

44<sup>th</sup> United States of America Mathematical Olympiad

Day II      12:30 PM – 5 PM EDT

April 29, 2015

**Note:** For any geometry problem, the first page of the solution must be a large, in-scale, clearly labeled diagram made with drawing instruments (ruler, compass, protractor, graph paper). Failure to meet this requirement will result in a 1-point automatic deduction.

USAMO 4. Steve is piling  $m \geq 1$  indistinguishable stones on the squares of an  $n \times n$  grid. Each square can have an arbitrarily high pile of stones. After he is finished piling his stones in some manner, he can then perform *stone moves*, defined as follows. Consider any four grid squares, which are corners of a rectangle, i.e. in positions  $(i, k)$ ,  $(i, l)$ ,  $(j, k)$ ,  $(j, l)$  for some  $1 \leq i, j, k, l \leq n$ , such that  $i < j$  and  $k < l$ . A stone move consists of either removing one stone from each of  $(i, k)$  and  $(j, l)$  and moving them to  $(i, l)$  and  $(j, k)$  respectively, or removing one stone from each of  $(i, l)$  and  $(j, k)$  and moving them to  $(i, k)$  and  $(j, l)$  respectively.

Two ways of piling the stones are equivalent if they can be obtained from one another by a sequence of stone moves.

How many different non-equivalent ways can Steve pile the stones on the grid?

USAMO 5. Let  $a, b, c, d, e$  be distinct positive integers such that  $a^4 + b^4 = c^4 + d^4 = e^5$ . Show that  $ac + bd$  is a composite number.

USAMO 6. Consider  $0 < \lambda < 1$ , and let  $A$  be a multiset of positive integers. Let  $A_n = \{a \in A : a \leq n\}$ . Assume that for every  $n \in \mathbb{N}$ , the set  $A_n$  contains at most  $n\lambda$  numbers. Show that there are infinitely many  $n \in \mathbb{N}$  for which the sum of the elements in  $A_n$  is at most  $\frac{n(n+1)}{2}\lambda$ . (A multiset is a set-like collection of elements in which order is ignored, but repetition of elements is allowed and multiplicity of elements is significant. For example, multisets  $\{1, 2, 3\}$  and  $\{2, 1, 3\}$  are equivalent, but  $\{1, 1, 2, 3\}$  and  $\{1, 2, 3\}$  differ.)
