

# Fabrication and Wind Tunnel Tests of High Speed Swept-tip Tilt-rotor Blades

**Kali Mathura**

Holton Arms 2023 & UMD Intern  
[kali.mathura.2023@holton-arms.edu](mailto:kali.mathura.2023@holton-arms.edu)

**Xavier Delgado**  
Graduate Research Assistant

**Dr. Anubhav Datta**  
Associate Professor

# What is a tiltrotor?

- Unique aircraft
- Hovers like a helicopter
- Cruises like an airplane

# Why are tiltrotors important?

Goes where no other aircraft can

**Civil**

V-22  
Osprey

**Military**

# Vision for Future: Very High-speed

- Current speed 250 knots
- Future vision 500 knots
- DOD's vision for Future Vertical Lift

AW60

V-22

# Path to the Future

- 1. Advanced Blades**
- 2. Advanced Hub**
- 3. Advanced/Thinner Wings**

# Path to the Future

- 1. Advanced Blades**
- 2. Advanced Hub**
- 3. Advanced/Thinner Wings**

# **Technical Approach of My Internship**

- 1. Fabricate advanced swept-tip tilt rotor blade**
- 2. Integrate on the Maryland Tiltrotor Rig (MTR)**
- 3. Test at high speeds in Glenn L. Martin Tunnel**

# Why Swept Tip?

Reduces the speed at which air hits the tip, prevents approach to speed of sound.

Speed of sound leads to shocks, breaks blades, spikes drag, creates deafening noise.

# What is Aeroelastic Scaling?

Build blades to have same dynamics as real aircraft

XV-15/NASA precursor to V-22

**Scale-Factor**

**Real rotor  $R = 12.5$  ft**

**Model rotor  $R = 2.375$  ft**

**$12.5/2.375 = 5.26$**

# Major Equipment

**Curing Oven**

**4 axis CNC**

**Band Saw**

# Power Tools

**Eclectic Wrench**

**Dremel**

**Drill**

# Many Other Tools

**Filers**

**Allen  
Keys**

**Pliers**

**X-ACTo Knife**

**Hammer**

**Wrench**

# Step 1: Trace foam from template and trim

**Rohacell  
foam**

# Materials

<u>Material</u>	<u>Designation</u>	<u>Density</u>	<u>Modulus</u>	<u>Source</u>
Foam	IG-31	0.00116 lb/in <sup>3</sup>	0.0360 GPa	Rohacell
Adhesive	EA 7000 AERO Epoxy Film Adhesive			Loctite
Aluminium	Root insert 6061	0.0975 lb/in <sup>3</sup>	68.9 GPa	
	Blade Grip 7075	0.102 lb/in <sup>3</sup>	71.7 GPa	
Carbon Fiber	IM7/8552		10.3 GPa	Boeing

# Use Aluminium Mold of Same Shape

**Top  
mold**

**Bottom  
mold**

## Step 2: Put foam in mold

Foam must be aligned so it covers the full area

# Step 3: Tighten screws in star pattern

2 washers

3 washers

# Step 4: Cure in oven for 90 minutes at 350°F

Curing Oven

After curing is over

# Step 5: Trim the foam and sand it down

Before sanding and trimming

# Strategy for Fabrication: Build in Two Parts

# Step 8: Cut out root insert space and spar

Must align foam so it is straight

# Step 6: Create divots in root insert using CNC

Root Insert  
made of  
Aluminium

# Step 7: Drill through using CNC

# 13. Wrap root insert in adhesive

## 9. Cut leading edge weight slots

7 slots, 50mm in length cut using g-code

# 10. Wrap leading edge weights in adhesive

# 11. Insert leading edge weights

## 12. Wrap Spar in adhesive

# 14. Wrap Trailing Edge in adhesive

# 15. Wrap spar in carbon fiber twice

IM7/8552  
Carbon  
Fiber from  
Boeing

# 16. Wrap everything in carbon fiber once

# 17. Put wrapped blade in mold Cure in over for 90 minutes at 350°F

Peel-ply wraps around blade before it is put in mold

# 18. Take blade out of mold

# Final Blade

**Finished blade without grip adapter: 174.19g**

# Intricate Integration of Blades on MTR

7.75 ft. High,  
11.04 ft. Wide

- Mechanical
- Electronic
- Computer System for data

# Wind Tunnel Testing

## 1 Week in UMD Wind tunnel

- 30 ft. High, 20 ft. Wide
- Settling Chamber

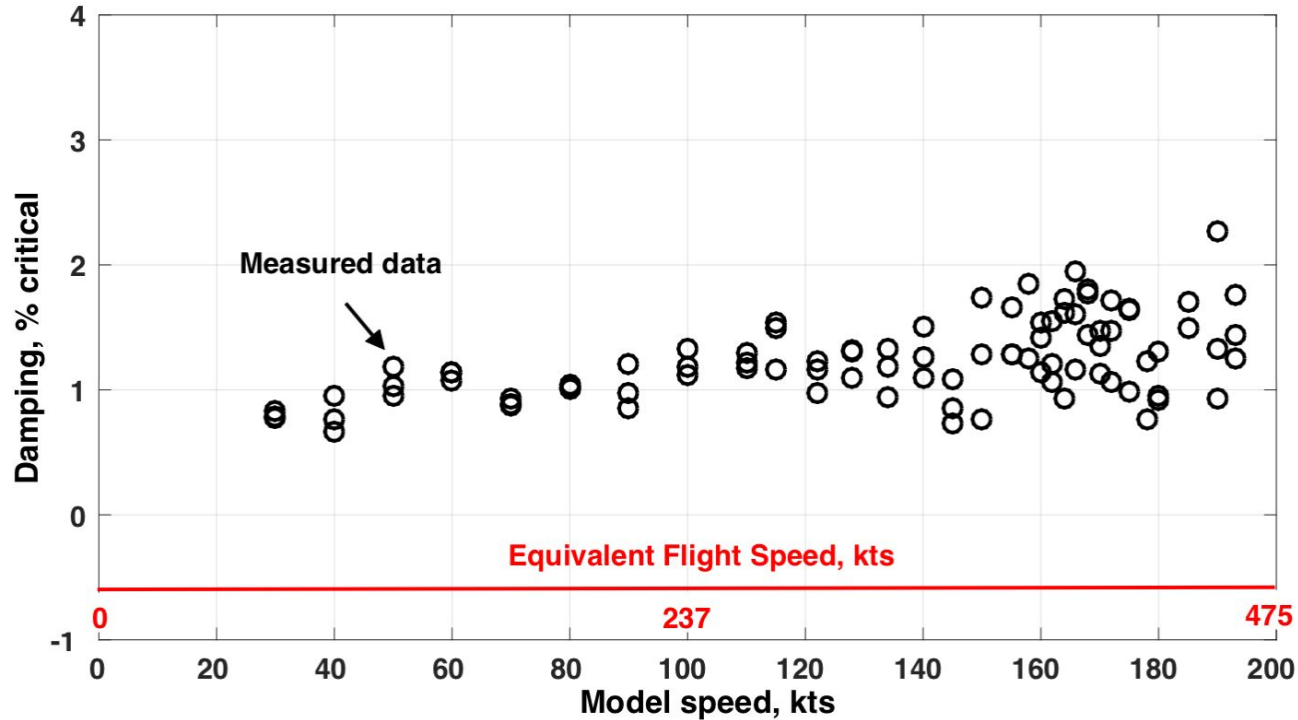

# 200 Knot Testing on August 5

# Data/Results

# Summary/Conclusions

- Swept-tip blades tested at historic speeds up to 200 knots equivalent to 475 knots full-scale
- Blades proven to be stable
- Rich data set acquired on stability & loads at more than 200 tests conditions to guide future engineers

# Conclusions

- Froude scale models can be used to predict a full scale aircraft
- Proper engineering equipment and exact aircraft materials are needed
- Must be precise with each step

# Lessons Learned

- **Engineering is teamwork**
- **Crucial to have a plan**
- **But do not expect to go 100% as planned**
- **Be prepared for contingency**
- **Perseverance is important in engineering**
- **If you do not fail, sometimes, you are not trying hard enough**

# Special thank you to:

**Dr. Krug and Holton-Arms**

**Dr. Datta, Xavier, Nathan, Ola, Mrinal, and everyone in the UMD Rotorcraft Center**
