OFFICE OF CURRICULUM AND INSTRUCTION

AP Biology

Length of Course:	Term
Longin of Course.	

Elective/Required: Elective

Schools:

Eligibility:

Credit Value:

7 Credits

High Schools

Grade 11-12

Date Approved: August 17, 2021

TABLE OF CONTENTS

STATEME	ENT OF PUR	POSE	3
COURSE	UNITS:		
	UNIT 1	CHEMISTRY OF LIFE	4
	UNIT 2	CELL STRUCTURE AND FUNCTION	7
	UNIT 3	CELLULAR ENERGETICS	11
	UNIT 4	CELL COMMUNICATION AND CELL CYCLE	16
	UNIT 5	HEREDITY	20
	UNIT 6	GENE EXPRESSION AND REGULATION	24
	UNIT 7	NATURAL SELECTION	28
	UNIT 8	ECOLOGY	35

Modifications will be made to accommodate IEP mandates for classified students.

STATEMENT OF PURPOSE

Advanced Placement courses are designed to allow qualified students to experience college level studies while still in high school, and in many instances, to obtain college credit via successful performance on an AP Exam. For years Advanced Placement Biology has successfully prepared students for this exam and for careers in the life sciences.

Understandably, the course is designed for our finest science students and therefore, admission requires departmental approval. Since the subject is presented as a first year course in biology at the collegiate level, qualified students must have completed, or be simultaneously enrolled in the completion of the traditional three years of college prep biology, chemistry and physics.

While those enrolled in the course should be encouraged to prepare for the AP exam, they are not required to take it, and the primary purpose of the offering is to provide our most advanced science students with a challenging course of study in the life sciences that is an extension of their previous experiences with biology and commensurate with their abilities.

This curriculum guide was written in the Spring of 2012 following the adaptation of the new state standards in science. As always with an Advanced Placement course, every attempt has been made to follow the recommendations of the College Entrance Examination Board, who prescribes much of the curriculum for courses of this nature, but at the same time our own experienced instructors have contributed many of the ideas and activities herein.

This guide was again revised in Fall of 2020 and in August 2021 to reflect changes to both the updated AP Course and Exam Description (CED) and the current NJSLS-S/NGSS standards.

The committee members responsible for this revision are: Jennifer Przygoda (EHS)

Coordinated by:

Laurie Maier - Supervisor, John P. Stevens High School/Edison High School

Unit of Study: Unit 1: Chemistry of Life (allow approximately 3 Weeks)

Targeted State Standards ((NJSLS-S/NGSS): LS1.A, LS1.C, ESS2.C

Unit Objectives/Enduring Understandings: Living systems are organized in a hierarchy of structure. The highly complex organization of living systems requires constant input of energy and the exchange of macromolecules. Living systems are organized into a hierarchy of structural levels that interact. Heritable information provides for continuity of life.

Essential Questions: What is the role of energy in the making and breaking of polymers? How do living systems transmit information in order to ensure their survival? How would living systems function without the polarity of the water molecule?

	Core Content Objectives		Instructional Actions	
Disciplinary Core Ideas	Concepts What students will know.	Skills What students will be able to do.	Activities/Strategies Technology Implementation/ Interdisciplinary Connections	Assessment Check Points
All cells contain genetic information in the form of DNA molecules. Genes are regions in the DNA that contain the instructions that code for the formation of proteins, which carry out most of the work of cells. (HS-LS1- 1)	Chemical elements to support life Biological Polymers Macromolecules Molecules of life are exchanged between organisms and the environment	Justify the selection of data regarding the types of molecules that an animal, plant, or bacterium will take up as necessary building blocks and excrete as waste products. Explain the connection between the sequence and the subcomponents of a biological polymer and its properties.	Laboratory Investigations: (optional, but not limited to the following) Lab – Water Lab – Biomolecules Optional Gizmo Labs/Activities - Dehydration Synthesis - Identifying Nutrients	Formative Assessment Class Discussions Class Activities Informal Polling Summative
As matter and energy flow through different organizational levels of living systems, chemical elements	Polymer structure and properties Enzyme structure	Macromolecules Construct explanations based on evidence of how variation in	Optional Pivot Labs/Activities - Properties of Water - Organic Molecules	Assessments Quizzes

Instructional Adjustments: Modifications, student difficulties, possible misunderstandings

Unit of Study: Unit 2: Cell Structure and Function (Allow approximately 4 Weeks)

Targeted Standards (NJSLS-S/NGSS): LS1.A,

Unit Objectives/Enduring Understandings: Living systems are organized in a hierarchy of structural levels that interact. The highly complex organization of living systems requires constant input of energy and the exchange of macromolecules. Cells have membranes that allow them to establish and maintain internal environments that are different from their external environments. Evolution is characterized by a change in the genetic makeup of a population over time and is supported b multiple lines of evidence.

Essential Questions: How can you defend the origin of the eukaryotic cells? How do the mechanisms for transport across membranes support energy conservation? What are the advantages and disadvantages of cellular compartmentalization? How are living systems affected by the presence or absence of subcellular components?

	Core Content Objectives		Instructional Actions

Unit of Study: Unit 4: Cell Communication and Cell Cycle (Allowed approximately 3 Weeks)

Targeted State Standards (NJSLS-S/NGSS): LS1.A, LS1.B

Unit Objectives/Enduring Understandings: Cells communicate by generating, transmitting, receiving, and responding to chemical signals. Timing and coordination of biological mechanisms involved in growth, reproduction, and homeostasis depend on organisms responding to environmental cues. Heritable information provides for the continuity of life.

Essential Questions: In what ways do cells use energy to communicate with one another? How does the cell cycle aid in the conservation of genetic material? Why and in what ways do cells communicate with one another?

Unit Assessment: The student can use representations and models to communicate scientific phenomena and solve scientific problems. The student can use mathematics appropriately. The student can engage in scientific questioning to extend thinking or to guide investigations within the context of the AP course. The student can plan and implement data collection strategies appropriate to a particular scientific question. The student can perform data analysis

and evaluation of evidence. The student can work with scientific explanations and theories. The student is able to connect and relate knowledge across various

scales, concepts and representations in and across domains.

- Connections to Body Systems Muscular, Endocrine, Immune, Reproductive/Development

Unit of Study: Unit 5: Heredity (Allowed approximately 4 Weeks)

Targeted State Standards (NJSLS-S/NGSS): LS1.A, LS3.B,

Unit Objectives/Enduring Understandings: Heritable information provides for continuity of life. Organisms are linked by lines of descent from common ancestry. Naturally occurring diversity among and between components within biological systems affects interactions with the environment.

Essential Questions: How is our understanding of evolution influenced by our knowledge of genetics? Why is it important that not all inherited characteristics get expressed in the next generation? How would Mendel's laws have been affected if he had studied a different type of plant? How does the diversity of a species affect inheritance?

Unit Assessment: The student can use representations and models to communicate scientific phenomena and solve scientific problems. The student can use mathematics appropriately. The student can engage in scientific questioning to extend thinking or to guide investigations within the context of the AP course. The student can plan and implement data collection strategies appropriate to a particular scientific question. The student can perform data analysis

and evaluation of evidence. The student can work with scientific explanations and theories. The student is able to connect and relate knowledge across various

scales, concepts and representations in and across domains.

Unit of Study: Unit 7: Natural Selection (Allow approximately 4 Weeks)

Targeted Standards (NJSLS-S/NGSS): LS4.A, LS4.B, LS4.C

Unit Objectives/Enduring Understandings: Evolution is characterized by a change in the genetic makeup of a population over time and is supported by multiple lines of evidence. Organisms are linked by lines of descent from common ancestry. Life continues to evolve within a changing environment. Naturally occurring diversity among and between components within biological systems affects interactions with the environment.

Essential Questions: What conditions in a population make it more or less likely to evolve? How can you scientifically defend the theory of evolution? How does species interaction encourage or slow changes in species?

	Core Content Objectives		Instructional Actions

susceptible to a disease outbreak)	
 Evolutionary Trends in plant, animals, fungus, protists 	

Unit of Study: Unit 8: Ecology (Allow approximately 5 Weeks)

Targeted State Standards (NJSLS-S/NGSS): LS2.A, LS2.B, LS2.C, LS2.D, LS4.D, PS3.4

Unit Objectives/Enduring Understandings: Timing and coordination of biological mechanisms involved in growth, reproduction, and homeostasis depend on organisms responding to environmental cues. The highly complex organization of living systems requires constant input of energy and the exchange of macromolecules. Living systems are organized in a hierarchy of structural levels that interact. Communities and ecosystems change on the basis of interactions among populations and disruptions to the environment. Naturally occurring diversity among and between components within biological systems affects interactions with the environment. Evolution is characterized by change in the genetic make-up of a population over time and is supported by multiple lines of evidence. Competition and cooperation are important aspects of biological systems.

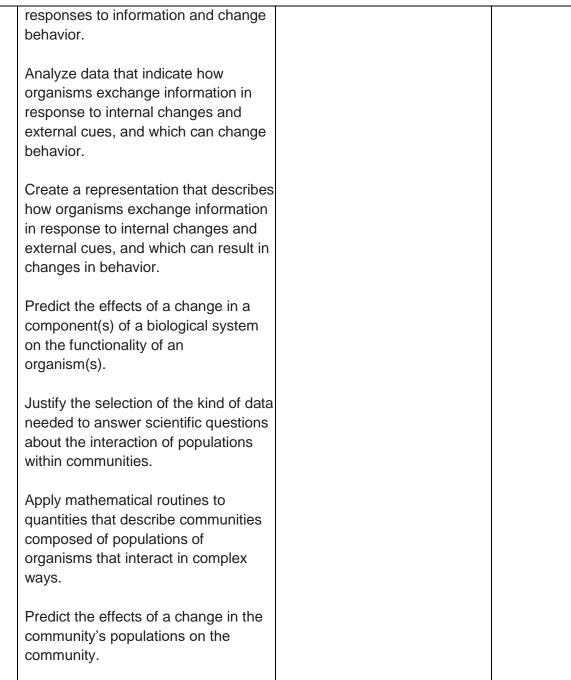

Essential Questions: How does diversity among and between species in a biological system affect the evolution of species within the system? How does the acquisition of energy relate to the health of a biological system? How do communities and ecosystems change, for better or worse, due to biological disruption? How does a disruption of a biological system affect genetic information storage and transmission? How do species interactions affect the survival of an ecosystem?

	Core Content Objectives		Instructional Actio	ons
Disciplinary Core Ideas	Concepts What students will know.	Skills What students will be able to do.	Activities/Strategies Technology Implementation/ Interdisciplinary Connections	Assessment Check Points
Ecosystems have carrying capacities, which are limits to the numbers of organisms and populations they can support. These limits	Ecological interactions- biotic vs. abiotic Behavioral ecology- natural selection involvement	Justify the selection of the kind of data needed to answer scientific questions about the relevant mechanism that organisms use to respond to changes in their external environment. result from such factors	Population dynamics-			Class Activities

and nonliving resources and from such challenges such as predation, competition, and disease. Organisms would have the capacity to produce populations of great size were it not for the fact that environments and resources are finite. This fundamental tension affects the abundance (number of individuals) of species in any given ecosystem. (HS- LS2-1),(HSLS2-2)Con Posi hum enviPhotosynthesis and cellular respiration (including anaerobic processes) provide most of the energy for life processes. (HS-LS2- 3)Con Eco level symePlants or algae form the lowest level of the food web. At each link upward in a food web, only a small fraction of the matter consumed at the lower level is transferred upward, to produce growth and release energy in cellularInter mole struct	opperative interactions hin organisms promote iciency in the	Use representations or models to analyze quantitatively and qualitatively the effects of disruptions to dynamic homeostasis in biological systems. Explain how the distribution of ecosystems changes over time by identifying large-scale events that have resulted in these changes in the past. Analyze data to identify phylogenetic patterns or relationships, showing that homeostatic mechanisms reflect both continuity due to common ancestry and change due to evolution in different environments. Connect differences in the environment with the evolution of homeostatic mechanisms. Refine scientific models and questions about the effect of complex biotic and abiotic interactions on all biological systems, from cells and organisms to populations, communities, and ecosystems. Analyze data to identify phylogenetic patterns or relationships, showing that homeostatic mechanisms reflect both continuity due to common ancestry and change due to evolution in different environments. ecosystem can keep its numbers and types of organisms relatively constant over long periods of time under stable conditions. If a modest biological or physical disturbance to an ecosystem occurs, it may return to its more or less original status (i.e., the ecosystem is resilient), as opposed to becoming a very different ecosystem. Extreme fluctuations in conditions or the size of any population, however, can challenge the functioning of ecosystems in terms of resources and habitat availability. (HS-LS2-2),(HS-LS2-6) Moreover, anthropogenic changes (induced by human activity) in the environment-including habitat destruction. pollution, introduction of invasive species, overexploitation, and climate change-can disrupt an ecosystem and threaten the survival of some species.
