

Computer Integrated Manufacturing Unit 1: 3D Scanning & Rapid Prototyping

Unit Focus

Computer-integrated manufacturing (CIM) is an introduction to the use of computer techniques to integrate manufacturing activities. These activities encompass all functions necessary to translate customer needs into a final product. CIM usually starts with the development of a product concept then product design and specification with the final step revolving around automating the manufacturing process.

The content and skills learned throughout the course will be taught in 3 separate modules (units) followed by an all encompassing PBA. For each module, students will work collaboratively, at their own pace, following a guided instructional tutorial. The first three days of the trimester will be used for review of computer aided mechanical drawing and 3D printing skills.

In this module, students will learn about the rapid prototype processes used in Manufacturing. This will revolve around the concepts of additive prototyping, 3d scanning and computer Aided Drafting. Prototyping is part of the design process in which a functional solution is created and able to be tested. 3D scanning enhances this prototyping process by improving accuracy and complexity while reducing time. A PBA will have students conceptualize and create a theme based Chess game piece prototype.

Stage 1: Desired Results - Key Understandings

 Develop, revise, and/or use a model based on evidence to illustrate and/or predict the relationships between systems or between components of a system. <i>SE.9-12.2.3</i> Develop a complex model that allows for manipulation and 	Acquisition of Knowledge and Skill	
	Knowledge	Skill(s)
 Develop a complex model that allows for manipulation and testing of a proposed process or system. <i>SE.9-12.2.5</i> Design, evaluate, and/or refine a solution to a complex real-world problem, based on scientific knowledge, student-generated sources of evidence, prioritized criteria, and tradeoff considerations. <i>SE.9-12.6.5</i> Madison Public Schools Profile of a Graduate Analyzing: Examining information/data/evidence from multiple sources to identify possible underlying assumptions, patterns, and relationships in order to make inferences. (POG.1.2) Idea Generation: Studying a problem, need or model (mentor text, political piece, documents, art work, etc.) to consider limitations and imagine new solutions/transformations. (POG.2.1) Product Creation: Effectively use a medium to communicate important information. (POG.3.2) 	 Students will know K1 Reverse Modeling allows CAD programs to create a three-dimensional virtual model of an existing physical part. K2 Meshes are the main output of all 3D scanners, and the format commonly understood by 3D printers (STLs). A mesh represents the surface of a shape with a large number of triangles, connected edge to edge. Mesh models don't contain any information about the object, besides the position of the triangles that define the shape. K3 Solid models hold information about how an object is designed, and this information is explicitly encoded into the model as features in a 'stack' of logical steps. In solid CAD, it's possible to change the dimensions for a single feature, and the rest of the model will update to accommodate the change. 	 Students will be skilled at S1 Digitize a 3-dimensional object using a 3D Scanner. S2 Convert an STL file into a workable file that will be manipulated in SolidWorks. S3 Conceptualize and create a functional prototype intended to solve a problem.
