

coronavirus detector

Charlotte

My name is Charlotte and today my invention is the coronavirus detector. This invention helps you know if an object has coronavirus germs. Do you have a hard time telling what important objects have germs from the coronavirus? Well most of us in this world have this problem every now and then. I decided to make my invention because people mostly get the coronavirus by touching or holding infected objects.

My Idea

Benefits of my invention:

- Helps you know if an object, like an iphone has germs or the coronavirus on it
- Keep us and our friends or families more healthy and safe
- Also keeps delivery people more sanitary when people get their packages.

Problem Solving

The problem that my invention solves is to keep the coronavirus from spreading to other people everyday. The deaths of people would go down and recoveries would go up.

Helping out:

The people who would usually use my invention are either going out of their house to get groceries, or going to help a friend or family member with something important they need. This will help them by not spreading the germs to a friend or family member, if they are not near them.

Helping all around the world

I believe my invention is a good idea that people should have all over the world, so people are less likely to get the coronavirus when they do their everyday routines.

Conclusion

Also, scientist can find a vaccine for the coronavirus way faster without being infected by the coronavirus. So they can figure out a cure together, instead of being on a video chat. As you can see, that is why people all over the world need my invention to stay healthy.
