length

One Semester, 5 units

Course Adoption

UC/CSU "a-f" inclusion

Prerequisites

Chemistry B (P) and Algebra II B (P) with a B average or better. (Recommended)

Standards of Expected Student Achievement

Activity: It is expected that the student complete a preliminary summer assignment on the following topics:

A. Scientific Method
B. Significant digits and scientific calculations
C. Matter and energy
D. Properties of Matter
E. Elements, compounds and mixtures
F. The modern atomic theory
G. Compounds and inorganic nomenclature
H. The mole concept
I. Percentage composition and the empirical formula
J. Writing and balancing chemical equations
K. Stoichiometry
L. Limiting Reactant and percentage yield

Chemistry A (AP) (continued)

Students will demonstrate, through testing, problem solving and laboratory work, at least, a reasonable mastery of the following topics:

I. Structure of Matter
   A. Atomic theory and atomic structure
      1. Evidence of the atomic theory
      2. Atomic masses; determination by chemical and physical means
      3. Atomic number and mass number; isotopes
      4. Electron energy levels; atomic spectra, quantum numbers, atomic orbitals
      5. Periodic relationships including, for example, atomic radii, ionization energies, electron affinities, oxidation states

   B. Chemical bonding
      1. Binding forces
         a. Types: ionic, covalent, metallic, hydrogen bonding, van der Waals (including London dispersion forces)
         b. Relationships to states, structure, and properties of matter
         c. Polarity of bonds, electronegativities
      2. Molecular models
         a. Lewis structures
         b. Valence bond: hybridization of orbitals, resonance, sigma and pi bonds
         c. VSEPR
      3. Geometry of molecules and ions, structural isomerism of simple organic molecules and coordination complexes; dipole moments of molecules; relation of properties to structure
   C. Nuclear chemistry; nuclear equations, half-lives, and radioactivity; chemical applications
II. States of Matter
   A. Gases
      1. Laws of ideal gases
         a. Equation of state for an ideal gas
         b. Partial pressures
      2. Kinetic-molecular theory
         a. Interpretation of ideal gas laws on the basis of this theory
         b. Avogadro's hypothesis and the mole concept
         c. Dependence of kinetic energy of molecules of temperature
         d. Deviations from ideal gas laws
   B. Liquids and solids
      1. Liquids and solids from the kinetic-molecular viewpoint
      2. Phase diagrams of one-component systems
      3. Changes of state, including critical points and triple points
      4. Structure of solids; lattice energies
   C. Solutions
      1. Types of solutions and factors affecting solubility
      2. Methods of expressing concentration (The use of normalities is not tested.)

3. Raoult's law and colligative properties (nonvolatile solutes); osmosis
4. Non-ideal behavior (qualitative aspects)

III. Laboratory

A. Making observations of chemical reactions and substances
B. Recording data
C. Calculating and interpreting results based on the quantitative data obtained
D. Communicating effectively the results of experimental work

Methods of Assessment of Student Learning: Written examinations, laboratory reports, assigned homework problems, and College Board Advanced Placement Examination.

Textbook

Refer to: Secondary Adopted texts and Approved Supplementary Books used in the Santa Maria Joint Union High School District.

This course is not a graduation requirement for the Santa Maria Union High School District.

Department

RHS Science

Description/ Target group

This is two-semester laboratory course of inorganic chemistry, designed for college bound students entering the fields of science and engineering, family health and human resources.

All students are expected to take the College Board Advanced Placement Exam for Chemistry in May.

Course Length

One Semester, 5 units

Course Adoption

UC/CSU "a-f" inclusion

Prerequisites

Chemistry A (AP) with passing grade

Standards of Expected Student Achievement

Students will demonstrate, through testing, problem solving and laboratory work, at least, a reasonable mastery of the following topics:

I. Reactions
   A. Reaction types
      1. Acid-base reactions; concepts of Arrhenius, Brønsted-Lowry, and Lewis; coordination complexes; amphoterism
      2. Precipitation reactions
      3. Oxidation-reduction reactions
         a. Oxidation number
         b. The role of the electron in oxidation-reduction
         c. Electrochemistry: electrolytic and galvanic cells; Faraday's laws; standard half-cell potentials; Nernst equation; prediction of the direction of redox reactions

Chemistry B (AP) (continued)

   B. Stoichiometry

1. Ionic and molecular species present in chemical systems: net ionic equations
2. Balancing of equations including those for redox reactions
3. Mass and volume relations with emphasis on the mole concept, including empirical formulas and limiting empirical formulas and limiting reactants

C. Equilibrium
1. Concept of dynamic equilibrium, physical and chemical; Le Chatelier's principal; equilibrium constants
2. Quantitative treatment
a. Equilibrium constants for gaseous reactions: K_p, K_c
b. Equilibrium constants for reactions in solution
(1) Constants for acids and bases; pK; pH
(2) Solubility product constants and their and their application to precipitation and the dissolution of slightly soluble compounds
(3) Common ion effect; buffers; hydrolysis

D. Kinetics
1. Concept of rate of reaction
2. Use of experimental data and graphical analysis to determine reactant order, rate constants, and reaction rate laws.
3. Effect of temperature charge on rates
4. Energy of activation; the role of catalysts
5. The relationship between the rate-determining step and a mechanism

E. Thermodynamics
1. State functions
2. First law: change in enthalpy; heat of formation; heat of reaction; Hess's law; heats of vaporization and fusion; calorimetry
3. Second law: entropy; free energy of formation; free energy of reaction; dependence of change in free energy on enthalpy and entropy changes.
4. Relationship of change in free energy to equilibrium constants and electrode potentials

II. Descriptive Chemistry
A. Chemical reactivity and products of chemical reactions
B. Relationships in the periodic table; horizontal, vertical, and diagonal with examples from alkali metals, alkaline earth metals, halogens, and the first series of transition elements
C. Introduction to organic chemistry: hydrocarbons and functional groups

III. Laboratory

A. Making observations of chemical reactions and substances
B. Recording data
C. Calculating and interpreting results based on the quantitative data obtained
D. Communicating effectively the results of experimental work

Methods of Assessment of Student Learning: Written examinations, laboratory reports, assigned homework problems, and College Board Advanced Placement Examination

Textbook

Refer to: Secondary Adopted texts and Approved Supplementary Books used in the Santa Maria Joint Union High School District.

This course is not a graduation requirement for the Santa Maria Union High School District.

Course Title **ERHS**

Chemistry A/B (Honors)

Prerequisites: Algebra 1 and Geometry (A average), Biology (A average), or Honors Biology (B average).

Description of Target Group

This is a two semester laboratory course of inorganic chemistry, designed for college bound students entering the fields of science and engineering, family health and human resources.

Standards of Expected Student Achievement

Students will demonstrate, through testing, problem solving and laboratory work, at least, a reasonable mastery of the following topics:

I. Structure of Matter

A. Atomic Theory and Atomic Structure
1. Atomic Theory
2. Atomic weights determination by chemical and laboratory (physical) means
3. Atomic number and mass number; isotopes and mass spectroscopy
4. Electron energy levels; atomic spectra, quantum numbers, atomic orbitals
5. Periodic relationships, i.e. atomic radii, ionization energies, electron affinities, oxidation states

B. Chemical Bonding
1. Binding Forces
   a. Types: ionic, covalent, metallic, hydrogen bonding, Van der Waals
   b. Relationships to states, structure, and properties of matter
   c. Polarity of bonds, dipoles, electronegativity
2. Geometry of molecules, ions, and coordination complexes; structural isomerism; dipole moments of molecules, vectors relations; relations or properties to structure

3. Molecular models
   a. Valence bond theory; hybridization of orbitals, resonance, sigma and pi bonds
   b. Molecular orbitals

C. Nuclear Chemistry; nuclear equations, half-lives, radioactivity; chemical applications.

II. States of Matter

A. Gases
1. Laws of gases, including ideal gas law; equations
2. Kinetic-molecular Theory
a. Interpretation of ideal gas law
b. Avogadro's Hypothesis and the mole concept
c. Kinetic energy and temperature; Boltzmann distribution
d. Deviations from ideal gas law

B. Liquids and Solids
1. Liquids and solids from kinetic energy viewpoint
2. Phase diagrams or one-component systems
3. Changes of state, critical phenomena
4. Crystal structure

C. Solutions
1. Types of solutions and factors affecting solubility
2. Methods of expressing concentrations (molarity, etc.)
3. Colligative properties, i.e. Raoult's Law
4. Effect of interionic attraction of colligative properties and solubility

III. Reactions

A. Stoichiometry
1. Ionic and molecular species present in chemical systems; ionic and new ionic equations
2. Balancing of equations including those for redox reactions
3. Weight and volume relations with emphasis on the mole concept.

B. Equilibrium
1. Concept of dynamic equilibrium, physical and chemical; Le Chatelier's; equilibrium constants; deviations from ideality

Textbook: Refer to: Secondary Adopted Texts and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

This course is not a graduation requirement for the Santa Maria Joint Union High School District

Course Title **SMHS**

Chemistry A/B (P)

Description of Target Group

This course is designed for 10th, 11th, and 12th grade students who are university or technical prep and who are going to major in a science related field. Recommend passing grades in IPS or Biology Blue, Algebra 1, Geometry, and concurrent enrollment in Algebra 2.

Purpose

To provide the students information about the substances in the environment and how these substances interact.

Standards of Expected Student Achievement

The students will demonstrate their mastery of chemistry by solving problems using the following facts, theories, concepts, and techniques:

1. graphing
2. scientific notation
3. metric system
4. significant figures
5. gas pressure
6. Boyle's law
7. molecular model of gases
8. weights of equal volumes of gases
9. Avogadro's hypothesis
10. mole
11. atoms
12. chemical equations
13. molarmass
14. partial pressures
15. Charle'slaw
16. standard temperature and pressure
17. absolute temperature
18. Kinetic energy
19. kelvins
20. absolute zero
21. gas content
22. ideal gas law
23. element
24. compound
25. purity
26. decomposition of compounds
27. analysis

28. chemical synthesis
29. Law of Definite Proportions
30. symbols
31. structural formulas
32. reactants
33. products
34. chemical reactions
35. balancing equations
36. molecule relationships
37. mole relationships
38. volume relationships
39. mass relationships
40. combustion
41. hydrocarbons
42. carbohydrate
43. alkali metals
44. hydroxides
45. periodicity
46. periodic table
47. groups
48. noble gases
49. columns
50. rows
51. electric charge
52. like charge repulsion
53. opposite charge attraction
54. Coulomb's Law
55. neutral
56. protons
57. electrons
58. vacuum tube
59. field
60. cathode
61. charge of electron
62. mass of electron
63. Millikan's oil drop experiment
64. ions
65. mass spectrograph
66. isotopes
67. J.J. Thomson's atomic model
68. Rutherford's scattering experiment
69. Rutherford's atomic model
70. alpha particle
71. nucleus

72. atomic number

73. atomic size
74. angstrom
75. neutron
76. mass number
77. radioactivity
78. alpha particle
79. beta particle
80. gamma ray
81. nuclear fission
82. nuclear fusion
83. light as a wave
84. frequency
85. wavelength
86. diffraction pattern
87. interference pattern
88. spectrograph
89. refraction
90. hertz
91. infrared
92. ultraviolet
93. light as energy
94. Planck's constant
95. photon
96. photoelectric effect
97. atomic spectra
98. atomic spectra model
99. atomic energy levels
100. quantum mechanics
101. Bohr's model of the Hydrogen atom
102. wave properties of matter
103. DeBroglie's standing wave model
104. probability
105. principle quantum number
106. orbital
107. s orbital
108. p orbital
109. d orbital
110. f orbital
111. wave functions
112. electron configuration
113. ground state
114. Pauli's exclusion principle
115. dosed shell

116. energy level filling
117. periodic pattern of electron configurations

118. periodic pattern of chemical properties
119. ionization energy
120. alkaline earth metals
121. chemical bond
122. overlap of half-filled orbitals
123. covalent bond
124. representation of chemical bonding
125. orbital representation
126. dot representation
127. line representation
128. valance orbitals
129. valance electrons
130. bonding capacity
131. reactivity
132. stability
133. ionic bond
134. dipole
135. electron density maps
136. molecular structure
137. X-ray diffraction
138. bond angle
139. electron dot formula
140. electron pairs
141. electron-pair repulsion theory
142. tetrahedral electron pair arrangement
143. unshared electron pairs
144. shared or bonding electron pairs
145. hybrid orbitals
146. hybridization of orbitals
147. double bonds
148. triple bonds
149. bond energy
150. resonance
151. resonance hybrids
152. molecular formulas
153. dipole moment
154. isomers
155. structural isomers
156. geometric isomers
157. Identify activities such as observing, describing, classifying, testing, and predicting as important in science of chemistry.
158. Recognize formulas and develop proficiency in the balancing of equations.

159. Ability to use empirical and mathematical relationships to solve weight volume relationships (stoichiometry).

160. Accurately work through assigned experiments to arrive at a definitive and logical conclusion.

161. To describe and show how chemical bonding explains stability of chemicals in combined state.

162. Recognize and know implications of acid-base PH, oxidation-reduction states, ionization and equilibrium.

163. Be able, at all times, to use all metric and scientific notation.

164. Understand radioactive decay and be able to write nuclear equations.

165. Identify the organic compound structures of saturated and unsaturated hydrocarbons.

166. To accept responsibility for the safe and careful handling of all needed equipment and materials.

Instructional Materials

Text and Supplementary Materials

Refer to: Secondary Adopted Texts and Approves Supplementary Books Used in the Santa Maria Joint Union High School District

Activities

Experiments at assigned lab desks, three dimensional physical model construction, correlated chemistry study films, demonstrations, weekly quizzes and tests on point score basis.

Course Title

Chemistry B (Honors)

Description of Target Group

This is the second semester of a one-year course designed for 11th and 12th grade students who plan to be science or engineering majors in college. Students must have had top grads on IPS or Biology Blue, Algebra 1 and Geometry and should at least, be in Algebra 2 and preferable in Math Analysis.

Purpose

The purpose of this course is to give students a course similar to a chemistry course taken during the first college year. Students will be given a depth of understanding of fundamentals and a reasonable Competence in dealing with chemical problems.

Standards of Expected Student Achievement

Students will demonstrate, through testing, problem solving and laboratory work, at least, a reasonable mastery of the following topics:

I. Structure of Matter

A. Atomic Theory and Atomic Structure
1. Atomic Theory
2. Atomic weights determination by chemical and laboratory (physical) means
3. Atomic number and mass number; isotopes and mass spectroscopy
4. Electron energy levels; atomic spectra, quantum numbers, atomic orbitals
5. Periodic relationships, i.e. atomic radii, ionization energies, electron affinities, oxidation states

B. Chemical Bonding
1. Binding Forces
   a. Types: ionic, covalent, metallic, hydrogen bonding, Van der Waals
   b. Relationships to states, structure, and properties of matter
   c. Polarity of bonds, dipoles, electronegativity

2. Geometry of molecules, ions, and coordination complexes; structural isomerism; dipole moments of molecules, vectors relations; relations or properties to structure

3. Molecular models
   a. Valence bond theory; hybridization of orbitals, resonance, sigma and pi bonds
   b. Molecular orbitals

C. Nuclear Chemistry, nuclear equations, half-lives, radioactivity, chemical applications.

II. States of Matter
A. Gases
1. Laws of gases, including ideal gas law; equations
2. Kinetic-molecular Theory
   a. Interpretation of ideal gas law
   b. Avogadro's Hypothesis and the mole concept
   c. Kinetic energy and temperature; Boltzmann distribution
   d. Deviations from ideal gas law

B. Liquids and Solids
1. Liquids and solids from kinetic energy viewpoint
2. Phase diagrams or one-component systems
3. Changes of state, critical phenomena
4. Crystal structure

C. Solutions
1. Types of solutions and factors affecting solubility
2. Methods of expressing concentrations (molarity, etc.)
3. Colligative properties, i.e. Raoult's Law
4. Effect of interionic attraction of colligative properties and solubility

lll. Reactions

A. Reaction Types
1. Formation and cleavage or covalent bonds
   a. Acid-base reactions; concepts of Arrhenius, Bronsted-Lowry, and Lewis; Amphoterism
   b. Reactions involving coordination complexes; amphoterism.
2. Precipitation-Reactions

Chemistry B (Honors) (continued)

3. Oxidation-Reduction Reactions
   a. Oxidation-reduction reactions
   b. Role of electron
   c. Electro chemistry

B. Stoichiometry

1. Ionic and molecular species present in chemical systems; ionic and new ionic equations

2. Balancing of equations including those for redox reactions

3. Weight and volume relations with emphasis on the mole concept

C. Equilibrium

1. Concept of dynamic equilibrium, physical and chemical; Le Chatelier's; equilibrium constants; deviations from ideality

2. Quantitative Treatment
   a. Equilibrium constants for gaseous reactions. Kp,Kc
   b. Equilibrium constants for reactions in solutions.
      (1) Constants for acids and bases. Pk,Ph
      (2) Solubility product constants and their applications to precipitation and the dissolution of slightly soluble compounds
      (3) Constants for complex ions
      (4) Common ion effects; buffers

D. Kinetics

1. Concept of rate of reaction

2. Order of reaction and rate constant; their determination from experimental data

3. Effect of temperature change on rates

4. Energy of activation; the role of catalysts

5. The relationship between rate-determining step and a mechanism

E. Thermodynamics

Chemistry B (Honors) (continued)

1. State functions

2. First Law: heat or formation, heat or reaction, change in enthalph, Hess's Law; heat capacity; heats of vaporization and fusion

3. Second Law: free energy or formation; free energy or reaction; dependence or change in free energy or enthalphy and entropy changes

4. Relationship of change in free energy to equilibrium constants and electrode potentials

Instructional Materials

Text and Supplementary Materials

Audio-visual materials: filmstrips, films, videocassettes, and records

Refer to: Secondary Adopted Texts and Approves Supplementary Books Used in the Santa Maria Joint Union High School District

University of California *It starts here*

Review Course - Previous Review - 10/26/12 8:49 PM

A. COVER PAGE - Submission ID: 326232		
	Proposed	Approved
1. Course Title	Earth Science A/B	Earth Science A/B
5. Subject Area	Subject: Elective Category: Science-Physical	Subject Area: g - Elective Category: Science-Physical

Checklist for Course Review and Feedback

- Course approved
- Not Approved:
  - Lacking necessary course information (see Section A below)
  - Lack of pre-requisites
  - Other:

Please do not scatter the labs throughout the submission; there was lab information in the key assignments and the assesssment methods. In addition, the assessment methods contained many repeated elements; please proofread and be sure you have entered information where it belongs and only entered it once.

Comments:
All laboratory science courses must have at a minimum a required pre- or co-requisite of Algebra I

??

A. Lacking Necessary Course Information

Component	Not Adequate	Comments
Course outline or list of topics	✓	
Other:	✓	A listing of topics in the course outline does not provide evidence of depth of study. A more annotated outline would illustrate what the students will be learning as well as the goals and purposes of each unit. It should include evidence of the course rigor, relevance, and development of essential skills and habits of mind (communication, critical thinking, analysis, synthesis of materials, etc.). Please elaborate on the Chemistry labs-just listing them does not show academic rigor.

B. Fails to Meet Honors Criteria:

Notes/Comments (Public) *This note will be visible on a-g course list site.*

- **Previously Approved Courses**

NOTE: Complete outlines are not needed for courses previously approved by UC. Courses that are defined as "previously approved" are courses from programs (Advanced Placement, International Baccalaureate, ROP courses, etc.), courses from within the same district, courses that have been removed within a three-year window and are being reinstated, and courses from UC-approved online providers. Courses modeled after courses from outside the school district are also defined as "previously approved" but a complete course description will be required for submission. Each section below represents an individual page on the electronic submission site.

Was this course "Previously Approved" by UC? _____ Yes ✓ No

If "No", proceed to the **Course Description** section.

If "Yes," please indicate which category applies:

Is this course modeled after a UC-approved course from another school outside your district?

_____ Yes _____ No

NOTE: If "Yes," you will be required to submit a complete course description. UC will review the previous submission, if available, to assist in our review process.

If "Yes," which school and ATP code? _____

Exact Course Title: _____

_____ National University Virtual High School

_____ PASS Program / Cyber High

_____ UC College Prep Online (UCCP)

Exact Course Title: _____

Is this course modeled after an identical course approved for the current year at another school in the same comprehensive school district?

_____ Yes _____ No

If "Yes," which school? _____

Exact Course Title: _____

- **Course Description**

Course Title: Earth Science A/B

NOTE: Courses that are "previously approved" must use the same exact course title as the previously approved course.

Transcript Title(s)/Abbreviation(s): Earth Sci A/B

Course Code(s): Earth Sci A: SC1032 Earth Sci B: SC1033

Seeking "Honors" Distinction

NOTE: To receive "honors" distinction, the course submission must satisfy certain requirements. For information about these requirements, please visit the a-g Guide: http://www.ucop.edu/a-gGuide/ag/a-g/honors.html. For "previously approved" courses (including AP and IB), the honors information will be pre-populated as applicable.

✔ No

_____ Yes, AP

_____ Yes, IB (Higher Level)

_____ Yes, IB (Standard Level)

_____ Yes, Other Honors

NOTE: Defined as a course specifically designed by the school with distinctive features which sets it apart from regular high school courses in the same discipline areas. Course should be seen as comparable in terms of workload and emphasis to AP, IB, or introductory college courses in the subject. Honors courses must be designed for the 11th and 12th grade level and require a comprehensive, year-long, written final exam. In addition to AP and IB higher level courses, high schools may certify as honors level courses *not more than one unit in each of the following subject areas only*: history, English, advanced mathematics, each laboratory science, each language other than English, and each of the four VPA disciplines. If there are no AP or IB higher level courses in a given subject area, the high school may certify up to, but not more than, two units at the honors level in that area.

Subject Area and Category

_____ "a" – History / Social Science

_____ U.S. History

_____ American Government / Civics

_____ World History / Geography / Cultures

_____ "b" – English

_____ English

_____ English-ESL/ELD

_____ "c" – Mathematics

Grade Level: ✔ 9 _____ 10 _____ 11 _____ 12

NOTE: Grade level pertains to which grades the course has been designed. 9th grade cannot be selected for Advanced VPA. 9th and 10th grades cannot be selected for honors courses.

Unit Value: _____ 0.5 (half year or semester equiv.) ✔ 1.0 (one year, 2 semesters or 3 trimesters equiv.)

- **Course Attributes**

Is this course classified as a Career Technical Education course?

_____ Yes ✔ No

If "Yes," please select the name of the Industry Sector and Career Pathway:

_____ Agriculture and Natural Resources

_____ Agricultural Business

_____ Agricultural Mechanics

_____ Agriscience

_____ Animal Science

Brief Course Outline

This is a two semester college preparatory science class designed to give students an overview of earth science. Students will learn about global phenomena such as earthquakes, volcanoes, climate change, global winds and ocean currents. Geology, Earth's energy, astronomy, basic chemistry and physics will also be explored. This class will include reading assignments, hands-on projects and activities that will stimulate an understanding of these scientific subjects. Receiving a passing grade for both semesters meets the physical science requirement for graduation.

Pre-Requisites: _____ Required _____ Recommended _____

NOTE: Laboratory science and Advanced VPA courses require a pre-requisite. Submissions will not be allowed if this is not included. Some courses, particularly in the mathematics subject areas, require appropriate pre-requisites. For further explanation, refer either to the "Guide to a-g Requirements" document or the a-g Interactive Guide web site at www.ucop.edu/a-gGuide.

Co-Requisites: _____ Required _____ Recommended _____

- **Background Information**

NOTE: Do not include information that could identify your school or district.

Context for Course (optional) **REQUIRED FOR CTE COURSES**

NOTE: In order to understand the context for a new course, sometimes it is helpful for UC to understand the broader educational program and/or reform efforts of the school. How does this course fit into broader departmental and/or pathway structure? How does it fit into the overall school restructuring plans? Is the course intended to be a core course or supplemental? What are the student/school/community needs met by this course?

History of Course Development (optional) **REQUIRED FOR CTE COURSES**

NOTE: Likewise, it is sometimes helpful for UC to know the origins of a course and who was involved in its development. Did you consult with UC Admissions personnel or UC professors? If so, what was the nature of such consultation and what was the result? Was this course modeled after another course at another school? If so, is that course UC approved? How does the course being submitted differ from the course after which it was modeled? Has this course received any special recognitions, designations or awards? Has it been articulated to local community colleges or universities?

- **Textbooks**

NOTE: Include list of Primary and Secondary Texts. Make sure to note the books that will be read entirely and those that will be as excerpts. Textbook information is not necessary if your course is a Visual and Performing Arts, Advanced Placement or an International Baccalaureate course. Online texts or non-standard text materials should include a link to the online text.

Textbook

Title: Holt Earth Science

Edition: First

Publication Date: 2007

Publisher: Holt, Rinehart and Winston

Author(s): Mead A. Allison, Ph.D., Arthur T. DeGaetano, Ph.D., Jay M. Pasachoff, Ph.D.

URL Resource(s): _____

Usage: _____ Primary Text ✔ Read in entirety or near entirety

(Be sure to list any additional textbooks that are used for the class.)

Course Purpose

This is a two semester college preparatory science class designed to teach students about Earth and space sciences.
Students will learn about global phenomena such as earthquakes, volcanoes, climate change, global winds and ocean currents. Geology, Earth's energy, astronomy, basic chemistry and physics will also be explored.

Students will learn about the tectonic processes that shape the Earth and how the tectonic processes are the driving forces of the Earth's resources. They will also see how these processes create different geologic hazards. Students will learn how to read and interpret both topographic maps and cross-sections in order to successfully complete the given projects. The astronomy section will cover the big bang theory, stellar evolution including how elements on the periodic table were formed and planetary geology. This course is designed to reinforce student understanding of scientific investigation and experimentation within the realm of geologic science.

Goals/completed outcomes for this course are:

**Students will be able to think critically in order solve real-world problems by completing standards-based group and individual projects, laboratory experiments and assignments.

**Students will be able to determine areas which may be threatened by natural disasters and by using learned geologic concepts, when looking for places to live later in life.

**Students will be able to explain the evidence how the geological studies of Earth and other planets suggests that early Earth was very different from the Earth today.

**Students will be able to explain the differences between explosive and non-explosive volcanoes and show where these types of volcanoes would be found around the world.

**Students will be able to interpret California geology and its relationship to the state's wealth of natural resources and to its natural hazards.

**Students will be able to analyze ways in which life has changed Earth's atmosphere and ways that changes in the atmosphere affect conditions for life.

**Students will be able to describe the process of stellar evolution, the life and death of stars, in order to fully explain the process of our own sun within our solar system.

Course Outline

Earth Science--Course Outline

Chemistry & Density Unit:
Oberservation vs Inference
Volume & Measurement Lab
Density Notes

Lab: Density of Coke vs Diet Coke
Lab: Density of Materials
Overview: Matter flow Chart + Book Assignment
PowerPoint: Physical & Chemical Properties of Minerals
PowerPoint: Mohs Hardness Scale
Lab: Mohs Hardness Scale
Lab: Physical & Chemical Properties of Minerals
Notebook Check #1
Superquiz: Density, Physical & Chemical Properties

Lab: Periodic Table of Stick Figures
PowerPoint: Overview of the Periodic Table
Video: The Elements
Assignment: Creating a Periodic Table
PowerPoint: Finding protons, nuetrons & electrons
Assignment: Drawing atomic structures
Lab: Periodic Table Scavenger Hunt
Notebook Check #2
Study guide for periodic table exam
Exam: Periodic Table
Assignment: Finding valence electrons
Notes: Lewis Dot Structures + practice problems
Notes: Ions & Finding oxidation #'s
Assignment: Finding oxidation #'s
Quiz: Ions & Oxidation #'s
Lab: Molecular Model
Notebook Check #3
Study Guide: Bonding & Oxidation #'s

Lesson: Balancing Equations
Assignment: Balancing Equations Worksheets
Video Lab: Walking with Dinos & Photosynthesis
Lesson: Types of Reactions + Worksheet
Lab: Double Displacement
Lab: Alginate Kelp Ball Lab
Video: World of Plastics
Assignment: Chemistry crossword

Weather, Atmosphere & Climate Unit:
Project: The Water Cycle
PowerPoint: Earth's Atmosphere Over Time
PowerPoint: Severe Weather
Video: Wonders of Weather
PowerPoint: Rain Shadows
Lab: Geography of US & Severe Weather
PowerPoint: Atmosphere

Lab: Cross-section of the atmosphere
Assignment: Section 22.1 Book Assignment
Lab: Ozone
Assignment: Section 22.2 Book Assignment
Assignment: Atmosphere Round Robin
Lesson: Earth's Energy Budget
Group Project: The Atmosphere
PowerPoint: Weather & Climate
Lab: Climograph
Lab: Gobal Wind Pattern Map
Video Assignment: El Nino

Atmosphere & Climate Crossword
Video: Understanding Oceans
PowerPoint: Oceans & it's Salinity
Assignment: Ocean Questions
Lab: Ocean Currents
Notebook Check #4
Study Guide: Atmosphere, Climate & Ocean Currents
Exam: Atmosphere, Climate & Ocean Currents
Written Review for Finals
Final: Chemistry, Weather, Atmosphere & Climate

Astronomy Unit:
Lab: Making an Alien + Writing
Astronomy pre-assessment
Lab: Distances of the Solar System
Video: Understanding the Universe
PowerPoint: Stellar Evolution
Video Assignment: Exploding Stars & Black Holes
Group Project: Stellar Evolution
Assignment: Astronomy Crossword Puzzle
Standards-based Astronomy Project
Notebook Check #5
Study Guide: Astronomy
Exam: Astronomy

Geology Unit:
Video: The Ocean Floor
Partner Project: The Ocean Floor
Lab: Cross-cutting Relations
Lab: Reading Topographic Maps
Demo: Tearing Paper
PowerPoint: Continental Drift
Lab: Pangaea
PowerPoint: The Layers of the Earth

Lab: Pie Slice of the Earth
PowerPoint: Seafloor Spreading
Lab: Paleomagnetics
PowerPoint: Plate Tectonics & Boundaries
Video Assignment: Explosive & Non-explosive Volcanoes
PowerPoint: Hot Spots
Notes: Viscosity + Demo
Quiz: Viscosity
Lab: Convergent Boundary Drawing Lab
Assignment: Plate Map of the World
Lab: Boundaries of the World
Video Assignment: Dante's Peak + Volcano writing assignment
Notebook Check #6
Study Guide: Plate Tectonics + Volcanoes
Exam: Plate Tectonics & Viscosity

California Geology Project
Project: Renewable & Non-renewable Energy
Group Project: Build a Wind Turbine to make electricity
Group Project: Create Hydroelectric Power
PowerPoint: Overview of Anticlines & Synclines & Oil Deposition in California
PowerPoint: Cross-cutting Relations & Topographic Maps
PowerPoint: Deposition of Rocks
Lab: Rock Cycle Roulette
Assignment: The Rock Cycle
PowerPoint: San Andreas Faullt
Video: Loma Prieta Quake
PowerPoint: Earthquakes
Video: Mexico City Quake
Video: Kobe Japan Quake
Paper: Earthquake comparisons

Group Project Pre-Lab: Create a 1:40 scale model of the classroom
Group Project: Seismic Retrofit

Physics Unit:
PowerPoint: Tsunamis
Video: Indonesian Tsunami
Lesson: Wave & Frequency Problems
Assignment: Frequency math problems
Lesson: Velocity
Group lab: How Fast Do You Walk?
Assignment: Velocity Problems
Lab: Constant Velocity
Lab: Sled Races
Notes: Acceleration

Assignment: Acceleration Problems
Lab: Acceleration
Quiz: Acceleration & Velocity

Review for Final
Finals: Astronomy, Geology &Physics

Key Assignments
Key Assignments for this class include:
Laboratory investigations
Laboratory reports
Model construction
Common formative assessments
Homework
Vocabulary

Following are a list of assignments that students will be completing during the earth science course:

Video Assignment: Collapse
This is a video assignment. Students will watch a segment of a video where a bridge collapses and where a dam breaks, causing death & destruction. Students will write down their observations fo the video. When the video is stopped, they will infer why the collapses occured. This assignment is meant to teach students the difference between observation & inference. In earth science, the is a very important concept. Geologists must infer what occurred geologically based on their observations of an area such as type of rocks, structures within the rock beds and types of fossils found in the rocks.

Density & Measurement Labs:
These labs help students understand the concept of density. Students are to measure different materials such as aluminum bars, aluminum cubes, metal spheres, glass spheres, candy bars and minerals. Students will find the mass of materials by using a balance. They will then find the volume of the different materials by either using volume equations or by measuring the displacement of water in a graduated cylinder. They will then find the density by using the density equation. Students will finish the lab write-up by answering the conclusion questions.

Salinity Lab:
After a demo showing different salinities of water in class, students will be given a real life situation to answer in class: "How could a fisherman in the Gulf of Mexico drink a cup of seawater without having kidney failure?" The starts a great conversation about salinity and density. It's a stepping stone to the real lab: Students must use their knowledge of density to solve the problem: Getting all 4 colors/different salinities of water in the straw. Students will complete a detailed lab write-up that should be reproducible!

Various Chemistry Labs:

Students will do a series of small experiments that will help them review the physical & chemical properties of chemistry. These small experiements will help them with the concepts such as:
**Location of elements on the periodic table
**Understanding the periodic nature of the periodic table
**Ionic & Covalent bonds of the periodic table
**Creating polymers out of alginate from seaweed (kelp ball lab)

Lab: Mohs Hardness Scale & Cleavage
Given the notes on physical & chemical properties of minerals, students will complete the given Mohs Hardness Scale lab. They will also participate in a cleavage demo and will CAREFULLY break apart minerals. Through this lab, students will know how to use the Mohs Hardness Scale for the upcoming physical & chemical properties of minerals lab.

Assignment: Creating the Periodic Table & The Scavenger Hunt
Students will create a periodic table based on their knowledge of the number system and the old game, handman. They will put together a periodic table based on the repeating nature of the given symbols. After doing this, students will be able to put together their own periodic table and color it according to metals, non-metals and metalloids. Using this information, students will be able to complete a periodic able scavenger hunt which shows them what items in their lives use each type of element.

Video Assignment: Walking With Dinosaurs
Students will be given the chemcal equation for photosynthesis. By looking at this formula, students will be able to see how life depends on photosynthesis to even exist on earth. Students will think about the ultimate demise of the dinosaurs 65 million years ago and put together that a nuclear winter due to dust in the atmosphere is to blame for the break down of photosynthesis.

Project: Water Cycle
Students will use their notes to put together a cross section of the water cycle. They will label the water cycle correctly using key vocabulary words. They will also show where phase changes occur. The will have a writing component to complete with questions based on the environment and ground water contamination. This assignment is used as a spring board into the entire atmosphere, climate & weather unit.

Lab: Geography of US & Severe weather
Students will use their knowledge of rain shadows, hurricanes and tornadoes to map where the major rain shadows are in the United States. They will also use their knowledge based on the notes to show where tornado alley and hurricane alley are located. There is a writing component to this lab where students need to explain why rain shadows are located where they are and they need to explain why our area, Santa Maria, does not have a major threat of hurricanes and tornadoes.

Lab: Cross-Section of the Atmosphere

Students will use their notes and their textbook to create a cross-section of the atmosphere. Within this cross-section students need to show altitude of each layer of the atmosphere and include why there is an increase in temperature in the upper stratosphere.

Book Assignment: Section 21.1
Students will use their textbooks to answer standards-based questions about the atmosphere.

Lab: Ozone
Students will use their notes on the atmosphere to complete this lab. Studets will be using candy to construct both ozone molecules and oxygen molecules. Then, they will show how chlorofluorocarbons break down ozone. During this lab, students will have to create a written explanation in their lab write up about how ozone protects living things on Earth. This lab is earth science standards based.

Textbook Assignment:
Students will read section 22.2 in their book and then answer the given questions. The answers to the questions will then be the words that students need to find in the given word search.

Group Project: The Earth's Atmosphere
Students will create a project, as a group, which puts together the concepts of atmosphere, climate and global warming. Students get to choose which assignment they will do: Putting together articles for an environmental newspaper, Creating songs and a cd cover about the atmosphere or creating campaign slogans/products about the environment and global warming. Thoughout this project, students work together and talk about the concepts they've learned about the atmosphere and global warming.

Lab: Climograph
Students use their the knowledge they learn about climate and weather in order to read a climograph. During this lab, students use data to first create the climograph and then use the climographs in order to answer the given questions about what affects climate around the world.

Lab: Global Wind Pattern Map
Students will use their knowledge about currents, weather and climate to complete this lab. Students will use a world map to show where global winds such as tradewinds and polar winds are located. Students will use this map to help them answer the given questions pertaining to climate.

Video Assignment: El Nino
Students will use their knowledge of what the weather phenomenon El Nino entails. They will then watch a video about the effects of El Nino around the world, making a list showing both effects in the United States and around the world. We will also have a discussion about how an El Nino year affects our local area of Santa Maria.

Astronomy Unit:

Lab: Distances of the Solar System

Students will learn what an astronomical unit is. Given a conversion for these astronomical units, students will create a scaled model of the solar system on a piece of register tape. Students will then complete a lab write-up which will include written questions about the planets of the solar system. Students will have to figure out why the outer planets could retain their original atmospheres where the inner planets could not. Students will see that the inner planets are closer to the sun so when nuclear fusion first took place the primary atmosphere was blown off whereas the outer planets are very far away and therefore were not affected by this.

Partner Project: Stellar Evolution
Students will take notes on stellar evolution, the life cycle of stars. Based on this knowledge, students will create a comic strip, storyboard or play that goes through all the phases of stellar evolution. In their lab, studetns must correctly identify whether a star will become a white dwarf, neutron star or a black hole (which depends on how much mass the star starts with). This lab is used as a performance assessment to see if students truly understand the concept.

Project: Astronomy
Students will research the California State Science Standards in astronomy using their textbook, the internet and the library. Students will research the concepts based on the guiding questions I have given them (Students are given background information via various PowerPoints on the astronomy standards). Throughout this project, students ask clarifying questions and we have class conversations based on the concepts in astronomy. From this project, students have a working knowledge how both the universe and solar system were formed billions of years ago. It also shows students when the elements on the periodic table were formed, how the Earth's atmosphere has changed over geologic time and how important the process of photosynthesis is. Students will put this information together as a packet and turn it in as a portfolio for a performance grade. This project will be used to help students study for the astronomy exam.

Physical Geology Unit:

Partner Project: The Ocean Floor
Students will learn about the topography of the ocean floor. They will be given only half of the ocean floor as notes and they will have to draw the topography of the ocean floor including the mirror image of the side given. Students will label where areas such as the mid ocean ridge, abyss, continental rise, continental slope and continental shelf would be located. They will also have to correctly label where the planktonic, benthic and necktonic zone would be and show what type of animal life would be found there. Because this is a type of performance assessment, students will have to show where the oldest oceanic rocks would be found compared to the youngest oceanic rocks. When students are given a drawing project, there is always a written component added so students will also have questions pertaining to their pictures and about the age of the oceans. This assignment is used as a spring board into plate tectonics and continental drift.

Lab: Pangaea, Paleomagnetics & Platemovements
Given the notes on continental drift, paleomagnetics and seafloor spreading, students will first do a lab putting Pangaea back together based on the evidence given that supports continental drift. Students will them complete a pre-lab on how some iron-bearing minerals line up to magnetic

north while in the magma chamber. Students need to understand this concept before they can understand the concept of paleomagnetics and polar reversals. After the pre-lab, students will complete the given paleomagnetics lab and based on their given data, they will figure out the average rate of movement of the North America Plate away from the European Plate. From this, students will figure out how far Africa has split from South America since the time of Pangaea. Students will use this as background knowledge during the upcoming plate boundary and tectonics of the world lab while looking at geographic/geologic areas around the world.

Lab: Viscosity--Water, Warm Honey & Cold Honey
Students will use household items to fully understand the concept of viscosity. Students will do mini-lab usinng water, warm honey and cold honey to determine viscosity. Students will be using this knowledge to explain how gas bubbles move through materials such as magma. They should come up with the conclusion that cold honey has the highest viscosity and therefore the air bubbles they are blowing into it cannot easily escape. This will be used as a springboard nto the explosivity of volcanoes.

Lab: Viscosity & Explosivity of Volcanoes
This is a video lab. Students will first watch a video about the Kalapana, Hawaii (non-explosive volcanoes). In this video, they will take observation notes on the viscosity of the magma. They will note how destructive the lava flow is. They will also note whether they can see the gas bubbles escaping (one can see them bubble out). Students will write a conclusion putting all their observations together. They will include the difference between aa and pahoehoe (types of magma learned about in the hot spot PowerPoint). Students will also write about what they have learned about the Hawaiian hot spot. The next day, students will watch a video about explosive volcanoes. They will take observation notes on the viscosity of magma. They will note the destruction associated with these types of volcanoes. They will write a conclusion about the types of rocks being formed by this type of volcano, the types of geologic features associated with the area and the destructiveness of lahars and pyroclastic flows. At this point we will have a class discussion about the extinct volcano, Morro Rock, in our local area.

Video & Written Paper: Dante's Peak
Students will watch the movie, Dante's Peak. Throughout the movie they will write clues that tell them teh mountain will erupt. In the process, they will learn about the magma source in Mammoth Mountain. (Long Valley Caldera area has forests that are dying due to too much carbon dioxide being emitted in the area. This happens in Dante's Peak, too.) They will put all their observations/clues in a formal paper about the movie. They will include the type of volcano Dante's Peak is, the viscosity of the magma and the volcanic hazards associated with the area. This assignment is used as a springboard into the Boundaries of the World lab.

Lab: Boundaries of the World
Students will take their colored plates of the world map and determine the types of boundaries at specific locations around the world such as the Himalayas, Red Sea, East African Rift Valley, Papua new Guinea, Italy, Aleutian Trench, Indonesia, Andes Mountains, Reelfoot Rift, etc. Students will use their knowledge of plate tectonics and plate movements to determine what specific type of plate boundary they are on. Students will then also write in geologic features associated with teh area and whether volcanoes would be found along this area. If there are

volcanoes associated with teh area, students will have to write in what type of viscosity it has (high or low) and whether it would be an explosive or non explosive volcano associated with it. Students are notoriously poor at geography so this lab helps them look at geography of the world while doing geology. Students should start to see a pattern emerge such as the Ring of Fire where there are volcanoes and earthquakes associated with the area and that there is a tectonic boundary associated with it.

Project: California Geology
Students will put together a portfolio based on resources of California. This is a standards based assignment where students learn about water issues in California, Gold deposition and the renewable and non-renewable resources of California. Students must also put together their own earthquake evacuation map and plan for their individual homes.

Lab: Topographic Maps
Students will be able to read a topographic map during this lab. Students will first start with easy topographic maps and then they will get gradually more difficult. Students will look for different types of features on topographic maps such as hills, valleys, cliffs and depressions. Students will use this knowledge to successfully navigate the more difficult maps in order to answer the given lab questions.

Lab: Cross-Cutting Relations
students will look at the given cross-sections and determine the relative age of the given rock layers and faults. They will log the ages in a key, at the side of the cross-sections from oldest on the bottom to the youngest at the top.

Lab: Anticlines, Synclines & Oil Depositions
Students will use their knowledge from the notes to create 3-dimensional geo-blocks for anticlines & synclines. Within this lab, students will use their knowledge of compressional stress & strain due to the bend of the San Andreas Fault to explain how anticlines & synclines are formed in the lab write-up. Students will need to include in their lab write up how oil is formed. They must explain the events that must occur in oil formation and what specific events occurred in Santa Maria area to give us this oil. (This concept was touched upon during the California Geology Unit.) Students will need to go through the process of accummulation of phytoplankton on the ocean floor through the compression associated from the locked ortion of the San Andreas Fault giving our specific location oil deposits. Students will hopefuly understand a little more of our local history--we are on the map due to oil production in the area (Orcutt, CA).

Lab: Finding the Epicenter of an Earthquake Using Triangulation
Given the notes on earthquakes including definitions of focus, the epicenter, P waves and S waves, students will use the given information to find the earthquake epicenter using triangulation. Students will use data received at a seismic station to determine lag time. They will then plot this data on a graph and find the distance from the epicenter. They will use compasses to find the epicenter. Students will use compasses to find the epicenter of an earthquake and be able to define the term lag time. These are part of the California state science standards. Given the conversations that arise about the seismograph and the Richter Scale, students will be able to explain the difference between the Richter Scale and the Mercalli Scale.

These are also part of the science standards. This information will be used as background knowledge for the Seismic Retrofit Lab.

Paper: Comparing Major Earthquakes Around the World
Students will watch 3 different videos on earthquakes that have occurred in recent years: The 1989 Loma Prieta Quake, the 1985 Mexico City Quake, and the 1995 Kobe, Japan Quake. Students will take observation notes on each video. They will be required to explain what type of tectonic boundary each area lies on, what types of other geologic hazards are associated with the area (liquefaction, volcanoes, pyroclastic flows, tsunamis, etc.) and how much death and destruction is associated with each. From these notes, students will be required to write a paper comparing the three areas.

Lab: How Big Is Our Room
This is a hands-on laboratory. Students will measure the room in meters. They will then use their metric system knowledge to convert the meters into centimeters. Given the lesson on scale, students will take measurements of the classroom and create a 1:40 scale model of it. Once this is done, students will take their assigned 1:40 scale dinosaur and answer questions in their write-ups that pertain to their data. This lab reinforces the concept of scale which is important for the next project....the seismic retrofit project.

Group Lab: Seismic Retrofit
Using the concepts learned from the plate tectonics unit and from the earthquake videos viewed in class, students will create a scaled 13,000 square foot floor plan of an earthquake safe building. In this floor plan, they will show evacuation routes/plans, include a key showing what types of special building materials they will need to create this earthquake proof building and what furniture will be in these rooms. (Students will do this on graph paper where 1 square = 4 feet.) Students will also put together a plan view (front view) of the building. The plan view does not need to be to scale.

The second part of this lab, students will build an "earthquake proof" building out of cards, masking tape and straws. The amount of money students will have to buy supplies is based on the socioeconimcs of the chosen area. Students will randomly choose from these earthquake prone areas: Los Angeles, San Francisco, Kobe Japan, Lima Peru, Mexico City, Papua New Guinea and New Dehli India.

Students must build an earthquake-proof building that can withstand a 7.0 magnitude earthquake on the earthquake table. Students musst also complete a write-up about the building process and include in this write up what type of other geologic hazards are associated with their area and what type tectonic boundary their area is found along.

Various labs + Acceleration & Velocity Quiz
Because earth science is the main concepts taught in this course, students only have a small unit in physics. During this unit, students learn about the physics of tsunamis and using algebra to solve wave and frequency problems. There are also various performance labs in which students must solve for speed, velocity and acceleration. At the end of this short, 3 week unit, students

take an acceleration and velocity quiz. This quiz has word based math problems associated with it.

Instructional Methods and/or Strategies:

Concepts will be taught in a variety of ways so students with different learning styles can excel in the course. It should be noted that learning levels are determined at the beginning of the year and the methods of instruction are flexible throughout the year so everyone can learn to the best of their ability.

Laboratory Work/Projects	40%
Project-based Learning	25%
Lectur	20%
Group Work Projects	10%
Videos	5%

	100%

These instructional methods and/or stategies include:
Direct instruction/lecture
Demonstrations
Data collection & analysis
Colloborative groups
Student-centered learning
Problem-solving labs & activities
Graphic organizers
Observation of models
PowerPoint Presentations
Reading Video

Assessments Including Methods and/or Tools:

These averages may differ minutely due to the concepts taught during the first semester compared to the second semester.

Relative Weighting of Grades:	
Laboratory Experiences/Projects:	40%
Standards-based Exams :	20%
(These include both multiple choice exams and performance based exams)	
Classwork:	25%
(icludes standards-based projects & notebook checks)	
Quizzes:	10%

Homework:	5%

	100%

Chemistry Unit Assessments:

Lab: Physical & Chemical Properties of Minerals
Although this is a laboratory activity, it is also a performance assessment to see if students can use their knowledge of properties of minerals such as density and hardness. This assessment gets students to think critically, one of the goals in the class.

Superquiz: Density, physical & chemical properties
This is a multiple-choice/true-false quiz to assess whether students understand the given concepts. Because this is a 9th grade level class, organization and learning how to study for an exam is an important concept to learn. Students are taught how to organize their classroom notes and assignments in order to use them to study for the exam. Students complete a written study guide (which are given before each major exam) and then take the test on a scantron.

Quiz: Finding Protons, Nuetrons & Electrons
This is a pop-quiz given to students to see if they understand this concept before moving on to more in-depth chemistry concepts that will give them enough background knowledge for the other concepts learned throughout the course.

Exam: Periodic Table
This is a multiple-choice/true-false exam on the overview of the periodic table. The goal of this exam is to see if students can correctly use the periodic table. Students will be asked to draw atomic structures as part of a performance exam. Students need to have a working knowledge of the periodic table in order to complete the next part of the course--bonding and finding oxidation numbers.

Exam: Bonding and Oxidation Numbers
After learning elements bond based on their oxidation numbers and location on the periodic table, students will take this multiple-choice and true false scantron exam to show their proficiency of bonding. Students will be using this knowledge during the atmosphere and climate portion of the course, especially while learning about ozone and the process of photosynthesis.

Project: Atmosphere

This is a performance based group project in which students use their knowledge of atmosphere in order to show they understand the concepts of what the ozone layer does and how it affects life on Earth. During this project, students will be working in a group of three students to put together either written articles about the atmosphere, songs and drawings about the atmosphere or campaign slogans about the atmosphere and global warming.

Exam: Atmosphere, Climate & Ocean Currents
Students will take a multiple choice, true-false scantron exam to show their knowledge of the atmosphere, climate and ocean currents. This is the unit exam. Because all students learn differently, throughout the unit, students will have a series of written assignments, projects, labs, etc. to do to show they have effectively learned the required standards-based curriclum.

Common Formative Assessment: Atmosphere & Climate
In our district, we have common formative assessments which students take so we can monitor their progress of the standards-based earth science curriculum. Students take a pre-assessment at the beginning of the earth science course and then they take the post-assessment at the end of the major unit. This common formative assessment is for atmosphere & climate and is used to assess their progress but also show the teachers of the earth science classes the effectiveness of the curriculum.

Final: Chemistry, Density & Atmosphere & Climate
The earth science course is a college preparatory course. As a result, it is assumed that students will someday go to college and therefore need to be prepared for it. The final is based on the entire first semester concepts gone over in class. Students complete a written final review to study and then take the final which covers chemistry, density, atmosphere & climate. The goal of this is to get students to think critically and learn how to study for exams when they are in college. Also--this assessment assesses whether they understand the main goals of the course pertaining to the Earth's atmosphere over time.

Astronomy Unit Assessments:

Group Project: Stellar Evolution Comics
This project is a performance exam which assesses the students ability to correctly explain/show through drawings the life cycle of stars, which is one of the goals of the course. Students work in cooperative learning groups for this which is an

important skill to learn before joining the work force later in life. Students work together to create drawings about stellar evolution for this.

Exam: Astronomy
This is a multiple-choice/true-false exam. Students complete this assessment on a scantron and it covers all the California state astronomy standards. Students use the astronomy project packet they put together as a portfolio to complete the given written study guide.

Common Formative Assessment: Astronomy
Students complete the district CFA for astronomy to see how much knowledge they have gained about the astronomy standards. Teachers use this data to see how to change the curriculum for the following year's earth science course.

Partner Project: The Ocean Floor
This is a performance assessment to see if students can correctly label the topography of the ocean floor. There is also a writing component attached to this assignment in which students have to explain where the youngest and oldest rocks would be found on the ocean floor. This project hits two main standards such as how the Earth has changed over time and also about the topography of the ocean floor. This project is used as a spring board into the next section: Continental drift and plate tectonics.

Quiz: Viscosity
This is a small quiz to assess whether students truly understand the concept of viscosity. It is a written quiz in which students not only need to define viscosity, they also need to put these concept together with explosive and non-explosive volcanoes, a major earth science standard and a major goal for the course.

Exam: Plate Tectonics
This is a multiple choice/true-false exam that is done on a scantron. This assessment shows how much students have learned about continental drift, plate tectonics and the topography of the ocean floor. These are all major earth science standards. This exam also shows how much students know for the goals of the course: How the Earth has changed over time, where students may want to choose to live later in life, solving real-world problems and about explosively of volcanoes.

Common Formative Assessment: Physical Geology

This is the last common formative assessment for the earth science course. Students take this and hopefully they have shown a lot of growth over time for the earth science course. Teachers use this exam to help them assess their own teaching for the following year.

Physics Unit:

Various labs + Acceleration & Velocity Quiz
Because earth science is the main concepts taught in this course, students only have a small unit in physics. During this unit, students learn about the physics of tsunamis and using algebra to solve wave and frequency problems. There are also various performance labs in which students must solve for speed, velocity and acceleration. At the end of this short, 3 week unit, students take an acceleration and velocity quiz. This quiz has word based math problems associated with it.
The goal is for students to show that they can solve some real-world speed & acceleration problems.

Final Exam: Astronomy, Physical Geology & Physics
The earth science course is a college preparatory course. As a result, it is assumed that students will someday go to college and therefore need to be prepared for it. The final is based on the entire second semester concepts gone over in class. Students complete a written final review to study and then take the final which covers astronomy, physical geology and physics. The goal of this is to get students to think critically and learn how to study for exams when they are in college. Also--this assessment assesses whether they understand the main goals of the course pertaining to the astronomy and geology standards.

Title:
Emergency Medical Responder

Length of course:
Half Year

Subject area:
College-Preparatory Elective ("g") / Interdisciplinary

Integrated (Academics / CTE)?
Yes: Patient Care

Grade levels:
10th, 11th, 12th

UC honors designation?
No

Course Description

edit

Course overview:

As a student in our public service program, you'll receive and overview of Emergency Medical systems, its historic background, and the role and function of the Public Health system at the local, state, and national levels. The student will learn the anatomy and physiology of the human body, the EMR principles of emergency care, and on-scene safety and precautions. The student will gain practical experience in assessing patients, protocols and procedures for transporting patients, and dealing with medical or behavioral emergencies. Student will gain knowledge of childbirth and how to deal with pediatric emergencies. The curriculum for this course includes very important 21st century skills, such as effective communication, critical thinking, creativity, and collaboration that have been identified as foundational to success at school and at work.

Prerequisites:
Medical Terminology (Recommended)

Co-requisites:
None

Course content:

Unit 1: Introduction and Orientation
Outline

Discuss objectives for this course, including competencies, teacher expectations, classroom policies, and procedures.

Identify and discuss the acquisition of transferable skills (communication, collaboration, creativity, and critical thinking) and their importance to being college and career ready and for future personal professional success.

Discuss student and teacher expectations including behavior, class rules, appropriate dress, pre-course knowledge, and grading policies. Review enrollment and attendance requirements and procedures, and classroom/school safety and disaster procedures.

Discuss next steps in course sequence related to additional education, the need for reinforcement of basic skills, further education, and possible future employment.

Discuss the Student Learning Goals and the Standards for Career Ready Practice as they relate to this course, being college and carer ready, and future employment.

Effective Communication

Demonstrate understanding that effective verbal communication is dependent upon other interpersonal skills, such as non-verbal communication, listening skills, and clarification.

Demonstrate effective written communication by understanding the importance of tone, audience, organization, format, and that research, prewriting, writing, and rewriting are integral to the writing process.

Understand why effective internal and external communication is essential to any profession and be able to formulate appropriate responses to address concerns and questions of employers, co-workers, and clients in a positive manner.

Demonstrate positive verbal communication skills using appropriate vocabulary, correct terminology, professional demeanor and body language, and vocal intonation appropriate for the classroom, a lab, or in professional work environment. Demonstrate professional verbal skills appropriate for resolving conflict.

Practice active listening skills (Reflection, restatement, and clarification) by giving full attention to what others are saying (and not interrupting inappropriately), taking time to understand the points being made, and asking clarifying questions as needed. Interpret verbal and nonverbal communications and respond appropriately.

Use electronic and Web-based reference and source materials and other communication technologies, ensuring resource validity and reliability, gather and use information to synthesize, summarize, compare, and contrast information from multiple sources.

Effectively use real-world tools by mastering current and emerging technologies to communicate and collaborate with others, to problem solve, accomplish tasks, and to produce or publish products.

Key Assignment: Students will research the Internet sites that focus on information related to the evolution and history of Emergency Medical Services. Write a 300 - word essay on the history of Emergency Medical Services.

Key assignment: Students will research Internet sites that focus on information on benefits of Emergency Medical Services and create a brochure that includes five of the benefits of EMS and prepare a class presentation.

Unit 2: Collaboration, Creativity, and Critical Thinking
Outline

Demonstrate that the ability to think critically and creatively is fundamental and, depending on context and purpose, can take place independently or interdependently.

Demonstrate understanding that collaboration is the collective determination to reach an identical objective by sharing knowledge, tasks, learning, and building consensus.

Commit the time and energy required to elaborate, refine, analyze, and evaluate original ideas to improve and maximize creative efforts.

Understand that failure is an opportunity to learn; understand that creativity and innovation are part of a long-term, cyclical process of small successes and frequent mistakes.

Demonstrate the ability to alternate between divergent and convergent thinking to arrive at an original and useful solution or idea.

Analyze and evaluate evidence, arguments, claims, and beliefs; make connections between information and arguments. Identify bias, prejudice, propaganda, self-deception, distortion, and misinformation.

Produce, either individually or as part of a team, intellectual, informational, or material products that serve an authentic purpose.

Demonstrate the ability to work effectively and respectfully with those from diverse backgrounds or cultures.

Unit 3: Roles and Responsibilities
Outline

Acquire knowledge of individuals' and team member's roles and responsibilities and demonstrate the importance of technical, social, and communication skills in team success.

Demonstrate leadership skills(i.e., negotiation skills, initiative, positive reinforcement, recognition of others' efforts, problem-solving skills, conflict resolution, and delegation).

Identify and discuss effective leadership qualities, such as integrity and wisdom and the important role these characteristics play in effective leadership and teamwork.

Exhibit a strong sense of team identity and a commitment to purpose by brainstorming solutions, volunteering, assisting others, practicing respect and courtesy, and taking initiative.

Identify the characteristics of successful teams.

Understand the need to adapt to changing and varied roles and responsibilities; practice prioritizing, time management and efficiency to fulfill responsibilities.

Key Assignments

List and describe the elements of effective leadership. Create a chart and compare leadership skills and follower skills.

Based on the definition of communication, write a 500-word essay showing a dialog between a first responder and a patient by using effective verbal and nonverbal communication.

Unit 4: Legal, Ethical, and Environmental Considerations
Outline

Demonstrate how ethics, liability, and legal responsibility are integral to success within this industry sector.

Discuss the importance of being 'eco-friendly' and environmentally conscious within your industry sector.

Demonstrate the ethical and legal practices consistent with the industry sector workplace standards of this course.

Identify local, state, and federal regulatory agencies, agencies, entities, laws, and regulations related to the industry sector of this course.

Understand the ethical and legal implications for both employers and employees with regards to discrimination based on race, nationality, religion, gender, age, disability, or sexual orientation.

Demonstrate knowledge and understanding of society's impact on the environment; analyze environmental issues as it relates to this industry sector.

Examine ethical and legal standards and practices that positively impact this industry sectors' careers.

Demonstrate knowledge of the importance of personal character traits (e.g. integrity, trustworthiness, honesty, responsibility, accountability, and self-reliance) within careers within this industry sector.

Understand the importance of safe, welcoming, and harassment-free work environments and that bullying behavior or harassment, sexual or otherwise, by employees and employers, is illegal and punishable by a court of law.

Key Assignment: Student will write a 300 word essay describing why it is inappropriate to judge a patient based on a cultural, gender, age, or socioeconomic model, and to vary the standard of care rendered as a result of that judgment.

Write a 450-word essay identifying a law that helps ensure the confidentiality of medical information and summarizing the importance of confidentiality in health care.

Unit 5: Personal Growth and Career Planning
Outline

Demonstrate the importance of personal development and growth (e.g., self-awareness, developing strengths and talents, improving health learning new skills, improving social skills) to personal and professional success

Integrate multiple sources of career information from diverse formats to make informed career decisions and develop and manage personal career plans.

Possess an understanding of how money works in the world and the importance of building sound financial habits to create and manage personal financial resources for lifetime financial security.

Demonstrating self-direction, the ability to work independently, manage one's time and work, and evaluate one's learning process.

Recognize and understand that change is a constant, and deal with change positively by being flexible and 'modifying one's thinking, attitude, or behavior' to the new situation.

Discuss job search and retention techniques and identify strategies to prepare for employment.

Demonstrate intrapersonal skills appropriate for the workplace, such as responsibility, dependability, punctuality, positive attitude, initiative, and respect for self and others.

Recognize that perseverance is an integral component for success; demonstrate commitment, heard, work patience, and tenacity in doing something despite its difficulty.

Identify personal career interests, aptitudes and skills and synthesize acquired information to develop a comprehensive career plan.

Key Assignments

Develop a resume. List of skills, work experience, education, awards, etc. Have two peers in the class review the resume and give positive feedback on what they like about the resume and constructive criticism on what they would change about the resume. Type up the corrected resume and present it to administration for critiquing.**(CTEFS) (2.0 Communication 2.1, 2.2, 2.3; 3.0 Career Planning; 11.0 Demonstration and Application).**

Unit 6: Workplace Safety and Personal Wellness
Outline

Demonstrate the proper implementation of safe work practices to prevent injury or illness as designated by each class, laboratory, and/or facility's safety protocol.

Understand that developing goals and attending to personal growth are instrumental to present and future personal and professional success.

Demonstrate the basics of safe work habits, security, and emergency procedures required in this industry.

Understand how preventative measures lessen the likelihood or impact of emergencies such as personal injury or illness, fire, floods,and incidents of employee rate or violet behavior.

Identify the causes, prevention, and treatment of common accidents and the reporting procedures involved.

Understand the role of the Cal-OSHA.

Demonstrate an understanding of the basics of system operations and the importance of maintaining facilities, equipment, tools, and supplies.

Recognize the types of materials and supplies used in the maintenance of facilities, including the identification of hazardous environmental and physical properties of chemicals and the use of Material Safety Data Sheets (MSDS). Know the proper use of the personal protective equipment (PPE).

Practice the basic procedures for the safety of coworkers, clients, and community, including the procedure for emergency situations.

Demonstrate an understanding of proper internet use and security issues. Identify and discuss cyber ethics, cyber safety, and cyber security.

Practice preventative physical and mental health measures, including proper diet, nutrition, exercise, risk avoidance (e.g., drugs, alcohol, and tobacco use) and stress-reduction.

Unit 7: Introduction to EMS systems
Outline

Demonstrate knowledge of the various components of an Emergency Medical System (EMS) and the levels of training required.

Identify the elements of an EMS system and discuss the four levels of EMS training and licensure.

Describe the public health resources an how it applies to EMS responders.

Discuss the historic background and the development of the EMS system.

Describe the role and function of the Public Health System at the local, state, national, and international levels.

Identify current and emerging technology as it relates to health and EMS systems.

Explain how to establish situational awareness, identify hazards, and assess personal, team, or environmental risks.

Describe the hazardous materials labeling system and explain definitions associated with various hazardous

Key Assignment: Students will research the Internet sites that focus on information related to the evolution and history of Emergency Medical Services. Write a 300 - word essay on the history of Emergency Medical Services.

Unit 8: On Scene Safety and Precautions
Demonstrate knowledge of occupational health and safety issues related to on-scene responder for patients, families, and Emergency Medical Responders.

Demonstrate knowledge of on-scene assessments and the process and procedures required to ensure empathic and careful delivery of service for critically injured or dying patients.

Discuss the emotional aspects of emergency care for patients, families, bystanders, and EMRs.

Identify signs and symptoms of stress and explain actions the EMR can take to reduce or alleviate stress at on-scene incidents.

Describe Universal Precautions for preventing infectious disease transmission from air and blood borne pathogens.

Demonstrate proper hand washing. Demonstrate proper gloving and glove removal.

Explain the proper steps to take if the EMR's clothing comes in contact with the patient's bodily fluid.

Identify and describe the function of safety equipment EMRs use for protection and safety.

Explain how to establish situational awareness, identify hazards, and assess personal, team, and environmental risks.

Describe the hazardous materials labeling system and explain definitions associated with various hazardous materials.

Demonstrate the proper steps for scene size-up and create a chart that includes all the steps in order.

Unit 9: EMR Principles of Emergency Care
Outline

Demonstrate knowledge of the basic medical ,legal, and ethical principles and responsibilities of Emergency Medical Responders.

Discuss the 'Good Samaritan' laws as they relate to emergency medical response.

Explain the steps to be taken in the preservation of different types of crime scene evidence. Discuss the special situations and reportable events.

Discuss the importance of proper and accurate documentation and report writing

Explain the legal aspects and types of consent necessary prior to providing emergency medical Services.

Discuss different types of legal documents and issues relating to patient care, e.g., advance directives, consent, confidentiality, negligence, and abandonment.

Unit 10: Anatomy and Physiology of the Human Body
Outline

Demonstrate knowledge of basic anatomical and physiological structures and systems.

Identify, locate, and describe the function of the primary systems and structure of surface anatomy; identify anatomical body planes, cavities, and the organs in the plan.

Locate landmarks of the human skull, facial, neck, abdomen, and extremities. Identify vital centers of the brainstem and their functions.

Locate and identify functions of eye and ear structures.

Identify structures and describe the basic functions of the nervous system, e.g., cerebral, spinal cord, peripheral and autonomic nerves. Identify primary functions of the cerebral lobes.

Identify and explain the basic structure of the circulatory system, e.g., heart blood flow, atria, vena cava, arteries, veins, and capillaries.

Identify the location and describe the function of the respiratory system, e.g., upper airway, lower airway, and lungs during inhalation and exhalation.

Identify signs and symptoms of respiratory distress or failure; identify signs of adequate oxygenation.

Key Assignment

Write a 400-word essay describing the journey of the blood from the heart to the body cells and the return of the blood back to the heart. Create a diagram of the circulatory system and present it to the class.

Unit 11: Lifting and Moving Patients
Outline

Demonstrate knowledge of the methods and protocols used in moving and transporting patients while waiting the arrival of EMS support for a higher level of care.

Describe the principles of lifting, moving, and positioning patients.

Identify and describe the various methods of moving patients e.g., emergency, standard, 'carries' for non-ambulatory patients. Demonstrate the process used for 'walking assists' for ambulatory patients.

Identify and describe the function of equipment commonly used in moving and transporting patients.

Discuss proper patient positioning and restraining techniques.

Identify procedures for moving patients with suspected spinal injuries, and describe the steps in each procedure.

Key Assignments

In 300 - words summarize the general considerations required to move patients safely without causing them further harm while simultaneously protecting the First Responder from injury.

Unit 12: Patient Assessment
Outline

Demonstrate knowledge of the processes, procedures, an strategies in patient assessment to identify and manage immediate life threats and injuries within the scope of practice of the Emergency Medical Responder.

Identify the purpose and elements of primary and secondary patient assessment. identify the differences between performing an assessment on a trauma patient and that on a medical patient.

Discuss the importance of obtaining a patient's medical history.

Describe the steps and functions of the assessment process, e.g., general impression, responsiveness, assessing respiration, and updating EMS units.

Explain the differences in checking airway, breathing, and circulation based on the age of the patient: infant, child, and adult.

List the information that should be addressed in the hand-off report about the patient's condition.

Describe the components of an on-going assessment.

Key Assignments

Define the heart rate and explain what information can be determined from monitoring the pulse. Write a 450-word report describing the changes in the heart rate caused by common diseases.

Unit 13: CPR and the Anatomy of the Circulatory System
Outline

Demonstrate knowledge of the human anatomical structures and functions of the circulatory system.

Demonstrate proper rescue CPR on adults, children, and infants.

Describe the anatomy and function of the of the circulatory system.

List reasons for heart failure and explain the links in the cardiac chain of survival.

Describe the components of CPR, Demonstrate CPR, and explain when to start and stop CPR.

Demonstrate the steps for one-rescuer and two-rescuer adult CPR.

Describe the process and demonstrate the steps for correctly using an Automated External Defibrillator (AED).

Explain the complications and legal implications for performing CPR.

Key Assignments

Write a 450 - word essay describing the recovery techniques and resuscitation efforts First Responder may need to follow when managing a patient who has been involved in a submersion incident.

Unit 14: Illness and Injuries: Medical Emergencies
Outline

Demonstrate knowledge of recognizing and managing life threats based on assessment findings while awaiting additional response.

Explain the causes, symptoms, and treatment for patients with altered mental status, seizures, loss of consciousness, and heat and cold exposure.

Explain the major causes, signs, symptoms, and initial medical treatment for: angina pectoris, heart attack, congestive heart failure, dyspnea, stroke, insulin shock, diabetic coma, abdominal pain, and a dialysis patient.

Describe the signs symptoms and treatment for patients who has ingested, inhaled, injected, or absorbed poisons.

Describe the signs, symptoms, and treatment of a drug overdose caused by uppers, downers, hallucinogens, or abused inhalants.

Key Assignments

Patients with diabetes mellitus who are not being treated with insulin rapidly metabolize lipids and acidic by-products of lipid metabolism will accumulate in the circulatory system. In a 500-word essay describe the effects this has on the ventilation.

Unit 15: Behavioral Emergencies
Outline

Demonstrate knowledge on how to manage life threats based on assessment findings of a patient with a medical emergency awaiting additional EMS response.

Describe the principles and procedures for assessing patients experiencing a behavioral emergency.

Discuss safety precautions that should be taken when dealing with a potentially violent patient.

Describe signs and symptoms of abuse.

Discuss the medical and legal considerations related to healing with behavioral emergencies.

Define and discuss the importance of a critical stress incident briefing.

Key Assignment

Write a 250 word essay on Post traumatic stress disorder, include signs and symptoms and presented it to the classroom.

Unit 16: Bleeding, Shock, and Soft-Tissues
Outline

Demonstrate knowledge of assessment skills to recognize and car for patients suffering from shock, bleeding, and soft-tissue injuries.

Describe the function and relationship between the parts of the circulatory system, e.g., heart, blood vessels, and blood. Differentiate between arterial, venous, and capillary bleeding. Explain emergency care for external bleeding.

Describe signs, symptoms, possible complications, and emergency medical care for patients with thermal, respiratory, chemical, and electrical burns.

Discuss emergency medical treatment for patients with different types of wounds, e.g., face and scalp, eye and nose injuries, head and neck wounds, chest and back wounds, impaled objects, closed abdominal wounds, genital wounds, extremity wounds, gunshot wounds, and bites.

Explain the signs, symptoms, and treatment of shock.

Key assignment

In a 600-word essay explain the tissue response and inflammatory response to physical injury.

Unit 17: Injuries to Muscles and Bones
Outline

Demonstrate knowledge of the assessment and management of injuries to the upper and lower extremities, the head, spinal cord, and the chest while awaiting EMS response.

Describe the mechanics of musculoskeletal injuries.

Define and describe treatment for fractures, dislocations, and sprains.

Describe the signs, symptoms, and emergency treatment for head, facial, spine, fractured ribs, flail chest, and penetrating chest wounds.

Evaluate the circulation and sensation of a patient with an extremity injury. Describe the general principles of splinting.

Describe how to best remove a helmet and helmet mask.

Explain body substance isolation techniques when treating a patient with musculoskeletal injuries.

Unit 18: Childbirth
Outline

Demonstrate knowledge concerning the anatomical and physiological changes that occur during pregnancy and how to manage a normal delivery process while waiting for additional emergency response.

Describe the three stages of labor and delivery. Discuss the possible complications that can occur during childbirth.

Explain the importance of standard precautions and body substance isolation in childbirth situations.

Explain the steps to be taken to assist a pregnant woman in childbirth and care for a newborn infant.

Demonstrate how to resuscitate a newborn infant.

Key Assignment

Writing Assignment: Write a 300 - word essay describing the assessment and management of gynecological emergencies and list the three stages of labor.

Unit 19: Infant and Children - Pediatric Emergencies
Outline

Demonstrate knowledge of the anatomical and physiological differences between infants and children and describe age-appropriate assessment and treatment while awaiting additional emergency response.

Describe the signs, symptoms, and treatment for shock in pediatric patients.

Explain how to take vital signs on infants and children, e.g., pulse rate, respiratory rate, and body temperature.

Demonstrate proper respiratory skills or infants and children, e.g., opening airways, suctioning, performing basic life support, and inserting an oral airway device. Explain the process for partial and complete airway obstruction.

Describe the signs, symptoms, and treatment for pediatric injury or illness, e.g., altered mental state, high fever, asthma, croup, drowning.

Describe the protocol for children displaying signs of child abuse or sexual assault.

Discuss the child restraint laws and describe pediatric trauma caused by the incorrect or non-use of restraints.

Unit 20: EMS Operations: The Role of the Emergency Medical Responder
Outline

Demonstrate knowledge of the immediate basic life support and interim medical care for a sick, injured, or compromised person until advanced medical care is provided or until transportation is initiated.

Identify the medical and non-medical equipment, and its function, needed to respond to a call.

Discuss the role of a medical responder in extrication. Describe the extrication procedures a medical responder can perform.

Describe the START triage system.

Discuss the role of a medical responder and the precautionary steps taken when hazardous materials are present.

Demonstrate knowledge of the emergency medical responder role in a multiple-casualty incident, the purpose of triage and the steps involved in the START triage system.

Explain how to manage an incident scene as the first responder, using emergency response skills appropriate to training and certification.

Discuss the importance of following instructions to immediate care procedure as transmitted by an emergency medical dispatcher during transport.

Unit 21: Supplemental skills: Special Situations
Outline

Demonstrate knowledge of supplement skills required by those acting as an emergency medical responder.

Demonstrate proper Cardiopulmonary Resuscitation (CPR) on adults, children, and infants and the proper use of an Automated External Defibrillator (AED).

Explain the benefits of an automated external defibrillation in a cardiac chain of survival and demonstrate steps used with an AED.

Explain the indications for using supplemental oxygen and discuss the safety considerations and hazards of oxygen administration. Describe the equipment used to administer oxygen.

Describe how to measure blood pressure by palpation and auscultation.

Key Assignment

Adult, Child and Baby First Aid/CPR/AED

Unit 22: Introduction to the Incident Command System
Outline

Understand the process by which emergency management organizations and emergency managers exert command and control over an emergency response and recovery operation.

Describe the principles and responsibilities of the Incident command Systems and the National Incident Management Systems (NIMS).

Identify and explain the different positions and relationships within the ICS structure.

Explain the importance of an organized Command and Control System to provide interoperability, efficiency, and effectiveness.

Describe the core set of basic concepts, principles, terminology, and technologies of emergency response management.

Explain the importance of multiagency coordination, unified command, training, identification and management of resources, and the collection, tracking, evaluation, and dissemination of information.

Unit 23: Community Emergency Responder (CERT)
Outline

Demonstrate Knowledge of the Community Responder Training Program, its intended function, and its relevance to emergency and disaster responders.

Explain the CERT program, its goals, and the competencies taught, e.g., disaster preparedness, fire safety, disaster medical operations, light search and rescue, disaster psychology, and terrorism.

Describe the role of the CERT program and its volunteers when participating in natural disasters, e.g., earthquakes and tsunamis, fires and wildfires, floods, excessive heat, volcanoes, winter storms, hurricanes and tornadoes, landslides and mudflows, nuclear power emergencies, and pandemics or infectious disease outbreaks.

Understand the role of federal, state, and local agencies in catastrophic event planning, preparation, response, and recovery.

Recognize the importance and variety of recovery strategies to support individuals and communities impacted by a catastrophic event.

Assessment
Assessment methods and tools

Students will be graded based on the following:

Quizzes, Midterm, and Final Examinations = 25%

Class Assignments, Journal, Portfolio = 30%

Projects, Presentations, Group activities = 15%

Labs, critical thinking scenarios, Skills drill examinations = 30%

Grading Scale

90-100% (Exceptional/outstanding)

80-89% (Meets some of the requirements)

70-79% (Meets minimum effort/requirements)

60- below (Not passing)

Instruction Methods and Strategies

All sections of the course outline are based on lecture, PowerPoint presentations, short documentaries and videos (DVD, YouTube) and class discussions. Lectures will be presented for all types of learners: visual, auditory, and kinesthetic. Discussions will be teacher guided, role-play, critical thinking, and problem-solving tasks. These methods introduces and expands the students understanding of sports medicine theoretical and application component.

Use of the internet will be guided by the instructor in developing skills and proper content on the internet sites. Internet research will only supplement text reading throughout the course, especially in these sections:

Visual Aids

Models, charts, graphs, diagrams, and equipment will be used throughout the lectures and discussions. All these will be demonstrated by the instructor.

Hands-on activities

Using hands on activities and demonstrations will allow students to put in practice the theoretical part of the course. Teacher will demonstrate the skills, will assist the students practicing the skills, and will allow students to work in groups in order to acquire the level of comfort and confidence necessary in health care professions.

Conversion of weights and measures

Conversion of medications

Demonstrate the use of an inhaler, EpiPen, and other medication administration

Demonstrate routes of medication on a manikin

Demonstrate and Certify students in CPR/AED and first aid though the American Heart Association

Demonstrate heimlick procedure

Create an emergency action plan and evacuation plan for the class

Demonstrate splinting, back board, cervical brace, sling, etc.

Demonstrate log roll procedure

Demonstrate and list the five steps of PRICE procedure for someone with a sprain/strain

Demonstrate temporary care for: sprains, strains, fractures, dislocations, concussions

Demonstrate treatment for ear, eye, or nose injuries

Perform Patient Assessment and treatment for:

- Hyperventilation
- Flail chest
- Pneumothorax and hemothorax
- Shock
- Hernia
- Contusions
- Sunburn, heat cramps, heat stroke, heat exhaustion
- Cold emergencies
- Diabetes
- Asthma
- Seizures
- Appendicitis
- Different taping or wrapping techniques

Student will also be evaluated on Skill Drills:

- Transferring a patient
- CPR
- Airway
- Epipen administration
- Patient Assessment
- Scenario protocols in an emergency setting
- Proper techniques of backboard

8. School Course List Contact

Name: Jim Armstrong

Title/Position: Asst. Supt/Curric/Instruction

Phone: (805)922-4573 **Ext.:** 4211

E-mail: jarmstrong@smjuhsd.org

9. Subject Area

- ☐ History/Social Science
- ☐ English
- ☐ Mathematics
- ☒ Laboratory Science
- ☐ Language other than English
- ☐ Visual & Performing Arts
  - ☐ Intro ☐ Advanced
- ☐ College Prep Elective

10. Grade Level(s) for which this course is designed
11 12

11. Seeking "Honors" Distinction? ☒ Yes ☐ No

12. Unit Value

- ☐ 0.5 (half year or semester equivalent)
- ☒ 1.0 (one year equivalent)
- ☐ 2.0 (two year equivalent)
- ☐ Other: _____

13. Complete outlines are not needed for courses that were previously approved by UC. If course was previously approved, indicate in which category it falls.

- ☐ A course reinstated after removal within 3 years. Year removed from list? _____
  Same course title? ☐ Yes ☐ No
  If no, previous course title? _____
- ☐ An identical course approved at another school in same district. Which school?
  Same course title? ☐ Yes ☐ No
  If no, course title at other school? _____
- ☐ Alternative course title for course with identical content at this school
  Title of previously-approved identical course: _____
- ☒ Approved Advanced Placement (AP) or International Baccalaureate (IB) course
- ☐ Approved UC College Prep (UCCP) Initiative course
- ☐ Year-long VPA course replacing two approved successive semester-long courses in the same discipline
- ☐ Approved P.A.S.S. course
- ☐ Approved ROP/C course. Name of ROP/C? _____
- ☐ Other. Explain: _____

14. Is this course modeled after an UC-approved course from another school outside your district? [X] Yes [ ] No

If so, which school(s)? Nipomo High School, Castro Valley High School

Course title at other schools Advanced Placement Environmental Science

15. Pre-Requisites 'B' grade (or better) in Biology A/B, and in Chemistry A/B or Physics A/B, and in Algebra I A/B or Algebra II A/B, or consent of the instructor.

16. Co-Requisites

none

17. Is this course a resubmission? [ ] Yes [X] No

If yes, date(s) of previous submission? _____

Title of previous submission? _____

18. Brief Course Description

Advanced Placement Environmental Science is multidisciplinary; it embraces a wide variety of topics from different areas of study. It will be taught from a rigorous science perspective which stresses scientific principles and analysis, and includes a laboratory component. Environmental issues will also be studied from sociological and political perspectives. It is intended to enable students to undertake, as first-year college students, a more advanced study of topics in environmental science, or alternatively, to fulfill a basic requirement for a laboratory science and thus free time for taking other courses.

The goal of the AP Environmental Science course is to provide students with the scientific principles, concepts, and methodologies required to understand the relationships of the natural world, to identify and analyze environmental problems both natural and man-made, to evaluate the relative risks associated with these problems, and to examine alternative solutions for resolving and/or preventing them.

B. COURSE CONTENT

Please refer to instructions

19. Course Goals and/or Major Student Outcomes

The goal of the AP Environmental Science course is to provide students with the scientific principles, concepts, and methodologies required to understand the relationships of the natural world, to identify and analyze environmental problems both natural and man-made, to evaluate the relative risks associated with these problems, and to examine alternative solutions for resolving and/or preventing them.

Students will make connections between the concepts discussed and everyday life, see the importance of understanding scientific ideas, and see the interconnectedness of science and society.

Students will benefit from understanding how integral science is to society and that an educated person has knowledge about science, social science, and humanities

20. Course Objectives

A. Awareness of Human Impacts on the Environment

- The students will know behaviors of responsible consumers.
- The students will look at environmental science with a global perspective.
- The students will analyze industry practices regarding sustainability.
- The students will begin to develop personal goals regarding environmental stewardship.
- The students will employ sound scientific principles.

B. Thinking and Problem Solving Skills

- The students will exhibit critical and creative thinking.
- The students will apply numerical estimation.
- The students will apply measurement and calculations where appropriate.
- The students will recognize problem situations.
- The students will identify, locate and organize needed information or data.
- The students will propose, evaluate and select alternative solutions.

C. Employment Literacy

- The students will understand career paths and strategies for obtaining employment within the environmental field.
- The students will be familiar with environmental impacts relevant to their field.

21. Course Outline

First Term

I. The Ecosystem: interdependence of Earth's systems: fundamental principles and concepts.

- A. Energy flow
- B. Matter cycling
- C. The solid earth
- D. The atmosphere
- E. The biosphere

II. Scientific analysis: initiation of research project:

- A. development of topic
- B. research question
- C. null hypothesis
- D. research data gathering
- E. plan of action

III. Human population: dynamics.

- A. Human history--beginnings.
- B. Global distribution of population.
- C. Carrying capacity.
- D. Cultural and economic influences.

Second Term

IV. Renewable and nonrenewable resources: distribution, ownership, use, degradation

- A. Water.
- B. Minerals.
- C. Soils.
- D. Biological.
- E. Energy.
- F. Land.

V. Environmental quality.

- A. Air, water, soil: pollutants and their effects.
- B. Solid waste.
- C. Human health: impact of chemical and biological agents.

VI. Global changes and their consequences

A. changes

1. atmosphere
2. oceans
3. biota

B. Consequences

1. atmosphere
2. oceans
3. biota

VII. Environment and society: trade-offs and decision making

- A. Economic forces
- B. Cultural and aesthetic considerations
- C. Environmental ethics
- D. Environmental laws and regulations
- E. Issues and options

1. conservation, preservation, restoration
2. sustainability, mitigation, remediation

22. Texts & Supplemental Instructional Materials

Text: Wright, Richard T. *Environmental Science, Toward a Sustainable Future, Ninth Edition.* Pearson, Prentice Hall. 2005.

Supplemental Instructional Materials:

State of California Integrated Waste Management Board. *Earth Resources, A Case Study: Oil*. 2001.

Sussman, Art. *Dr. Art's Guide to Planet Earth*. Chelsea Green Publishing Co. 2000.

23. Key Assignments

Investigate a science-based societal issue through research
Possible topics: Land and water use decisions in California
Choice of energy sources
Interactive CD ROM Activities: "Global City, Environmental Science in Practice"
Understand a Pest Species Population Growth
Identify the Source of Air Pollution
Compare Risks as Global City faces a Disease Outbreak
Monitoring for Sewage Contamination
Coping with Ultraviolet Radiation
Light & Nutrients: The Controlling Factors in Marine Ecosystems

24. Instructional Methods and/or Strategies

Reading, writing, inquiry, collaboration
Critical thinking/problem solving
Lecture and interactive presentations
Think About It Labs
In-class small group activities
Individual study
Touchstones Discussions
Guest speakers
Student research
Student presentations
Social action: use of research knowledge

25. Assessment Methods and/or Tools

Class participation
Homework
Tests and quizzes
Essays
Research project: written and oral presentation to class and involved community agencies

C. HONORS COURSES ONLY

Please refer to instructions

26. Indicate how this honors course is different from the standard course.

D. OPTIONAL BACKGROUND INFORMATION

Please refer to instructions

27. Context for Course (optional)

28. History of Course Development (optional)

The course description for Advanced Placement Environmental Science from the Castro Valley Unified School District was used in the development of this course. Slight modifications to that description have been made.

AERIES FORM

Co-requisites:	None
Integrated (Academics / CTE)?	No
Does your course include lab activities in your course description?	Yes
Grade levels:	10th, 11th, 12th
Course learning environment:	Classroom Based

ourse Description

ɔurse overview: *This Course Overview is not available on the A-G Course Management Portal. For more information out this course, you need to contact the institution that authored this course.*

Using STEM principles, the purpose of this course is to give students a broad overview of environmental science and concerns with an emphasis on their role and responsibility. Furthermore, using this course as a platform, students will be given the opportunity to:

- improve their reading and writing skills
- develop their ability to be objective observers of the world around them
- formulate testable questions and justify their position with evidence
- become comfortable with technological applications beyond social media.

Goals:

Students will develop three dimensional perspectives on how human populations, economics and global concerns interact and effect the environment through an understanding of our environmental resources, ecology, biodiversity and sustainability.

This course will create educated citizens that understand how their choices impact the world around them.

This course will influence individuals to become proactive agents of environmental change.

This course will foster enthusiasm and joy for the environment.

Expected Outcomes:

Students will become proficient at justifying their opinions with evidence and constructively critiquing others.

Students will, through the understanding of environmental concerns, be empowered to participate in civic minded environmental projects.

Students will participate in field studies involving environmental issues.

Students will take a stand and action on an environmental issue

Students will engineer solutions to environmental problems.

ɔurse content: *This Course Content is not available on the A-G Course Management Portal. For more information abo is course, users should directly contact the institution that authored this course.*

Unit 5 – Environmental Concerns

In this unit, the human factor is the focus.

A. Human Population and Urbanization

This chapter focuses on human population demands. It examines factors that influence and effect urbanization. It closes with new ideas for becoming more sustainable.

B. Environmental Hazards and Human Health

This chapter discusses types of health hazards which include both biological hazards and chemical hazards. It discusses risk evaluation, the population's perception of risk and postulates methods of avoidance.

C. Air Pollution, Climate Change, and Ozone Depletion

This chapter tackles major air pollution problems. It addresses the effects of climate change and ideas for slowing climate change. It finishes with a discussion on reversing ozone depletion.

D. Solid and Hazardous Waste

This chapter is about dealing with solid waste and hazardous waste. It also suggests ways to transition to low waste economy.

E. Environmental Economics, Politics, and World Views

This chapter is about how economic systems are related to ecological resources and services. It addresses the use of economic tools to address environmental problems. It discusses the challenges global political systems have had in the past to enact global environmental policies. It ends with suggesting the social enactment of just environmental politics, and the encouragement to live more sustainably.

Unit 4 – Environment Quality

This unit centers on natural resources and services, their protection and management, and methods to increase sustainability.

A. Agriculture

This chapter focuses on the role and importance agriculture plays in the world. This includes; food security, agriculture systems and developments, and procedural changes.

B. Water Resources and Pollution

This chapter is about the limited supply of freshwater on the planet. It includes; management of the fresh water supply, increasing the sustainability of that supply, and water pollution issues that threaten the supply.

C. Geology and Nonrenewable Mineral Resources

This chapter describes geological processes with the focus on mineral resource use, ecological effects, and sustainability.

D. Nonrenewable Energy Resources

This chapter enumerates the advantages and disadvantages of fossil fuels and nuclear power.

E. Renewable Energy Resources

This chapter discusses energy efficiency, sources of renewable energy and society's transition to renewable energy sources.

Unit 3- Sustaining Biodiversity

This unit dives into the problems and issues created by human interaction with nature and what humans are doing to rectify and insure sustainable biodiversity for the future.

A. Sustaining Species

The focus is on individual species and how to protect them. It details endangered and threatened species and the issues surrounding them, as well as, their species sustainability.

B. Sustaining Ecosystems

The focus here changes from individual species to an entire ecosystem, treating all components of an ecosystem as vital to the survival of the whole. Problems and solutions in sustaining valuable ecosystems are addressed.

C. Politics of Biodiversity

This section deals with the role politics plays in protecting endangered species and critical ecosystems. It

delves primarily into the EPA, Environmental Protection Act.

Unit 2 – Biodiversity

This unit focuses on ecosystem characteristics and natural factors that affect and shape ecosystems.

A. Biodiversity and Evolution

Biodiversity and mechanisms explain species origins based on scientific evidence.

B. Species Interactions

Species interactions deals with species relationships, such as, predator prey, mutualism, parasitism, etc.

C. Ecological Succession

Ecological succession describes how ecosystems respond to change in conditions. For instance, how a pond can become a meadow and eventually a tree stand. Or, factors that can limit succession.

D. Population Control

Population control deals with factors that limit the growth in plant and animal populations. Human populations will be dealt with later in the course.

E. Ecosystems and Climate

Ecosystems and climate details how climatic conditions, along with topography, latitude, and proximity to bodies of water can determine ecosystem characteristics.

F. Terrestrial and Aquatic Ecosystems

These chapters detail the similarities and unique characteristics of each major terrestrial and aquatic ecosystem, including fresh and salt water systems.

Unit 1 – Ecology and Ecosystems

This unit outlines ecosystems and how matter and energy flow through these systems.

A. Environment and Sustainability

This chapter introduces limited resources, sustainability, and our ecological footprint.

B. Science Matter Energy and systems

This chapter focuses on the carbon, nitrogen, phosphorous and water cycle and how mater and energy flow through the systems.

C. Ecosystem Dynamics

This chapter details the components of ecosystems and their interactions.

Laboratory Activities

Most laboratory activities take multiple 50 minute periods to complete.

Photosynthesis: Using Vernier probe ware students investigate the concentration of carbon dioxide, pH and oxygen levels of a photosynthetic system through various environments.

Biomass: Developed by the MSP, Math Science Project, Biomass is a series of experiments that lead students through photosynthesis and the uptake of carbon dioxide to form biomass.

Runoff: In this lab, students create a model to help conduct a controlled experiment to examine how ground cover effects the amount, quality, or composition of water runoff.

Owl Pellets, Food webs, and Pyramids: This lab extends the common use of owl pellets to a more complex level that relates the contents of the owl pellet to the flow of energy and matter. Students will dissect owl pellets to collect and count the contents. Students will use their data to create food webs and biomass pyramids.

Design a system to access a local species: Students will learn how to function as Citizen Scientists as they follow the prescribed protocol from the Sandy Beach Monitoring Program to collect, analyze and share data.

Bottle-ology Ecosystems: Students engineer aquatic, terrestrial, and decomposing solid waste ecosystems which include biotic and abiotic components. Students will perform experiments to track nutrients as they pass through the various systems. Their systems must be in contact with one another, sustainable and cycle nutrients throughout all the systems.

Food Webs: Working in groups, students will use photos of various organisms to create a hypothetical food chain, then a food web. Peer review will allow students to both critique and justify their arrangements. Students will explore the ramifications of an extinction event and the significance of keystone species. Finally, students will demonstrate the effects of biological magnification in a role-playing exercise.

Heat Transfer on Earth: Students will develop a model to investigate the specific heat content of various surfaces on earth. Students will explore how latitude effects the intensity of solar radiation. Finally, students will determine how surface covering, and latitude effect temperature ranges.

CO_2 and Ocean Acidification: Using Vernier probe ware, students will explore the chemical properties of seawater such as; pH, CO_2 levels, and oxygen levels. Other tests will determine ammonium, nitrate, and temperature levels. Students will explore what happens to the chemical balance of sea water and various shell fish when this balance is altered.

Investigate Species Diversity: Students will dissect a holdfast from our local offshore kelp forest. Students will examine this mini ecosystem and identify the diverse invertebrate organisms living in this environment. Students will use the statistical analysis tool, Shannon-Weiner Diversity Index, to analyze their data and determine the diversity of this mini-ecosystem.

Endangered Species Data Analysis: Students will use the data presented by the textbook to design a model that shows the proportion of endangered and threatened species.

Camping trip to Big Basin Redwood Forest: Students will participate in several experiments and activities that will take place over several days during an extended camping trip. Students will access the forest's health and gain an appreciation for an old growth forest.

- Using a random sampling plot method, students will examine, identify and record all the species they can identify on the forest floor using identification guides as a reference. They will then perform a statistical analysis of their data using the Simpson Diversity Index to determine the biodiversity of the area.
- Students will explore the forest looking for evidence of nutrient cycling. Students will then participate in a discussion where they will attempt to track biotic and abiotic cycling through the forest ecosystem. Students will be encouraged to justify their positions with the evidence they found.
- Students will examine the forest for producers, consumers, and decomposers and the food webs that they create.

In addition, students will hypothesize about the interspecies relationships that might exist and support their opinion with their observations and findings.

- Students will examine evidence for ecological succession in the forest.
- Students will develop an understanding of forest resources, services, and management by gathering and analyzing data from a stand in the Big Basin Redwood Forest. Student will determine an estimate of the total stand volume.
- Students will examine some of the challenges facing our forests today including invasive species, wildfire, ownership, and climate change.

Fire Ecology: Students will examine the role of fire in forest and chaparral ecosystems. Students will focus on the natural role fire plays in the life cycle of these ecosystems and how fire is being used to manage these ecosystems. Students will experiment with charate which is charred wood remains left after a fire that contain leachable chemicals that stimulate seed germination in some plant species. Students will finally explore the issues that present themselves at the wildland-urban interface and propose fire safety solutions.

Soil Analysis: Students will identify soil types and characteristics based on; ribbon test, sieve test, sedimentation test, field test, and the soil pyramid. Students will identify organic matter, sand, silt, clay percentages in a variety of soil types. Furthermore, students will determine soil productive capacity based on; nitrogen test, phosphorus test, potassium test, pH test and percolation rate test. Using test results, students will determine best fit plant life and identify strategies to maximize production.

Effects of Nitrogen on Plant Growth: Eutrophication from Agricultural Run-off: This is a series of experiments. Students will be working in small groups. When the experiments are completed, students will prepare a presentation of their findings and share with the class.

Part one: Design an experiment to assess the changes in the dynamics of a freshwater system (interplay of such parameters as turbidity, pH, CO_2) as nutrients become increasingly more available.

Part two: Students will investigate one of the following:

- Design an experiment that could be used to compare the effects of nutrient enrichment on two different bodies of water.
- Design an experiment to access the dissolved oxygen content of similar bodies of water with different surrounding factors.

- Design an experiment to determine what types of household items might be contributing to cultural eutrophication (i.e.; many detergents contain phosphorus; lawn fertilizer contains nitrogen).
- Design an experiment to determine whether there is a marked difference in the biological consequences of continuous low-level nutrient enhancement and sudden high-level nutrient enhancement.

Design, Build and Test a Passive Water Filtration System: Students must keep in mind the usefulness of their design to a third world area as they build a passive water filtration system. Students will test the quantity and effectiveness of various factors that contribute to their passive water filtration system. Students will access the quality of the filtered water by the following factors; total dissolved solids, pH, and bacteria content. In addition to the chemical tests, student will need to learn sterile technique, microbiology techniques, and serial dilutions to test their water.

Serial Dilutions: Students will learn how to perform serial dilutions and calculate the resulting concentrations of each solution.

Microbiology: Students will learn sterile techniques as they prepare petri dishes with medium. Students will learn how to streak a petri plate and how to identify and count colonies. Do to the potential hazard, students will not be identifying strains of bacteria.

Water Quality Study: Students will follow established protocols to sample and test local water from around the Santa Maria area. Some additional water samples will be provided by the instructor in the classroom for students unable to go into the field. Students will use probe ware when possible. Some of the chemical tests will involve different techniques. Students will analyze their results and discuss their findings.

Get the Lead Out: Get the Lead Out is a guided-inquiry lab where students are challenged to determine how lead can be removed from a sample of contaminated water.

NEED Energy Transformation Investigations: Students will perform many experiments to become familiar with the various forms of energy transformations. Students will also learn about sources of energy, energy production and energy efficiency.

Electricity Use and Efficiency: Students will use a device called a Kill a Watt which is an electric usage monitor to evaluate electricity consumption of personal electrical appliances around their home. Students will pick one appliance to perform calculations to determine the amount of energy consumed.

In addition, students will choose one of the following or suggest their own investigation.

- evaluate several different devices with the same purpose.
- evaluate an electrical device in the variety of modes offered; such as, heat on/off, sleep mode or active mode for a computer
- evaluate hidden electric use by appliances that always consume electricity even when turned off

Nicotine Toxicity: Students will investigate how various concentrations of nicotine affect the behavior of Lumbriculus variegatus (California blackworms)

LD_{50}: LD stands for lethal dose and LD_{50} signifies the single dose needed to kill 50% of the animals used in the experiment. It is widely used to test the toxicity of household products, pesticides, cosmetics, drugs, weed killers and industrial products. Students will use serial dilution to create different concentrations of a copper sulfate solution. Students will expose Daphnia magna, a small planktonic crustacean, to the various concentrations. The results are graphed on semi log paper and the LD_{50} is determined.

Greenhouse: Students will create a model to simulate the greenhouse effect and monitor temperature and CO_2 levels with Vernier probe ware. Students will analyze the data and discuss the relationship between CO_2 levels and temperature.

Lab Albedo: In a controlled experiment, equal amounts of shaved ice are placed on different colored metal substrates. The amount of "snow" that melts as a function of time is measured and the data is graphed. Students will discuss their results as a model for polar ice verse land base ice melt and the compounding ramifications of global warming. Students will explore the concept of a positive feedback loop and realize the complexity of these scenarios.

Key Assignments: *Detailed descriptions of all Key Assignments which should incorporate activities and projects, as well as, short answers and essay questions. How do assignments incorporate topics? Include all assignments that students will be required to complete. Assignments should be linked to components mentioned in the course outline. It is not appropriate or necessary to include instructions given to students regarding the execution of assignments (formatting, timeliness, etc.). Do not include exams or assessments in this section.*

Students will be assigned a writing activity for each chapter. It will focus on the case study presented by that chapter. It will be modeled after the Common Core writing standards for technical writing. The first six will have the data that the chapter offers. The next six assignments will have additional data provided by outside sources to provide students with experience from multiple data sources. The final six assignments will include opposing points of view from multiple sources to help prepare students to be proficient writers. The 18 case study topics are: The Greening of American Schools, Experimenting with a Forest, Disappearing Tropical Rain Forests, Amphibians at Risk, The Southern Sea Otter: A Species in Recovery, The Importance of Coral Reefs, A Honeybee Mystery, Costa Rica; A Global Conservation Leader, Growing Power- An Urban Food Oasis, The Colorado river Story, The Importance of Rare Earth Metals, Fracking for Oil and Gas, The Potential for Wind Power in the United States, Population 7.3 Billion, Mercury's Toxic Effects, Melting Ice in Greenland, E-Waste- An Exploding Problem, The United States, China, and Sustainability.

Tragedy of the Commons: In this activity students discovery, how individuals typically act independently and in accordance with their own self-interests. Students are introduced to the concept of sustainability and the necessity of shared public resources for the common good of everyone.

Ecological Footprint: In this activity student examine their own ecological footprint and then the footprint of the school as a business using an on-line calculator. Students then work in groups to develop recommendations and strategies of implementation to improve our school's footprint. These recommendations will be sent to the principal and interested parties.

www.footprintnetwork.org/en/index.php/GFN/page/calculators/
(http://www.footprintnetwork.org/en/index.php/GFN/page/calculators/)

Fieldtrip to Santa Barbara Natural History Museum: Students will be able to compare a multitude of similar species up close and study their adaptions. Students will speculate to the forces that acted on the species and postulate how the adaptions can to be.

Butcher paper Biomes: Using knowledge of latitude, topography, ocean currents, precipitation and temperature, students will create an imaginary island around the world where they will have to determine the climate, biomes present, and subsequent species supported by that biome.

Fieldtrip to Oso Flaco Lake: Oso Flaco Lake is located three miles north of Guadalupe. It is part of the Santa Maria Valley watershed in which Oso Flaco Creek drains into the lakes after passing through miles of agricultural land. There is a riparian zone along Oso Flaco creek, a marsh, a wooded ecosystem, and a sand dunes ecosystem. Students will study the diverse habitats as well as the impact of agricultural run-off on these habitats.

Trip to Tidal pools at Shell Beach: Students will explore this fragile tidal region near Shell Beach. Students will examine and identify ten plant species and ten invertebrate species. Students will pay close attention to the special adaptions that allow these species to exist in this difficult habitat. This is a protected marine area and as such, no specimen collection is allowed. Students will document their "collection" with photographs and report the classification, habitat, reproduction, and adaptions of each species.

Fieldtrip/Camping trip to Refugio State Beach: All students, including those who have never been in the ocean, will go body surfing on boogie boards for the first time. Students will experience the wonder and power of the ocean. Students will feel the characteristics of the ocean as they try to catch a wave.

Honeybee Habitat: After researching about CCD, Colony Collapse Disorder, students will work in small groups to develop a proposal for a Honeybee Habitat to be created on campus. The habitat should take into consideration technical, social, economic, and environmental impacts as well as location and climatic requirements. Groups will present their proposal to the class. The students will determine a final decision. Students will work in small groups to build various aspects of the habitat.

Design a hydroponics system: Working in groups, students will be assigned a system to be design. These systems include; construction of support structure, electrical pumps, and wiring, attaching lighting fixtures, lights and wiring, light timing, chemical composition of nutrients, testing and maintenance of nutrients, and plumbing. Students will need to work together to build and integrate all the systems to create a functioning hydroponic growing environment.

Fish Consumption: Designing models: Using the information provided by the textbook, students will graph and analyze data to determine how much food is available and used for human consumption.

Take Action: Track your food: For one week, students will weigh the food that is purchased in their home and the food that is thrown out. Students will use categories to keep track of the food they eat. After one week, students will compare their data with other students. Students will then develop a plan to increase their food sustainability and share that plan with their family. Finally, students will report to the class their family's reaction to their recommendations.

Fieldtrip to Waste water treatment facility: Students will research and compare the components of an urban waste water treatment facility to an artificial wetlands system which can be used to treat sewage. Students will examine the advantages and disadvantages of both systems prior to going to the facility. At the facility, students will take a tour and learn how the plant operate. Students will take part in a question/answer session with plant personnel to get their prospective of the future of waste water treatment.

Cradle to Cradle Product life cycle: In this activity, students will research three products that could have a cradle to cradle life cycle and learn what it takes to make the products more sustainable.

Create recycling program for heavy metals: Students will search EPA website for information on e-waste recycling. Students will create an e-waste/ heavy metal recycling program for the school. Students will create a PSA to educate the student body about ways to reduce their e-waste.

Fracking: In this activity supplied by the textbook, students will investigate potential impacts of fracking on a community and decide if it should or should not be allowed there.

Take Action EPA and MyEnviroment: The EPA runs an interactive database on their website called MyEnvironment. Its purpose is to provide a cross-section of environmental data for any geographic location in the US. Students will develop a question that they can investigate regarding nonrenewable energy use as it relates to their community.

Design and build solar ovens: After researching various designs, students will build and evaluate the effectiveness of their solar oven by determining the highest temperature reached and highest temperature range sustained for more than one hour.

24 Hour Challenge: Students are challenged to live "off the grid" using no electricity for 24 hours. The challenge begins at the end of one school day. The next school day, students will prepare a great meal cooked in the solar ovens they have made. At the end of the day, students will sit down for a great meal and wonderful stories of personal revelation and sustainability.

Build solar lanterns: After researching global projects which bring solar light and power to regions without electricity, students will build solar lanterns using a solar cell and a mason jar.

Design a carbon-capture device: Following the directed-inquiry provided by the textbook, students will design, build, and test a habitat for cultivating algae and create a carbon-capture and storage device

Design a sustainable, carbon neutral city of the future: Using what they have learned about sustainability, student groups will design and build a model of a carbon neutral city. Student groups will present their model to the class and a discussion will follow which will focus on the merits of the various models.

Analyze data to create age structure diagrams: An age structure diagram shows the distribution by ages of females and males within a certain population in graphic form. Data for constructing the diagram will come from Census Year 2000 data. Students will access a database, http://www.census.gov/population/cen2000/phc-t9/tab03.pdf (http://www.census.gov/population/cen2000/phc-t9/tab03.pdf) , graph the data and analyze the diagram to make predictions about the condition of the population.

Solid waste personal inventory: For one week, students will collect all of their personal waste. Some waste will be simulated with clean alternatives. At the end of a week, students will sort their waste into categories and weigh the waste products. Students will graph their data and compare their data to other students in the class. A class discussion will follow about the types of waste and their quantities. Students will propose alternative habits that would limit their personal waste.

Fieldtrip to landfill and recycling plant: Students will research solid waste disposal and develop questions before setting off to the municipal landfill and recycling plant. Students will tour the facilities and learn how the plants operate. Students will interview the managers of the plants to get their prospective of the future of waste disposal in our area.

Climate Change and the Global Summit: In this activity, students will have an opportunity to investigate climate change for themselves. Each student will be a representative of an interest group. They will research the topics relates climate change and represent their interest's perspectives at an international summit where they will express and debate the viewpoint of their interest group and share their vital concerns with this issue much like the United Nations and the Kyoto Protocol.

ENVIRONMENTAL SCIENCE

Laboratory Science Subject Template

(Required Information needed to prepare for course submission)

Course Guidance

GENERAL LABORATORY SCIENCE GUIDANCE

The intent of the laboratory science requirement is to ensure that entering freshmen have a minimum of one year of preparation in each of at least two of the areas of Physics, Chemistry, and Biology/Life Science. This requirement can be satisfied by taking two courses from among these specific subject areas, but courses from across the broad spectrum of scientific subjects are potentially acceptable, provided they conform to the Course Requirements specified below.

Goals of the Laboratory Science Requirement

The overarching goal of the subject requirement in laboratory science is to ensure that freshmen are adequately prepared to undertake university-level study in any scientific or science-related discipline. The term "laboratory" is intended to signify an empirical basis of the subject matter, as well as inclusion of a substantial experimental and/or observational activity in the course design. The requirement emphasizes biology/life sciences, chemistry and physics because these subjects are preparatory to university-level study in all scientific and science-related disciplines. However, coverage of these foundational subjects in suitable breadth and depth can potentially be found in a wide range of science courses provided the courses conform to the criteria described under the Course Requirements below.

All courses certified in the laboratory science subject area should be designed with the explicit intention of developing and encouraging these scientific habits of mind:

Students should develop a perception of science as a way of understanding the world around them, not as a collection of theories and definitions to be memorized.

Students should emerge from high school embracing an ease in using their scientific knowledge to perceive patterns and regularity, make predictions, and test those predictions against evidence and reason.

Students should recognize that abstraction and generalization are important sources of the power of science.

Students should understand that scientific models are useful to represent phenomena in the physical world. They should appreciate that models and theories are valuable only when vigorously tested against observation.

Students should understand that assertions require justification based on evidence and logic, and should develop an ability to supply appropriate justifications for their assertions. They should habitually ask "Why?" and "How do I know?"

Students should develop and maintain openness to using technological tools appropriately, including graphing calculators and computers, in gathering and analyzing data. They should be aware of the limitations of these tools, and should be capable of effectively using them while making sound judgments about when such tools are and are not useful.

Students should recognize that measurements and observations are subject to variability and error, and that these must be accounted for in a quantitative way when assessing the relationship between observation and theory.

Course Requirements

Regardless of the scientific subject, all approved courses are expected to satisfy these criteria:

Courses should be consistent with and illustrate the goals described above.

Courses must explain the relevant phenomena on the basis of the underlying biological, chemical and/or physical principles, as appropriate. They should provide rigorous, in-depth treatments of the conceptual foundations of the scientific subject studied.

Courses should afford students opportunities to participate in all phases of the scientific process, including formulation of well-posed scientific questions and hypotheses, design of experiments and/or data collection strategies, analysis of data and drawing of conclusions. They should also require students to discuss scientific ideas with other students and to write clearly and coherently on scientific topics.

Courses must specify, at a minimum, elementary algebra as a prerequisite or co-requisite, and should employ quantitative reasoning and methods wherever appropriate.

Courses must take an overall approach that is consistent with the scientific method in relation to observing, forming hypotheses, testing hypotheses through experimentation and/or further observation, and forming objective conclusions.

Courses must include hands-on laboratory activities that are directly related to and support the other class work, and that involve inquiry, observation, analysis and write-up. These hands-on activities should account for at least 20 percent of class time, and should be itemized and described in the course description.

The content for physics, chemistry and biology/life sciences courses in grades 9 through 12 will usually be drawn from the Science Content Standards for California Public Schools [PDF], and may, in some cases, also be drawn from the California Career Technical Education Model Curriculum Standards [PDF]. While these standards can be a useful guide, coverage of all items in the standards is not necessary for the specific purpose of meeting the subject requirements for university admission. Likewise, simple coverage of all standards is not enough to assure course approval. For success in college, secondary science teachers should help students learn to assimilate the major ideas and principles that encompass the standards rather than explore the breadth of all the standards. More important than the topics covered, or even than the skills directly used in class, are the more general abilities and attitudes gained through the effort of mastering the course content. These general abilities and attitudes are described in the goals section above.

HONORS LABORATORY SCIENCE GUIDANCE

Laboratory Science Honors courses are expected to provide both breadth and depth of exploration in the subject area, developing writing, research, and analytical skills. Specific detailed evidence must be included in the course outline.
The courses must offer content and/or experience that are demonstrably more challenging than what is offered through the regular college preparatory courses in the same field.
Factors considered for UC approved honors courses that satisfy the "d" requirement include but are not limited to the assignment and evaluation of one long or numerous short, challenging, and properly-annotated research papers and a comprehensive final examination. Specific details of each of these assignments are required.
The use of college-level textbooks is encouraged.
Regular college preparatory courses in the subject areas should be offered. If regular non-honors courses are offered, a strong justification for the lack of a regular course is required.
In addition to AP and IB higher level courses, high schools may certify as honors level courses **not more than one unit** for each Laboratory Science Discipline.
A single, written, comprehensive, full year final exam must be administered that encompasses all the material that has been covered for the entire year.

Course Content

NOTE: The following questions are subject specific and ask for detailed information regarding the course curriculum. Since UC has developed their own criteria for the review of curricula, it is not necessary (and preferred) that the State Standards are not listed when submitting course descriptions to the University. When preparing the course submission, keep in mind that your audience is the UC High School Articulation unit and UC faculty. Include relevant information that would assist those reviewing the course and provide UC a better understanding and clarity about the intent of the curriculum. UC expects to see information that would show specific, detailed evidence of the course rigor and development of essential skills and habits of mind. Course template components need to be more expository and illustrative of the integration of each course component and how the overarching goals are being accomplished. The text boxes below will expand to accommodate additional text.

Course Purpose: *What is the purpose of this course? Please provide a brief description of the goals and expected outcomes. (How these will be accomplished should be reserved for the Course Outline, Key and Written assignments, Assessments, and/or Instructional Methods.)*

NOTE: More specificity than a simple recitation of the State Standards is needed.

Purpose:
Using STEM principles, the purpose of this course is to give students a broad overview of environmental science and concerns with an emphasis on their role and responsibility. Furthermore, using this course as a platform, students will be given the opportunity to:

- improve their reading and writing skills
- develop their ability to be objective observers of the world around them
- formulate testable questions and justify their position with evidence
- become comfortable with technological applications beyond social media.

Goals:
Students will develop three dimensional perspectives on how human populations, economics and global concerns interact and effect the environment through an understanding of our environmental resources, ecology, biodiversity and sustainability.
This course will create educated citizens that understand how their choices impact the world around them.
This course will influence individuals to become proactive agents of environmental change.
This course will foster enthusiasm and joy for the environment.

Expected Outcomes:

Students will become proficient at justifying their opinions with evidence and constructively critiquing others.
Students will, through the understanding of environmental concerns, be empowered to participate in civic minded environmental projects.
Students will participate in field studies involving environmental issues.
Students will take a stand and action on an environmental issue
Students will engineer solutions to environmental problems.

Course Outline: A *detailed descriptive summary of all topics covered. All historical knowledge is expected to be empirically based, give examples. Show examples of how the text is incorporated into the topics covered. A mere listing of topics in outline form is not sufficient (i.e. textbook table of contents or California State Standards).*

Course Outline

Unit 1 – Ecology and Ecosystems

This unit outlines ecosystems and how matter and energy flow through these systems.

A. Environment and Sustainability
   This chapter introduces limited resources, sustainability, and our ecological footprint.
B. Science Matter Energy and systems
   This chapter focuses on the carbon, nitrogen, phosphorous and water cycle and how mater and energy flow through the systems.
C. Ecosystem Dynamics
   This chapter details the components of ecosystems and their interactions.

Unit 2 – Biodiversity

This unit focuses on ecosystem characteristics and natural factors that affect and shape ecosystems.

A. Biodiversity and Evolution
   Biodiversity and mechanisms explain species origins based on scientific evidence.
B. Species Interactions
   Species interactions deals with species relationships, such as, predator prey, mutualism, parasitism, etc.
C. Ecological Succession
   Ecological succession describes how ecosystems respond to change in conditions. For instance, how a pond can become a meadow and eventually a tree stand. Or, factors that can limit succession.
D. Population Control
   Population control deals with factors that limit the growth in plant and animal populations. Human populations will be dealt with later in the course.
E. Ecosystems and Climate
   Ecosystems and climate details how climatic conditions, along with topography, latitude, and proximity to bodies of water can determine ecosystem characteristics.
F. Terrestrial and Aquatic Ecosystems
   These chapters detail the similarities and unique characteristics of each major terrestrial and aquatic ecosystem, including fresh and salt water systems.

Unit 3- Sustaining Biodiversity

This unit dives into the problems and issues created by human interaction with nature and what humans are doing to rectify and insure sustainable biodiversity for the future.

A. Sustaining Species
   The focus is on individual species and how to protect them. It details endangered and threatened species and the issues surrounding them, as well as, their species sustainability.
B. Sustaining Ecosystems
   The focus here changes from individual species to an entire ecosystem, treating all components of an ecosystem as vital to the survival of the whole. Problems and solutions in sustaining valuable ecosystems are addressed.
C. Politics of Biodiversity

This section deals with the role politics plays in protecting endangered species and critical ecosystems. It delves primarily into the EPA, Environmental Protection Act.

Unit 4 – Environment Quality

This unit centers on natural resources and services, their protection and management, and methods to increase sustainability.

A. Agriculture
   This chapter focuses on the role and importance agriculture plays in the world. This includes; food security, agriculture systems and developments, and procedural changes.
B. Water Resources and Pollution
   This chapter is about the limited supply of freshwater on the planet. It includes; management of the fresh water supply, increasing the sustainability of that supply, and water pollution issues that threaten the supply.
C. Geology and Nonrenewable Mineral Resources
   This chapter describes geological processes with the focus on mineral resource use, ecological effects, and sustainability.
D. Nonrenewable Energy Resources
   This chapter enumerates the advantages and disadvantages of fossil fuels and nuclear power.
E. Renewable Energy Resources
   This chapter discusses energy efficiency, sources of renewable energy and society's transition to renewable energy sources.

Unit 5 – Environmental Concerns

In this unit, the human factor is the focus.

A. Human Population and Urbanization
   This chapter focuses on human population demands. It examines factors that influence and effect urbanization. It closes with new ideas for becoming more sustainable.
B. Environmental Hazards and Human Health
   This chapter discusses types of health hazards which include both biological hazards and chemical hazards. It discusses risk evaluation, the population's perception of risk and postulates methods of avoidance.
C. Air Pollution, Climate Change, and Ozone Depletion
   This chapter tackles major air pollution problems. It addresses the effects of climate change and ideas for slowing climate change. It finishes with a discussion on reversing ozone depletion.
D. Solid and Hazardous Waste
   This chapter is about dealing with solid waste and hazardous waste. It also suggests ways to transition to low waste economy.
E. Environmental Economics, Politics, and World Views
   This chapter is about how economic systems are related to ecological resources and services. It addresses the use of economic tools to address environmental problems. It discusses the challenges global political systems have had in the past to enact global environmental policies. It ends with suggesting the social enactment of just environmental politics, and the encouragement to live more sustainably.

Laboratory Activities: *Acceptable courses include hands-on scientific activities that are directly related to and support the other classwork, and that involve inquiry, observation, analysis, and write-up. These hands-on activities should account for at least 20% of class time, and should be listed and described in detail. Please itemize and describe each laboratory activity in detail.*

Most laboratory activities take multiple 50 minute periods to complete.

Photosynthesis: Using Vernier probe ware students investigate the concentration of carbon dioxide, pH and oxygen levels of a photosynthetic system through various environments.

Biomass: Developed by the MSP, Math Science Project, Biomass is a series of experiments that lead students through photosynthesis and the uptake of carbon dioxide to form biomass.

Runoff: In this lab, students create a model to help conduct a controlled experiment to examine how ground cover effects the amount, quality, or composition of water runoff.

Owl Pellets, Food webs, and Pyramids: This lab extends the common use of owl pellets to a more complex level that relates the contents of the owl pellet to the flow of energy and matter. Students will dissect owl pellets to collect and count the contents. Students will use their data to create food webs and biomass pyramids.

Design a system to access a local species: Students will learn how to function as Citizen Scientists as they follow the prescribed protocol from the Sandy Beach Monitoring Program to collect, analyze and share data.

Bottle-ology Ecosystems: Students engineer aquatic, terrestrial, and decomposing solid waste ecosystems which include biotic and abiotic components. Students will perform experiments to track nutrients as they pass through the various systems. Their systems must be in contact with one another, sustainable and cycle nutrients throughout all the systems.

Food Webs: Working in groups, students will use photos of various organisms to create a hypothetical food chain, then a food web. Peer review will allow students to both critique and justify their arrangements. Students will explore the ramifications of an extinction event and the significance of keystone species. Finally, students will demonstrate the effects of biological magnification in a role-playing exercise.

Heat Transfer on Earth: Students will develop a model to investigate the specific heat content of various surfaces on earth. Students will explore how latitude effects the intensity of solar radiation. Finally, students will determine how surface covering, and latitude effect temperature ranges.

CO_2 and Ocean Acidification: Using Vernier probe ware, students will explore the chemical properties of seawater such as; pH, CO_2 levels, and oxygen levels. Other tests will determine ammonium, nitrate, and temperature levels. Students will explore what happens to the chemical balance of sea water and various shell fish when this balance is altered.

Investigate Species Diversity: Students will dissect a holdfast from our local offshore kelp forest. Students will examine this mini ecosystem and identify the diverse invertebrate organisms living in this environment. Students will use the statistical analysis tool, Shannon-Weiner Diversity Index, to analyze their data and determine the diversity of this mini-ecosystem.

Endangered Species Data Analysis: Students will use the data presented by the textbook to design a model that shows the proportion of endangered and threatened species.

Camping trip to Big Basin Redwood Forest: Students will participate in several experiments and activities that will take place over several days during an extended camping trip. Students will access the forest's health and gain an appreciation for an old growth forest.

- Using a random sampling plot method, students will examine, identify and record all the species they can identify on the forest floor using identification guides as a reference. They will then perform a statistical analysis of their data using the Simpson Diversity Index to determine the biodiversity of the area.

- Students will explore the forest looking for evidence of nutrient cycling. Students will then participate in a discussion where they will attempt to track biotic and abiotic cycling through the forest ecosystem. Students will be encouraged to justify their positions with the evidence they found.

- Students will examine the forest for producers, consumers, and decomposers and the food webs that they create. In addition, students will hypothesize about the interspecies relationships that might exist and support their opinion with their observations and findings.

- Students will examine evidence for ecological succession in the forest.

- Students will develop an understanding of forest resources, services, and management by gathering and analyzing data from a stand in the Big Basin Redwood Forest. Student will determine an estimate of the total stand volume.

- Students will examine some of the challenges facing our forests today including invasive species, wildfire, ownership, and climate change.

Fire Ecology: Students will examine the role of fire in forest and chaparral ecosystems. Students will focus on the natural role fire plays in the life cycle of these ecosystems and how fire is being used to manage these ecosystems. Students will experiment with charade which is charred wood remains left after a fire that contain leachable chemicals that stimulate seed germination in some plant species. Students will finally explore the issues that present themselves at the wildland-urban interface and propose fire safety solutions.

Soil Analysis: Students will identify soil types and characteristics based on: ribbon test, sieve test, sedimentation test, field test, and the soil pyramid. Students will identify organic matter, sand, silt, clay percentages in a variety of soil types. Furthermore, students will determine soil productive capacity based on: nitrogen test, phosphorus test, potassium test, pH test and percolation rate test. Using test results, students will determine best fit plant life and identify strategies to maximize production.

Effects of Nitrogen on Plant Growth: Eutrophication from Agricultural Run-off: This is a series of experiments. Students will be working in small groups. When the experiments are completed, students will prepare a presentation of their findings and share with the class.

Part one: Design an experiment to assess the changes in the dynamics of a freshwater system (interplay of such parameters as turbidity, pH, CO_2) as nutrients become increasingly more available.

Part two: Students will investigate one of the following:

- Design an experiment that could be used to compare the effects of nutrient enrichment on two different bodies of water.
- Design an experiment to access the dissolved oxygen content of similar bodies of water with different surrounding factors.
- Design an experiment to determine what types of household items might be contributing to cultural eutrophication (i.e.; many detergents contain phosphorus; lawn fertilizer contains nitrogen).
- Design an experiment to determine whether there is a marked difference in the biological consequences of continuous low-level nutrient enhancement and sudden high-level nutrient enhancement.

Design, Build and Test a Passive Water Filtration System: Students must keep in mind the usefulness of their design to a third world area as they build a passive water filtration system. Students will test the quantity and effectiveness of various factors that contribute to their passive water filtration system. Students will access the quality of the filtered water by the following factors: total dissolved solids, pH, and bacteria content. In addition to the chemical tests, student will need to learn sterile technique, microbiology techniques, and serial dilutions to test their water.

Serial Dilutions: Students will learn how to perform serial dilutions and calculate the resulting concentrations of each solution.

Microbiology: Students will learn sterile techniques as they prepare petri dishes with medium. Students will learn how to streak a petri plate and how to identify and count colonies. Do to the potential hazard, students will not be identifying strains of bacteria.

Water Quality Study: Students will follow established protocols to sample and test local water from around the Santa Maria area. Some additional water samples will be provided by the instructor in the classroom for students unable to go into the field. Students will use probe ware when possible. Some of the chemical tests will involve different techniques. Students will analyze their results and discuss their findings.

Get the Lead Out: Get the Lead Out is a guided-inquiry lab where students are challenged to determine how lead can be removed from a sample of contaminated water.

NEED Energy Transformation Investigations: Students will perform many experiments to become familiar with the various forms of energy transformations. Students will also learn about sources of energy, energy production and energy efficiency.

Electricity Use and Efficiency: Students will use a device called a Kill a Watt which is an electric usage monitor to evaluate electricity consumption of personal electrical appliances around their home. Students will pick one appliance to perform calculations to determine the amount of energy consumed.
In addition, students will choose one of the following or suggest their own investigation.

- evaluate several different devices with the same purpose.
- evaluate an electrical device in the variety of modes offered; such as, heat on/off, sleep mode or active mode for a

computer
- evaluate hidden electric use by appliances that always consume electricity even when turned off

Nicotine Toxicity: Students will investigate how various concentrations of nicotine affect the behavior of Lumbriculus variegatus (California blackworms)

LD_{50} : LD stands for lethal dose and LD_{50} signifies the single dose needed to kill 50% of the animals used in the experiment. It is widely used to test the toxicity of household products, pesticides, cosmetics, drugs, weed killers and industrial products. Students will use serial dilution to create different concentrations of a copper sulfate solution. Students will expose Daphnia magna, a small planktonic crustacean, to the various concentrations. The results are graphed on semi log paper and the LD_{50} is determined.

Greenhouse: Students will create a model to simulate the greenhouse effect and monitor temperature and CO_2 levels with Vernier probe ware. Students will analyze the data and discuss the relationship between CO_2 levels and temperature.

Lab Albedo: In a controlled experiment, equal amounts of shaved ice are placed on different colored metal substrates. The amount of "snow" that melts as a function of time is measured and the data is graphed. Students will discuss their results as a model for polar ice verse land base ice melt and the compounding ramifications of global warming. Students will explore the concept of a positive feedback loop and realize the complexity of these scenarios.

Key Assignments: *Detailed descriptions of all Key Assignments which should incorporate activities and projects, as well as, short answers and essay questions. How do assignments incorporate topics? Include all assignments that students will be required to complete. Assignments should be linked to components mentioned in the course outline. It is not appropriate or necessary to include instructions given to students regarding the execution of assignments (formatting, timeliness, etc.). Do not include exams or assessments in this section.*

Students will be assigned a writing activity for each chapter. It will focus on the case study presented by that chapter. It will be modeled after the Common Core writing standards for technical writing. The first six will have the data that the chapter offers. The next six assignments will have additional data provided by outside sources to provide students with experience from multiple data sources. The final six assignments will include opposing points of view from multiple sources to help prepare students to be proficient writers. The 18 case study topics are: The Greening of American Schools, Experimenting with a Forest, Disappearing Tropical Rain Forests, Amphibians at Risk, The Southern Sea Otter: A Species in Recovery, The Importance of Coral Reefs, A Honeybee Mystery, Costa Rica; A Global Conservation Leader, Growing Power- An Urban Food Oasis, The Colorado river Story, The Importance of Rare Earth Metals, Fracking for Oil and Gas, The Potential for Wind Power in the United States, Population 7.3 Billion, Mercury's Toxic Effects, Melting Ice in Greenland, E-Waste- An Exploding Problem, The United States, China, and Sustainability.

Tragedy of the Commons: In this activity students discovery, how individuals typically act independently and in accordance with their own self-interests. Students are introduced to the concept of sustainability and the necessity of shared public resources for the common good of everyone.

Ecological Footprint: In this activity student examine their own ecological footprint and then the footprint of the school as a business using an on-line calculator. Students then work in groups to develop recommendations and strategies of implementation to improve our school's footprint. These recommendations will be sent to the principal and interested parties.
www.footprintnetwork.org/en/index.php/GFN/page/calculators/

Fieldtrip to Santa Barbara Natural History Museum: Students will be able to compare a multitude of similar species up close and study their adaptions. Students will speculate to the forces that acted on the species and postulate how the adaptions can to be.

Butcher paper Biomes: Using knowledge of latitude, topography, ocean currents, precipitation and temperature, students will create an imaginary island around the world where they will have to determine the climate, biomes present, and subsequent species supported by that biome.

Fieldtrip to Oso Flaco Lake: Oso Flaco Lake is located three miles north of Guadalupe. It is part of the Santa Maria Valley watershed in which Oso Flaco Creek drains into the lakes after passing through miles of agricultural land. There is a riparian zone along Oso Flaco creek, a marsh, a wooded ecosystem, and a sand dunes ecosystem. Students will study the diverse habitats as well as the impact of agricultural run-off on these habitats.

Trip to Tidal pools at Shell Beach: Students will explore this fragile tidal region near Shell Beach. Students will examine and identify ten plant species and ten invertebrate species. Students will pay close attention to the special adaptions that allow

these species to exist in this difficult habitat. This is a protected marine area and as such, no specimen collection is allowed. Students will document their "collection" with photographs and report the classification, habitat, reproduction, and adaptions of each species.

Fieldtrip/Camping trip to Refugio State Beach: All students, including those who have never been in the ocean, will go body surfing on boogie boards for the first time. Students will experience the wonder and power of the ocean. Students will feel the characteristics of the ocean as they try to catch a wave.

Honeybee Habitat: After researching about CCD, Colony Collapse Disorder, students will work in small groups to develop a proposal for a Honeybee Habitat to be created on campus. The habitat should take into consideration technical, social, economic, and environmental impacts as well as location and climatic requirements. Groups will present their proposal to the class. The students will determine a final decision. Students will work in small groups to build various aspects of the habitat.

Design a hydroponics system: Working in groups, students will be assigned a system to be design. These systems include; construction of support structure, electrical pumps, and wiring, attaching lighting fixtures, lights and wiring, light timing, chemical composition of nutrients, testing and maintenance of nutrients, and plumbing. Students will need to work together to build and integrate all the systems to create a functioning hydroponic growing environment.

Fish Consumption: Designing models: Using the information provided by the textbook, students will graph and analyze data to determine how much food is available and used for human consumption.

Take Action: Track your food: For one week, students will weigh the food that is purchased in their home and the food that is thrown out. Students will use categories to keep track of the food they eat. After one week, students will compare their data with other students. Students will then develop a plan to increase their food sustainability and share that plan with their family. Finally, students will report to the class their family's reaction to their recommendations.

Fieldtrip to Waste water treatment facility: Students will research and compare the components of an urban waste water treatment facility to an artificial wetlands system which can be used to treat sewage. Students will examine the advantages and disadvantages of both systems prior to going to the facility. At the facility, students will take a tour and learn how the plant operate. Students will take part in a question/answer session with plant personnel to get their prospective of the future of waste water treatment.
Cradle to Cradle Product life cycle: In this activity, students will research three products that could have a cradle to cradle life cycle and learn what it takes to make the products more sustainable.

Create recycling program for heavy metals: Students will search EPA website for information on e-waste recycling. Students will create an e-waste/ heavy metal recycling program for the school. Students will create a PSA to educate the student body about ways to reduce their e-waste.

Fracking: In this activity supplied by the textbook, students will investigate potential impacts of fracking on a community and decide if it should or should not be allowed there.

Take Action EPA and MyEnviroment: The EPA runs an interactive database on their website called MyEnvironment. Its purpose is to provide a cross-section of environmental data for any geographic location in the US. Students will develop a question that they can investigate regarding nonrenewable energy use as it relates to their community.

Design and build solar ovens: After researching various designs, students will build and evaluate the effectiveness of their solar oven by determining the highest temperature reached and highest temperature range sustained for more than one hour.

24 Hour Challenge: Students are challenged to live "off the grid" using no electricity for 24 hours. The challenge begins at the end of one school day. The next school day, students will prepare a great meal cooked in the solar ovens they have made. At the end of the day, students will sit down for a great meal and wonderful stories of personal revelation and sustainability.

Build solar lanterns: After researching global projects which bring solar light and power to regions without electricity, students will build solar lanterns using a solar cell and a mason jar.

Design a carbon-capture device: Following the directed-inquiry provided by the textbook, students will design, build, and test a habitat for cultivating algae and create a carbon-capture and storage device

Design a sustainable, carbon neutral city of the future: Using what they have learned about sustainability, student groups will design and build a model of a carbon neutral city. Student groups will present their model to the class and a discussion will follow which will focus on the merits of the various models.

Analyze data to create age structure diagrams: An age structure diagram shows the distribution by ages of females and males within a certain population in graphic form. Data for constructing the diagram will come from Census Year 2000 data.

Students will access a database, http://www.census.gov/population/cen2000/phc-t9/tab03.pdf , graph the data and analyze the diagram to make predictions about the condition of the population.

Solid waste personal inventory: For one week, students will collect all of their personal waste. Some waste will be simulated with clean alternatives. At the end of a week, students will sort their waste into categories and weigh the waste products. Students will graph their data and compare their data to other students in the class. A class discussion will follow about the types of waste and their quantities. Students will propose alternative habits that would limit their personal waste.

Fieldtrip to landfill and recycling plant: Students will research solid waste disposal and develop questions before setting off to the municipal landfill and recycling plant. Students will tour the facilities and learn how the plants operate. Students will interview the managers of the plants to get their prospective of the future of waste disposal in our area.

Climate Change and the Global Summit: In this activity, students will have an opportunity to investigate climate change for themselves. Each student will be a representative of an interest group. They will research the topics relates climate change and represent their interest's perspectives at an international summit where they will express and debate the viewpoint of their interest group and share their vital concerns with this issue much like the United Nations and the Kyoto Protocol.

Instructional Methods and/or Strategies: *Indicate how the Instructional Methods and/or Strategies support delivery of the curriculum. What portions of the Course Outline are supported by the methods and strategies?*

Environmental Science is designed as a student-centered interactive course. This course is intentionally design to be very hands-on, minds-on with an extensive list of laboratories, projects, and activities for the students to participate in.

Higher order thinking skills and personal connections happen primarily though the labs, projects and activities as students discuss and justify their reasoning. Through the projects and activities, students see themselves as active participants in a movement for environmental change.

The camping trips are included to stimulate the students' affective educational domain. Imagine their experience as, for the first time, early dawn breaks through the silence in the old redwood forest. While the fog still shrouds the canopy, it feels as though the trees go straight to heaven. And, with the first glimmer of light, crowning over the mountains, the birds start to sing as if to welcome in a new day. How can you not be affected by that?

Most, 80-90%, of our population are second language learners. These kids carry the hopes and dreams of their families and they want so badly to do well in school. When they take notes from a book, they copy everything. They don't want to miss anything because to them, it might be important. The problem with this is that they are overwhelm with the sheer volume of work. They can't discern main ideas, and supporting material from the remaining text. Our challenge, as we see it, is to help our students develop reading strategies to distinguish important key ideas and supporting details from the rest of the text. To this end, and in keeping with a student-centered course, students will discover the main ideas themselves as they work in small groups to unwrap and digest the textbook. A new reading strategy to assist them will be introduced each chapter during the first semester.

There will be a writing activity for each chapter which will center on the core case study presented by the textbook. The writing assignments will be modeled after the Common Core writing standards for technical writing. The writing activities will get progressively more challenging to help prepare students to be proficient writers. Student will learn to make a scientific claim, support that claim with scientific evidence, and develop conclusions utilizing scientific reasoning.

Each chapter will include vocabulary development and will be primarily delivered using on-line game formats such as; Quizlet, bingo, and jeopardy.

Each chapter will also have concept development using another on-line game format called Kahoot. In addition to gaming, students will also regularly participate in white boarding, jigsaw grouping, museum walks and short student presentations. Student discussions and debates will become prominent in the second term as students become more familiar with justifying their opinions with evidence.

Students will also be exposed to a new technological application in each chapter and will then utilize these new applications throughout the remainder of the year. These applications include the following: Microsoft OneNote, Collaboration space in OneNote, Microsoft Word using tables and graphs, File hierarchy and file storage systems, One Drive, Dropbox, Microsoft PowerPoint, Google Docs, Google Calendar, Survey Monkey, Basic Microsoft Excel, Skype and video conferencing, and search engine strategies.

Assessments Including Methods and/or Tools: *Indicate the intent of each assessment and a brief description of how each relates to the Course Purpose and goals related to the development of critical thinking and other habits of mind skills.*

Grades will be determined by total points accumulated within weighted categories. Some assignments with holistic assessment will be converted to a point system to be integrated into the overall assessment of students.

35% tests and quizzes
20 % laboratory
15% projects
15% activities
15% writing assignments

On-going informal assessments

Quizzes are formative assessments carried out concurrently with instruction. Students can retake quizzes after participating in an afterschool tutorial.
Tests are formal, summative assessments which will include multiple choice and free response writing.
Laboratory work, projects, and activities will include a written report which is graded based on a published rubric given to students prior to the exercise. These rubrics all share common elements as well as unique elements specific to each assignment. Students may receive assistance with reports during afterschool tutoring. Some of the activities may be based on a holistic assessment. These assessments will be based on a published rubric provided to the students prior to the activity.
Writing assignments are graded based on the Common Core assessment for technical writing. On-going informal assessments are used to adjust the pace and scope of the class and make minor adjustments when warranted.

Comments:

Course Purpose: *What is the purpose of this course?*

ENVIRONMENTAL STUDIES (L) 0512 (ENVSTUDIES) Environmental Studies provides students opportunities to utilize several disciplines in examining ecosystems from a variety of human viewpoints. This course fosters an awareness of aesthetics in urban and rural areas and the ecological, economic, social and political interdependence of environmental factors. It introduces students to the knowledge, attitudes, commitments, and skills needed to make decisions and to choose personal actions that will contribute to intelligent resource management. This course also provides students with the skills needed to investigate the ecological effects regarding the uses of: (1) energy, (2) water, (3) air, (4) soils, (5) minerals, (6) wildlife, and (7) other natural resources. Field trips and community investigations provide examples of practical applications of resource management. Topics include: (1) identifying and monitoring the disposal of hazardous wastes, (2) acid rain, (3) land- use practices ranging from wilderness areas to areas under multipleuse management, (4) water and solid waste treatment, (5) transportation systems, (6) human population demands on the land, and (7) the impact of these factors on the quality of life and the culture of the area.

Outcomes: Students will…

1. develop proper laboratory skills.
2. trace the development of planet earth and its impact on its environmental wellness.
3. develop writing skills to show comprehension of learned materials.
4. develop critical thinking processes and make value judgments regarding ecology and environmental issues

B. COURSE CONTENT

Course Outline: A *detailed descriptive summary of all topics covered. All historical knowledge is expected to be empirically based, give examples. (i.e. California State Standards).*

Topic 1)Introduction to Environmental Science
Tools of Environmental Science—Science Safety and Scientific Method, Modeling
Recycling and Waste
Topic 2) Dynamic Earth and impact on environment—geosphere, atmosphere, hydrosphere, biosphere
Topic 3) Organization of Life—ecosystems, evolution, diversity of living things
Topic 4)How Eco-Systems Work—energy Flow, cycling, changes
Topic 5) Polar Ice Caps and their impact on Climate Change
Topic 6)Biomes—Desert, Tundra, GrasslandsTopic 7)
Biomes—Forests: Deciduous, Coniferous, Temperate Rainforests, Tropical Rainforests
Topic 8) Biomes—Freshwater and Marine
Topic 9) Energy Efficiency
Environmental and Human Health Economics and Polices
Topic 10) Population Impacts, Natural and Non-renewable Resources, Alternative Energy sources

Core Standards:
Scientific Investigations Use a Variety of Methods (HS-LS1-3)
Scientific inquiry is characterized by a common set of values that include: logical thinking, precision, open-mindedness, objectivity, skepticism, replicability of results, and honest and ethical reporting of findings.
WHST.9 - 12.7 Conduct short as well as more sustained research projects to answer a question (including a self-generated question) or solve a problem; narrow or broaden the inquiry when appropriate; synthesize multiple sources on the subject, demonstrating understanding of the subject under investigation. (HS-LS1-3)
WHST.11-12.8 Gather relevant information from multiple authoritative print and digital sources, using advanced searches effectively; assess the strengths and limitations of each source in terms of the specific task, purpose, and audience; integrate information into the text selectively to maintain the flow of ideas, avoiding plagiarism and overreliance on any one source and following a standard format for citation. (HS-LS1-3)
WHST.9 - 12.9 Draw evidence from informational texts to support analysis, reflection, and research. (HS-LS1-1)
SL.11-12.5 Make strategic use of digital media (e.g., textual, graphical, audio, visual, and interactive elements) in presentations to enhance understanding of findings, reasoning, and evidence and to add interest. (HS-LS1-2)
Mathematics -
MP.2 Reason abstractly and quantitatively. (HS-LS2-4)

18. Brief Course Description

Forensic Science is a class that will increase a student's knowledge and practical application of current methodologies utilized in the area of crime scene investigation. This is a class that will provide an avenue for students to use the scientific method to solve real-life crime situations. Students will use logical and critical thinking skills to process and evaluate information and evidence in order to arrive at a successful solution to any number of scenarios based on actual and mock crime scenes. Students must apply their knowledge of biology, chemistry, physics, and biotechnology in order to develop solutions within a forensic science context.

Course Content

Course Goals:

Topics in Forensic Science will provide students an opportunity to show or improve:

1. their ability to problem solve using the scientific method and their knowledge of biology, chemistry, physics, and biotechnology.

2. their ability to investigate a crime scene using the current methodologies of a forensic scientist which requires key observation skills, evidence gathering skills, evidence analysis, critical thinking, developing testable hypotheses, and scientific experimentation.

3. their ability to research using current Internet forensic sites, current textbooks, and journals to produce a research project

4. their reading skills by offering a wide array of appropriate and challenging materials. Reading will be a significant source of current information needed to increase their knowledge of the subject area, as well as to research their hypotheses from which they will develop their experiments.

5. their math skills by requiring accurate measuring of crime scene evidence, as well as computations associated with the analysis of the evidence, as well as being able to utilize scientific measuring equipment with precision and accuracy.

Course Objectives:

Forensic Science will prepare students to:

1. apply knowledge of science courses in a relevant and hands-on format that will stress application of the knowledge rather than just an understanding of it.

2. accurately collect and analyze data by using the current tools used by scientists.

3. evaluate information and formulate conclusions using the scientific method

4. increase their use of language, mathematics, and reading

5. increase their ability to think critically and solve problems through direct investigations related to crime scenes.

6. increase their ability to apply scientific problem solving in the context of forensic science

COURSE OUTLINE

I. Overview of Forensics
- A. The scientists
- B. Parts of the crime lab
- C. Legal aspects
  1. Miranda Warnings
  2. Constitutional Amendments
  3. Penal Law

II. The Crime Scene
- A. Securing the crime scene
- B. Collecting of evidence
- C. Diagramming the crime scene
  1. Rough sketch
  2. Smooth sketch
- D. Crime scene reconstruction
- E Frey's Principle

III. Types of Evidence
- A. Fingerprints
  1. Identifying different types
  1. Latent vs. visible prints
  2. Printing suspects
  3. Classification of Prints

- B. Serology (Blood)
  1. Types of blood
  2. Stain patterns of blood
  3. Collection and preservation of blood
  4. Principles of heredity
  5. Forensic characterization of semen
  6. Collection of rape evidence

C. DNA
    1. What is DNA?
    2. How is DNA used by law enforcement?

D. Firearms
    1. Ballistics
    2. Collection and preservation of firearm evidence
    3. Matching bullets
    4. Primer residue on hands

E. Arson and Explosives
    1. Chemistry of Fire
    2. Collection and preservation of arson evidence
    3. Analysis of Flammable residues
    4. Types of explosives
    5. Collection and analysis of explosives

F. Hair and fiber evidence
    1. Identification and comparison of hair
    2. Collection of Hair evidence
    3. Types of fibers
    4. Collection of fiber evidence

G. Glass and soil
    1. Physical properties of glass
    2. Collection and preservation of glass evidence
    3. Characteristics of Soil
    4. Collection an preservation of soil evidence

Texts and Supplemental Instructional Material

Primary text: Saferstein, Richard. Criminalistics: An Introduction to Forensic Science, 6th Edition

Supplemental texts: Houde, John. Crime Lab: A Guide for Nonscientists
Genge, N.E. The Forsensic Casebook
Platt, Richard. Crime Scene: the Ultimate Guide to Forensic Sciene
Evans, Colin. The Casebook of Forensic Detection.
0Walker, Pam. Crime Scene Investigations Real-Life Science

Supplemental Instructional Materials:
Court TV, Zeno's Forensic Site, Reddy's Forensic Page, National Forensic Science Technology
Center, Forensic Videos

Methods of Assessment

Students will be assessed continuously throughout the course in a variety of ways in order to allow for an accurate and varied method of evaluation. The following strategies will include, but are not limited to:

1. written test and quizzes with both subjective and objective questions
2. performance based evaluations, including experiments, demonstrations, simulations, debates, and projects
3. written assignments both as individuals and as teams that could include justifications, investigations, comparisons, and evaluations of research
4. individual and peer assessments

Instructional Methods

Methods of instruction will include but are not limited to:

1. direct instruction through lecture, readings, labs, essays, presentation, and guest speakers
2. laboratory investigations and projects
3. self-directed, cooperative, and collaborative learning
4. use of a variety of instructional materials and resources including the electronic media, scientific journals, community professionals

COURSE DATA

Title: Forensic Science
Department: Science
Grade Level: 11-12 2 Semester Course (10 units)
Prerequisites(s) Biology and Chemistry

Target Group: This course is recommended for students in grade 11 and 12 who plan to attend a four-year college or university and who have an interest in pursuing forensic science as a career. Students should have a basic understanding of both Biology and Chemistry.

Lab fees: none

Course Purpose:

Forensic Science is a class that will increase a student's knowledge and practical application of current methodologies utilized in the area of crime scene investigation. This is a class that will provide an avenue for students to use the scientific method to solve real-life crime situations. Student will use logical and critical thinking skills to process and evaluate information and evidence in order to arrive at a successful solution to any number of scenarios based on actual and mock crime scenes. Students must apply their knowledge of biology, chemistry, physics, and biotechnology in order to develop solutions within a forensic science context.

Course Content
Course Goals:

Topics in Forensic Science will provide students an opportunity to show or improve:

1. their ability to problem solve using the scientific method and their knowledge of biology, chemistry, physics, and biotechnology.

2. their ability to investigate a crime scene using the current methodologies of a forensic scientist which requires key observation skills, evidence gathering skills, evidence analysis, critical thinking, developing testable hypotheses, and scientific experimentation.

3. their ability to research using current Internet forensic sites, current textbooks, and journals to produce a research project

4. their reading skills by offering a wide array of appropriate and challenging materials. Reading will be a significant source of current information needed to increase their knowledge of the subject area, as well as to research their hypotheses from which they will develop their experiments.

5. their math skills by requiring accurate measuring of crime scene evidence, as well as computations associated with the analysis of the evidence, as well as being able to utilize scientific measuring equipment with precision and accuracy.

Course Objectives:

Forensic Science will prepare students to:

1. apply knowledge of science courses in a relevant and hands-on format that will stress application of the knowledge rather than just an understanding of it.

2. accurately collect and analyze data by using the current tools used by scientists.

3. evaluate information and formulate conclusions using the scientific method

4. increase their use of language, mathematics, and reading

5. increase their ability to think critically and solve problems through direct investigations related to crime scenes.

6. increase their ability to apply scientific problem solving in the context of forensic science

Standard of Expected Student Achievement
Upon completion of this course, students will be able to demonstrate the following knowledge and skills:

1. Describe the history of Forensic Science, the parts of a crime lab, and the legal aspects involved in crime scene investigation.
2. Describe and exhibit the proper way to secure a crime scene, collect evidence, and reconstruct the crime scene.
3. List and describe the various types of physical evidence used in crime scene investigation.
4. Describe and exhibit the correct way to collect and preserve the various types of evidence.
5. Apply the scientific method in order to form hypotheses and test them in a crime scene context.
6. Use the basic scientific tools and instruments
7. Solve a simulated crime scene by applying all the knowledge and skills learned throughout the course.

Methods of Assessment

Students will be assessed continuously throughout the course in a variety of ways in order to allow for an accurate and varied method of evaluation. The following strategies will include, but are not limited to:

1. written test and quizzes with both subjective and objective questions
2. formance based evaluations, including experiments, demonstrations, simulations, debates, and projects
3. tten assignments both as individuals and as teams that could include justifications, investigations, comparisons, and evaluations of research
4. individual and peer assessments

Instructional Methods and Activities

Methods of instruction will include but are not limited to:

1. direct instruction through lecture, readings, labs, essays, presentation, and guest speakers
2. laboratory investigations and projects
3. self-directed, cooperative, and collaborative learning
4. use of a variety of instructional materials and resources including the electronic media, scientific journals, community professionals

Instructional Materials: Criminalistics by Richard Saferstein 6th edition,

Supplementary forensic science lab book and other texts, guest speakers, web sites specific to forensic science, Court TV, forensic videos

College Preparatory Elective – Laboratory Science Subject Template

(Required Information needed to prepare for course submission)

- **Course Guidance**

GENERAL COLLEGE PREP ELECTIVE GUIDANCE

The intent of the college preparatory elective requirement is to encourage prospective UC students to fill out their high school programs with courses that will meet one or more of a number of objectives:

- To strengthen general study skills, particularly analytical reading, expository writing, and oral communications
- To provide an opportunity to begin work that could lead directly into a major program of study at the University, and
- To experience, in some depth, new areas of academic disciplines that might form the basis for future major or minor studies at the University

Quality. All courses selected to meet the "g-College Prep Elective – Laboratory Science" elective requirement are expected to meet standards of quality similar to those required for the "d-Laboratory Science" requirement. Courses acceptable for the "g" elective area should be advanced courses designed for the 11th and 12th grade level and/or have appropriate prerequisites, although laboratory science courses intended for 9th or 10th graders (e.g., earth science, physical science, integrated science) are accepted as an exception to the advanced policy regulation. Elective courses should present material at a sufficient depth to allow students to achieve mastery of fundamental knowledge that prepares them for University work or a future career path.

Examples of Acceptable Elective Courses. Typical courses acceptable to fulfill the "g-College Prep Elective – Laboratory Science" area include astronomy, agricultural science, biotechnology, earth science, environmental science, physical science, introductory integrated science, veterinary science, and others.

COLLEGE PREP ELECTIVE: LABORATORY SCIENCE GUIDANCE

Acceptable laboratory science courses should cover topics from the biological or physical sciences and include laboratory activities. A terminal course designed only to meet graduation requirements is not an acceptable science elective. In this subject area only, lower level courses (e.g., physical science, earth science) are often accepted as electives.

- **Course Content**

NOTE: The following questions are subject specific and ask for detailed information regarding the course curriculum. Since UC has developed their own criteria for the review of curricula, it is not necessary (and preferred) that the State Standards are not listed when submitting course descriptions to the University. When preparing the course submission, keep in mind that your audience is the UC High School Articulation unit and UC faculty. Include relevant information that would assist those reviewing the course and provide UC a better understanding and clarity about the intent of the curriculum. UC expects to see information that would show specific, detailed evidence of the course rigor and development of essential skills and habits of mind. Course template components need to be more expository and illustrative of the integration of each course component and how the overarching goals are being accomplished. The text boxes below will expand to accommodate additional text.

Course Purpose: *What is the purpose of this course? Please provide a brief description of the goals and expected outcomes. (How these will be accomplished should be reserved for the Course Outline, Key and Written assignments, Assessments, and/or Instructional Methods.)*

NOTE: More specificity than a simple recitation of the State Standards is needed.

Assessment of student performance will include but not limited to:

• Test	30%
• Quizzes	20%
• Scientific lab reports/lab notebooks	20%
• Daily homework	10%
• Essays, simulations, class participation	10%
• Final Exam	10%

For Preparation Only

Unit 1: Historical Introduction and Overview of Forensic Science

- Timeline of Forensic Science Poster Project
  - Students will be allowed to choose a scientist from a list of 150 notable forensic scientists.
  - They will create a poster about their scientist including the following:
    - Scientist Name
    - Dates of Life
    - Important Contributions to Forensic Science
  - Students then present their posters to the class and then create a giant time line with ll of the posters on the classroom walls.

- WebQuest
  - Students will use the tutorial of a crime scene lab to identify the functions of the different types of labs in a crime laboratory
  - The WebQuest also gives the students a chance to watch clips of interviews with actual forensic scientist and other members to the forensic science lab teams.
  - Students will use the information in the WebQuest to write an overview of the purpose of crime laboratories

- College Report
  - Students choose a local college that offers a forensic science degree program and create a brochure with the following information:
    - Degree option
    - Cost of Program
    - Length of time to complete program
    - Pre-requisites to be accepted into the program
    - Career/job you can get once you have completed the program.

Unit 2: the Crime Scene and Physical Evidence

- Crime Scene Investigation
  - Students will collect evidence at the mock crime scene using different search patterns.
  - Students will collect the evidence in collection bags and then list all items of evidence so that they can begin the chain of command
  - Students will write a report describing the details of their investigation.
- Case Study – The Wayne Williams trail; circumstantial fiber evidence and probability determination
- Case Study – Enrique Camarena (jurisdiction and evidence)
- Crime scene sketch kit – Sirchie Laboratories Evidence: The True witness (http://library.thinkquest.org/17049/gather/)

Unit 3: Physical Properties of Glass and Soil

- Measuring using the metric system practice:
  - Students will use rulers to measure different objects in the classroom to get an understanding about size and the metric system.
- Glass Lab (see above)
- Students will write a summary regarding the guest speaker's presentation on soil casting of footprints and ways to read the crime scene.

Unit 4 Organic and Inorganic Analysis

- Candy Chromatography Lab (see above section)
- Thin-Layer Chromatography of Ink Lab (see above section)
- Read: FDA's Forensic Center: Speedy, Sophisticated Sleuthing http://www.fda.gove/fdac/features/695_forensic.html; describe their uses of spectrometry, electrophoresis, and chromatography
- Calculations: Chemistry and Forensics WS (teacher created)
- Case Study – The assassination of President Kennedy: the use of neutron activation analysis

For Preparation Only

Unit 5: Hairs, Fibers, Paint and The Microscope

- Forensic Analysis (see above section)
- Hit and Run Crime Scene Investigation
- Case study – Microscopic Trance Evidence; wood evidence in the Lindbergh kidnapping

Unit 6: Drugs and Toxicology

- Drug ID virtual lab. (http://wps.prenhall.com/chet_faferstein_criminalistics_9/48/12532/3208430.cw/index.html)
- Opinion paper – what to do think about legalizing marijuana on a state level? What about at the federal level? What is the difference?

Unit 7: Arson and Explosives

- Dollhouse Fire Lab (see above section)
- Demo: Flame Colors (the Fire Rainbow)
- Nova video: Hunt for the Serial Arsonist

Unit 8: forensic Serology

- Vomit lab (see above section)
- Blood Spatter Evidence (see above section)
- Bloodstain Analysis Lab (see above section)
- Case Study – The "Bobby Joe" Long Serial Murder Case: A study in Cooperation

Unit 9: DNA Fingerprinting

- Case Study – OJ Simpson Case Study
- Case Study – The Forensic Community's Response to 9/11
- Activity: Creating Pedigrees from Electropherograms; students use electropherogram results to create a family pedigree
- Activity: Identifying the Remains of the Romanovs http://www.shodor.org/workshops/forensic/cases/romanov.htmt

Unit 10: Fingerprinting

- Quiz from anatomy teacher of overview of anatomy
- Fingerprinting Lab (see above section)
- Case Study – Attempted Assassination of Archbishop Makarious

Unit 11: Trace Evidence, Impressions, Firearms, and Tool Marks

- Position Paper – How do you feel about gun control? Students will argue for or against it and then we will have a class discussion.
- Tool Mark Analysis Lab (see section above)
- LAPD Investigator Crime Scene search activity and guest speaker reflection paper.

Unit 12: Human Remains and Entomology

- Forensic Anthropology Lab (see above section)
- Forensic Entomology Lab (see above section)
- Read – Body Farm article and complete questions
- Fetal Pig Autopsy Dissection – Carolina Biological Supply Company offers a kit to teach students the cuts commonly used in an autopsy. It gives students an idea of how the procedure is done and gives them another look at physiology and anatomy that we covered earlier in the year.

For Preparation Only

Course Outline: A *detailed descriptive summary of all topics covered. All historical knowledge is expected to be empirically based, give examples. Show examples of how the text is incorporated into the topics covered. A mere listing of topics in outline form is not sufficient (i.e. textbook table of contents or California State Standards).*

This class meets every day for one hour.

Introduction to Forensic Science (1 month)

I. Historical Introduction and Overview
   - *A. Timeline of forensic science (Scientist Poster Timeline Project)*
   - *B. Creating unique connections using physical, chemical, and biological foundations*

II. What is forensic science?
   - *A. History and development of forensic science labs in the U.S.*
   - *B. Crime lab organizations and services*
     - *1) Private vs. public labs*
     - *2) Departments*
     - *3) State/local lab vs. federal*
   - *C. Areas of forensic science*
     - *1) Criminalist, pathologist, medical examiner, coroner, accident reconstruction, odontologist,, pathologist, anthropologist, mental health profiler, document examiner, toxicologist, artist, accountant, ballistics expert, arson investigators, entomologist, geologist, computer examiner, linguist (Job Profiling poster project)*
     - *2) WebQuest using the textbook's accompanying website to discover the workings of each of the unit's labs*

III. What is a forensic scientist: education, training, and expert testimony
   - *A. Schools with forensic degree programs in the area*
   - *B. Pre-requisites to studying it in college*

IV. How did this become a science?
   - *A. Locard's principle*
   - *B. Scientific method*
   - *C. Lab Analysis Techniques(preview of the different types of experiments used in the upcoming chapters)*

V. Court room decisions that have impacted the admissibility of evidence
   - *A. Jacalevich Case Study*
   - *B. Camarena Case Study (dealing with jurisdiction problems)*

The Crime Scene and Physical Evidence (2.5 week)

I. Defining a crime scene: artifacts and evidences
II. How to collect evidence
III. Investigator guest speaker about how to collect and record evidence

IV. Review the metric system and appropriate units of measurement
   - *A. How scale is determined in forensic photos of crime scenes.*
   - *B. Examples of scales (rulers in photos) from autopsy reports.*

V. Uses for and information from physical evidence in criminal investigations

VI. Kinds of evidence:
   - *A. Individual vs. class, circumstantial, conclusive, conflicting, corroborating, presumptive, Prima facie, probative, tainted*
   - *B. Sample/Reference Evidence from the scene.*
   - *C. Eye witness basics*
     - *1) How to make better observations on the scene*
     - *2) Things that cause witnesses to misidentify people*
     - *3) The Innocence Project*

For Preparation Only

VII. General crime scene procedures (ARISN)
- A. Approach
- B. Render medical aid
- C. Identify additional victims or witnesses
- D. Secure the scene and physical evidence.
- E. Notifications made appropriately

VIII. Chain of custody
IX. Safety: universal precautions, protective equipment, handling of hazardous materials (OSHA Standards)

Physical Properties: Glass and Soil (2.5 weeks)

I. Errors and estimates in lab measurements
II. Significant figures
III. Metric systems

IV. Physical properties:
- *A. Temperature, Weight vs. mass, density, refractive index*
- *B. Compare and Contrast Physical Properties vs. Chemical Properties*
- *C. Analyzing evidence using density*

V. Glass:
- *A. Interactions of light and matter*
- *B. Applications of spectrometry*
- *C. Characteristics of glass*
- *D. Refractive index and the forensic applications of glass*
- *E. The effect of projectiles on glass*

VI. Types of Fractures
- *A. Interactions of light and matter*
- *B. Applications of spectrometry*
- *C. Characteristics of glass*
- *D. Refractive index and the forensic applications of glass*
- *E. The effect of projectiles on glass*

VII. Soil
- *A. Composition of color analysis*
- *B. Climate and soil formation*
- *C. Analysis of humic fractions of soils*
- *D. Microogranisms and their effects on evidence*

VIII. Labs
- A. Forensic Glass Analysis Lab (from Lab Book)
- B. Coke vs. Diet Coke Demo
- C. Demo: Samples of bullet holes from Guest Speakers

Organic & Inogranic Analysis (6 weeks)

I. Chemistry Overview:
- A. *Elements and compounds (inorganic and organic)*
- B. *Modern atomic theory*
- C. *Isotopes – calculating mass and their role in scientific research*
- D. *Balancing chemical equations and gram-mole conversions*
- E. *Nuclear Chemistry*
- F. *Types of reactions*

For Preparation Only

II. An Overview of Physics
    A. *The electromagnetic spectrum*
    B. *Properties of waves and mathematics of light*

III. Analytical Techniques
    A. Physical separation of solid mixtures
    B. Chemical separation of solid mixtures: solubility and pH
    C. Chromatography: separating small amounts of material
    D. Electrophoresis: separating very similar substances
    E. Spectrometry: identifying unknowns by their mass
    F. The emission and absorption spectrum of elements
    G. Neutron activation analysis
    H. X-ray diffraction

IV. Labs:
    A. Candy chromatography
    B. Thin-Layer Chromatography of Ink (from Lab Textbook)

Hair, Fibers, and Paint and the Microscope (3 weeks)

I. Microscopes
    A. Lenses: how objects are magnified
    B. Using the compound microscope, stereomicroscope, and comparison microscope
    C. Mechanics of a scanning electron microscope in forensics

II. Hair:
    A. Human vs. animal hair comparison
    B. Structure, growth, color, treatment and damage of hair
    C. The morphology hair and its forensic implications
    D. DNA analysis of hair

III. Polymer composition and structure
    A. Guest speaker: Fire Chief talking about Kevlar and Nomax

IV. Fiber:
    A. Morphology
    B. Analysis and interpretation of synthetic fibers

V. Paint and other coating compositions
    A. How cars are painted

VI. Identification of fiber and pint trace evidence using refractive index and fluorescence

VII. Labs:
    A. Forensic Hair Analysis (Lab Textbook)
    B. Hit and Run Crime Scene Investigation

Drugs and Toxicology (3 weeks)

I. Chemistry Overview
    A. Organic compounds
    B. Solubility and acid-base properties
    C. Classes and Schedules of Drugs
    D. Effect on the human body
    E. Dependency Issues
    F. Testing process
    G. Ethyl alcohol and measurement of blood alcohol content
    H. Pharmaceutical materials
    I. Nonmedical agents
    J. Metal analyses

For Preparation Only

II. Analytical methods:
   A. *Color tests*
   B. *Microcrystalline test*
   C. *Spectroscopy*
   D. *Chromatography*

III. Drug control laws
IV. Applications of forensic toxicology
V. Collection and Perseveration of Drugs

VI. Labs:
   A. *Drug Dog Demo (Drug Dogs come and visit and the K9 Officers will do demonstrations and speak)*

Arson and Explosives (3 weeks)

I. Chemistry Overview
   A. *Thermal equilibrium*
   B. *Balancing chemical equations for combustion*
   C. *Redox reactions*
   D. *Thermochemistry of fire*
   E. *Heat capacity and phase changes*
   F. *Kinetic molecular theory of gases*

II. Deliberately set fires: arson and incendiary
III. Collection and preservation of arson evidence
IV. The role of accelerants and types of explosives
V. Collection and analysis of explosives

VI. Labs:
   A. *Dollhouse Fire*
   B. *Guest Speaker: Fire Chief*

Forensic Serology (3 weeks)

I. Anatomy and Physiology Overview
   A. *Circulatory system – structures and functions*
   B. *The nature of blood – cell types and function*
   C. *Antigens, blood types, and antibodies*
   D. *Principles of heredity of blood characteristics*
   E. *Blood*

II. Immunoassay Techniques

III. Species origin determination in bloodstains
   A. *Size, shape and directionality of bloodstains*
   B. *Stain patterns of blood; spatter angle of impact and velocity*
   C. *Interpretation of bloodstains on clothing and footwear*

IV. Use of luminal photography of bloodstain pattern analysis
V. Identification of other biological fluids: semen, saliva, urine, feces, vomitus, and vaginal secretions

VI. Labs:
   A. *Crime Scene Investigation*
   B. *Vomit lab*
   C. *Blood Spatter Evidence Lab (Lab Textbook)*
   D. *Bloodstain Analysis (lab Textbook)*
   E. *Guest Speaker: Police Detective*

For preparation Only

DNA Fingerprinting (3 weeks)

I. Biology Overview
   - *A. DNA Base Pairing*
   - *B. The structure of DNA*
   - *C. Replicating DNA*
   - *D. Recombinant DNA*
   - *E. Repeating units of DNA*

II. History of DNA Fingerprinting
   - *A. Electrophoresis*
   - *B. CODIS*
   - *C. Population genetics support via statistical data*

III. Challenges in court:
   - *A. The admissibility of DNA evidence, discovery and legal procedures*
   - *B. Convicted offenders databases*
   - *C. Protecting the innocent*

IV. DNA in noncriminal cases
   - *A. The future of DNA typing*
   - *B. Probability statistics*

V. Case Studies:
   - *A. OJ Simpson Case Study*
   - *B. Forensic Community's Response to 9/11*

Fingerprints (2 weeks)

I. Review from the anatomy teacher as a guest speaker.
   - *A. The integumentary system*
   - *B. Epithelial tissue and histology slides*
   - *C. Skin layers: epidermis, dermis, and hypodermis*
   - *D. Accessory organs: nails, sebaceous glands, sweat glands, eccrine glands, and apocrine glands*
   - *E. Healing of wounds and burns*

II. Fingerprints as evidence
   - *A. History of fingerprinting*
   - *B. Classification of Fingerprints*
   - *C. Fundamental Principles of Fingerprinting*
      - *1) Fingerprints are unique*
      - *2) Fingerprints stay the same throughout a person's lifetime*

III. Fingerprints have general ridge characteristics
   - *A. Means of fingerprinting*
   - *B. Preservation of developed fingerprints: manually and via computer*

IV. Forensic Scientist
V. Fingerprinting Lab (Lab Textbook)

Trace of Evidence, Impressions, Firearms, and Tool Marks (1-2 weeks)

I. Firearms
   - *A. Issues surrounding gun control*
   - *B. Types of modern firearms, manufacturing, and ammunition*
   - *C. Collection of firearms-related evidence*
   - *D. Gunpowder residues and primer residues on hands*

For Preparation Only

II. Vehicles
   - *A. Coefficient of friction – determining a cars speed and direction*
   - *B. Original equipment tires, replacement tires, and tire construction*
   - *C. Tire tread nomenclature an sidewall information*
   - *D. Collecting tire track evidence*
   - *E. Headlamp analysis*
   - *F. Vehicular accident analysis*

III. Biometrics – lip prints and saliva

IV. Tools
   - *A. Types of tool marks*
   - *B. Processing of tool mark evidence at the crime scene*

V. Labs:
   - *A. Tool Mark Analysis (Textbook Lab)*
   - *B. Demos by Guest Speakers*

Human Remains and Entomology (6 weeks)

I. The Human Body
   - *A. Levels of organization*
   - *B. Four types of tissues*
   - *C. Human body systems overview*
   - *D. The human skeleton and anatomy of bones*
   - *E. Physical anthropology and the sexual dimorphism of bones*

II. Death
   - *A. Importance in determining time of death and decomposition*
   - *B. Taphonomy (the history of a body after death) and archaeology: human remains in water environments (diatom taxonomy) and buried remains*

III. Entomology
   - *A. Class Insecta*
   - *B. Metamorphosis and the life cycle of a fly*
   - *C. Collection and challenges of entomological evidence*

IV. Performing an autopsy

V. Labs:
   - *A. Forensic Anthropology (Lab Textbook)*
   - *B. Forensic Entomology (Lab Textbook)*
   - *C. Fetal Pig Dissection Autopsy (Carolina Biological Supply Company Kit)*

Character Education and Legal Issues

VI. Law enforcement and the law

VII. Forensic scientists, scientific values, and the law

VIII. How does our Character Counts Program relate to this course?

IX. Scientifically reliable methods….What happens when science “proves” innocent people guilty?

For Preparation Only

Laboratory Activities: *Acceptable courses include hands-on scientific activities that are directly related to and support the other classwork, and that involve inquiry, observation, analysis, and write-up. These hands-on activities should account for at least 20% of class time, and should be listed and described in detail. Please itemize and describe each laboratory activity in detail.*

The following labs will be completed during this course:

- Forensic Glass Analysis Lab (from Lab Book)
  - In this lab activity students will
    - Calculate the displacement of water
    - Compare samples of glass using their densities
    - Compares shards of glass using Glass Fracture Analysis
- Candy chromatography
  - In this lab activity students will
    - Use pieces of candy coated candies (M&Ms and skittles) to obtain dye samples.
    - Separate out the individual colors using paper chromatography in class.
- Thin-Layer Chromatography of Ink (from Lab Textbook)
  - In this lab activity students will:
    - TLC is used in the class because it is cheap and simple to perform.
    - Using capillary action students will separate out a mixture of chemicals using size.
- Forensic Hair Analysis (Lab Textbook)
  - In this lab activity students will:
    - Identify the three types of cuticles.
    - Describe the basic morphology of hair
    - Identify samples of hair using the microscope
    - Compare hair evidence using length, color, degree of curl and type of medulla.
- Hit and Run Crime Scene Investigation
  - In this lab activity students will
    - Collect evidence from a mock crime scene
    - Use the glass analysis techniques, Hair analysis techniques and chromatography techniques they learned in the previous labs to solve the crime.
    - The LAPD will be helping out with this activity.
- Dollhouse Fire
  - In this lab activity students will:
    - Make observations about the types of fires set in the building.
    - Note: The Fire Chief who was also an arson investigator has burned the structure for me in advance. He made sure that distinct char patterns and evidence are easily observed. He will also be leading a portion of this lab.
- Vomit Lab
  - In this lab activity students will:
    - Use 3 chemical tests (keytone test, protein test and fat test) to determine the presence of the victim's last meal.
    - Students will gather data and write a lab report to solve the mystery.
- Blood Spatter Evidence Lab (Lab Textbook)
  - In this lab activity students will:
    - Solve the murder of an imaginary case study.
    - Create a cast off spatter to determine the victim's direction of travel.
    - Determine the impact angle of the bullet by creating a model out of cardboard.
    - Calculate the stain shape vs. impact angle in order to determine how the blood evidence landed on nearby objects.
- Bloodstain Analysis (Lab Textbook)
  - In this lab activity students will
    - Design an experiment to test for the presence of blood.
    - Use a Kestle-Meyer Reagent test to determine the presence of blood.

        - Test for the presence of blood using a Hemastix® strip.
        - Determine blood type (Using Carolina Biological Supply Blood typing Kit)
- Fingerprinting (Lab Textbook)
    - In this lab activity students will:
        - Create enlarged fingerprints in order to view the individual characteristics of fingerprints using a balloon and thermoplastic ink.
        - Create graphite prints of their own fingers.
        - Practice taking inked prints onto a paper intake sheet.
        - Compare fingerprints and classify them.
        - Use finger print powder on a mock crime scene.
        - Superglue fuming of a small item.
- Tool Mark Analysis (Textbook Lab)
    - In this lab activity students will:
        - Make observations of tools and tool mark characteristics.
        - Create casting of tool marks and make observations to determine which tool was used in the mock crime.
- Forensic Anthropology (Lab Textbook)
    - In this lab activity students will:
        - Complete a virtual tutorial about how to compare skulls and jaws of primates.
        - Complete on online tutorial about species bone comparison.
        - Complete empirical measurements of Sex Differences in class and graph them
            - Chin to scalp
            - Ear lobe to ear lobe
            - Hand width
        - Create and compare human dentition impressions.
- Forensic Entomology (Lab Textbook)
    - In this lab activity students will:
        - Complete an examination of a model of entomological evidence collected from four crimes scenes.
        - Identify the color, size and developmental stage of each sample.
        - Make observations about the establishment of a blow fly colony over a period of 1 week.
- Fetal Pig Dissection Autopsy (Carolina Biological Supply Company Kit)
    - In this lab activity students will:
        - Dissect a fetal pig using the autopsy techniques describe in the accompanying dissection manual.

Key Assignments: *Detailed descriptions of all Key Assignments which should incorporate activities and projects, as well as, short answers and essay questions. How do assignments incorporate topics? Include all assignments that students will be required to complete. Assignments should be linked to components mentioned in the course outline. It is not appropriate or necessary to include instructions given to students regarding the execution of assignments (formatting, timeliness, etc.). Do not include exams or assessments in this section.*

Instructional Methods and/or Strategies: *Indicate how the Instructional Methods and/or Strategies support the delivery of the curriculum. What portions of the Course Outline are supported by the methods and strategies?*

- Unit Pretests to see how in detail overviews of sciences.
- PowerPoint lectures by teacher
- PowerPoint presentations by students
- Lab experiments and activities
- Case studies – Students complete a worksheet with the following:
    - Basic facts of the case (What is the story)
    - What pieces of evidence are examined?
    - How could the investigation been better?
    - What precedents were set?
    - What are the outcomes of the trial?
- Current events from journals and new sources
- Structured controversy via position paper assignments
- Online tutorials and interactive crime investigations
- Collaboration with LAPD, San Manuel Fire Department for guest speakers and one or more field trips
- Assigned reading and outlining from text to supplement lecture
- Forensic Files (Court TV) and Medical Detectives (TLC); these 30 minute segments offer real-life crime reconstructions and the forensic science behind cracking the case
- Unit/vocabulary study guide puzzles and Memory Cards to complete

Assessments Including Methods and/or Tools: *Indicate the intent of each assessment and a brief description of how each relates to the Course Purpose and goals related to the development of critical thinking and other habits of mind skills.*

Prerequisites: Biology (Required)
Chemistry (Recommended)

Co-requisites: Chemistry (Recommended)

Integrated (Academics / CTE)?	Yes: Biotechnology
Grade levels:	11th, 12th

ourse Description

urse overview:

Forensic Science I A/B is a fast-paced, rigorous, multi-disciplinary college preparatory CTE (Career Techinical Education) course that provides a bridge between science based inquiry and the criminal justice system. Emphasis is on understanding the underlying scientific theories of forensic science, with special emphasis on biology, chemistry, and biotechnology. This biotechnology focused course will build upon the students' prior knowledge of biology and chemistry, learning laboratory techniques and procedures to analyze and identify trace physical evidence, from ballistics to DNA. Students will use their academic and laboratory skills to develop a deeper understanding of science and its relation to criminal justice.

urse content:

Crime Scene

Students will learn the procedures for securing, recognizing, documenting, collecting, and packaging of most categories of physical evidence recovered at the scene of a crime. The unit of study will begin with students learning to define the principles of major laboratory procedures and identifying ethical, moral, legal, and cultural issues. Students will also learn a variety of methods in which to practice aseptic techniques in a laboratory and/or crime scene setting with the ultimate understanding of the ever-present nature and effects of microorganisms.

Unit Assignment(s):

Students will learn a variety of methods of documenting a crime scene including note taking, sketching, photographing, and narrative writing. Students will start the unit by documenting a small-scale mock crime scene via each documentation method. Other students will the need to recreate the mock crime scenes to a high degree of precision based solely on their peers prior documentation as this will reveal the deficiencies in their documentation methods. Students will then be given a chance to practice documenting and recreating crimes scenes on a progressively larger scale until they are able to produce precise crime scene sketches/photos/narratives. Once a crime scene is properly documented, students will learn all the practices involved in evidence collection and evidence packaging.

Learning Objectives:

- Students approach and secure mock crime scene
- Make initial survey of scene and evidence
- Make sketch/diagram of crime scene

- Digitally photograph crime scene
- Identify different types of evidence
- Prioritize and sequence evidence collection
- Collect and package physical evidence
- Document crime scene and physical evidence collected
- Understand chain of command and custody

🧪 Unit Lab Activities:

This unit will culminate in students documenting and collecting evidence from a mock crime scene on a vehicle. They will need to analyze all areas of the vehicle for documentation and evidence collection purposes. The crime scene will include a variety of types of evidence including blood spatter, ballistics, organic matter, and more. Students crime scene sketches and narratives will be graded for completeness, thoroughness, and accuracy. Students will write-up their findings in their laboratory notebooks in the form of an evidence report with narrative.

Lifting Prints

Students will learn that fingerprint friction ridges cover the tips of our fingers, palms of our hands as well as the outer surfaces of the soles of our feet and toes. The ridges are unique to each individual and stay the same throughout their life. Students will learn a variety of fingerprint identification, recovery, and documentation procedures including dusting, fuming, and digital photography. Since fingerprints are not generally visible to the unaided eye at a crime scene the students will add this skill to their methods of documenting, and collecting evidence from, a crime scene.

🖳 Unit Assignment(s):

Students will first learn how to create an exemplary reference set of prints from their own fingers. Once they do this they will learn how to analyze their own prints and also other peers prints. They will then learn to dust for, and lift, latent fingerprints using magnetic dusting powder and subsequently analyze and identify that dusted print. Student will prove via a fingerprint practical exam that they can dust, lift, and correctly identify one of the instructor's prints using the instructor's reference set of prints.

Learning Objectives:

- Learn the three types of fingerprints- arches, loops, and whorls
- Roll subject's fingers on FBI card and acquire clear fingerprints
- Identify the fingerprint types of the freshly rolled fingerprints
- Students will examine a completed print card and identify three unknown prints to the fingers on the print card
- Students will use manetic powder to locate latent prints and collect the prints using adhesive tape
- Collected prints will be placed on evidence card, properly labeled and identified

🧪 Unit Lab Activities:

Students will again analyze a mock crime scene on the same vehicle as the previous unit, but this time they will be primarily focused on dusting for, lifting, and processing latent fingerprints placed on the car by the instructor. Students will then take the lifted prints back to the lab to identify the prints when compared to the instructor's reference set of prints. Students will then compare notes as a whole class to determine where to best dust for prints and what type of surfaces yield the best prints. Students will write-up their findings in the laboratory notebooks in the form of an evidence report.

Trace Evidence

This unit focuses on understanding how to identify and collect evidence that is left behind at a crime scene in small detectable remnants, such as clothing fibers or hair. Students will learn how synthetic fibers are manufactured resulting in microscopic differences that are compared to hair from a variety of species. The cellular biology of hair follicle production results in microscopic difference between species and people. Once students are able to understand microscopic differences of fiber evidence, they will also gain skills in fiber collection and processing techniques. Locards Exchange Principle will also show them that once they enter a crime scene they have then, at least microscopically, contaminated that crime scene with things such as fibers and sloughed off epithelial cells.

💻 Unit Assignment(s):

Students will collect fibers from a wide variety of sources and note the microscopic characteristics, with accompanying drawings, in their lab notebooks. From their array of drawings and notes they will be able to not only identify fibers collected from a mystery source, but also identify if hair originated from a human or another species. Students will also be given the opportunity to make their fiber diagram/image catalog more robust with a digital microscope camera. From the digital photos and their notes, they will create a PowerPoint presentation of all natural, manufactured, synthetic, and biologic fibers.

Learning Objectives:

- Microscopic techniques
- Proper aseptic fiber collection techniques
- Microscopic characteristics of fibers
- Locard Exchange Principle
- Digital microscopic photography techniques
- Fiber manufacturing methods and microscopic characteristics

🧪 Unit Lab Activities:

Students will again be asked to analyze a mock vehicle crime scene, this time with the focus on fiber collection and identification. The instructor will have planted a variety of fibers throughout the vehicle and this activity will act as a practical exam on how well the students have learned to collect, process, and characterize fibers. A successful student will be able to collect and identify some of the fibers from the vehicle. The students will fill out an evidence report in their laboratory notebook to prove they are able to properly identify the fibers the collected using their lab notebooks and digital microscope photos as a reference source.

Blood Evidence

Students will learn about all the components which make up blood and how to properly test for and collect blood at a crimes scene. They will also learn how blood spatter patterns can be analyzed to accuately locate the origin/source of blood. Putting all that knowledge together students will focus on blood properties (leaving DNA concepts for a later unit) such as blood typing, presumtive tests for blood, and blood spatter patterns. In regards to spatter patterns, students will use mathmatical formulas to be able to accuaratly calculate the origin of a blood source.

🖳 Unit Assignment(s):

After learning how to test for and analyze blood spatter patterns, students will be given a spatter pattern in which they will determine whether or not the spatter pattern is in fact blood, and also show their mathematic calculations to determine the origin of the blood source. They will produce an evidence report in their notebooks to show what their pattern was made of, where their spatter originated from (both mathematically and diagrammatically), and whether or not the source was moving.

Learning Objectives:

- Basics of cell biology regarding blood and blood types (A, B, AB & O)
- Methods of chemical testing for blood
- Spatter pattern analysis
- Using geometry to calculate blood source origin
- Calculate blood volume from dried pools/patterns
- Aseptic techniques for collection/testing of a potential pathogenic material

🧪 Unit Lab Activities:

Students will work collaboratively with three other peers to produce a spatter pattern using an impact spattering device (ISD) and various colors of paint. The students will compare the spatter patterns created on a vertical wall by the ISD at various speeds and distances from the wall. The students will then trade spatter patterns with other groups and determine the distance and speed at which their spatter pattern was created. This will test the student's ability to apply their pattern

recognition and math skills in a collaborative way. Students will diagram and show their calculations in their lab notebooks and compare their notes with the group who created the spatter pattern to see if they were correct in locating the source and speed of the ISD based on their analysis.

DNA Quantification

Students will learn all about DNA, where DNA originates, how DNA can be collected at a crime scene, how DNA can identify an individual, and how to amplify DNA for purposes of criminal identificaiton. Students will always be asked to relate the procedures learned with the structure and funciton the DNA molecule. Being as DNA technology is one of the major advancements in forensic science in recent decades students will also learn how DNA review of prior convictions has led to many cases being overturned and innocent people being set free.

🖳 Unit Assignment(s):

The concepts in this unit will be taught by taking the class through the extraction and amplification, via polymerase chain reaction (PCR), of the students' DNA from their cheek cells. This will allow students to learn the process from collection to identification via electrophoresis separation using their own DNA and comparing the results to classmate's results. Students will produce a gel electrophoresis analysis in their notebook comparing their amplified DNA to 9 other classmates.

Learning Objectives:

- DNA structure and function
- DNA sources
- DNA collection techniques
- DNA extraction procedure
- DNA amplification via PCR
- DNA quantification via UV spectroscopy
- Gel electrophoresis

🧪 Unit Lab Activities:

One lab activity in this unit is students creating a serial dilution of calf thymus DNA. Using a UV-spectrometer the students will be able to create a standard curve for DNA concentrations. Once this standard curve is created students will related explain in their lab notebooks what amount of DNA needs to be collected at a crime scene for DNA amplification to be possible, and, thus, if a DNA identification is possible. Since DNA evidence is generally a key piece of evidence in a criminal case, students will use this DNA knowledge to compare two actual case studies, one where an innocent person was set free and another where the case hinged on the positive DNA identification.

Expert Witness

This unit focuses on the many areas of expertise a forensic scientist needs to specialize in, or at least be aware of. Students will learn about career as a medical examiner, a forensic odontologist, forensic entomologist, forensic botanist, forensic toxicologist, and digital forensics. Forensic scientists cannot specialize in every area of study, so they need to know when to call in experts for help with a case. Some things can easily be demonstrated in a high school lab, such as bite mark analysis, but the work that a medical examiner does is not so easily, or legally, replicated with minors. In this case, local professionals will be invited into the classroom to be interviewed by the students.

💻 Unit Assignment(s):

Based on who in the local forensic science community is available, or how many are available, to guest speak students will be given the opportunity to interview a local professional in the classroom. The students will develop interview questions for the professional regarding educational needs, skills to learn, and career benefits, and career challenges. After this interview, students will create a research report on a field of forensics that they may be interested in pursuing.

Learning Objectives:

- Career paths for specializing in various forensic science fields
- Educational requirements for careers in forensics
- Bite mark analysis
- Drug/alcohol detection
- Classifying local insects as crime scene evidence
- Classifying local plants/pollen as crime scene evidence

🧪 Unit Lab Activities:

Students will learn how to mix and create a negative impression, using dental plaster, from a bite mark created by an instructor on styrofoam cup using the teeth of a variety of classroom skeletons. From that plaster mold of the bite mark, students will use a dental putty to create a positive impression of the original bite mark. Using both of the impressions they created students will try to identify which skull the bit mark came from and report their findings in their lab notebook.

Ballistics

Students will learn fundamentals of ballistics, the components of live ammunition, and the tool marks left on the expended casings. Students will also learn the basic types of firearms. All firearm, silencers, and automatic weapon laws will be discussed. Methods for collecting firearm evidence at a crime scene will be discussed as well.

🖳 Unit Assignment(s):

Students will be given a fired bullet and corresponding shell casing to analyze. For the bullet, students will learn to identify and measure the caliber, rifling impressions, and direction of spin. For the casing students will learn to identify breechface impressions, ejector marks, extractor markings, an chamber discoloring. Students will also learn to input this information into an evidence report and to identify if two bullets and/or casings were fired from the same gun. All this information will be recorded in their lab notebooks.

Learning Objectives:

- Firearm basics
- Basic firearm laws
- Ammunitions basics
- Fired bullet/casing tool markings
- Evidence report writing
- How to use a comparison microscope for bullet/casing comparisons
- How to use a caliper

🧪 Unit Lab Activities:

Students will analyze a variety of similarly size bullets. Based on their rifling impressions, direction of twist, caliper measured caliber, and number of lands and groves students will need to draft an evidence report as though all bullets analyzed were collected at the same crime scene. They will then be tasked with the determination of whether or not the bullets were fired from the same firearm, explaining why, and how, they made that determination using the established bullet impression criteria.

Histology

Students will refine their microscope skills by analyzing the structure and function of approximately 10 different mammlian tissues, such as skeletal muscle and lung tissue. Many times during a violent crime blood is recovered as evidence as well and tissue samples. Students will learn the basics of tissue identification, collection, biologic staining, and slide preparation.

🖳 Unit Assignment(s):

Students will use a classroom set of prepared tissue slides to create reference drawings and notes about the appearance of the tissues at 100x and 400x magnification. Students will also be allowed to use digital microscope cameras to take

pictures of the tissues. All the histological information will be entered in their lab book. Students will be given a prepared slide of mystery tissue from a hypothetical crime scene. Students will need to use their reference drawings to determine the type of tissue and complete an evidence report with their explanation of cellular characteristics stating what type of tissue the mystery slide is and explaining how they came to that determination.

Learning Objectives:

- Compound microscope techniques
- Microscope digital photography
- Major tissues identification
- Anatomic tissue structures as they relate to physiologic function
- Cell staining techniques

🧪 Unit Lab Activities:

After students have learned to microscopically identify various tissues students will be prepare their own slides of their own buccal tissue. Students will simply scrape their cheeks, place a smear of cells on a glass slide and stain using a basic biological stain. Students will then add a diagram/picture with notes to their lab notebooks about their own cells in their lab notebooks. Students will also be asked to calculate, based on the size of the microscope field, how big their buccal cells are and to identify any visible cell structures.

Forensic Anthropology

This unit is an in-depth study of all the characteristics that can be determined from a victim's skeletal remains. Students will learn how to not only determine a victim's height and age, but also what sex the victim was. To do this students will have to learn basic anatomic planes and directional terminology. Students will also become privy to population statistics as much of anthropology is based on local population averages.

🖳 Unit Assignment(s):

Students will learn the characteristics of a human skull along with basic anatomic terminology. From this students will get to analyze a male and female skull side-by-side so as to see the variety of differences. Students will also learn how to determine approximate height of the person based on skull measurements. Students will produce in their lab notebooks a T-chart with bullet pointed lists comparing male and female skull characteristics as compared to worldwide population statistical averages.

Learning Objectives:

- Examine diagram of anatomy and terms of human skeleton
- Identify bones on life size skeleton model
- Receive Bone Data Table and measure listed bones for length, width, and angle to complete table
- Calculate Maximum cranial index, Orbital index, Nasal index, and pelvis opening

- Draw and sketch skeletal elements as directed by instructor

🧪 Unit Lab Activities:

Students will be given a bone (either a partial skull, scapula, femur, or pelvis) from a disarticulated skeleton. They will need to draft an evidence report as to what bone they received, what sex the victim is, what their approximate stature is, and approximate age. Comparing notes about the hypothetical crime scene with others in class they will need to make a determination as to whether or not the crime scene is multiple victims or if all the bones are from one skeleton.

---

mtDNA Sequencing and STRs

Students will do research into a variety of DNA techniques and the specific situations as to which they can be utilized at a crime scene. Students will analyze and compare case studies where various DNA techniques are used including mtDNA (mitochondrial DNA), RFLP (restriction fragment length polymorphisms), VNTRs (variable number tandem repeats), and STRs (short tandem repeats). Case studies will involve such cases as the OJ Simpson criminal trial and identifying remains at the World Trade Centers and within mass graves as a result of te Argentine Dirty War.

🖳 Unit Assignment(s):

Students will do some research regarding the circumstances surrounding the history of the Argentine Dirty War and all the people who disappeared between 1976-1983. Students will be given family trees with STRs results and asked to piece together if a set of missing persons fit into any of the family trees based solely on STR analysis. Students will complete the family trees in their notebook and offer genetic explanations of their findings along with focusing on genetic population probabilites and possible sources of error.

Learning Objectives:

- Various DNA analysis techniques
- Structure of a family tree and accompanying terminology
- Information from a variety of criminal case studies (including the Argentine Dirty War)
- Geopolitics and why the UN gets involved in certain cases
- Positives and negatives for various DNA techniques
- Implications for forensics science regarding newer DNA techniques such as CRISPR

🧪 Unit Lab Activities:

In the case of the Argentine Dirty War where thousands of young people disappeared students will learn about the Abuelas de Plaza de Mayo and how United Nations scientists work with mtDNA from mass graves to build family trees, reunite unknown family members, and identify Argentine children who were taken to government orphanages. Students will be given results of mtDNA analysis from a variety of grandmothers and a variety of missing, or unidentified, people. Through process of elimination and probability calculations students will build, rebuild, or fill in the blanks of certain family trees and write up a report detailing the procedures, the probabilities, and results in their lab notebooks.

Courtroom

The final unit of study will culminate in the acting out of all the major roles of a courtroom criminal trial. Students will play all the roles from judge to jury. Students will learn about courtroom proceedings, presumption of innocence, and the concept of reasonable doubt. Through acting as, or seeing their peers act as, all the possible roles in a courtroom students will get to experience a criminal trials prosecution, defense, deliberation, pronouncement of guilt, and sentencing. Within this culminating unit of study students will be given a chance to verbally exhibit their expertise on most of the topics and procedures learned throughout the year.

🖳 Unit Assignment(s):

Students will be introduced to a case study with no clear resolution. Students will all need to analyze the body of evidence and understand the strengths and weaknesses in each side of the mock trial. Each student will draft a report where they will explain who they would, or would not, prosecute and whether the level of reasonable doubt is met within the prosecution. In doing this students are acting as a special counsel's office in recommending to an attorney general whether to take the case to trial or not.

Learning Objectives:

- Concept of presumption of innocence
- Concept of reasonable doubt
- Roles in a courtroom (e.g. judge, jury, prosecution, defense)
- Burden of proof

🧪 Unit Lab Activities:

Students will be giving a mock case to study along with a body of evidence. The evidence is left intentionally inconclusive so that students can reasonably apply guilt to a variety of people, but can also reasonably apply no guild and recommend prosecution. The case involves a missing girl and students will need to analyze many pieces of evidence including a human femur fishmen pulled out of the bay, DNA from bloody fingerprints, tissue samples, circumstantial relationship evidence, and more. Students will be assessed on how well they understand each piece of evidence when they make statements during the courtroom mock trial. Every student will play some sort of significant role and will have to verbally respond during one or more portions of the trial. Not knowing what piece of evidence they will need to explain will require all students to know the case at an expert level.

ourse Description

urse overview:

Forensic Science II A/B is a fast-paced, rigorous, multi-disciplinary college preparatory CTE (Career Technical Education) capstone course that builds on prior knowledge and experience in Forensic Science I A/B. The focus of the course is a science and biotechnology based inquiry and the criminal justice system. Emphasis is on understanding the underlying scientific theories of forensic science, with special emphasis on biology, chemistry, and biotechnology. This biotechnology focused course will build upon the students' prior knowledge of biology, chemistry, and forensics, learning more advanced laboratory techniques and procedures to analyze and identify evidence from a variety of real-world case studies. Students will use their academic and laboratory skills to develop a deeper understanding of science and its relation to criminal justice.

urse content:

Golden State Killer

This unit of study revolves around the interworkings of the investigation and currently on-going trial of Joseph James DeAngelo (aka The Golden State Killer). Students will learn about the crimes committed, the reasons police went decades without any arrests, and the eventual breakthrough in the cold case that lead to DeAngelos arrest. Using the students' background knowledge, from Forensic Science I, of DNA analysis they will make use of the same DNA profiling mechanism (Short Tandem Repeats (STRs) and reverse paternity deconvolution) investigators used to solve this case and bring it to trial.

Unit Assignment(s):

Students will be presented with a mock crime scene as though they were investigators on the case of the Golden State Killer (GSK) at a site where he tried to dispose of human remains when he was an active criminal. Students will unearth a buried set of partial bones as part of a recreated crime scene. They will need to document and properly collect the evidence. Once back in the lab they will take a variety of measurements to make a determination of what the sex and stature are of the individual the remains belong to. The students will produce an evidence report with a narrative detailing the crime scene and their findings.

Learning Objectives:

- Crime scene documentation
- Evidence collection/processing
- Determining sexual dimorphism via skeletal remains
- Population statistics with focus on bone structure
- Techniques for measuring with a caliper
- Features of a human skeleton

🧪 Unit Lab Activities:

To simulate how investigators in the GSK case used public DNA records to reverse engineer a family tree, students will be given a mock set of DNA short tandem repeat (STRs) results from a variety of related and unrelated individuals. Students will then enter the STR information into a website (https://yhrd.org/ (https://yhrd.org/)) which yields results showing ethnic probabilities. Using that biotechnology resource students will be able to piece together a similar genetic puzzle that GSK investigators used to make their arrest. Students will present their results in the form or a report detailing whether they would recommend prosecution based on the evidence they have analyzed.

9/11

This unit of study will begin around the yearly anniversary of the attacks on the World Trade Center (WTC) towers on September 11, 2001. Students will need to become forensic experts in a variety of areas for this unit such as physics, engineering, statistics, and biotechnology. In the first part of the unit students will perform detailed video analysis of how and what made the towers fall. They will research the difference between static and dynamic load by building models of the WTC north and south towers. The unit will conclude with analysis of results from labs around the country who used a variety of DNA analysis techniques to help identify the remains of victims of the attacks.

💻 Unit Assignment(s):

Students will research how a variety of advanced biotechnology labs came together to filter through all the genetic material that needed to be processed with the task of identifying remains of the victims of the attacks. Students will learn the uses, but also the limitations of three DNA techniques: short tandem repeats (STRs), Y-chromosome STRs (Y-STRs), mitochondrial DNA (mtDNA). They will see how all those techniques can work in conjunction together to piece together family trees when given results from living relatives. Students will be given the allelic results of some unidentified remains along with some family trees. Based on their results and their understanding of all the DNA techniques the students will draft a report detailing which family they think the remains belong to and give statistical probabilities associated with their findings.

Learning Objectives:

- Appropriate applications of STR, Y-STR, and mtDNA techniques
- Building a genetic family tree
- Genetic ethnicity probabilities
- Proper biologic sample collection and cataloging
- Concepts behind genetic inheritance

🧪 Unit Lab Activities:

Students will construct scale models of both the north and south towers of the WTC. From video analysis of the airliners colliding with the towers and when each tower fell students will test their models for structural failures to determine why the tower that was struck first, and burned longer, stood for a longer time. Students will need to understand static and dynamic load along with kinetic and potential energy in their report. Students will test their models with increasing loads repeatedly and explain how towers can be better engineered to withstand kinetic forces and fires.

Search for the Disappeared

Students will learn about the history of the Argentine Dirty War and how many people were taken away in secret never to reappear. The focus of the unit will be on DNA profiling of grandparents to see if there are matches for now adults who, when they were children, were raised in a government orphanage between 1976-1983. During the war there were pregnant mothers who disappeared, were allowed to have their children, then their children were taken to a government run orphanage and many of the mothers were never seen again. Students will be tasked with understanding the biology of inheritance and DNA short tandem repeat (STR) profiling, along with a United Nations (UN) created math-index of grand paternity, to reunite the grandparents with the orphaned children who are missing their children and grandchildren. Students will also learn of the history and that this is an ongoing reunification effort in Argentina as grandmothers still regularly march in Plaza dy Mayo with hopes of being reunited with lost grandchildren.

💻 Unit Assignment(s):

Students will use their prior knowledge of DNA STR pedigrees to piece together mock orphan family trees with grandmothers who are searching for lost grandchildren. The UN created math-index of grandpaternity is introduced to students and used to establish the level of certainty a match needs to meet for researchers to be reasonably sure an orphan is part of a certain family tree. The math-index is a complex set of formulas based on genetic probabilities. Students will need to explain their understanding of biology, DNA STRs, and statistics in a report on a mock set of results. In their report they will need to explain why, or why not, the mock DNA results they were given constitute a match.

Learning Objectives:

- UN created math-index of grandpaternity
- DNA STR results
- History of Argentine Dirty War
- UN involvement in the conflict
- Awareness of ongoing reunification efforts
- Human pedigree construction and analysis

🧪 Unit Lab Activities:

Students will perform an STR analysis on their own DNA. Students will extract and amplify their DNA, using polymerase chain reaction (PCR), at a single locus labeled D1S80. Students will then compare their results with their peers using gel electrophoresis. Students will then draft a lab report showing an estimate of how many base pairs long their D1S80 is,

whether they are homo- or heterozygous for the allele, and how they compare statistically to the rest of the class. Students will perform the whole spectrum of this type of lab procedure including all micropipetting, vortexing, incubation, thermocycling, and more as they have been introduced to all these techniques in their Forensic Science I course.

Shroud of Turin

Students will learn of the history and implication of the near-infamous Shroud of Turin. They will also learn of all the techniques utilized by researcher over the decades to decipher more information about the shroud. Students will need to build on their chemical understanding of carbon-14 dating and carbon isotopes. They will also need to review microscopic techniques relating to fiber characteristics. They will then summarize the unit by making a determination of whether the shroud in fact holds up to scrutiny and is possibly the burial clothe of Jesus Christ.

🖳 Unit Assignment(s):

Students will research chemical isotopes and the concepts that allow for carbon-14 dating to be possible. Students will perform a simple modeling lab to track the results of radioisotope decay. Students will draft a lab report relating their modeling lab results to the actual C14 dating laboratories who dated a portion of the shroud. Students will also analyze why the three carbon dating labs yielding different results.

Learning Objectives:

- Chemical isotopes
- Radioisotope decay
- Experimental variability
- Statistical outliers
- Experimental modeling

🧪 Unit Lab Activities:

Students will be given a piece of linen and tasked with creating a properly mounted microscope slide of a linen fiber. They will use a compound light microscope with digital microscope camera to photograph their fiber at various magnifications. Students will be shown microscopic images of the linen fibers from the Shroud of Turin and create a report in their lab notebook of what the microscopic features of linen fibers are if their fibers match the shroud fiber images.

Escape from Alcatraz - Part I

This unit will be split into two parts, the first focusing on history and earth science concepts and the second on biology, statistics, and DNA analysis. In this first unit students will research the history of the federal prison on Alcatraz Island. The most famous escape attempt occurred in June of 1962 where three men escaped and were never heard from again in any

major capacity. Once students have an understanding of the history they will analyze if the men could have possibly escaped based on tidal information and computer simulation of ocean currents.

🖳 Unit Assignment(s):

Students will perform an analysis of ocean current and tidal information on the night of the escape and draft a PowerPoint presentation on whether they think the men could have physically escaped based on the three main escape theories. Students will work with computer simulations and their understanding of the ocean and tides to form their opinions. They will work in groups of four to create this presentation and will all need to be able to answer questions about their conclusions and research methods.

Learning Objectives:

- History of Alcatraz
- Ocean currents and tides
- PowerPoint features and techniques
- Computer simulations of ocean currents and tides
- Working and presenting collaboratively
- Verbal assessment during presentation

🧪 Unit Lab Activities:

Students will be asked to construct and model the ocean currents during the escape from Alcatraz using a large basin, sand, water, dye to track water movement, and a water pump. Students will create a scale model of the San Francisco Bay with all major geologic features present. Based on the shift of the tides at the time of the escape students will pump the water around the basin so as to see if they can recreate their group's conclusion on the success or failure of the escape. Students will draft individual lab reports detailing what they learned from the model and the probability that the three men escaped successfully.

Escape from Alcatraz - Part II

The second part of this Alcatraz unit focuses on the biological effects of hypothermia, DNA profiling of human remains found on the shore in the bay, and statistical analysis of DNA from the siblings of the convicts. Students will use the temperature of the ocean water and their understanding of human biology to further build out their theory on the success of escape. Students will utilize their knowledge of DNA profiling to rule out human remains found in the bay after the escape. Students will also compare genetic profiles of the convict's siblings to determine if any other possible biologic artifacts match the escapees.

🖳 Unit Assignment(s):

Using resources for training first responders and swift water rescue personnel, students will research what effect the cold would have had on the men while trying to escape and if it is possible that hypothermia could have set in within the time-frame of the escape. Students will submerse their hands in ice water to research the effects of cold on the human body and

how long their tissue takes to return to normal body temperature. Students will apply their findings to their escape theories and present them to the class again in the form of a PowerPoint presentation.

Learning Objectives:

- Biology of hypothermia
- Biology of thermoregulation
- Collaborative lab techniques
- Human capacity for cold exposure
- Homeostasis
- Infrared thermometer techniques
-

Unit Lab Activities:

Students will be given models of the type of skeletal remains that were found in the bay after the escape attempt. From the models the students will be tasked with determining the approximate stature of the individual, the sex of the individual, and to make a determination if the remains could have possibly belonged to any of the escapees. Once that determination is made the student will be given DNA STR analysis of the remains along with STR results from relatives of the escapees. They will need to draft a lab report including all the information regarding the skeletal remains and STR results stating whether the remains could possibly belong to any of the escapees.

Course Title

General Science A,B Honors

Prerequisites

Above average math and science skills, reading level at or above 9th grade and recommendation of the student's 8th grade science teacher.

Description of the Target Group

This course is recommended for students in grade 9 who are university bound, and are likely to achieve in a rigorous, accelerated course.

Course Content

This coordinated and integrated science program stresses the interconnectedness of the sciences and the multifaceted connections between science and other disciplines, such as art, literature and history and society. It reflects a careful "sequencing" of content from the physical sciences: chemistry, physics, earth science and technology. With this in mind, the following subjects and objectives should be viewed as a unified and interconnected science program. Approximately 40% of this course will be represented by hands-on laboratory and project content.

Unit 1: Electricity, Magnetism, Electrical Applications, and Electromagnetic Waves

- demonstrate the two kinds of electrical charges
- distinguish electrical conductors from insulators
- demonstrate a variety of effects of static electricity; explain the effects of resistance on the current in a circuit
- describe the forces magnets produce
- explain the role of magnetic fields
- make an electromagnet and demonstrate its magnetic effects
- use magnetic domain theory to describe how objects can be magnetized or demagnetized
- demonstrate the effects of magnetic fields on wires carrying electric currents, and the ability of a changing magnetic field to produce an electric current; explain the operation of transformers
- draw circuit diagrams for series and parallel
- demonstrate how a diode allows current to flow in one direction only
- determine the amount of power used by various electrical appliances
- calculate electrical energy used and its cost

Unit 2: Structure of the Atom, The Periodic Table, Combining Atoms, and Molecules in Motion

- relate the contributions of Crookes, Thomson, Becquerel, and Rutherford to the study of the structure of the atom
- determine what atoms are formed by beta and alpha decay
- distinguish between subatomic particles
- describe the arrangement of the elements in the periodic table
- construct molecule models by determining how electrons are shared between atoms

- distinguish between ionic bonds, polar covalent bonds, and non-polar covalent bonds
- name and determine formulas for molecules and compounds
- demonstrate how to write a balanced chemical equation
- identify and describe four types of chemical reactions; describe the molecular structure of solids, liquids, and gases
- apply kinetic theory
- explain the meaning of temperature

Unit 3: Weather, Ocean Life and Water, and Organic Chemistry

- explain the role of water vapor in the atmosphere and its effect on weather
- relate relative humidity to weather
- explain how clouds form
- describe the weather associated with different types of fronts
- compare and contrast tornadoes and hurricanes
- explain the relationship between wind and waves
- differentiate between the movement of water particles in a wave and the movement of wave energy
- explain the cause of tides
- contrast surface currents and density currents
- discuss ways that ocean currents affect organisms
- describe the movement of water in an up welling
- describe and make structures of organic compounds and explain why carbon forms so many compounds
- distinguish between saturated and unsaturated hydrocarbons
- identify isomers of organic compounds
- draw and classify hydrocarbons as an alcohol, carboxylic acid, or amine;
- describe polymers and examine their importance as biological compounds
- compare and contrast proteins, carbohydrates, and lipids

Unit 4: Fission and Fusion, The Solar System, and Stars and Galaxies

- describe an artificial transmutation
- compare artificial and natural transmutation; outline and distinguish between nuclear fission and fusion reactions
- model a chain reaction
- compare and contrast Earth with Venus and Mars in relation to global warming and ozone
- compare gaseous giant planets with the terrestrial planets
- recognize how Pluto differs from other planets; differentiate between comets, asteroids, and meteors
- compare and contrast a star's actual brightness with how bright it appears from earth
- explain the process by which a star produces energy
- relate the temperature of a star to its color
- distinguish between the three main types of galaxies

Unit 5: The Metric System, Force and Motion, and Energy

- compare the different units of measurement in the metric system

• demonstrate conversions between the metric system and the English system of measuring

• explain and demonstrate how to measure distances, volume, mass, and temperature in standard metric units
• define and calculate problems involving speed, velocity, and acceleration
• define force and state and apply Newton's laws of motion
• define work and power
• calculate the mechanical advantage of the six simple machines
• define and state the forms of energy
• state and apply the law of conservation of energy
• describe the nature of electromagnetic waves
• compare and contrast the characteristics of waves in various parts of the electromagnetic spectrum
• describe how various observations of color and light can be explained by the wave model
• distinguish between refraction, reflection, and diffraction

Unit Six: Technology Projects

The technology component will consist of student projects in areas of technology relevant to data collection and analysis, computer imaging and communication. Approximately one classroom period per week is allotted for work on team projects. Additional work as necessary must be performed outside of class time.
• work cooperatively in small groups on a common project
• collect data on a long term research project and archive and analyze this data
• correspond with students from other schools who are engaged in similar projects
• use equipment consistent with current technology to communicate scientific information to others
• become producers of information and contribute this information to the global knowledge base via the world wide web
• construct a short lesson about a scientific topic of interest, and share this lesson with students at other schools

Purpose

• To arouse the students' natural curiosity and keep their innate love of science alive by linking the major themes on which the science disciplines are built.
• To provide a basis so that students will continue learning science through school and into adulthood.
• To provide students with the knowledge and analytical skills needed for the jobs of the future.
• To provide students with a "deep understanding" of important science concepts and processes, such as
• critical thinking and problem solving abilities, rather than a loose accumulation of facts.
• To relate science to technology, society, issues, hobbies and careers, and to show that science is everywhere in our daily lives.
• To show how history, arts, society and literature can be a part of science.
• To show that women and minorities have made and will continue to make significant achievements in science.
• To develop within the student the idea that science, technology, and society are linked, and that cooperation, diligence, and application of the scientific method can apply in all of these areas.

Methods of Instruction and Textbook Teaching Tools

The textbook provides special features or "core lessons" in each chapter that provide a coordinated and integrated science program. Many of these "core lessons" actively involve students in science and entice them to discover fundamental concepts on their own. Each of these hands-on "core lessons" are described below:

- *Explore* -"Outside of class" open-ended activities that allow students to observe, manipulate materials, and discover things on their own.
- *Find* Out!-"Outside of class" activities that emphasize a specific concept, as students collect and analyze data.
- *Investigate!*- Formal "in class" activities that teach students to apply scientific methods and manipuiate scientific data.
- *Skillbuilder*- Exercises both in and out of class, and offer students additional skills and processes related to chapter content.

Other "core lessons" stimulate interest and awareness and stress connections and interdependence in almost every aspect of life in the modern world. Each of these "core lessons" are described below:

- *How Do We Know?* Gives further insight into the discovery or development of important scientific ideas.
- *Looking Back and Looking Ahead* - Focuses on unifying themes and interactions among major topics in adjacent chapters.
- A *Closer Look* - Examines a relevant chapter topic in depth. Science Connection explores interconnections between one science field and another.
- *Technology and Science and Society Connections* - Reveal the impact of science and technology in today's world. Teens In Science shows teenagers actively involved in various field of science.
- *How* It Works - Applies scientific principles to the inner workings of everyday devices.
- Connections to art, history, literature, and other non-science subjects illustrate the relationships between science and these disciplines.

It must be recognized that besides being a guide, a good teacher shares his or her various experiences, joys, failures, and interests in stimulating students. Therefore, an integral part of this course, when appropriate, includes:

- demonstration -discussion and explanation
- video and laser disc images and short subject movies
- transparency projections

Evaluation

Evaluation and assignment of grades will be assigned from three different aspects of the course.

- Notebooks: Each student is required to keep a science notebook. This book is kept "journal style", and all course notes, homework and laboratory records are kept here. The notebook therefore

becomes a portfolio of all the students progress and accomplishments. This book is collected 2-3 times per 6 week grading period and scored. The notebook score represents approximately 25% of the students overall grade.

- Tests and Quizzes: Tests and quizzes are given when appropriate as major units of study are completed. Tests and quizzes represent approximately 50% of the overall grade. A comprehensive final exam is given at the end of each semester and contributes to this portion of the grade.

- Student Projects: Grades on student projects are a composition of student self-evaluation on the the project and the teacher's assessment of the project. Students complete an evaluation form indicative of their participation level, and suggested personal and group grade for the project. The student projects represent approximately 25% of the overall student grade.

Instructional Materials

Refer to: Secondary Adopted Textbooks and Approved Supplementary Books Used in the Santa Maria Joint Union High School District

This course meets the Righetti High School graduation requirement for Physical Science.

Course Title

General Science A/B (Honors)

Prerequisites

Above average math and science skills, reading level at or above 9th grade and recommendation of the student's 8th grade science teacher.

Description of the Target Group

This course is recommended for students in grade 9 who are university bound, and are likely to achieve in a rigorous, accelerated course.

Course Content

This coordinated and integrated science program stresses the interconnectedness of the sciences and the multifaceted connections between science and other disciplines, such as art, literature and history and society. It reflects a careful "sequencing" of content from the physical sciences: chemistry, physics, earth science and technology. With this in mind, the following subjects and objectives should be viewed as a unified and interconnected science program. Approximately 40% of this course will be represented by hands-on laboratory and project content.

Unit 1: Electricity, Magnetism, Electrical Applications, and Electromagnetic Waves

- demonstrate the two kinds of electrical charges
- distinguish electrical conductors from insulators
- demonstrate a variety of effects of static electricity; explain the effects of resistance on the current in a circuit
- describe the forces magnets produce
- explain the role of magnetic fields
- make an electromagnet and demonstrate its magnetic effects
- use magnetic domain theory to describe how objects can be magnetized or demagnetized
- demonstrate the effects of magnetic fields on wires carrying electric currents, and the ability of a changing magnetic field to produce an electric current; explain the operation of transformers
- draw circuit diagrams for series and parallel
- demonstrate how a diode allows current to flow in one direction only
- determine the amount of power used by various electrical appliances
- calculate electrical energy used and its cost

General Science A/B (Honors) (continued)

Unit 2: Structure of the Atom, The Periodic Table, Combining Atoms, and Molecules in Motion

- relate the contributions of Crookes, Thomson, Becquerel, and Rutherford to the study of the structure of the atom
- determine what atoms are formed by beta and alpha decay
- distinguish between subatomic particles
- describe the arrangement of the elements in the periodic table
- construct molecule models by determining how electrons are shared between atoms
- distinguish between ionic bonds, polar covalent bonds, and non-polar covalent bonds
- name and determine formulas for molecules and compounds
- demonstrate how to write a balanced chemical equation
- identify and describe four types of chemical reactions; describe the molecular structure of solids, liquids, and gases

Description of Target Group

This course is recommended for students in grade 9 who have achieved at least a seventh grade reading level.

Textbook

Science Interactions Course 3
Glencoe Division
Macmillan / McGraw- Hill Publishing Co., Columbus, Ohio 43216
Copyright 1993 (first edition)

Course Content

This coordinated and integrated science program stresses the interconnectedness of the sciences and the multifaceted connections between science and other disciplines, such as art, literature and history. It reflects a careful "sequencing" of content from the physical sciences: chemistry, physics, and earth science. With this in mind, the following subjects and objectives should be viewed as a unified and interconnected science program.

Unit 1: Electricity, Magnetism, Electrical applications and Electromagnetic waves

Objectives

Demonstrate the two kinds of electrical charges; distinguish electrical conductors form insulators; demonstrate a variety of effects of static electricity; explain the effects of resistance on the current in a circuit; describe the forces magnets produce; explain the role of magnetic fields; make an electromagnet and demonstrate its magnetic effects; use magnetic domain theory to describe how objects can be magnetized or demagnetized; demonstrate the effects of magnetic fields on wires carrying electric currents, and the ability of a changing magnetic field to produce an electric current; explain the operation of transformers; draw circuit diagrams for series and parallel; demonstrate how a diode allows current to flow in one direction only; determine the amount of power used by various electrical appliances; calculate electrical energy used and its cost.

Unit 2: Structure of the Atom, The Periodic Table, Combining Atoms, and Molecules in motion

Objectives

Relate the contributions of Crookes, Thomson, Becquerel, and Rutherford to the study of the structure of the atom; determine what atoms are formed by beta and alpha decay; distinguish between subatomic particles; describe the arrangement of the elements in the periodic table; construct molecule models by determining how electrons are shared between atoms; distinguish between ionic bonds, polar covalent bonds, and non-polar covalent bonds; name and determine formulas for molecules and compounds; demonstrate how to write a balanced chemical equation; identify and describe four types of chemical reactions; describe the molecular structure of solids, liquids, and gases; apply kinetic theory; explain the meaning of temperature.

Unit 3: Weather, Ocean Life and Water, and Organic Chemistry

Objectives

Explain the role of water vapor in the atmosphere and its effect on weather; relate relative humidity to weather; explain how clouds form; describe the weather associated with different types of fronts; compare and contrast tornadoes and hurricanes; explain the relationship between wind and waves; differentiate between the movement of water particles in a wave and the movement of wave energy; explain the cause of tides; contrast surface currents and density currents; discuss ways that ocean currents affect organisms; describe the movement of water in an up welling; describe and make structures of organic compounds and explain why carbon forms so many compounds; distinguish between saturated and unsaturated hydrocarbons; identify isomers of organic compounds; draw and classify hydrocarbons; identify isomers of organic compounds; draw and classify hydrocarbons as an alcohol, carboxylic acid, or amine; describe polymers and examine their importance as biological compounds; compare and contrast proteins, carbohydrates, and lipids.

Unit 4: Fission and Fusion, The Solar System, and Stars and Galaxies

Objectives

Describe an artificial transmutation; compare artificial and natural transmutation; outline and distinguish between nuclear fission and fusion reactions; model a chain reaction; compare and contrast Earth with Venus and Mars in relation to global warming and ozone; compare gaseous giant planets with the terrestrial planets; recognize how Pluto differs form other planets; differentiate between comets, asteroids, and meteors; compare and contrast a star's actual brightness with how bright it appears from earth; explain the process by which a star produces energy; relate the temperature of a star to its color; distinguish between the three main types of galaxies.

Unit 5: The Metric System, Force and Motion, and Energy

Objectives

Compare the different units of measurement in the metric system, demonstrate conversions between the metric system and the English system of measuring, explain and demonstrate how to measure distances, volume, mass and temperature in standard metric units, define and calculate problems involving speed, velocity, and accelerations, define force and state and apply Newton's laws of motion, define work and power, calculate the mechanical advantage of the six simple machines, define and state the forms of energy, state and apply the law of conservation of energy; describe the nature of electromagnetic waves; compare and contrast the characteristics of waves in various parts of the electromagnetic spectrum; describe how various observations of color and light can be explained by the wave model; distinguish between refraction, reflection, and diffraction.

Purpose

The purpose of this course:

- To arouse the students' natural curiosity and keep their innate love of science alive by linking the major themes on which the science disciplines are built.
- To provide a basis so that students will continue learning science through school and into adulthood.
- To provide students with the knowledge and analytical skills needed for the jobs of the future.
- To provide students with a "deep understanding" of important science concepts and processes, such as critical thinking and problem solving abilities, rather than a loose accumulation of facts.
- To relate science to technology, society, issues, hobbies and careers, and to show that science is everywhere in our daily lives.
- To show how history, arts and literature can be a part of science.
- To show that women and minorities have made and will continue to make significant achievements in science.
- To involve parents with their child's education by actively involving them in the learning process.

Methods of Instruction and Textbook Teaching Tools

This textbook provides special features or "core lessons" in each chapter that provide a coordinated and integrated science program. Many of these "core lessons" actively involve students in science and entice them to discover fundamental concepts on their own. Each of these hands-on "core lessons" is described below.

Explore! - "outside of class" open-ended activities that allow students to observe, manipulate materials and discover things on their own.

Find Out! - "outside of class" activities that emphasize a specific concept, as students collect and analyze data.

Investigate! - formal "in class" activities that teach students to apply scientific methods and manipulate scientific data.

Skillbuilder! - exercises both in and out of class, and offer students additional skills and processes related to chapter content.

Other "core lessons" stimulate interest and awareness and stress connections and interdependence in almost every aspect of life in the modern world. Each of these "core lessons" are described below:

How Do We Know? - Gives further insight into the discovery or development of important scientific ideas.

Looking Back and Looking Ahead- Focuses on unifying themes and interactions among major topics in adjacent chapters.

A Closer Look- Examines a relevant chapter topic in depth.

Science Connection- Explores interconnections between one science field and another.

Technology and Science and Society Connections- Reveal the impact of science and technology in today's world.

-Teens In Science- Shows teenagers actively involved in various field of science.

How It Works- Applies scientific principles to the inner workings of everyday devices.

Connections to art, history, literature- And other non-science subjects illustrate the relationships between science and these disciplines.

It must be recognized that besides being a guide, a good teacher shares his or her Various experiences, joys, failures, and interests in stimulating students. Therefore, an Integral part of this course, when appropriate, includes:

- Demonstration
- Discussion and explanation
- Video and laser disc images and short subject movies
- Transparency projections

When appropriate, bilingual aids will provide additional instruction, while textbook, study guides, quizzes, and tests will be made available in “Spanish Format” to support a successful multicultural learning experience.

Course Title

Genetics (P)

Description of Target Group

This advanced course is for 11th and 12th grade students who are considering a biology-related major. They must have completed biology, chemistry, and / or physiology and anatomy with a grade of B or better. Students who have only completed biology but cannot take chemistry due to that course being impacted would be eligible under the stipulation that they will take chemistry at a later date. This class is not a substitute for chemistry.

Purpose

The purpose of this class is to give students an opportunity to explore in detail the structure and function of DNA. This is a two-term class that is designed to expand upon the limited exposure to genetics provided in basic biology classes. Students who complete this class will have an excellent background into the structure and function of DNA, as well as a working, hands-on experience in basic laboratory procedures associated with genetic experimentation and research. Genetics and it's associated fields provide a wide range of professional and laboratory careers in a variety of areas including health, research and agriculture.

Standards of Expected Student Achievement

Upon completion of this course, students will be able to successfully demonstrate skills and knowledge in the following areas:

* Mendelian Genetics
* Cellular and Molecular Genetics
* Developmental Genetics
* Population and Evolutionary Genetics
* The Human Genome
* Human Genetics
* Biotechnology
* Bioethics

Curriculum topics include:

1. Heredity
2. Meiosis and Fertilization
3. Chromosomes and Simple Inheritance
4. Chromosomes and Linkage
5. Unusual Chromosomal Constitutions
6. Sex Determination
7. Probability and Punnett Squares
8. Polygenic Inheritance
9. Human Conditions and Genetic Counseling
10. Detecting Conditions and Genetic Counseling
11. DNA: The Genetic Material

12. DNA: Structure and Replication
13. Transcription
14. Translation
15. Causes of Mutation
16. Consequences of Mutation
17. Evolution and Population Genetics
18. Hardy-Weinberg Law
19. Bioethics

Instructional Materials

Text and Supplementary Materials:

No text is needed for this class. Instead, a one-time purchase of "Genetics: Fundamentals and Frontiers", a comprehensive multimedia program on the science of genetics, will be made. This package from "Videodiscovery" includes:

1. A Comprehensive Double-Sided Laserdisc**,** which contains 4000+ photos, diagrams, tables, and graphs. In addition, there are 50+ minutes of video footage and 3-D animations. The laserdisc will be used in conjunction with fully developed lessons to provide clear and long-lasting explanations of complex theories and practices.
2. A 350 page curriculum manual covering all major topics in genetics. This manual includes lab investigations, concept development, assessment, extension activities, reproducible worksheets, and background information.
3. Tutorials and Directory, 2-Volume. This set includes presentations into the rapidly evolving field of genetics written by leading authorities in the field. A bar-coded Directory contains a complete, annotated index to all visuals on the laserdisc.
4. Genetics Wall Poster. This double-sided poster features all human chromosomes and locations of selected human genes as well as a bar-coded illustration of the role genetics plays in the cycle of life.

The cost of this package is $495.

Additional Materials:
This class will extensively use fruit flies to support key Mendelian concepts including monohybrid crosses, dihybrid crosses, and sex linkage. The materials needed for this portion of the class are easily purchased from the existing science budget. In addition, a gel electrophoresis apparatus will be needed to do gene sequencing. These machines are available through biological supply companies, are reasonably priced, and also can be purchased from existing funding. Other items, such as ears of dihybrid corn, will be purchased as needed from the science budget or from the science fund-raiser held twice a year.

Activities

1. Individual and team laboratory work
2. Lectures / Discussions
3. Bioethics debates / Discussions
4. Demonstrations
5. Audio-visual materials
6. Reports and research papers
7. Solving genetics problems

Geology

Santa Maria Joint Union High School District

Basic Course Information

School(s) Offering This Course:

School Name	Course Learning Environment	Transcript Code(s)
Ernest Righetti High School (053303)	Classroom Based	Abbreviation / Course Code Geology A / SC6638 Geology B / SC6639

Title:	Geology
Length of course:	Full Year
Subject area:	Laboratory Science ("d") / Earth and Space Sciences
UC honors designation?	No
Prerequisites:	Algebra 1 (Required) Biology or Biology (H) with a C or better (Required)
Co-requisites:	None
Integrated (Academics / CTE)?	Yes
Grade levels:	10th, 11th, 12th

Course Description

Course overview:

Geology is a 10th through 12th grade physical lab science course during which students will study the dynamic process that shape and change the surface of the Earth. Students will learn rock and mineral identification, study and interpret topographic and geological maps and study land forms and structures. Students will also apply real world applications of geology and how it can affect their everyday lives, the community in which they live and areas around the world. Throughout the year, students will study the different geological sciences to learn how they interact with one another while incorporating other disciplines such as Chemistry, Physics, Language Arts and Mathematics. This class emphasizes the hands-on approach along with inquiry-based labs that align to both the Next Generation Science Standards and the common core standards. Geology is a concentrator course for the CTE Environmental Resources Pathway.

Course content:

Course Content

Course Content

Students will be assessed using the standard multiple choice (30%) and written examinations (70%), Lab skills and practical examinations, homework, worksheets, lab reports, projects and teacher observations. A standard rubric for science writing (taken from:http://edweb.sdsu.edu/triton/tidepoolunit/Rubrics/reportrubric.html) will be used to grade reports and projects.

The criteria used for tracking and measuring student progress and program success are as follows:

Assessments per 18 week grading period:

1. Homework and Class Work 5%
2. Laboratory Work 20%
3. Laboratory Practical tests 10%
4. Exams 20%
5. Research Reports and Projects 15%
6. Midterm/Final Exams 20%
7. Quizzes 10%

Scoring is as follows:

90% - 100% A

80% – 89% B

70% - 79% C

60% - 69% D

0% - 59% F

Unit 1 Introduction

Maps are an important tool to know how to use when attempting to explain geologic phenomena. Topographic map are primary type of map used in the field of geology. Geologic Maps are used to interpret geologic reconstructions, rock types, faults of the area and are underlined by a topographic map. To review the scientific method, lab procedures, how to write a lab report, and learning about the maps in are used in geology will help students better under concepts that are taught in geology. In learning about the following tools students will:

1. **Introduction to Geology, Topographic Maps and Geologic Maps (weeks 1-2)**
2. **Discuss and explain the scientific method, review the metric system and go over how to write a lab report. Explain procedure for keeping and maintaining a vocabulary folder that consists of key vocabulary and terms. Each term should a paragraph definition put into the student's own words, a picture or illustration, a sentence that contain the term, and an example of the term.**
3. **Overview of Physical Geology and how it affects people and the surface of the earth. Why geology is an important field of study and which scientists made major discoveries in this field of science. Students will research a geologist of their choice. Students gather information and present it in "Geologist Wanted" poster. Describe the different branches involved in geology.**
4. **Map projections and purposes. Explain different types of maps and their purposes. Activities will explain map projections and scale. Students will review the concept of map scale and practice using distances on a map using fractional and graphic scales. Students will then examine the characteristics of different map projections.**
5. **Describe the difference between longitude and latitude. Demonstrate how to use longitude and latitude by using a map or globe to find various places on Earth by completing the location activity.**
6. **Topographic Maps and features will be discussed. Students will know the rules governing contour maps. How to interpret map symbols and find features on a topographic map. This will be accomplished by a contour activity and the interpreting topographic maps lab. Drawing contour intervals-worksheet with numbers in increments of 10's separate with lines using rules for contour intervals The contour activity involves learning to interpret elevation contour lines and discusses the rules governing contour lines.**
7. **Explain the different features and uses of geologic maps. Compare and contrast geologic and topographic maps.**

Lab: Interpreting topographic maps

Project: Geologist Wanted Poster

Activity: Location activity to review the system of longitude and latitude and experience how to

use a

globe and world maps.

Activity: Interpreting contour elevation lines.

Activity: Map scales and projection

Unit 2 Plate Tectonics

Next Generation Science standards:

HS-ESS1-5. Evaluate evidence of the past and current movements of continental and oceanic crust and the theory of plate tectonics to explain the ages of crustal rocks.

HS-ESS1-6. Apply scientific reasoning and evidence from ancient Earth materials, meteorites, and other planetary surfaces to construct an account of Earth's formation and early history.

HS-ESS2-1. Develop a model to illustrate how Earth's internal and surface processes operate at different spatial and temporal scales to form continental and ocean-floor features.

HS-ESS2-3. Develop a model based on evidence of Earth's interior to describe the cycling of matter by thermal convection.

Plate tectonics will introduce by a short historical look and the development of the theory of plate tectonics itself. The different boundary features, mechanism and types will be described. Using the text and lecture/discussion as the primary mode of instruction and video support students will investigate the following:

Planet Earth Structure and Formation (weeks 2-3)

2. Discuss and know the internal structure, composition and characteristic behavior of materials found within the earth. Student will complete the Earth's interior lab to tie in the physical properties that associated with the different layers of the Earth. Students will construct a diagram of Earth's interior by coloring and labeling all appropriate structures.
3. The nature of continental and oceanic crust will be explored to determine the importance and involvement in plate tectonics. .Students will determine the differences in oceanic and continental crusts by completing the density of Earth's crust lab.
4. Discuss the physical evolution of Earth through time from formation to present day.

Lab; Earth's Interior

Lab: Density of Earth's crust

Worksheet: Blank diagram of Earth's interior

Worksheets: On atomic structure and periodic table

3. Study of plate tectonics (weeks 4-5)
4. Explain evidence for and against Alfred Wagner Continental Drift

5. Describe the Theory of Plate Tectonics and how sea floor spreading is involved. Describe the age and position of rock formations associated with the Mid-Atlantic Ridge to support the hypothesis of sea floor spreading. And explain how it relates to the theory of plate tectonics.
6. Describe in detail what happens at the following plate boundaries give examples and features associated with each one.

- Oceanic-oceanic convergence
- Oceanic-continental convergence
- Divergent boundary

Oceanic spreading centers

Continental rift valleys

- Transform fault boundary

1. Describe mechanisms that drive plate motion such as ridge push and slab pull. Explain how these mechanisms work at plate boundaries and how these mechanisms support the theory of plate tectonics.

Lab: Sea-floor spreading

Lab: Plates and plate boundaries

Worksheet; Comparing and contrasting different plate boundaries.

Unit 3 Minerals, the Rock Cycle and California's Mineral Resources

Next Generation Science standards:

HS-PS1-1. Use the periodic table as a model to predict the relative properties of elements based on the patterns of electrons in the outermost energy level of atoms.

HS-PS1-3. Plan and conduct an investigation to gather evidence to compare the structure of substances at the bulk scale to infer the strength of electrical forces between particles.

HS-PS2-6. Communicate scientific and technical information about why the molecular-level structure is important in the functioning of designed materials.*

HS-ESS3-1. Construct an explanation based on evidence for how the availability of natural resources, occurrence of natural hazards, and changes in climate have influenced human activity.

HS-ESS3-2. Evaluate competing design solutions for developing, managing, and utilizing energy and mineral resources based on cost-benefit ratios.*

The chemistry of the earth and its' materials will be introduced in this unit, but not before students know the difference between a rock and a mineral. Students will:

4. **Mineralogy (weeks 6-7)**
5. **Know the definition of a mineral and it's properties and how mineral's form.**
6. **Identify the six different crystalline structures of a mineral. Students will construct block models of the six crystal systems to help them better understand crystal formation and structure of Earth's minerals.**
7. **Review basic atomic structure and the Periodic Table Elements. Discuss the types of bonding and how compounds and mixtures form. Students need to identify what an atom is and it's subatomic particles. As well as characteristics of the periodic table and how it relates to bonding.**
8. **Differentiate between ionic, covalent, metallic and Van der Waals bonds**
9. **Identify the different physical and diagnostic properties of minerals**
10. **Exploration of the different mineral families such as silicates and the different silicon oxygen tetrahedron chains, carbonates, oxides, sulfates and sulfides, halides, and native elements, Students will know the different chemical properties behind each family of minerals.**
11. **Know the definition of a rock and the difference between a rock and a mineral**
12. **Describe and explain the rock cycle.**

Lab: Mineral crystal systems

Lab: Mineral identification

5. **California's Mineral Resources (weeks 8-9)**
6. **Identify mineral distribution in California**
7. **Describe the location, type and distribution of mining in California**
8. **Learn the different methods use for mining in both the past and present in California. Types of mining to be discussed are hard rock, strip mining and panning.**
9. **Know the economic importance of California's mineral resources**

Lab: Mapping mineral distribution in California

Unit 4 Rocks

Next Generation Science standards:

HS-ESS2-6. Develop a quantitative model to describe the cycling of carbon among the

hydrosphere, atmosphere, geosphere, and biosphere.

HS-ESS2-3. Develop a model based on evidence of Earth's interior to describe the cycling of matter by thermal convection.

HS-ESS3-1. Construct an explanation based on evidence for how the availability of natural resources, occurrence of natural hazards, and changes in climate have influenced human activity.

In this unit students will learn the processes and variable environments that create igneous, sedimentary and metamorphic rocks. Igneous rocks are the "New" earth materials that are produced in a very dynamic and sometimes violent way. Sedimentary In reality most of the earth's surface is covered in sediments and sedimentary rocks is one of the keys to dynamic planets structure. Because of the dynamic nature of earth , rocks and minerals are subject to variable heat and pressure that can, and does, change these materials, parent, into a completely new material, daughter. The students will be able to:

6. **Igneous Petrology and Volcanism (weeks 10-13)**
7. **Know how igneous activity is related to plate tectonics.**
8. **Learn the difference between the different types of volcanoes such as strato, shield, cinder cones, and calderas. Student will design a power point presentation on a volcano of their choice. Projects can be on an individual basis or in as a team. Comparing and contrasting the different types of volcanoes.**
9. **Identify the different types of eruptions and what volcanoes they associated with.**
10. **Know the causes and effects of volcanic hazards.**
11. **Differentiate between the different types of lava, such as tholeitic and calc-alkaline.**
12. **Describe hot spots and how they are related to intra-plate volcanism**
13. **Describe the formation and evolution of magma**
14. **Know how Bowen's Reaction series works and know when mineral's precipitate from a magma**
15. **Identify intrusive rocks using phanaretic (intrusive), aphanitic (extrusive) and porphyritic, textures and classification as well as use mineral content and identify how the formed.**
16. **Describe the different intrusive magmatic bodies such as batholiths, laccolith, sills, dikes, stocks, volcanic pipes and necks.**
17. **Distinguish between the different extrusive rocks such as scoria, pumice, and obsidian and know how they were formed.**

Lab: Identification of igneous rocks

Project: Volcano Power Point Presentations

Worksheet: Locating the world's volcanoes- Use a coordinated system (longitude and latitude) to locate volcanoes on a world map.

7. Sedimentary Petrology (weeks 14-15)
8. Will be able to determine how weathering (chemical and physical) process are relate to erosion.
9. Know the processes behind for sediment formation, deposition, transport, lithification
10. Identify the different types of texture and classification of sedimentary rocks
11. Describe and Identify the physical properties Clastic sedimentary rocks
12. Identify and describe the properties of chemical sedimentary rocks
13. Interpretation of depositional environment of sedimentary rocks

Lab: Identification of sedimentary rocks

8. Metamorphism and Metamorphic Petrology (weeks 16-17)
9. Know the difference types of metamorphism regional and contact and the processes that create them.
10. Distinguish and identify the metamorphic rock characteristics, texture as more heat and pressure are applied, formation and parent daughter material.
11. Determine and identify how metamorphic rocks are classified into foliated and non-foliated.
12. Identify the different minerals as well as heat and pressure that forms these minerals in the metamorphic gradient
13. Identify the different kinds of folds and be able to interpret surface outcropping of the following: anticline, synclines, plunging and non-plunging, basins and domes.
14. Know the tectonic forces that result in the following faults and their varieties.; reverse, normal, thrust, and strike-slip

Lab: Identification of metamorphic rocks

Lab: Syncline, anticline and monocline block models

Lab: Fault block models

Unit 5 Earthquakes

Next Generation Science standards:

HS-PS4-1. Use mathematical representations to support a claim regarding relationships among the frequency, wavelength, and speed of waves traveling in various media.

HS-PS4-5. Communicate technical information about how some technological devices use the principles of wave behavior and wave interactions with matter to transmit and capture information and energy.*

Earthquakes are a way of life in some parts of the world, specifically around the Pacific Ring of Fire. They are a reminder of the ever continuing dynamics of the planet in which we live. In this unit students will learn about the causes of earthquakes and why we study them. In the process students will:

9. **Earthquakes (weeks 18-20)**
10. **Describe the elastic rebound theory**
11. **Distinguish the different movement and speed of p-waves, s-waves and surface waves and how they behave within the Earth.**
12. **Interpret seismograms in order to determine the location of an epicenter, Richter magnitude and first motion and amplitude of the seismic waves.**
13. **Compare how earthquakes are measured using the Richter Scale and Mercalli Intensity Scale**
14. **Understand how seismic waves give us information about the interior of the Earth.**
15. **Describe earthquake hazards and safety by developing their emergency safety plan for their family.**

Lab: Locating an earthquake's epicenter

Project: Research an Earthquake

Project; Earthquake safety and Your Family

Worksheet: Locating the world's earthquakes- Use a coordinated system (longitude and latitude) to locate earthquakes on a world map.

Unit 6 Mass Wasting

HS-ESS2-5. Plan and conduct an investigation of the properties of water and its effects on Earth materials and surface processes.

Living in Santa Brbara County Area, California unstable slopes are common due to the nature of the ground beneath our feet. Where does this loose material come from, and determines if a slope is stable or not? In this process, soils are produced, which is one of most valuable resources. In this unit students will:

10. **Mass wasting (weeks 21 - 22)**
11. **Identify the different types factors that contribute to mass wasting such as water content, nature of rock or sediment, steepness of the slope, angle of bedding planes or other areas of weakness.**

12. Describe different kinds of mass wasting by the speed and kind of movement, amount of water present and kind of material (rock, debris, mud): avalanche, slide, fall, flow, creep and solufluction
13. Describe hazards of mass wasting and ways to preventing and control mass wasting
14. Identify areas that are more prone to mass wasting.
15. Describe the process and conditions for the creation of soils and why this resource is important in today's society.

Lab: Slope stability

Unit 7 Water on Earth

Next Generation Science standards:

HS-ESS2-5. Plan and conduct an investigation of the properties of water and its effects on Earth materials and surface processes.

HS-ESS3-1. Construct an explanation based on evidence for how the availability of natural resources, occurrence of natural hazards, and changes in climate have influenced human activity.

HS-ESS3-1. Construct an explanation based on evidence for how the availability of natural resources, occurrence of natural hazards, and changes in climate have influenced human activity.

Water is the most important resource for those that live on this planet. Water is necessary for the survival of many organisms that inhabit the Earth. California is no stranger when it comes to controversy of fresh water rights. In order for students to better understand water and its' issues, students will explore:

11. Water on Earth's surface (weeks 23 – 24)
12. Processes of the water cycle such as evaporations, transpiration, runoff, and condensation
13. Describe the development of rivers and streams, processes that formed them and features associated with rivers and streams. Features to be discussed include: headwaters, drainage basins, tributaries, sediment deposition at the base of mountains and alluvial fans, erosion and deposition in bedrock channels, and low-gradient river systems.
14. How a river or steam transports solid and dissolved material,
15. How velocity relates to sediment size and capacity
16. Describe flooding and its' hazards

Lab: Stream Table

Lab: Discharge Rate Investigation

12. **Groundwater (weeks 25- 26)**
13. **Porosity and permeability and how water moves through sediment and rock to accumulate and form ground water.**
14. **What features are associated with groundwater**
15. **How the movement of groundwater influences aquifers and springs**
16. **Describe unconfined, confined and artesian aquifers. What are some the difference between them and how are they similar.**
17. **What is required to form a spring and where and why do springs occur.**

Lab: Permeability and porosity

Lab: Ground water table

Unit 8 Glaciers

Next Generation Science standards:

HS-ESS2-4. Use a model to describe how variations in the flow of energy into and out of Earth's systems result in changes in climate.

HS-ESS3-5. Analyze geoscience data and the results from global climate models to make an evidence-based forecast of the current rate of global or regional climate change and associated future impacts to Earth systems.

In order to understand the effect of global climate change, it is import to recognize how the Earth has done this is the past. One way is to study periods of glaciation and glaciers of the past and evidence of their existence they have left behind. In doing this, students will:

13. **Glaciation (weeks 27 = 28)**
14. **Describe the Milankovitch Cycles with periods of glaciations.**
15. **Know the causes of the Pleistocene Ice age.**
16. **Understand how isostasy works and how it influences the crust**
17. **Describe the formation and movement of glaciers and long term effects of glaciations.**
18. **Identify glacier deposition and erosion and glacial features such as fiord, horn, arête, cirque, hanging valley, striations, kettle, erratic, eskers, outwash plain and glacial till.**

19. Identify and describe glacial features such as moraines, braided streams, crevasses, calving, firn and firn-line, ice burgs, and moulins.

Lab: Glacial valley reconstruction

Lab: Identify glacial features on a topographic map

Unit 9 Coastal Environment

Next Generation Science standards:

HS-PS4-1. Use mathematical representations to support a claim regarding relationships among the frequency, wavelength, and speed of waves traveling in various media.

HS-PS4-5. Communicate technical information about how some technological devices use the principles of wave behavior and wave interactions with matter to transmit and capture information and energy.*

HS-ESS2-4. Use a model to describe how variations in the flow of energy into and out of Earth's systems result in changes in climate.

HS-ESS3-5. Analyze geoscience data and the results from global climate models to make an evidence-based forecast of the current rate of global or regional climate change and associated future impacts to Earth systems.

HS-ESS3-1. Construct an explanation based on evidence for how the availability of natural resources, occurrence of natural hazards, and changes in climate have influenced human activity.

In order to understand the effect of global climate change, it is import to recognize how the Earth has done this is the past. One way is to study the ever changing costal environment and the shoreline. In doing this, students will:

14. Coasts and Wave Action (weeks 29 – 30)
15. Describe the properties of waves such as height, period and crest.
16. Identify the different types of waves associated with deep ocean and the shoreline

17. How coastlines development and features associated with them. Features that will be identified are beaches, cliffs, headlands, caves, stack, natural arches, spit, tombolo, sand dunes, lagoon and back bays and bays.
18. Different types and characteristics of beaches such as dissipative, reflective and bar-rip.
19. How wave energy determines the erosion and deposition of beaches. Students will describe how waves approach and break on the beach. They will also differentiate between the different types of waves and how ocean topography effects the formation of waves. Types of waves students will explore are plunging, spilling, collapsing and surging waves.
20. Describe the different features of a beach such as low tide flats, salt marshes, maritime forests, barrier flats, dunes, drift lines, backshore, foreshore and nearshore.
21. Identify manmade features that are used to manipulate the erosion of beaches by man. These features are jetties, groins and seawalls.

Lab: Compare and Contrast plunging, spilling, surging, breaking and ocean waves using block models

Unit 10 Eolian Environment

Next Generation Science standards:

HS-ESS2-4. Use a model to describe how variations in the flow of energy into and out of Earth's systems result in changes in climate.

HS-ESS3-5. Analyze geoscience data and the results from global climate models to make an evidence-based forecast of the current rate of global or regional climate change and associated future impacts to Earth systems.

In order to understand the effect of global climate change, it is import to recognize how the Earth has done this is the past. Another excellent link between climate and geology is seen when we examine arid landscapes. Arid regions are not dominated by a single geologic process, but by tectonic forces, running water and wind. When learning about arid landscapes students will:

15. Desert and Wind (weeks 31 - 32)
16. Know the distribution and causes of arid lands such as low-latitude deserts, middle-latitude deserts and rain shadow deserts
17. Describe the rain shadow effect
18. Identify and describe the geologic processes that help shape arid regions such as weathering, erosion and the effects of water,

19. Describe the evolution and of desert features such as ephemeral streams, bajadas, arroyos, and alluvial fans,
20. Know how sediments are transported by winds. Describe the process of saltation, bed load and suspended load.
21. Identify features that are formed from wind erosion such as deflation, blowouts and desert pavement.
22. Describe the different two types of wind deposits. Identify the different types of sand dunes Barchan, Transverse, barchanoid, Longitudinal, Parabolic, Star associated with wind deposits. Know what loess deposits are and how they form.

Lab: Topographic map interpretations of desert features

Unit 11 History of Earth

Next Generation Science standards:

HS-PS1-8. Develop models to illustrate the changes in the composition of the nucleus of the atom and the energy released during the processes of fission, fusion, and radioactive decay.

HS-LS2-6. Evaluate the claims, evidence, and reasoning that the complex interactions in ecosystems maintain relatively consistent numbers and types of organisms in stable conditions, but changing conditions may result in a new ecosystem.

HS-LS4-5. Evaluate the evidence supporting claims that changes in environmental conditions may result in: (1) increases in the number of individuals of some species, (2) the emergence of new species over time, and (3) the extinction of other species.

HS-ESS2-2. Analyze geoscience data to make the claim that one change to Earth's surface can create feedbacks that cause changes to other Earth systems.

HS-ESS2-7. Construct an argument based on evidence about the simultaneous coevolution of Earth's systems and life on Earth.

The rocks of the earth contain evidence of how it was changed over time. The "story" of geologic history and how we use geologic principles to reconstruct Earth History will be presented to the students in this unit. To understand this reconstruction students will:

16. **Geologic Time**

1) Know the Geologic Time Scale though time. Identify the eras Hadean, Archean, Proterozoic, Paleozoic, Mesozoic and Cenozoic. Students should also Identify the major time periods Cambrian, Ordovician, Silurian, Devonian, Carboniferous, Permian, Triassic, Jurassic, Cretaceous, Eocene, Oligocene, Pliocene, Miocene, Pleistocene, and Holocene and describe the major events that occurred in each.

2) Be able to interpret and sequence rock layers based upon key principles of relative dating such as::

- **Law of Superposition**
- **Principle of Original Horizontality**
- **Principle of Cross-Cutting Relationships**
- **Law of Inclusions**
- **Faunal Successions**

3) Know what a fossil is and how it forms. Identify index fossils for the major time periods of the Geologic Time Scale.

4) Recognize and explain the following formations:

- **Unconformity**
- **Disconformities**
- **Nonconformity**
- **Angular Unconformity**

5) Understand the principle of radiometric dating.

Lab: Relative dating

Project: Reconstruction of the geologic time scale

Final Project: National Park Presentations

Labs/Activities

- **Topographic Maps**
- **Location using longitude and latitude**
- **Interpreting contour elevation lines.**
- **Map scales and projection**
- **Earth's Interior**
- **Density of Oceanic and Continental crust.**
- **Plates and Plate Boundaries**
- **Mineral Identification**
- **Identification of Igneous Rocks**
- **Identification of Sedimentary Rocks**
- **Identification of Metamorphic Rocks**
- **Location of Earthquakes**
- **Fault and Folding Block Models**

- Slope stability
- Stream Table
- Discharge Rate Investigation
- Permeability and Porosity
- Ground Water Table
- Glacier Valley Reconstruction
- Glacial Features on Topographic Map
- Wave Model Blocks- Compare and Contrast
- Eolian Features on a Topographic Map.
- Relative Dating- Sequencing Geologic Events

💻 Unit Assignment(s):

Assignments:

Vocabulary Folder: A folder that consists of key vocabulary and terms. Each term should a paragraph definition put into the student's own words, a picture or illustration, a sentence that contain the term, and an example of the term.

Assessment questions for each unit.

Assessments for each unit of study will include multiple choice, completion and short essay.

Supplemental worksheets

- Drawing contour intervals-worksheet with numbers in increments of 10's separate with lines using rules for contour intervals
- Earth's Layer's-coloring and labeling earth's layered interior
- On atomic structure and periodic table
- Plate Boundaries- compare and contrast the different plate boundaries.
- Different Volcanoes compare and contrast the different volcanoes
- Locating the world's volcanoes- Use a coordinated system (longitude and latitude) to locate volcanoes on a world map.
- Locating the world's earthquakes- Use a coordinated system (longitude and latitude) to locate earthquakes on a world map.

Projects:

Project: Geologist Wanted Poster:

Students research a geologist of their choice. Students gather information and present it in "Geologist Wanted" poster. Information that should be on the wanted poster is first, middle and last name of geologist, picture of geologist, date of birth and year of death or if still alive, what country they were born in and where do they do they work?, What is their field of study? What are their major contributions to geology? List at least three sources on the back of the poster.

Project: Volcano Power Point Presentations

Students are to work n groups of two. Create power point presentation of a volcano that is 10-15 minutes in length. Presentations will be presented to the class. Information should include location, name, elevation, near-by towns/cities, type of volcano, type of plate boundary or intra plate volcanism associate with the volcano, formation and eruptive history, types of igneous rock associated with volcano, alert level, should also include pictures, charts and illustration supporting information on volcano. At least three sources should be used.

Project: Research an Earthquake

A research paper on an earthquake of student's choice. The paper should be 3-5 pages in length and include the following, location, name of fault, type of faulting associated with the fault, type of tectonics associated with the faulting, history and development of fault, summary of damage done by the quake, and magnitude. The report should include at least sources.

Project: Earthquake safety and Your Family

Students are to research earthquake safety using the FEMA web sites dealing with earthquake safety such as:

http://www.fema.gov/earthquake/earthquake-safety-home

http://www.fema.gov/earthquake

http://www.ready.gov/earthquakes

They are gather information regarding earthquake safety and make a family presentation, safety plan, and summarize the presentation and safety plan in 2-3 page report. Reports must have signatures of those present in the family presentation

Project: Reconstruction of the geologic time scale

Create a booklet of geologic time using the following guide lines. The front cover should have an illustration of geologic time with definition for geologic time. On the inside cove is the table of contents. The following pages should include the following: name of the geologic time should include Eon, Era, period, ad epoch. An illustration of the time period including life present if any. A minimum of 6-8 sentences paragraph summing up geologic time. Paragraphs should include life, paleoclimate, major geologic events or any other interesting facts. The following geologic time should make up the book: Archeon and Hadean Eon, Proterozoic Eon, Cambrian Period, Ordovician Period, Silurian Period, Devonian Period, Carboniferous Period, Permian Period, Triassic Period, Jurassic Period, Cretaceous Period, Eocene Epoch, Oligocene Epoch, Miocene Epoch, Pliocene Epoch, Pleistocene Epoch, Holocene Epoch. A minimum of 3 sources should be used on this project.

Final Project: National Park Presentations

National Park presentations should be 10=15 minutes in length. Student's chose a national park and present the following information to the class as a whole as a power point presentation. Information should include the following: name of park, where it is located, when it was made a national park, why it was made a national park, what geologic province is the national park located, what type of rocks are present and how were they deposited, geologic event that formed the park, and what geologic events are still taking place today. Illustrations, maps pictures and charts should be used to support information. At least three sources should be used.

Unit Lab Activities:

The labs in this class are used as a summative and inquiry based activities that are important to teaching Geology. When appropriate students will be expected to write a formal laboratory report, but there will be exceptions when the activity is not conducive for writing a formal report.

In a formal lab report students will be required to write the following:

1. **A problem Statement**
2. **Hypothesis**
3. **The experimental design, including procedures and materials used in tests performed.**
4. **Analysis and conclusion to the initial problem stated.**
5. **Conclusion to the initial problem statement**
6. **Statements of further inquiry related to the original question and that can lead to new investigations.**

Laboratory Activities:

Lab: Interpreting topographic maps

Part 1 Lab Activity: Contour line

Purpose: To interpret elevation contour lines and determine the high spot and low spot on the map.

Materials: Lab hand-out with contour line definition, sample topographic map, contour line rules with exercises using a simple contour line map and problems.

Procedure; Read and familiarize the contour line rules. Look at simple topographic map and answer problems associated with the map. Problems involve answering question regarding what is the elevation on the map at certain given points. Identifying land features on a topographic map and observing cross-sectional data that is gained from the topographic map.

Part 2 Lab Activity Interpretation of a topographic map

Purpose: Read, interpret topographic maps and draw cross-sections

Materials: Topographic maps, handout with tasks regarding the use of the map.

Procedure: The hand-out has tasks that include naming the quadrangle of map and what series it is in. Determine the scale of map. Determine what quadrangles are located adjacent to the map. Determine the longitude and latitude of the map and the colors that are used on the topographic maps given for the lab. Find elevations of certain features as well as township and range that can be found on the map. Draw a cross-section of a determined area on the topographic map.

Lab Report: For this lab activity students will write reflection or opinion paper concerning the importance of accurate topographic maps to city planners, hikers, military personnel, environmentalists, and geologists.

-

Laboratory Experiences:

Lab: Earth's Interior

Purpose: Identify the physical properties that are associated with the different portions of Earth's interior.

Materials: Graph paper, colored pencils, lab hand-out with Earth's interior temperature and depth chart with conclusion questions.

Procedure: Use the data in the given table to construct three separate line graphs showing temperature of Earth's interior, mantle melting point and core melting point. Shade in and label different portions of Earth's interior using five different colors. Answer conclusion questions using the information on the graph.

Lab Report: Each student will write a lab report describing the lab process and his/hers results and analysis.

Lab: Density of Earth's crust

Purpose: To determine the differences in densities of the Earth's continental crust and oceanic crusts. Density plays a difference which is an important role in the interactions of the Earth's tectonic plates.

Materials: 10 samples of oceanic crust (basalt), 10 samples of continental crust (granite), balances or scales, 250 ml plastic graduated cylinders, and lab hand-outs

Procedure: Measure and record mass of 10 samples of oceanic crust. Then determine volume of all 10 oceanic crust by using the displacement method. Record volume in chart provided. Using the mass and volume calculate the density for each oceanic crust sample and record results. Average the mass, volume and density record. Repeat using 10 samples of continental crust. Find the mass, volume and density for each sample. Answer conclusion question regarding Which type of rock is more dense? Which type of rock makes up continental and oceanic crusts? Describe what would happen if an oceanic plate collided with a continental plate. Would the densities of the different rock influence what happens?

Lab Report: Each student will write a lab report describing the lab process and his/hers results and analysis.

Lab: Paleomagnetics & sea-floor spreading

Purpose: To use the positions and ages of oceanic rock formations associate with the Mid-Atlantic Ridge to support the idea of sea-floor spreading. Sea-floor spreading also present the idea that new crust is formed at mid-ocean ridges. This is thought to be the man mechanism for plate movement.

Materials: Metric ruler, colored pencils and lab hand-out.

Procedure: Use the cross-section in the hand-out to log data into the data table based on paleomagnetic data associated with the Mid-Atlantic ridge system. Calculate the spreading rate for each side of the ridge. Answer conclusion questions regarding lab. How does the mapping of the

sea-floor help support the theory of plate tectonics? How can the rate of sea-floor spreading be determined in both the Atlantic and Pacific Oceans? Are the rates the same for both ridge systems? Explain how sea-floor spreading helps the theory of continental drift.

Lab Report: Each student will write a lab report describing the lab process and his/hers results and analysis.

Lab: Plates, plate boundaries & physical geography of the world

Purpose: To locate and identify the different plates and types of boundaries associated with each plate and determine the geologic hazards associated with each around the world

Materials: Plate tectonic map, blank tectonic map, colored pencils

Procedure: Use colored tectonic map to label and draw plate boundaries onto blank map. Name each plate and color each plate a different color, determining whether the plate consists of oceanic or continental crust. Mark convergent boundaries with a line that has a saw-tooth edge, use red to draw this boundary, Divergent plate boundaries draw line with alternating hatch marks, use blue for this boundary. Transform plate boundary draw arrows on both side of boundary indicating plate motion on either side of boundary. Take a black marker and mark arrows on the plate to indicate general plate motion. Complete the given table and determine the types of geologic hazards associated with each area, viscosity of magma, and whether it would have explosive or nonexplosive volcanoes.

Lab Practical: Students will draw geologic cross-sections for 8 different areas as noted on the tectonic map, noting the specific type of boundary associated with the area, type of rocks and minerals that are associated and whether this boundary would have explosive or non-explosive volcanoes.

Laboratory Experiences:

Lab: Mineral crystal systems

Purpose: To identify the six different crystal formations associated with minerals

Materials: Unassembled block models, scissors, glue, colored pencils.

Procedure: Cut out and assemble block models. Color each crystal. Identify the different facies, angles and cleavage planes.

Lab Report: Each student will write a lab report describing the lab process and his/hers results and analysis.

Lab: Mineral identification

Purpose: To identify the different rock-forming minerals by their physical and chemical properties. Minerals are important resources as well as forming many common rocks that are found within the Earth's crust.

Materials: mineral samples, Mohs Hardness Scale specimens, glass plates, magnets, streak plates, dilute hydrochloric acid, safety goggles, hand-lens, lab hand out with diagnostic charts.

Procedure: Identify minerals using the minerals physical and chemical characteristics. Identify the density, luster, hardness, cleavage, color, streak, other special properties and name. Explain why color is not a diagnostic property, determine the type of luster each mineral has along with which mineral properties are most helpful when used to identify minerals. Use Mohs hardness scale in identifying minerals. Determine the difference between ore minerals and gangue minerals.

Post lab evaluation: **Lab practical identifying 18 different previously study minerals. Students will identify minerals using: streak, luster, hardness, effervescence, and cleavage. Minerals will be placed at various stations throughout the lab. Students will be able to determine whether each mineral could be classified as igneous rock forming, sedimentary rock forming or ore and gangue minerals.**

Lab: Identification of intrusive igneous rocks

Purpose: To identify common igneous rocks by the composition, texture, color and density. Be able to distinguish the difference between intrusive and extrusive igneous rocks. Use the Bowen's Reaction Series to determine which minerals are found together and determine the temperature of the magma.

Materials: Igneous rock samples, hand-lens and handouts with blank scheme igneous rock chart, blank igneous rock identification chart, Bowen's Reaction Series hand-out

Procedure: Fill in the blanks on the scheme for igneous rocks chart. The information should include name, environment of formation, texture, and mineral composition. Have chart checked for accuracy. Use your chart to identify the igneous rock samples provided. Explain what is meant by a rock sample's texture. What is the difference between phaneritic, aphanitic and porphyritic textures and what causes the differences. Explain the difference between lava and magma. Describe the specific mineral composition, density and color between mafic and felsic rocks. Describe the main physical properties that are used to identify igneous rocks. Define magmatic differentiation and fractionation process and use in evolution of magma along different types of tectonic boundaries.

Post lab evaluation: Lab practical identifying 10 samples of igneous rocks. Students will need to also state texture, classification and probable temperature rock formed at. Igneous rocks will be placed at various stations throughout the lab.

Lab: Identification of sedimentary rocks

Purpose: To identify common sedimentary rocks on the basis of grain size, composition and texture. Be able to identify the processes of the formation of sedimentary rocks and draw environments rocks were deposited in.

Materials: sedimentary rock samples, hand-lens, dilute hydrochloric acid, hand-outs for lab, including blank scheme sedimentary rock chart and blank sedimentary rock identification chart.

Procedure: Fill in the blanks on the scheme for sedimentary rocks chart. The information should include name, texture, grain size, and composition, method of lithification and processes of formation. Have chart checked for accuracy. Use your chart to identify the sedimentary rock

samples provided. What are the three types of textures used to classify sedimentary rock. Describe processes used to identify sedimentary rocks. What is the difference between silt, clay and sand sediments? How do sedimentary rocks become soil, an important resource in our agricultural area?

Post lab evaluation: **Lab practical identifying 10 samples of sedimentary rocks. Students will need to also state texture and classification of rock. Sedimentary rocks will be placed at various stations throughout the lab.**

Lab: Identification of metamorphic rocks

Purpose: To identify common metamorphic rocks on the basis of grain size, texture and degree of metamorphism and be able to identify the parent rock from which each metamorphic rock formed. Be able to determine whether metamorphic rocks are foliated or non-foliated and whether they were formed by contact or regional metamorphism.

Materials: Metamorphic rock samples, hand-lens, dilute hydrochloric acid, hand outs for lab That include blank scheme metamorphic rock chart and blank metamorphic rock identification chart.

Procedure: Fill in the blanks on the scheme for metamorphic rocks chart. The information should include name, texture, grain size, type of metamorphism and parent rock, Describe the three different textures used to classify metamorphic rocks. Know the difference between foliated and non-foliated metamorphic rocks. Why are metamorphic rocks usually found in mountainous regions? Describe characteristic used to identify metamorphic rocks.

***Post lab evaluation*: Lab practical identifying 10 samples of metamorphic rocks. Students will need to also state texture, parent material, whether its foliated or nonfoliated and whether it would be formed by contact or regional metamorphism along with the classification of rock. Metamorphic rocks will be placed at various stations throughout the lab**

Lab: Locating an earthquake's epicenter

Purpose: To use triangulation and lag-time to locate the epicenter of an earthquake. To find the seismic wave amplitude so that the magnitude of an earthquake may be determined. Determine the difference between the Richter Scale and Mercalli Scale.

Materials: Sothern Californian triangulation packets, markers, compasses, rulers. Lab hand-outs

Procedure: Find the lag-time, set compass at recording station using distance on the map to find the radius to make a complete circle. Calculate distance by finding the time in seconds from the first P wave to the first S wave on the bottom of the seismograph. Then use the chart to find the distance. Find this for all three stations. Find the Magnitude by using the chart that has distance magnitude, magnitude and amplitude on it. Find the amplitude by using ruler and seismograph. Repeat for two other earthquakes. Complete virtual earthquake lab at "Virtual Earthquakes." Science Course Ware. Online:
Http://www.sciencecourseware.org/VirtualEarthquake/VQuakeExecute.html
(Http://www.sciencecourseware.org/VirtualEarthquake/VQuakeExecute.html)

Answer: How is a seismograph is used. What is the triangulation method and why is it used? Why do you need three seismic stations? How do you find the magnitude of an earthquake? What is amplitude? What is the difference between the Richter Scale and the Mercalli Scale.

Lab Report: Each student will write a lab report describing the lab process and his/hers results and analysis.

Lab: Fault block models

Purpose: To identify the different types of faults found within the Earth's crust

Materials: Unassembled block models, scissors, glue, colored pencils.

Procedure: Cut out and assemble block models. Color each block model according to color key. Describe each fault block model. Describe movement along each type of fault a strike-slip right lateral, thrust faults, reverse and normal faulting. Identify hanging wall and footwall and relative motion associated with each. Compare and contrast fault block models with each and whether each would be associated with extentional, compressional or shearing stress/strain.

Lab Report: **Each student will write a lab report describing the lab process and his/hers results and analysis.**

Lab: Syncline, anticline and monocline block models

Purpose: To identify the processes formed as a result of faulting.

Materials: Unassembled block models, scissors, glue, colored pencils.

Procedure: Cut out and assemble block models. Color each model according to color key. Describe each block. Identify what stress causes synclines, anticlines and monoclines. Compare and contrast the different blocks. What types of faulting causes these formations.

Lab Report: Each student will write a lab report describing the lab process and his/hers results and analysis.

Lab: Slope stability

Purpose: To study the angle of repose, learn the effects of water on sediments and how the angle of repose is associated with landslides such as the one in La Conchita.

Materials: Buckets, sand, stream tables, water, coffee cans with holes in the bottom, protractors.

Procedure; Using a small stream table or square container, pour some dry sand out to form a cone. Stop periodically to observe and measure the shape and angle of the cone. Record your measurements and observations. Using the "rainmaker" carefully sprinkle water onto the cone until it becomes saturated. Determine the slope and angle of the sides of the dry cone. Determine what happens to the sand when it becomes saturated? Determine the slope and angle of the

saturated cone? How is the angle of reposed repose affected in the experiment? Equate the angle of repose in the lab to the angle of repose of areas such as areas associated with landslides in our local area, La Conchita, Malibu and other parts of California.

Lab Report: Each student will write a lab report following the prescribed format. Each student will describe the purpose of the lab, the experimentation process, and his/hers results and analysis.

Lab: Stream Table

Purpose: To study the formation of alluvial fans and deltas as well as the erosional power of water.

Materials: EmRiver stream table, sand, water

Procedure: Using sand, build a flat area with a very steep slope in the stream table. Turn on the water very slowly and allow it to run down the steep slope. Turn the water off after 30 seconds.

Describe the feature that has formed at the bottom of the slope. What is this feature called? Draw a picture. Are there any features that have formed along the steep slope away from the water channel? What are these called? Draw a picture. Turn the water back on and watch the feature build for about two minutes. What has happened to the feature at the bottom of the slope? Draw a picture. Turn the water on medium to high (for about three minutes) and observe sedimentation where the flowing water encounters still water. What feature are you watching form? How does this feature differ from the previous one? Draw a picture.

Lab Report: Each student will write a lab report describing the lab process and his/hers results and analysis.

Lab: Discharge Rate Investigation

Purpose: to observe stream velocity vs. gradient and discharge.

Material: plastic flume, calculator, stands, paper, stop watch, large graduate cylinder and handouts.

Procedure: Set up the plastic flume with the stand such that the lower end of the flume is in/over the sink. The stand heights are set to produce 5º, 10º, and 15º. Adjust the output of the water to about 5cc/second (slow). Measure the discharge by running the water into the graduated cylinder for 5 seconds and measuring the amount accumulated volume of water (you may need to adjust the flow and measure again) and allow the water to run down the 5º slope. Measure the velocity by dropping a small piece of paper in and timing its trip down the marked section of the flume. Record velocity on the table in the hand out. Repeat for slopes 10º and 15º. Repeat the experiment having a 10 cc/second water flow. Plot the results on the graph in the hand out.

Lab Report: Each student will write a lab report following the prescribed format. Each student will describe the purpose of the lab, the experimentation process, and his/hers results and analysis.

Lab: Permeability and porosity

Purpose: To explore, determine, test and measure the amount of moisture, permeability, and

porosity of local soil samples.

Materials: Balance, cheese cloth, clear tube, one end open, clear tube open ends, plastic cup, small aluminum container, drying oven, 100 mL graduated cylinder, magnifying glass, rubber bands, 100 mL sand. 100 mL Soil (sediment), stop watch, teaspoon, tray or large piece of white paper, 400 mL of water, calculator and hand out for lab with questions.

Procedure:

Part 1: Get a soil sample of local origins. Place soil sample on tray or piece of white paper. Use the magnifying glass to observe the soil sample record your observations on the worksheet provided. Information should include color, particle size, organic material, insects, plant material ect.. Draw a picture of your soil sample.

Part 2: Use the balance and measure the mass of the aluminum container and record value. Using the spoon, place several spoonfuls of soil in the aluminum container. Measure the combined mass of soil and container record measure on the worksheet. Place container with into a drying oven at 90-95 ºC for 24 hours. Measure the combined mass of the soil and container after cooling the sample. Determine the loss in mass due to heating.

Part 3: Permeability

1. **Permeability of dry soil: Obtain a clear tube with open ends. Rubber-band two puces of cheese cloth to one end of the tube. Place tube upright with cheese cloth end down in a plastic cup. Using a graduated cylinder measure 40 mL of dry soil in tube. Hold the tube above the plastic cup and pour 20 mL of water into the tube. Use a stop watch and start timing as soon as all the water has been poured into the tube. Stop timing when the water stops dripping from the bottom of the tube Record time on worksheet. Calculate the time required for drainage then determine the drainage rate of the soil in mL per second. Record you value.**
2. **Permeability of wet soil. Pull tube with wet soil out of cup. Pour water out of the cup. Repeat above set with wet soil sample. What is the difference of the permeability of wet soil versus the dry soil? What would determine the permeability of a soil?**

Part 4: Porosity, Obtain a tube with a closed end..Using a graduated cylinder measure 100 mL of dry soil and place it into the tube. Measure 100 mL of water into graduated cylinder. This will be the initial amount of water. Use a stop watch and slowly pour the water from the graduated cylinder into the tube until the soil is saturated. Record the amount of time it takes for the water to reach the bottom of the tube. Write this on your worksheet. Empty the graduated cylinder. Pinch the tube and pour the water retained in the soil into the graduated cylinder. Be sure not to pour any of the soil into the graduated cylinder. Record this amount on your worksheet. Repeat the above steps using sand instead of dry soil. What is the benefit of having a moisture content in soils? What about possible drawbacks? What factors may affect the drainage rate of soils? What is the relationship between permeability and particle size? What is the relationship between particle size and porosity? Compare and contrast permeability and porosity.

Lab Report: Each student will write a lab report following the prescribed format. Each student will describe the purpose of the lab, the experimentation process, and his/hers results and analysis.

Lab: Ground Water—Can Water Get Through This & Arsenic Groundwater Pollution

Purpose: To identify pollution sources within the groundwater system

Materials: Groundwater Models, Can Water Get Through It lab hand-out, colored pencils

Procedure: Use groundwater models to observe permeability and porosity of sediments in the model, find the groundwater zones and water table. What is the zone of saturation? Explain in detail what happens to precipitation when it hits the Earth's surface? Explain where the pollutants are coming from and where the best place would be for a freshwater well. Students create a cross-section for their well log data, put it together for a class cross-section. Use well data on a given map to determine where the arsenic is coming from in.

Lab Report: **Each student will write a lab report describing the lab process and his/hers results and analysis.**

Lab: Glacial valley reconstruction

Purpose: To identify the different type of features formed from glacial erosion

Materials: Unassembled block models, scissors, glue, colored pencils.

Procedure: Cut out and assemble block models. Color. Identify glacial features and draw illustrations of features seen on model.

Lab Report: Each student will write a lab report describing the lab process and his/hers results and analysis.

Lab: Identify glacial features on a topographic map

Purpose: To understand the processes of mountain and continental glacial and the land forms and water bodies that produced glacial action.

Materials: ruler, calculator, stereoscope (optional), lab hand out with review questions and topographic maps.

Procedure: Answer the following questions regarding the Siffleur River, Alberta, quadrangle. Name the glaciation features that formed Marmot Mountain and Conical Peak? How do these feature form? The boundary between Improvement District 9 and 10 follows a ridge from the Siffleur River Valley to Mount Kentigern. What type of ridge (glacial Feature) is this and how did it form? Near the northern edge of the map, what type of valley is located above the falls west of the Siffleur River and how did it form? What type of lake is at the headwaters of the stream that forms these falls? What other features produced by mountain glaciations can you see on the map. Explain and give locations of these features. Refer to the part of the Peterborough, Ontario, quadrangle to answer the following questions. Study the shape and size of the oblong hills. What type of feature are they and how did they form? In what direction did the ice move over this area? Explain how you determined the direction. What type of sediment would you find in a drumlin? Would it be stratified (layered) and well sorted? How could you tell? Explain your answer. Find the red highway

route 7, that crosses the upper part of the map. About 1¼ inches below the number 7, what is the long, narrow feature that runs northeast-southwest? How did it form? Explain the formation of this feature.

Lab Report: For this lab activity students will write reflection or opinion paper concerning the importance of recognizing geologic features on a topographic map.

Lab: Compare and Contrast plunging, spilling, surging, breaking and ocean waves using block models

Purpose: To identify the different type of waves

Materials: Unassembled block models, scissors, glue, colored pencils.

Procedure: Cut out and assemble block models. Color each model according to color key. Describe each block. Identify what types of waves they are and how the break. What type of beach shore causes which types of wave to break/form? How does sea-floor topography play a role in how a wave breaks/forms? Compare and contrast the different types of waves.

Lab Report: Each student will write a lab report describing the lab process and his/hers results and analysis.

Lab: Topographic map interpretations of desert features

Purpose: To identify desert associate with an arid landscape.

Materials: Part of the Furnace Creek California, quadrangle, colored pencils, ruler, calculator, lab hand out with questions

Procedure: Complete the following tasks using the Furnace Creek, California, quadrangle. Color the alluvial fans yellow. What feature formed from the joining of alluvial fans? Color the inselbergs red. Color the arroyos brown. Color the zero-level contour line. This is sea level. Mark a green line to indicate the edge of the mountain front. Find the playa and place a capital P on it. Color the playa light blue. How would the grain size of the sediment along the streams on the map change as you walk down slope from the high arroyos? Draw dark dashed lines to indicate where you think there might be faults. Notice that people built a ranch on one of the alluvial fans, even though this region arid. Why do you think they chose this alluvial fan and not one of the other ones?

Lab Report: For this lab activity students will write reflection or opinion paper concerning the importance of recognizing geologic features on a topographic map.

Lab: Relative dating vs Absolute dating

Purpose: To learn and be able to apply techniques for relative and absolute age dating of Earth's materials and events. To apply stratigraphic principles regarding sequencing geologic events.

Materials: Hand-outs, colored pencils, West of the West DVD, Radioactive Wolves DVD, case studies—radiation poisoning

Procedure: Number each event, using the stratigraphic principles you learned and outlined in the hand out. Each of the following cross sections show geologic development of a sequence of rocks. The rock patterns are the same as given in the hand out. Review the sample sections shown in the hand out to see how the stratigraphic principles are applied. Number the formations of rock units and geologic events in each cross section, in the order in which they occurred. Write each number in the appropriate circle. If two or more circles are found within the same formation give them the same number. A few fossils and isotopic dates occur in these sections, so there are some time constraints in the possible ages for many of the rock units given. Write in the appropriate space on the hand out the possible age ranges for each unit.

Lab Report: Each student will write a lab report describing the lab process and his/hers results and analysis.
