BERKSHIRE ELEMENTARY BEARS

Learning and Leading... We're Better Together!

LIFE CYCLE OF A BEAR

are called cubs. When they are born, they are small, blind, and hairless. Cubs start
as soon as they are born. By the spring, they will weigh 10 to 20
live with their mothers until they are two to
food a day during the fall!

2

HABITATS

Different types of bears also live in different habitats.
Brown bears and American black bears live in mountain forests, meadows,
or near rivers. The giant panda lives in forests that are thick with bamboo.
The polar bear, though, lives in a place with very little plant life.
Polar bears spend their lives on large sheets of ice!

3

FOOD & DIET

Most bears are omnivores. They eat mostly plants, such as leaves,
roots, nuts, berries, fruit, and fungi. However, they also eat
insects, fish, and other small animals. Some bears have long tongues that
they use to get honey out of beehives. Polar bears are mostly carnivores.

4

TIME TO SLEEP

Bears that live in warmer places can stay active all year. However, most bears enter a hibernation state
during the cold winter months. This is called hibernation. When a bear is ready to hibernate, it will find
a cave or hollow log in which to lie down. During this time, a bear's heart beats slower to save energy.
In the fall, a bear eats extra food to build up its body. During its winter hibernation,
the bear must live off the fat in its body until it wakes up in the spring.

5

BIG AND BIGGER

Bears are very different sizes. The largest bear is the Kodiak bear. It can weigh over 1,500 pounds.
The smallest bear is the pygmy hog. It weighs only about 150 pounds. Bears of all sizes are very strong.
They can climb trees and swim. Some bears can run as fast as 35 miles per hour.
Bears have sharp claws that they use to dig for food and to climb trees.
