Cougar Mountain Middle School (Issaquah School District)

Grades 6 and 8

Introduction and Overview

This report presents results from the 2025 Washington State Healthy Youth Survey (HYS). The HYS was sponsored by the Health Care Authority (HCA), the Department of Health (DOH), the Office of Superintendent of Public Instruction (OSPI), and the Liquor and Cannabis Board (LCB) in partnership with schools throughout the state of Washington.

This Multiple Grade Report does not provide comparisons to the state. To compare local results to the state sample, see the Multiple Grade State Sample Report for grades 6, 8, 10 and 12. This report is available at: https://www.askhys.net/SurveyResults/FrequencyReports

Survey questions are grouped by topic, when possible. Some questions are related to multiple topics, but all questions are only included once in this report. Use the **Questions by Topic** index to identify all questions related to a specific topic. The numbering in this report is not the same as the question order on the survey itself.

The dot points and graphs included at the beginning of this report highlight selected findings. Additional information may be found in the *HYS Interpretive Guide* posted to the Healthy Youth Survey site under Data Resources: **https://www.askhys.net/Resources/Data** .

Survey Participation in this Report

	Grade 6	*Grade 8*
Number of students surveyed:	*133*	*183*
Number of valid responses:	*132*	*181*
Number of enrolled students:*	*159*	*213*
*Local survey participation rate**:*	*83%*	*85%*

* The estimate of enrolled students is based on figures from the 2025-26 school year, provided on the OSPI data portal: **https://www.askhys.net/Resources/Data**.

** The survey participation rate is the number of valid responses divided by the number of enrolled students.

Note: Results not available for non-surveyed grades or grades suppressed for under-participation. See Past Participation for details: http://www.askhys.net/Past

Caution about Participation Rates and Bias

Please use the following guidance when reviewing results:

- **70% or greater participation** - Results are *likely representative* of students in this grade.
- **40–69% participation** - Results *may be representative* of students in this grade.
- **Less than 40% participation** - Results are *likely not representative* of students in this grade but do reflect students who completed the survey.

There may be limitations to the results, even with a high participation rate. For instance, a particular group of students (e.g., the school orchestra) may have been away from school the day of the survey, and that could bias the results. It is important to acknowledge the potential limitations when using the results in this report. For reports summarizing results at the county or school district level, you should also consider whether the schools that participated represent all students in that area.

Small Numbers: Caution about Number of Students Participating

Results based on small numbers of students answering a question should be interpreted with caution. A small sample size does NOT mean that the results are "wrong." However, estimates based on small numbers tend to be unreliable. This means they could easily change with the absence from school of only a couple of students. This is especially the case when only a few students choose a particular answer option. Use caution if fewer than 30 students answered a question and/or fewer than 5 students selected a given response option.

For example, if 20 students answered a question and of those 20 only 3 students answered "Yes", the estimate may be unstable and should be interpreted with caution.

The number of students answering a question influences the range of the confidence interval (CI) associated with the estimate. Generally, estimates based on smaller numbers of students have a wider CI. You can learn more about CIs and how they can guide your interpretation of your results in the **Understanding Your Results** section of this report.

Survey Administration Overview

The 2025 HYS was administered in-person, during school, in-person, through an e-survey platform. Alternative Learning Environments (ALEs) or virtual schools unable to administer the survey in-person, during school could request a remote administration of the HYS, provided they could ensure all of the following:

- A synchronous environment where students log in during a live class period with an instructor to take the survey
- "Test-like" conditions to ensure data quality and student privacy
- The survey is taken during normal school hours during a 45-minute period
- Students are not permitted to complete the survey as homework
- The survey is not emailed out to students ahead of time, posted online, or shared on social media

The elementary survey was given to students in grade 6 (and grade 7 in small school districts). At registration, elementary school administrators could opt-in to include a gender question in addition to the established question asking sex assigned at birth.

Students in grades 8, 10, and 12 (and 9th grade in small school districts) received the secondary survey. The "Core" questions were asked of all students and "Bank" questions were randomized to about 50% of students. The secondary survey included seven questions on sexual behavior and sexual violence. Schools could apply to opt-out of sexual behavior and/or sexual violence questions. This required that schools submit a letter to the HYS Planning Committee, signed by the superintendent, explaining why asking these questions would create an undue hardship. Information about the exemption process is available here: **https://www.askhys.net/Hys/Exemptions**

A list of the topics asked and their location in the report are provided in the **Questions by Topic** section at the end of this report.

Notation Used in this Report

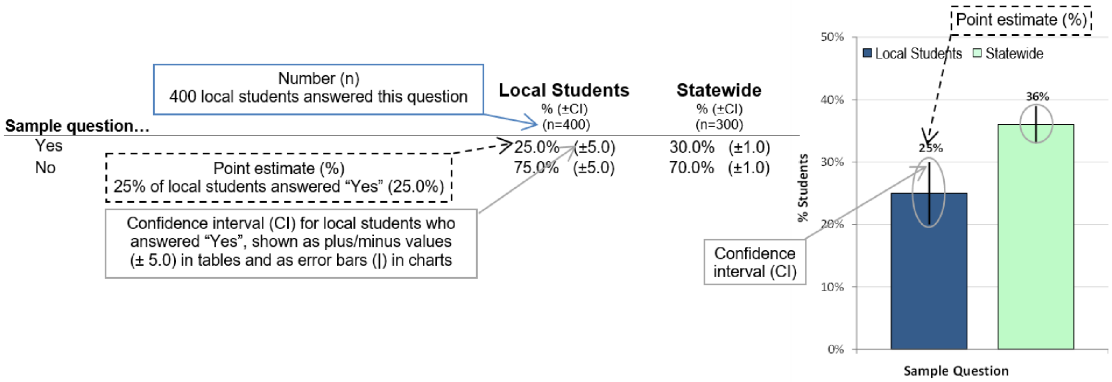
† = Question eligible for exemption or optional question

* = 95% confidence intervals (CI) for local and statewide estimates do not overlap. Read more about CIs in the "Understanding Results" section below or in the Interpretive Guide.

Legal requirements: Federal and Washington State regulations prohibit discrimination against Limited English Proficiency individuals and/or individuals who are Deaf, Hard of Hearing, or visually impaired. ReadHCA Policy 01-27 Language Access Services and Policy 01-30 Equal Access to Services for Individuals with Disabilitiesfor more information. If you have a question about an accommodation, please contact the Healthy Youth Survey study Principal Investigator, at Healthy.Youth@doh.wa.gov or call toll free (877-HYS-7111).

Understanding Your Results

Here is an example of how results are displayed in the report tables and charts.



Ns

In this report "n" is shorthand for "number". It tells you the number of students who took this survey or who answered a survey question. N's are important!

How many students took this survey?

Look on page 2, under Survey Participation. The "number of students surveyed" is the number of surveys that we received. We have careful procedures for "cleaning" to remove surveys with many inconsistent or false answers – the "clean" surveys are the "number of valid surveys". Only valid surveys are presented in this report.

How many students answered each survey question?

The n's are different for each question. Why? There are a few reasons:

- For students in grades 8, 10, and 12, the survey has core and bank questions. The n's for core questions are about the same as the number of valid surveys. The n's for non-core questions will be about half, or less.
- Some schools chose to administer questions about sexual behavior and sexual violence. Schools that chose to not ask those additional questions will have no responses for those questions. District and county reports may include some schools that DID ask those questions and some that DID NOT.
- Students may decide to skip questions.
- Remember that some questions are only asked on the elementary survey and some are only asked on the secondary survey. This means that in multiple grade reports, responses for a particular grade may be blank.

Here are examples from a district with 400 valid surveys --- notice how the n's change with each question type.

Have you ever, even once in your life used marijuana?	(n=398)	(n=6,000)
No	80.0% (±5.0)	87.0% (±2.0)
Yes	20.0% (±5.0)	13.0% (±2.0)

N for a core question (almost all students)

Have you ever had a bump, hit, or jolt to the head that made it difficult to study or complete school work?	(n=200)	(n=3,000)
Yes	30.0% (±6.0)	22.0% (±2.0)
No	70.0% (±6.0)	78.0% (±2.0)

N for a non-core question (about half the students)

Have you ever been in a situation where someone made you engage in, kissing, sexual touch or having sex when you did not want to? †	(n=100)	(n=2,000)
Yes	10.0% (±8.0)	12.0% (±4.0)
No	90.0% (±8.0)	88.0% (±4.0)

N for a sexual behavior or sexual violence question (about half, or less if some schools received an exemption for those questions)

Confidence Intervals

What are confidence intervals?

We report a point estimate (%) and 95% confidence interval (CI) for each question response option. A point estimate is our "best guess" of the true value based on the information collected in the survey. A CI gives the estimated range of values that is likely to include the true population value based on survey results. A CI has an upper and a lower limit. In this report, the presented CIs are symmetrical; you can calculate the upper and lower values of the 95% CI by adding or subtracting the value to the right of the point estimate. Using the sample data below, the point estimate for local students reporting they have never used marijuana is 80%. The lower range of the 95% CI is 77% (calculated as 80-3) and the upper range of the 95% CI is 83% (calculated as 80+3). Therefore, we can say that and estimated 80% of local students reported never using marijuana and the "true" value likely falls between 77% and 83%.

How are confidence intervals calculated?

Confidence intervals are affected by the number of students who responded and how much variability in the data (how much students' responses varied overall). In general, if fewer students respond to a question (a small n), there will be more uncertainty around a point estimate and a wider confidence interval. The CI does not account for bias in the estimate. Bias refers to systematic errors that result in estimates that deviate from the "truth." For example, a low participation rate in a given school, district, or county can create bias which will not be reflected in the CI, since those who participate may answer differently than those who did not participate.

The 95% CIs presented in this report are calculated using SAS (SAS Institute Inc.) and the default options for the SURVEYFREQ procedure. This relies on Taylor Series linearization to generate a symmetrical CI that accounts for the survey sampling design and clustering. Note that in this report, CIs are not bounded by zero and lower limits might be negative. Please use caution when interpreting lower confidence limits that cross zero. SAS Institute Inc. provides more information on the calculations used in this repo

How can confidence intervals be used to help guide the interpretation of your results?

A single asterisk (*) between two columns of results in this report indicates that the 95% CI for the local and statewide estimates DO NOT overlap. If CIs do not overlap, there is a statistically significant difference in the estimate between the local and statewide results. If CIs DO overlap, it suggests there is no difference between the groups, however, there could still be a statistically significant difference between the **true values** of the groups that CIs may not be able to detect, especially when estimates are based on a small number of responses. If CIs overlap so much that the point estimate of at least one group falls within the CI of the other group, then it is unlikely there is a significant difference in the true values of these groups.

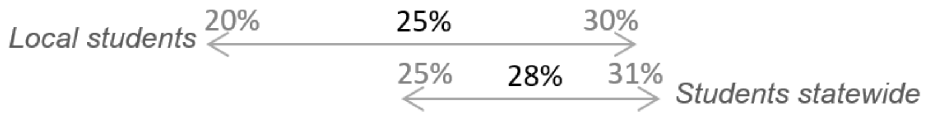
Here are 3 examples of how you can assess the overlap of confidence intervals:

Example 1

- Local students report 25% ±5%. The point estimate is 25% and the CI is 20% to 30%
- Statewide, students report 36% ±3%. The point estimate is 36% and the CI is 33% to 39%
- The CIs don't overlap. There is a statistically significant difference in the values between local and statewide students. In the report, there would be an asterisk between the local and statewide columns

Example 2

- Local students report 25% ±5%. The point estimate is 25% and the CI is 20% to 30%
- Statewide, students report 28% ±3%. The point estimate is 28% and the CI is 25% to 31%
- The CI for local and state estimates overlap.
- At least one group's point estimate (in this case both) overlaps with the confidence interval of the other group.
- There is likely no statistically significant difference between the local and statewide values. It is unlikely further testing will reveal a difference that the overlapping CIs cannot detect.



Example 3

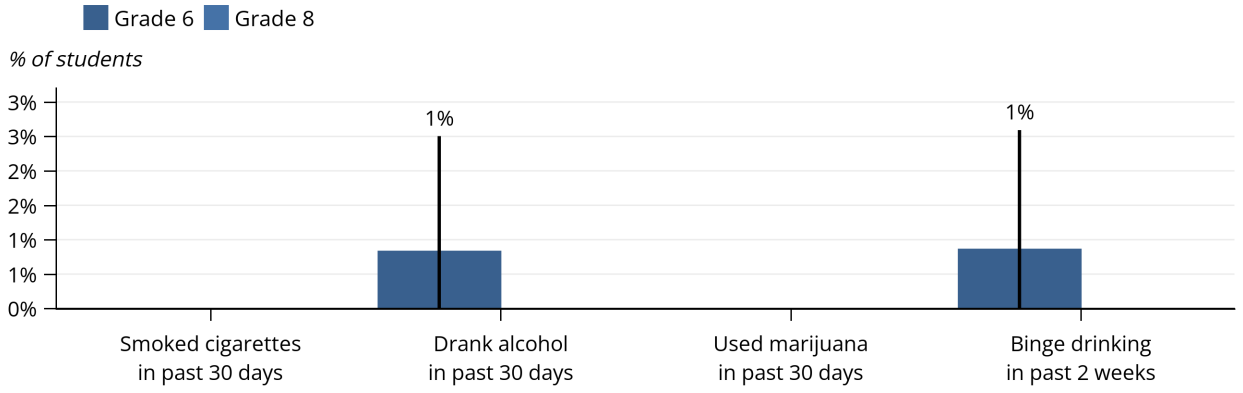
- Local students report 25% ±5%. The point estimate is 25% and the CI is 20% to 30%
- Statewide, students report 32% ±3%. The point estimate is 32% and the CI is 29% to 35%
- The CIs overlap, but neither CI includes the point estimate from the other group.
- There is a possibility that there is still a true difference between local and state students in this scenario. Further significance testing could provide additional information and is worth doing when possible.
- A significance testing tool is available on the Healthy Youth Survey web site under Data Resources: https://www.askhys.net/Resources/Data

More information about interpreting CIs is available on the Healthy Youth Survey web site under Data Resources: https://www.askhys.net/Resources/Data, including past HYS training materials and a "Tool for Determining HYS Statistical Significance".

Highlights of the Local Results

Local students reported the following behaviors and attitudes:

Substance Use	Grade 6 % (± CI)	Grade 8 % (± CI)
Smoked cigarettes in past 30 days	0.0% (±0.0)	0.0% (±0.0)
Drank alcohol in past 30 days	0.8% (±1.7)	0.0% (±0.0)
Used marijuana in past 30 days	0.0% (±0.0)	0.0% (±0.0)
Binge drinking in past 2 weeks	0.9% (±1.7)	0.0% (±0.0)



Bullying and School Climate	Grade 6 % (± CI)	Grade 8 % (± CI)
Carried a weapon at school in the past 30 days	0.0% (±0.0)	0.7% (±1.3)
Bullied in the past 30 days	21.0% (±7.4)	15.2% (±5.8)
Enjoyed school over the past year	59.8% (±9.0)	33.8% (±7.6)
Felt safe during school	93.8% (±4.5)	93.5% (±3.9)

Gender Identity and Sexual Orientation

The next four items display data on gender identity and sexual orientation of participating students. There are different ways to look at these data. Items 6 and 8 show mutually exclusive categories. This means that every student is counted only one time. If a student indicated more than one identity, they are included in the bottom row (more than one identity marked). These items have been reported in prior HYS reports. Items 7 and 9 show the data in non-mutually exclusive categories. This means that each student is counted for every identity they indicated. Each category displays the number of students who indicated they are of that particular sexual orientation or gender identity, either alone or in combination with another. Because these are not mutually exclusive categories the total will be more than 100%. The HYS continues to evolve, as do our reporting practices, to focus more on highlighting student identity and limiting erasure of students with multiple identities.

Race and Ethnicity

The next two tables display data on race and ethnicity of participating students. There are different ways to look at these data. Table 10 shows mutually exclusive categories. This means that every student is counted only one time. If a student indicated more than one race or ethnicity, they are included in the bottom row (more than one race/ethnicity marked). Table 11 shows the data in non-mutually exclusive categories. This means that each student is counted for every race or ethnicity they indicated. Each category displays the number of youth who indicated they are of that particular race or ethnicity, either alone or in combination with another. Because these are not mutually exclusive categories the total will be more than 100%. The HYS continues to evolve, as do our reporting practices, to focus more on highlighting student identity and limiting erasure of students with multiple identities.

10. How do you describe yourself? ***These are mutually exclusive categories. Those who selected more than one are captured in the bottom row of the table.***	**Grade 6** **% (± CI)** (n=128)	**Grade 8** **% (± CI)** (n=180)

Alcohol, Tobacco and Other Drug Use

Alcohol, tobacco, and other drug (ATOD) use has been a major concern in this country for many years. The consequences of ATOD use are well known. In the short term, ATOD use interferes with positive physical, emotional, and social development. In the long term, ATOD use is associated with delinquency and criminal activity, unintended injuries, and a variety of health complications including shorter life expectancy. Tobacco use is the world's leading cause of preventable death, disease, and disability. This section provides information about lifetime ATOD use (which in part reflects experimental use), use in the past 30 days (i.e., current use), and other tobacco-, alcohol-, and drug-related issues.

Other Health Concerns

Nutrition and Fitness

This section provides results regarding other health concerns including nutrition and fitness, health conditions and health care, safety, behaviors related to intentional injury, and depression. Exercise, nutrition, and access to preventative health care are important components of a healthy life. Safety-related behaviors can profoundly influence the outcome of an accident. Injury is the leading cause of death for adolescents aged 10 to 19, and violence contributes to injury-related deaths. People who are depressed experience a range of symptoms, and depression is associated with suicidal behavior.

The Body Mass Index (BMI) compares a person's height and weight. Lower BMI scores do not necessarily mean better health and higher scores do not necessarily mean worse health. The BMI was designed to look at trends in the population. It is not a great measure of health in adults or children. It is still used in some clinical settings to look at how children develop over time.

Disordered Eating and Weight Stigma

Adolescents are exposed to a variety of messaging about body, weight, fitness, and health. This messaging combined with the experiences of each youth can lead to dangerous disordered behaviors with regard to food and body. Sometimes this can result in diagnosed eating disorders and other times these behaviors go undiagnosed and untreated. The following questions assess disordered behaviors and exposure to harmful interactions with others that can affect body acceptance among youth.

99. During the past year, did you: (Choose all that apply)	(n=0)	(n=70)
Exercise to lose weight or to keep from gaining weight?	**	50.0% (±12.0)
Eat less food, fewer calories or foods low in fat or carbohydrates to lose weight or to keep from gaining weight?	**	37.1% (±11.6)

Washington Healthy Youth Survey – Adverse Childhood Experiences Scale (WAH-ACEs)

Eleven questions from the HYS were selected to be included in the WAH-ACEs score based on review of public health, social work, and psychology literature on adverse experiences among children, youth and young adults and the association with short and long-term effects on their health and wellbeing. These questions addressed the topics identified in the literature review, including intimate partner violence, physical or sexual abuse by an adult, safety in school, bullying, and financial hardship, among other topics. Some adverse experiences identified in the literature were not captured in HYS questions and could therefore not be included in WAH-ACEs (e.g., neglect).

For each question, a student could get a value of 0 or 1 and these were added up to create their final score. Sometimes students did not answer all questions on the survey; the WAH-ACEs score accounts for any missing answers to give schools and districts a more precise picture of what their students are experiencing. For more information about the WAH-ACEs, please see WAH-ACEs Interpretive Guide.

170. Adverse Childhood Experiences Scale (WAH-ACEs)	Grade 6 % (± CI) (n=0)	Grade 8 % (± CI) (n=181)

Social & Emotional Learning

Social Emotional Learning (SEL) is broadly understood as a process through which individuals build awareness and skills in managing emotions, setting goals, establishing relationships, and making responsible decisions that support success in school and in life.

171. I know how to disagree without starting a fight or argument.	(n=0)	(n=90)

Risk and Protective Factors

Decades of research have shown that certain risk factors are associated with increased likelihood of health risk behaviors including alcohol, tobacco, and other drug (ATOD) use, violence, and delinquent behaviors. Similarly, research from the University of Washington Social Development Research Group has shown that protective factors exert a positive influence against the negative influence of risk factors. The premise of the risk reduction and protective factor enhancement approach to prevention is that preventing a problem before it occurs requires addressing the factors that predict the problem. Ideally, this strategy entails discovering the causes of the problem behavior and influencing those causes. Many of the survey questions were used to assess students' status on risk and protective factors in the community, school, family, and peer-individual domains. Composite scales were computed for each of these domains for program planning. For more information on risk and protective factors, please see the HYS fact sheet "What Are Risk and Protective Factors?" at: https://www.askhys.net/SurveyResults/FactSheets.
