# **ESM 6:**BUILDING WEATHERIZATION

# **ESM 6: Building Weatherization**

Benefits: This measure will reduce infiltration of unconditioned air, save energy, and improve occupant comfort. All buildings, regardless of type and age, experience infiltration losses through cracks in the building. In addition to providing energy and cost savings, the sealing of the buildings' envelopes will help preserve each building's construction over time.

Buildings: Barnard Adult Education Bucks Hill School

Chase Building Chase School

City Hall Crosby-Wallace Complex

Department of Public Health Driggs School

Duggan School Enlightenment School

Generali School Gilmartin School

Hopeville School Kennedy High School

Kingsbury School Maloney School

Police Headquarters Reed School

Regan School Rotella School

Silas Bronson Library Sprague School

Tinker School Walsh School

Washington School Waterbury Career Academy School

Wilby-North End Complex Wilson School

**Summary:** NORESCO will reduce infiltration by sealing cracks with foam or beads of caulk as needed, improving door seals, replacing worn sweeps and weatherization strips on doors, making roof-to-wall joint gaps airtight and sealing exterior envelope penetrations.

Implementation Cost: \$584,745

Energy Cost Savings: \$47,528

Annual Energy Reduction: 40,828 CCF · 13,417 kWh

M&V Protocol: Option A

# **Detailed Description**

# **Existing Description**

The buildings were inspected visually and using smoke tracer tests in accordance with ASTM E-1186 – 03. A smoke puffer was used to identify the location and severity of air leakage paths. These air leakage paths are detailed in the scope of work below. Areas inspected include roof-wall joints, elevation changes, soffit areas, roofs, walls, windows, doors, and other penetrations.

Building envelope inspections were performed on thirty-three (33) buildings located in the City of Waterbury. Overall, the buildings are in good to fair condition and well maintained by facility staff. During our inspection we found that the buildings were fairly to moderately leaky.

Many of the buildings were built in the 1920s to the 1940s, with the oldest built in 1898. A few of the buildings are newer structures, built within the last 10-15 years. Five of the buildings are municipal buildings, while the remaining twenty-eight are school buildings. Several of the buildings have had significant renovation projects performed, addressing several key building systems (e.g., doors, windows, roof surfaces, remodeled interior surfaces). The structures represented a cross-section of construction styles, which include:

- Masonry and brick walls with steel-framed pitched and/or flat concrete roofing
- Steel-frame and CMU walls with flat and/or pitched concrete roofing systems
- Masonry and brick walls with steel-framed pitched and/or flat roofing
- Steel-frame with masonry wall and glass curtain-wall systems, with flat and/or pitched concrete and metal roofing systems
- One-, two-, three-, and four-story structures
- Stand-alone structures, structures with multiple wings, bump-out sections and/or portable sections directly attached and/or connected via enclosed or open corridors

Tracer smoke testing indicating leaky seals on Police Headquarter roll-up garage doors.

Our building envelope assessments identified several significant air leakage paths in a majority of the buildings we inspected, with the key leakage areas being:

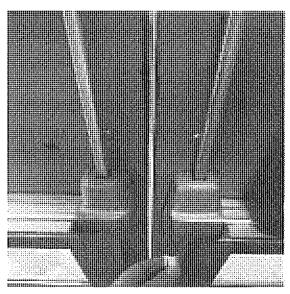

- Exterior, mechanical/boiler room and roof-access doors
- Window systems
- Roof-wall junctures and building joints
- Exterior walls open to vented soffit systems
- Attic/cockloft floor systems with significant chases, penetrations and bypasses allowing significant communication to conditioned spaces,

 Older, passive ventilation systems that allow significant, ongoing air-leakage and that should not be sealed without newer, dedicated building Make-Up-Air systems in place

Ventilation must be hard ducted or blocked in combination with installation of mechanical venting for insulation to be feasible. Continuing to dump building air into the cockloft after insulating these areas would cause condensation and building deterioration issues. Roof fans that connect conditioned spaces within the building envelopes to unconditioned building sections and directly to the outdoors.

The majority of the air leakage paths identified during our building assessments are a direct result of misalignment of the building's thermal and air barriers that resulted from design issues, implementation/framing issues during construction and/or deterioration of materials over time or voids in maintenance activities (contracted vs. in-house).

A gap (5/-inch) between double door entrance to Maloney School.

Discussions with staff revealed the following issues:

- Significant hot/cold sections of the buildings, lending to ongoing occupant comfort complaints stemming from significant air-leakage and poorly insulated building sections
- Ongoing moisture intrusion through leaky door and window systems, leading to higher maintenance, repair and replacement issues associated with the door and window systems and adjoining building systems (e.g., floor, wall, and ceiling surfaces).

Sealing these air leakage pathways can considerably reduce the energy usage of these buildings, improve structural integrity (by stopping the intrusion of moisture, which can cause a significant amount of deterioration to the various construction materials/systems) and can greatly improve the comfort and indoor air quality of the building occupants.

### Recommended Improvements

After completing the audit, our assessment is that we can cost-effectively address weatherization deficiencies in twenty-eight of the buildings studied, that will provide a significant impact on future energy consumption with a reasonable payback. Weatherization in this ESM will include both air sealing and some insulating. Air sealing will include weatherstripping, sealing around exterior penetrations, and roof wall joints. Insulation includes batt insulation on knee-walls, and Thermaxx rigid insulation.

# Scope of Work

#### Barnard

#### Windows

The window systems are metal-framed, double-pane units with fixed and double-hung sections. The window systems tested tight along the sashes, but leaky along the frame-wall junctures of each system. The frame-wall junctures need to be sealed, 1-line, using appropriate non-foam sealant materials.

 Seal along the frame-to-wall junctures of each window system (#1, #2, #3 with appropriate non-foam sealant, total 2,560 lineal feet

#### Attic Air-Sealing

The attic area in the original section has wood-framing and wood flooring with old, deteriorated blown insulation (4"-6") installed within the floored framing. The pitched wood-framed roof deck is uninsulated. There are multiple chases and bypasses that connect the attic to the conditioned spaces below which need to be air-sealed using appropriate materials (2 crew days). Access to the attic space is via an access door and narrow staircase. Much of the old, large disavowed passive ventilation system is still in place. There is ample working height clearance throughout attic section.

 Air-seal chases and penetrations along attic floor system, total 2 crew days, total 8.0 square feet

#### Bucks Hill

#### Windows

The window systems are metal-framed, double-pane units with fixed, slider and hopper-type sections. The windows tested tight along the sashes. The framing details above the window systems in the attached modular tested leaky and these seams need to be air-sealed along 2 seams, using appropriate non-foam sealants. One seam is along the bottom of beam-to-framing. The second seam is along the top of window framing-to-trim. The max working height is 12', with access to the seams above the suspended ceiling system.

- Seal seam along bottom of beam, 1-line (at beam-framing) using appropriate non-foam sealant, total 172 lineal feet
- Seal seam along top of window frame-to-trim, 1-line, using appropriate non-foam sealant, total
   172 lineal feet

# Chase Building

#### Doors

The exterior, attic access, and key interior doors tested leaky and need new weatherstripping installed.

- Weatherstrip standard-sized attic and garage access doors, total 2 doors
- Weatherstrip non-standard doors (3'6" W x 7' H), total 3 doors
- Weatherstrip non-standard door (3'6" W x 8' H), total 1 door

- Weatherstrip non-standard doors (3'6" W x 8' H, copper-clad), total 3 doors
- Weatherstrip non-standard doors (2'6" W x 9' H, copper-clad), total 2 doors
- Weatherstrip the (2' W x 2' H) attic hatch, total 1 hatch

#### Overhead Doors

There is one (1) sectional overhead door installed. The door (10' W x 10' H), tested leaky and should be weatherstripped.

Weatherstrip the sectional overhead door (10' W x 10' H), total 1 door

# Seal Fireplace Damper

The fireplace installed (2nd floor, SW) is leaky at the flue damper (1' W  $\times$  5' L) and the damper needs to be sealed.

Seal the fireplace flue damper, 1-line (½" gap max.), using appropriate sealant materials, total
 13 lineal feet

#### Chase School

#### Doors

The exterior, mechanical room and boiler room door systems tested leaky and need new weatherstrip materials installed.

- Weatherstrip standard exterior, and roof access doors, total 21 doors
- Weatherstrip non-standard roof/attic access door (3' W x 7'6" H), total 1 door
- Weatherstrip non-standard exterior doors (3'6" W x 7'6" H), total 2 doors
- Weatherstrip standard mechanical and boiler room doors, using fire-rated materials, total 2 doors

#### City Hall

#### Doors

The exterior and roof-access doors tested leaky and need new weatherstrip materials installed.

- Weatherstrip standard-sized roof-access and exterior doors, total 15 doors
- Weatherstrip non-standard exterior door (3'6" W x 7'6" H), total 1 door
- Weatherstrip non-standard exterior "auto" doors (3' W x 8'6" H), total 8 doors

#### Crosby-Wallace

#### Roof-Wall

The roof-wall junctures throughout the original middle school and high school wings tested leaky and need to be sealed with 2-component, closed-cell polyurethane spray foam. All flutes on steel decking must be punched and sealed. The 1-story entry and building joints (3rd floor H5 wings-to-library) need to be sealed with 1-line of two-component closed-cell polyurethane spray foam. There are 286 lineal feet of roof-wall and 176 lineal feet of building joints, above the suspended ceilings, at a working height of 13 feet. There are 3,020 lineal feet of roof-wall junctures along the M5 (1,390 LF) and H5 (1,630 LF)

wings, which need 2-lines (1 at roof-wall joint, 1 at bottom of I-beam). Access is above the suspended ceilings, at a working height of 13 feet.

- Seal the roof-wall joint and any framing penetrations, per floor plans, 1-line, at 13' working height, total 286 lineal feet
- Seal the building joints and any framing penetrations, per floor plans, 1-line, at 13' working height, total 176 lineal feet
- Seal the roof-wall joints and any framing penetrations, per floor plans, 2-lines, at 13' working height, total 3,020 lineal feet

# Department of Public Health

#### Doors

The exterior, roof access, boiler room and fire stairwell doors tested leaky. New, effective weatherstrip materials need to be installed.

- Weatherstrip exterior doors, total 9 doors
- Weatherstrip boiler room and stairwell doors, using appropriate fire-rated materials, total 17 doors

# Driggs

#### Attic Hatches

The attic access doors in the building tested leaky and need to be weatherstripped.

Weatherstrip standard-sized attic access and pump room doors, total 2 doors

#### Duggan

#### Doors

The exterior and boiler room doors tested leaky and need new, effective weatherstrip materials installed.

- Weatherstrip standard-sized exterior doors, total 15 doors
- Weatherstrip non-standard exterior doors (3'6" W x 7' H), total 6 doors
- Weatherstrip non-standard exterior doors (4' W x 7' H), total 4 doors
- Weatherstrip standard-sized boiler room doors, using appropriate fire-rated materials, total 2 doors

#### Miscellaneous Sealing

There is a dryer vent penetration along the NE elevation that is leaky and needs to be sealed, using appropriate materials. The vent is 5" in diameter with 3/4" to 1" gap. The vent is directly accessible and the max work height is 8 feet.

 Air-seal dryer vent penetration (5" diam. vent, ¾" to 1" gap), using appropriate sealant materials, total 1 dryer vent

# Enlightenment

#### Doors

The exterior, boiler and fan room doors tested leaky and need new, effective weatherstrip materials installed.

- Weatherstrip standard-sized exterior and fan room doors, total 16 doors
- Weatherstrip non-standard sized boiler room door 4' W x 7' H), total 1 door

### Generali

#### Windows

The window systems are metal-framed, double-pane units with fixed, slider, panel, and double-hung sections. One of the three double-hung systems (W-4) tested leaky along the sashes and need new weatherstrip materials installed.

Weatherstrip the four (4) double-hung window units (W-4), total 44 lineal feet

# Roof-Wall

The roof-wall junctures tested leaky along sections of the portable. the junctures need to be sealed, 1-line, with 2-component, closed-cell polyurethane spray foam. Access to the junctures is above the suspended ceiling system, at a working height of 12 feet.

• Seal the roof-wall joint and any framing penetrations, at 12' working height, total 134 lineal feet

#### Wall-Ceiling Junctures

The wall-to-ceiling panel seams along sections of the gym/stage are leaky and need to be sealed, 1-line, using appropriate sealant materials. There is direct access to the seams, at a working height of 22 feet. A lift may be an option.

Seal the wall-ceiling panel seams and any framing penetrations, 1-line, at 22' working height,
 total 328 lineal feet

### Gilmartin

#### Windows

The metal-frame, double-pane window systems have fixed and casement-type units. The windows tested tight along the sashes, glazing and top/left/right framing seams. The units (Wsys-1, 2, 3, 4, 5, 7, and 8) tested leaky along the bottom frame-sill junctures which need to be sealed using appropriate non-foam sealants. There are 259 window units that need to be sealed along the frame-sill junctures.

 Seal along the frame-to-sill juncture only, (Wsys-1, 2, 3, 4, 5, 7, and 8), 1-line, using appropriate non-foam sealant, total 942 lineal feet

#### Hopeville

# Doors

The exterior and boiler room doors tested leaky and need new weatherstrip materials installed.

- Weatherstrip standard-sized exterior doors, total 15 doors
- Weatherstrip non-standard doors (3' W x 7'6" H), total 4 doors
- Weatherstrip standard-sized boiler room doors, using appropriate fire-rated materials, total 2 doors

#### Windows

The windows are metal-frame, double-pane systems with fixed, panel, slider and double-hung units. The slider and double-hung units tested leaky along the sashes and need to have new, effective weatherstrip materials installed. The meeting rails on the double-hung units tested leaky as well. new sash locks need to be installed. The slider-type units in the gymnasium (W-5) need to have some seals reset and the sash locks replaced. The maximum working height for the gym windows is 18' - 20 feet.

- Weatherstrip the slider-type window units in the main sections (W-1, W-2), total 835 lineal feet
- Weatherstrip the double-hung window units (W-3, W-4), total 2,009 lineal feet
- Replace top-mount sash locks on ninety-seven (97) double-hung window units (W-3, W-4) (2 per unit), total 194 sash locks
- Weatherstrip the seventeen (17) slider-type window units in the gym (W-5), with a max working height of 18 – 20 feet, total 170 lineal feet
- Replace sash locks on seventeen (17) slider-type window units in gym (W-5) (2 per unit), total
   34 sash locks
- Reset window seals in the corners (as needed), on slider-type window units in the gym (W-5) (approx. 5 to 7 of 17 units), total 28 corners

# Kennedy

#### Doors

The exterior doors tested leaky and new weatherstrip materials need to be installed.

- Weatherstrip standard-sized exterior doors, total 55 doors
- Weatherstrip non-standard door, (3'6" W x 7' H), total 1 door

#### Kingsbury

# Doors

The exterior and boiler room doors tested leaky and need new, effective weatherstrip materials installed. The cockloft/roof access hatch needs to be weatherstripped and insulated.

- Weatherstrip standard-sized exterior doors, total 16 doors
- Weatherstrip standard-sized boiler room doors, using appropriate fire-rated materials, total 2 doors
- Weatherstrip and insulate with 4" Thermax the (2'6" W x 2'6" L) roof/cockloft hatch, total 1
   hatch

# Penetrations (Boiler Room Pipe)

There are numerous pipe penetrations in the boiler room which allow ongoing communication with conditioned spaces. the penetrations need to be air-sealed using appropriate fire-rated sealant materials. There are (4) 3" diameter pipes with (1"-2" gaps). There are six (6) 6" diameter pipes with (2" to 4" gaps/holes). There are two (2) bundled 2" pipe penetrations with (2"-3" gaps). The max working height is 16'.

- Air seal pipe penetrations (3" diam., 1"-2" gaps), total 4 penetrations
- Air seal pipe penetrations (6" diam., 2"-4" gaps), total 6 penetrations
- Air seal 2 bundled pipe penetrations (3, 2" pipes within 1 penetration) (2" -" gaps), total 2 bundled penetrations

#### Attic Sealing

Two of the main building sections have an uninsulated plaster/metal lath ceiling surface, with an accessible cockloft section above. The old, passive ventilation ducts vent into the cockloft section, allowing ongoing communication between the conditioned spaces below, the attic and outdoors. The attic side of the plaster/lath ceiling should be air-sealed. Onsite staff noted the existing metal lath framing has supported workers previously using walk-boards. The working height is approximately 4' to 4'6" from plaster/lath surface to underside of the ribs of the concrete roof deck. Access to the cockloft is via access hatch in corridor ceiling, which provides access to the roof hatch as well.

 Air-seal penetrations along plaster/lath ceiling surface, using appropriate sealant materials, total 1 crew day

# Maloney

#### Doors

The exterior, boiler room and mechanical room doors tested leaky and need new, effective weatherstrip materials installed. The boiler and mechanical room doors need fire-rated weatherstrip materials installed. The doors in the building are blue/mill-finished, and beige. Beige and mill-finished door kits will be fine. Weatherstrip the doors, per the floor plan.

- Weatherstrip standard exterior doors, total 16 doors
- Weatherstrip non-standard exterior doors, (3'6" W x 7' H), total 2 doors
- Weatherstrip non-standard exterior doors, (4' W x 7' H), total 9 doors
- Weatherstrip standard boiler/mechanical room doors, using fire-rated materials, total 3 doors

#### Police

# Doors

The exterior doors are leaky and need new weatherstrip materials installed.

- Weatherstrip exterior doors, total 9 doors
- Weatherstrip non-standard doors, (3'6" W x 7' H), total 6 doors
- Weatherstrip non-standard doors, (3' W x 7'6" H), total 2 doors
- Weatherstrip non-standard door, (3' W x 8' H), total 1 door

Weatherstrip non-standard door, (4' W x 7' H), total 1 door

#### Overhead Doors

There are four (4) roll-up overhead doors installed. Three of the doors each measure (11'6" W X 10' H). The remaining door measures (12' W x 10' H). The doors tested leaky and should be weatherstripped.

- Weatherstrip the roll-up overhead doors, (11'6" W x 10' H), total 3 doors
- Weatherstrip the roll-up overhead door, (12' W x 10' H), total 1 door

# Windows

The window systems are metal-frame, double-pane systems, with fixed and casement sections. The casement units (Wsys-2, 2'6" W x 5' H ea.) are leaky along the sashes and need new weatherstrip materials installed.

• Weatherstrip the casement windows, (Wsys-2), total 450 lineal feet

#### Compactor Chute

The old compactor is no longer used. the large (2'6" diameter) compactor chute is very leaky and connects to each floor of the building. The bottom of the chute needs to be sealed, using appropriate sealants.

 Seal bottom opening of compactor chute (2'6" diam.), using appropriate sealant materials, total 1 chute

#### Reed

#### Roof-Wall

The roof-wall junctures in areas of the 2-story and 1-story sections tested leaky and need to be air-sealed, 1-line, using 2-component, closed-cell polyurethane spray foam. All flutes on steel decking must be punched and sealed. Access to the junctures is above the suspended ceiling, a radiant heating panel is installed above the 1st section of suspended ceiling (3' in from exterior walls) and some piping runs parallel to the exterior walls. There are 627 lineal feet of roof-wall junctures along sections of the 2nd floor, at a working height of 16 feet. There are 152 lineal feet of roof-wall junctures along the 1-story section, at a working height of 16 feet.

- Seal the roof-wall joint and any framing penetrations (2nd floor), 1-line, at 16' working height, total 627 lineal feet
- Seal the roof-wall joint and any framing penetrations (1st floor), 1-line, at 16' working height, total 152 lineal feet

#### Regan

#### Doors

The exterior doors tested leaky. New, effective weatherstrip materials need to be installed. The Bilco roof hatch is in poor condition, showing signs of deterioration and damaged framing. We noted considerable air-leakage and significant signs of ongoing water intrusion. We recommend consideration be given toward replacing the hatch with a new energy efficient unit (by others).

- Weatherstrip standard-sized exterior doors, total 17 doors
- Weatherstrip the roof-access hatch (2' W x 3' L), total 1 hatch

#### Rotella

#### Batt Insulated Kneewall

There is an insulated kneewall-type wall section (behind I-beam, in the framing detail beneath the slanted window system in the central corridor, lobby and library) which needs to be covered/sealed, using Thermax (or similar). The kneewall-type detail measures 294 lineal feet by 2' high.

 Cover/seal the batt insulated kneewall (294 LF x 2' H), with Thermax (or similar), and seal all seams using appropriate sealant materials, total 588 square feet

# Silas Bronson Library

#### Doors

The exterior and mechanical room doors tested leaky and need new weatherstrip materials installed. The louver/grille (1'6" W x 1'H) on the mechanical room door should be sealed, using appropriate sealants (e.g., Thermax and flashing, with seams sealed with fire-rated sealant).

- Weatherstrip standard-sized exterior doors, total 3 doors
- Weatherstrip non-standard doors (3'6" W x 7' H), total 2 doors
- Weatherstrip non-standard doors (3'6" W x 7'6" H), total 8 doors
- Weatherstrip non-standard doors ornate metal/brass (3' W x 9' H), total 4 doors
- Weatherstrip standard-sized mechanical room door, using fire-rated materials, total 1 door
- Seal louver/grille (1'6" W x 1' H) on mechanical room door, using appropriate sealants, total 1
   grill

## Windows

The window systems are metal-framed, double-pane fixed units. The windows tested leaky along the frame-wall junctures and the bottom sections of each of the snap trim sections. The frame-wall junctures need to be sealed, 1-line, using appropriate non-foam sealant. The max work height is 15 feet. The bottom gaps, of each snap trim section (4" W x ¾" deep) needs to be sealed using appropriate non-foam sealant materials. The max work height is 15 feet.

- Seal the window systems along the frame-to-wall junctures, 1-line, with appropriate non-foam sealant, total 218 lineal feet
- Seal the bottom gaps of each snap trim section (4" W x ¾" deep ea.), total 86 snap trim sections

#### Roof-Wall

The roof-wall junctures tested leaky in several locations throughout the building. The building joints along 2 sections tested leaky as well. The roof-wall junctures and building joints need to be sealed with 2-component, closed-cell polyurethane spray foam. All flutes on steel decking must be punched and sealed. Access to the junctures and building joints is above the suspended ceiling systems. There are 38 lineal feet of roof-wall junctures and 70 lineal feet of building joints to be sealed, 1-line, at 10' work

height. There are 54 lineal feet of roof-wall junctures and 54 lineal feet of building joints to be sealed, 1-line, at 16' work height. There are 280 lineal feet of roof-wall junctures to be sealed, 3-lines, at 14' work height (1-line at top of beam with 3" gap, 2-lines at bottom of beam with 6" gap). Seal the roof-wall junctures and building joints.

- Seal the roof-wall junctures and building joints, and any framing penetrations, 1-line, at 10'
  working height, total 108 lineal feet
- Seal the roof-wall junctures and building joints, and any framing penetrations, 1-line, at 16'
  working height, total 108 lineal feet
- Seal the roof-wall junctures and any framing penetrations, 3-lines, at 14' working height, total
   280 lineal feet

#### Roof-top Fans

There are two (2) fans on the roof that need to be sealed. Fans should be serviced annually. Inspect fan for proper operation. Inspect and clean dampers.

Inspect and seal the roof-top fans, total 2 roof fans

#### Sprague

#### Windows

The window systems installed are metal-frame, double-pane systems. The window A/C units (1'6" W x 1'6" H each) installed within a number of the window systems are leaky and need to be sealed along the unit-to-window junctures, using appropriate sealant materials.

 Seal the window A/C units, (1'6" W x 1'6" H), along the unit--to-frame junctures, with appropriate sealant materials, (e.g., non-foam sealants/Thermax), total 204 lineal feet

#### Tinker

#### Doors

The exterior and boiler room doors in the building are leaky and need to be weatherstripped. One newer standard-sized exterior door tested tight along door-frame seams but leaky along the framewall junctures. These junctures need to be sealed, 1-line, using appropriate non-foam sealant materials.

- Weatherstrip standard-sized exterior doors, total 21 doors
- Weatherstrip standard-sized boiler doors, using appropriate fire-rated materials, total 2 doors
- Seal along the frame-wall junctures of standard exterior door (1-line at left and top, 2-lines at right) with appropriate non-foam sealant, total 24 lineal feet

#### Penetrations (Boiler Room Pipe)

There are (10) pipe penetrations in the boiler room which allow ongoing communication with conditioned spaces. the penetrations need to be air-sealed using appropriate fire-rated sealant materials. There are (7) 2" diameter pipes with (3/4"-1") gaps). There are 3 bundled pipe penetrations (three 2" pipes thru 1 hole) with (1' x 1' hole to be sealed). The max working height is 16 feet.

- Air-seal pipe penetrations using appropriate fire-rated sealant materials (2" diam., 3/4"-1" gaps), total 7 penetrations
- Air-seal (3) bundled pipe penetrations using appropriate fire-rated sealant materials (1' x 1' holes), total 3 bundled penetrations

#### Air-Seal Cockloft Floor Surface

Three (3) of the main building sections have an uninsulated plaster/metal lath ceiling surface with an accessible cockloft section above. The old, passive ventilation ducts/chases vent into the cockloft section then directly outdoors. The attic side of the plaster/lath ceiling should be air-sealed. Onsite staff noted the existing metal lath framing has supported workers previously using walk-boards, with some walk-boards still present in cockloft. The working height is approximately 3' to 3'6" from plaster/lath surface to underside of the ribs of the concrete roof deck. Access to the cockloft is via access hatch, with fixed steel ladder. The fixed ladder continues through cockloft to underside of the roof-access hatch.

 Air-seal penetrations along plaster/lath ceiling surface, using appropriate sealant materials, total 1.5 crew days

#### Walsh

#### **Building Joints**

The building joints tested leaky at two building junctures. The junctures need to be sealed with 2-lines of two-component, closed-cell polyurethane spray foam. Access to the junctures is above the suspended ceiling. There are 180 lineal feet of building joints, at 16' working height.

Seal the building joints and any framing penetrations, 2-lines, at 16' working height, total 180 lineal feet

#### Wall-Ceiling Joint

A small section of wall-ceiling juncture tested leaky along a 2nd floor landing. The air-leakage path needs to be sealed, 1-line, using appropriate sealant material. Access to the juncture is above the window and drop ceiling at the beam/framing. The working height is 12 feet.

Air-seal leakage path at wall-ceiling juncture, 1-line, using appropriate sealant material, total
 14 lineal feet

# Washington

Attic Insulation and Air Sealing

The air barrier between the conditioned and unconditioned spaces is leaky. All penetrations (e.g., chimney, pipe, and wiring) need to be sealed using appropriate sealant materials. Access to the attic is

Air-seal all penetrations along attic floor, total 1 crew day

### Waterbury Career

#### Doors

The exterior, roof-access and mechanical/chiller room doors tested leaky and need new, effective weatherstrip materials installed.

- Weatherstrip standard-sized exterior and roof-access doors, total 17 doors
- Weatherstrip non-standard doors (3'6" W x 7' H), total 6 doors
- Weatherstrip non-standard doors (3'6" W x 7'6" H), total 10 doors
- Weatherstrip non-standard doors (3'6" W x 10' H), total 2 doors
- Weatherstrip standard-sized mechanical room doors, using appropriate fire-rated materials, total 4 doors

# Wilby-North End

#### Doors

The exterior and boiler room doors tested leaky and new weatherstrip materials need to be installed. One roof hatch (Bilco, 2' W x 5' L) has deteriorated weatherstrip materials. New, appropriate weatherstrip materials need to be installed.

- Weatherstrip standard-sized exterior doors, total 118 doors
- Weatherstrip standard boiler room doors, using fire-rated materials, total 4 doors
- Weatherstrip non-standard doors, (3'6" W x 7' H), total 3 doors
- Weatherstrip non-standard doors, (4' W x 7' H), total 7 doors
- Weatherstrip non-standard doors, (4' W x 8' H), total 2 doors
- Weatherstrip roof access hatch, (2' W x 5' L), total 1 hatch

#### Wilson

#### Air-Seal Cockloft Floor Surface

The main building section has an uninsulated plaster/metal lath ceiling surface, with an accessible cockloft section above. The old, passive ventilation ducts/chases vent into the cockloft section then directly outdoors. The attic side of the plaster/lath ceiling should be air-sealed. Onsite staff noted the existing metal lath framing has supported workers previously, using walk-boards, with some walkboards still present in cockloft. The working height is approximately 3' to 3'6" from plaster/lath surface to underside of the ribs of the concrete roof deck. Access to the cockloft is via access hatch, with fixed steel ladder. The fixed ladder continues through cockloft to underside of the roof-access hatch.

Air-seal penetrations along plaster/lath ceiling surface, using appropriate sealant materials. total 1.5 crew days

#### City's Responsibilities

City shall be responsible for the removal or relocation of stored items in occupied spaces and mechanical rooms that interfere with work and staging areas. Customer shall clean mechanical room floors prior to start of work to assure they are free of oil, grease or other chemicals. Customer shall

relocate furniture, file cabinets, or other obstructions in order to facilitate safe, unimpeded access to areas and equipment or otherwise interfere with the ESM implementation and installation process.

#### Hazardous Materials Abatement Allowance

The scope of work (SOW) includes a project allowance in the amount of \$890,000 for testing and abatement of hazardous materials that may be encountered, including the abatement of lead and asbestos that may be encountered with this ESM. NORESCO may use this allowance for abatement at its discretion during the construction period. Any hazardous materials testing or abatement required for the completion of the SOW in excess of this allowance shall be the sole responsibility of the City. NORESCO makes no representations or warranties with respect to the amount or character of hazardous materials that may be encountered in the SOW. NORESCO will provide the City with an accounting of this allowance prior to Final Acceptance of the project. Any funds remaining in the allowance may be allocated to additional work through execution of a change order or remitted to the City.

# Interface with Existing Systems & Operations

#### Maintenance Procedures

Worn weather-stripping will need to be inspected and repaired if damaged. Maintenance procedures will be similar to existing requirements.

# Special Operating Requirements

There are no special operating requirements.

# **Equipment Information**

# Manufacturer & Type

NORESCO will install weatherization products as shown below, or approved equal:

- Dow Building Solutions, 200 Larkin Center, Midland, MI 48674, 800-583-BLUE, www.dowbuildingsolutions.com
- Todol Products, 25 Washington Avenue, Natick, MA 01760, 508-651-3818, www.todol.com
- Schlegal Systems, Inc., 1555 Jefferson Road, Rochester, NY 14692, 800-586-0354

# Savings Calculations

To quantify energy savings associated with this measure, NORESCO has developed a spreadsheet model using the American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) formulas that calculates air leakage through door and roof-to-wall intersections as a function of gap widths and wind pressure. The savings are calculated by finding the energy cost of this infiltration due to the additional winter heating and summer cooling loads associated from unconditioned air entering the building. Savings were calculated based on the following key assumptions:

- Building construction characteristics
- Infiltration rates for sealable gaps at each building

HVAC system efficiency

Local weather data including average temperature difference and wind speed are also used to calculate the air volume in cubic feet per minute. The energy required to condition this volume was then calculated using the following equations:

- Energy Usage (Btu) = 1.08 × Volume (cfm) × Temperature Difference (°F) × Heating Hours
- CFM = Area (sq.in.) × ((Stack Coeff. × Avg. Temp. Diff) × (Wind Coeff. × Wind Speed^2))1/2

# ESM 7:

# PIPE & FITTING INSULATION

## **ESM 7: Pipe & Fitting Insulation**

**Benefits:** This measure will reduce the amount of heat lost in ventilated mechanical spaces and reduce overheating in nearby occupied areas such as classrooms and administrative spaces. Reduced heat loss will decrease boiler fuel consumption and the City's utility costs. Insulating bare piping will also make it safer for staff and other building occupants by preventing burns on hot steam piping.

Buildings: Barnard Adult Education Bucks Hill School

Bunker Hill School Chase Building

Chase School City Hall

Crosby-Wallace Complex Department of Public Health

Driggs School Enlightenment School

Generali School Hopeville School

Kennedy High School Kingsbury School

Police Headquarters Reed School

Silas Bronson Library Sprague School

Tinker School Walsh School

Wendell Cross School West Side Middle School

Wilby-North End Complex

**Summary:** NORESCO will install new fiberglass pipe insulation with all service jackets, and removable insulating jackets on exposed metal steam and hot water pipe, fittings, valves, and associated equipment in twenty-three (23) City buildings and schools.

Implementation Cost: \$804,567

Energy Cost Savings: \$79,239

Annual Energy Reduction: 76,824 CCF

M&V Protocol: Option A

### Detailed Description

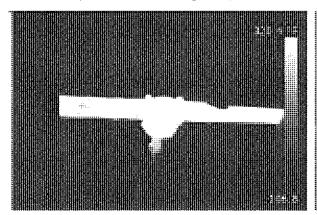

### Existing Description

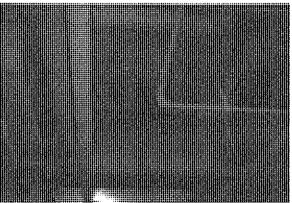

During the IGEA, NORESCO documented un-insulated lengths of heating and domestic hot water (DHW), steam, and condensate piping, fittings, flange pairs, bonnets, and equipment such as steam traps, isolation valves, and vessels such as heat exchangers, condensate receivers, and expansion

Information on this page is proprietary and subject to confidentiality restrictions

tanks. Steam leaks as well as bare steam pipe and equipment pose a significant safety concern to anyone with access to these conditions. Exposed piping results in significant energy losses and in the cases of building mechanical rooms, can also result in overheating and uncomfortable conditions in adjacent spaces. By installing new insulation on this piping and equipment, comfort conditions in these facilities will be improved and thermal savings will be achieved. Uninsulated piping can also pose a safety hazard for building occupants and maintenance workers.

Infrared photo of bare valve and pipe (left) and camera photo of bare valve and pipe (right).

### Recommended Improvements

NORESCO will insulate exposed steam and hot water heating system pipe in the boiler and mechanical rooms of the selected City's buildings and schools. We completed a comprehensive audit of all HVAC and related piping and equipment in the boiler and other mechanical rooms and penthouses.

The new insulation will greatly reduce the thermal losses associated with the steam and hot water piping systems. A reduction in thermal losses will lower the demand on the heating systems in the associated buildings, reducing fuel consumption and utility costs. Insulating bare steam pipe will also make these buildings safer for students and staff.

### Scope of Work

The scope of work includes insulating boiler and mechanical room bare piping and fittings in twenty-three of the City's buildings and schools.

- Remove and properly dispose of damaged insulation, pipe jacketing or other materials as
  necessary prior to the installation of blanket insulation. Pipe hangers, rollers and threaded rod
  shall remain in place and insulation shall be installed around these materials.
- Verify surfaces are clean and dry prior to installation. Examine the thermal valves, tanks, strainers, pumps, and fittings for signs of excessive wear or corrosion and notify the Owner of any defects in writing prior to the installation of thermal blankets.
- Field-verify IGEA measurements to ensure that the material inventory is accurate.
- Install the thermal blanket and removable jacket insulation for the specified equipment in accordance with the manufacturer's specifications.

Information on this page is proprietory and subject to confidentiality restrictions

- Install steam blankets snug and fasten with Velcro straps or 20 gauge stainless steel wire ties, with no portions left dangling or creating a hazard.
- Blanket will extend beyond mating flanges onto existing insulation for a minimum of 2". Where blanket cannot fit over existing insulation, blanket will butt up to existing insulation with friction fit closing seam.
- Type A pipe insulation includes a foil and paper jacket: Laminated glass-fiber-reinforced, flame retardant Kraft paper and aluminum foil – white exterior, Kraft reinforce foil vapor barrier with self-sealing adhesive joints.
- Type A pipe insulation terminations will be neatly finished with Childers Vi-Cryl CP-11 Mastic, or equal.
- Jacket pieces which match mating seams include an extended 2" flap constructed from the
  exterior fabric and shall be secured using hook & loop closure (i.e., Velcro TM) parallel to the
  seam.
- Insulation will be sewn as integral part of the jacket to prevent shifting of the insulation. Insulation pins are not an allowable method of preventing the insulation from shifting and will not be used.

### City's Responsibilities

City shall be responsible for the removal or relocation of stored items in occupied spaces and mechanical rooms that interfere with work and staging areas. Customer shall clean mechanical room floors prior to start of work to assure they are free of oil, grease or other chemicals. Customer shall relocate furniture, file cabinets, or other obstructions in order to facilitate safe, unimpeded access to areas and equipment or otherwise interfere with the ESM implementation and installation process.

### Hazardous Materials Abatement Allowance

The scope of work (SOW) includes a project allowance in the amount of \$890,000 for testing and abatement of hazardous materials that may be encountered, including the abatement of lead and asbestos that may be encountered with this ESM. NORESCO may use this allowance for abatement at its discretion during the construction period. Any hazardous materials testing or abatement required for the completion of the SOW in excess of this allowance shall be the sole responsibility of the City. NORESCO makes no representations or warranties with respect to the amount or character of hazardous materials that may be encountered in the SOW. NORESCO will provide the City with an accounting of this allowance prior to Final Acceptance of the project. Any funds remaining in the allowance may be allocated to additional work through execution of a change order or remitted to the City.

Table 1: Insulation Audit Schedule

ltem	Location 1	Location 2	Description	LF of Piping	Flange Class	Nom. Pipe Size	SqFt/ Item	Insulation Thickness

# **Interface with Existing Systems & Operations**

NORESCO will coordinate all work with facility personnel to minimize the impact on all occupants.

### Maintenance Procedures

The new insulation and removable insulating jackets will not require any regular maintenance. The removable insulating jackets will improve safety and reduce the time required to maintain or service the insulated equipment. These jackets are designed to quickly and easily be removed and reinstalled for maintenance and repair work.

### Special Operating Requirements

There are no special operations requirements with this ESM.

# **Equipment Information**

### Manufacturer & Type

NORESCO will provide Type A Fiberglass blanket manufactured by Knauf, or approved equal. 850° Pipe Insulation, ASTM C547, Class 1, k value of 0.23 at 75°F, with all service jacketing (ASJ).

NORESCO will provide removable insulation jackets manufactured by Thermaxx. Glass mat, type E needled fiber. 1/4", 1/2" @ 9 LB/CF and 1" @ 11.3 LB/CF.

# **Savings Calculations**

NORESCO used the 3E Plus (version 4.1) software program from the North American Insulation Manufacturers Association (NAIMA). This program was designed for the industrial process, environmental managers and the insulation industry. It is a valuable tool for calculating and selecting the insulation thickness needed to reduce heat transfer, and maintain a safe insulated surface temperature for personnel protection and condensation control. NAIMA provides technical input and guidance to standards and energy code-setting organizations that are important to energy-efficient building design and maintenance; and, with organizations that set standards regarding the thermal, acoustical and fire safety performance of materials used in building construction.

Conduction losses in the uninsulated pipe and mechanical equipment were calculated using pipe and equipment surface areas and their thermal conduction properties. Temperatures of piping and equipment were obtained via infrared surface temperature measurements.

The analysis inputs include exposed pipe lengths, sizes, emissivity, and temperatures as well as the operating hours and ambient space temperature in determining thermal heat loss. Development of the baseline energy consumption (losses) for this ESM includes site-specific parameters used for the 3E Plus software calculations and are included in *Appendix 1: Savings Calculations*.

# **ESM 8:**

STEAM TRAPS & THERMOSTATIC RADIATOR VALVES

# ESM 8: Steam Traps & Thermostatic Radiator Valves

**Benefits:** This measure will generate energy savings, extend equipment service life, enhance safety for maintenance staff, and greatly improve occupant comfort.

Buildings: Barnard Adult Education Bucks Hill School

Bunker Hill School Chase Building

Chase School Crosby-Wallace Complex

Driggs School Generali School

Hopeville School Kennedy High School

Kingsbury School Sprague School

Tinker School Walsh School

Wendell Cross West Side School

Wilby-North End Complex Wilson School

Summary: NORESCO performed a comprehensive steam trap audit, identifying all traps as well as quantifying leaking and plugged traps. We will repair two hundred and sixty-two (262) traps to generate energy savings and prolong the service life of equipment served by the steam system. NORESCO also performed a comprehensive audit of all the standalone perimeter steam terminal devices such as radiators, convectors, and baseboard fin tube, cataloguing each piece of equipment and its control device. NORESCO will install eight hundred and twelve (812) thermostatic radiator valves (TRVs) to automatically control the steam equipment's heat output to generate energy savings as well as significantly improve the comfort conditions in the spaces served. The installation of these temperature control valves will also include the removal of existing obsolete and problematic pneumatic valves and thermostats, resulting in additional maintenance cost savings as well as the energy savings associated with running the building air compressors.

Implementation Cost: \$784,363

Energy Cost Savings: \$93,420

Annual Energy Reduction: 77,878 CCF

M & V Protocol: Option A

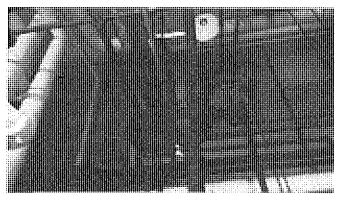

# **Detailed Description**

### Existing Description

The steam systems at the eighteen buildings included in this scope have a significant number of leaking and failed steam traps. The heating, ventilation, and air conditioning (HVAC) systems, domestic hot water, and pool water systems use steam for heat. A critical component of these systems is the steam trap. The function of a steam trap is to separate and discharge liquid condensate from the steam condensing equipment and piping systems. A trap that is leaking or has failed in the open position allows steam to pass through equipment such as radiators and other heat exchangers continuously, without giving up its energy. This results in significant energy losses through condensate system vents and poor heat transfer to the heating equipment.

The steam radiators, convectors, and baseboard fin tube (emitters) generally have three types of individual control valves -- pneumatic, manual shutoffs, and thermostatic. Many of the control valves are manual valves, which are typically left open all the time or are inoperable (open). The audit identified buildings where the emitters are primarily controlled by pneumatic valves with a single thermostat per valve, which are very maintenance intensive to keep calibrated and working properly. Some of the

Float and thermostatic (F&T) steam trap in the Wilby-North End boiler room.

radiators and convectors have a combination of manual valves and/or thermostatic valves, some of which have failed. The majority of the rooms and buildings in the audit that are overheating are doing so because they cannot be controlled. As a result, students and staff are using windows to control the overheating resulting in wasted energy. In some cases, mechanical air conditioning is being used to keep space temperatures tolerable, even during the winter.

The City-wide comprehensive steam trap and thermostatic radiator valve audits are included in *Appendix 4: Audit Data*.

### Recommended Improvements

Traps that leak cause a loss of heat transfer, water hammer, corrosion, and damage to heat transfer equipment. By repairing or replacing faulty steam traps with new, properly functioning traps and instituting an annual trap testing and repair program, comfort conditions in these buildings will be improved and thermal energy savings will be achieved.

NORESCO's experience is that without a comprehensive trap maintenance program, a significant number of traps will not operate properly over time. For the steam buildings, NORESCO will repair or replace the existing leaking or plugged steam traps with new, properly functioning traps or components to improve comfort conditions and reduce thermal energy losses.

Information on this page is proprietary and subject to confidentiality restrictions

### Scope of Work

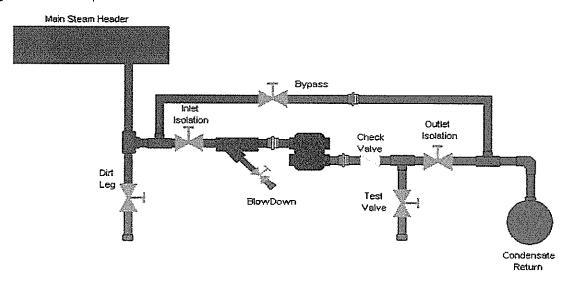

NORESCO will repair or replace a total of two hundred and sixty-two (262) steam traps at the locations and in quantities as listed in the tables below. The scope of work is:

- Confirm trap locations, sizes, and types for repair or replacement, including failed traps and traps that are operating correctly but that are of the incorrect type (such as an inverted bucket trap being used in an application where a float and thermostatic trap should be used).
- After verification, remove the existing traps, strainers, and isolation valves as required to install the new traps.
- Install correctly sized and type trap.

All the trap stations were evaluated for the components below:

- Dirtleg blow down valve
- Inlet isolation valve
- · Strainer with blow down valve
- Steam trap
- Outlet check valve
- Test valve
- Outlet isolation valve
- Bypass (on critical applications)

Figure 1: Ideal Trap Station

### City's Responsibilities

City shall be responsible for the removal or relocation of stored items in occupied spaces and mechanical rooms that interfere with work and staging areas. Customer shall clean mechanical room floors prior to start of work to assure they are free of oil, grease or other chemicals. Customer shall

Information on this page is proprietary and subject to confidentiality restrictions

relocate furniture, file cabinets, or other obstructions in order to facilitate safe, unimpeded access to areas and equipment or otherwise interfere with the ESM implementation and installation process.

#### Hazardous Materials Abatement Allowance

The scope of work (SOW) includes a project allowance in the amount of \$890,000 for testing and abatement of hazardous materials that may be encountered, including the abatement of lead and asbestos that may be encountered with this ESM. NORESCO may use this allowance for abatement at its discretion during the construction period. Any hazardous materials testing or abatement required for the completion of the SOW in excess of this allowance shall be the sole responsibility of the City. NORESCO makes no representations or warranties with respect to the amount or character of hazardous materials that may be encountered in the SOW. NORESCO will provide the City with an accounting of this allowance prior to Final Acceptance of the project. Any funds remaining in the allowance may be allocated to additional work through execution of a change order or remitted to the City.

City of Waterbury, Connecticut Investment Grade Energy Audit · May 13, 2016 (rev. June 29, 2016)

The new thermostatic radiator valves (TRVs) are equipped with a highly responsive, non-electric temperature sensor, capable of full modulation of the valve without an outside power source, which can be set to the desired room temperature. They shall have a temperature setpoint range of  $48^{\circ}F$  to  $84^{\circ}F$  as well as a freeze protection setting of  $42^{\circ}F$ . The thermostatic controls shall incorporate a feature to internally limit or lock the temperature setting. They shall be capable of regulating the temperature to within  $+/-1^{\circ}F$ . An extension piece shall be available to mount the sensor and control

dial away from the valve and the emitter enclosure if needed.

The rugged and reliable construction provides years of service in steam heating systems. The temperature sensor expands or contracts based on room temperature changes. This movement adjusts the valve opening, which increases or

- 1. Room Temperature Sensor Element
- 2. Room Temperature Selector
- 3. Patented Special Balancing Spring
- 4. Locking/Limiting Stops
- 5. Insulated Push Rod
- 6. O Rings
- 7. Stainless Steel Valve Stem
- 8. EPDM Valve Disc Material
- 9. Union Connections (NPT or SWEAT)
- 10. Precision Machined

decreases the flow through the radiator. Continual modulation of the valve reduces energy consumption, prevents costly overheating and provides even temperature levels in each heating zone.

NORESCO will install a total of eight hundred and twelve (812) new thermostatic radiator valves in the steam heated buildings at the locations and in the quantities listed in the Tables below. Installation of a reliable thermostatic radiator valve will improve heating system control and reduce the need to open windows to mitigate overheating spaces. The scope of work for this measure includes the following:

- Identify selected radiator or convector valves
- Remove existing pneumatic, thermostatic, or manual valve to facilitate new installation
- Determine proper valve size and valve Cv to provide optimal control
- Determine proper valve type and sensor orientation for each valve
- Install new thermostatic radiator valve, including re-piping where required

### Interface with Existing Systems and Operations

### Maintenance Procedures

The new steam traps and thermostatic radiator valves will require annual blowdowns and inspections. These blowdowns and inspections can be performed by the existing school maintenance staff as part of the heating system startup each year.

### **Special Operating Requirements**

There are no special operating requirements.

### **Equipment Information**

### Manufacturer and Type

NORESCO will install conventional mechanical steam traps and repair components manufactured by Tunstall Corporation or approved equal.

 Tunstall Corporation, 118 Exchange Street, Chicopee, MA 01013, 800-423-5578, www.tunstall-inc.com

NORESCO will install thermostatic radiator valves manufactured by Honeywell or approved equal.

 Honeywell International, 101 Columbia Road, Morristown NJ 07960, 973-455-2000, www.honeywell.com

### **Savings Calculations**

To quantify energy savings associated with the new steam traps, NORESCO developed a spreadsheet model that calculates steam energy loss through the trap orifice. The dimensionless Grashof Number uses the steam trap orifice size, which is directly related to the size and type of steam trap, and the steam operating pressure to calculate the steam flow rate loss. Pre- and post-retrofit steam, or thermal, losses are calculated using the following formula as its basis:

•  $q = h \times l \times q$ 

Where:

q = Thermal Heat Loss (lb steam)

h = Operating Hours (hrs)

f = Failure Rate (%)

q = Grashof Number (dimensionless)

For energy savings associated with the thermostatic radiator valves, NORESCO uses site specific parameters and the following formula to calculate steam energy loss through the existing failed control valves.

•  $q = A \times P \times H \times I \times FR \times h / (103,000 \text{ Btu/CCF} \times \text{System efficiency})$ 

### Where:

q = Thermal Heat Loss (lb steam) A = Average radiator area (sq. in.)

P = Steam Rate (lbs/hr) H = Annual Heating Hours

= Idle Time (estimated new radiator valves let steam into radiators and

convectors XX% of the time)

FR = Failure Rate (estimated existing radiator valve failure rate)

h = Energy Content (Btu) in 1 lb of steam

### **ESM 9:** PLUG LOAD CONTROLS

### **ESM 9: Plug Load Controls**

**Benefits:** This measure will achieve energy savings from the automatic turning on/off of equipment that would not be in use during unoccupied hours of the night and weekends. The measure will also be a clear demonstration of the City's commitment to energy efficiency to its building occupants.

**Summary:** NORESCO will install plug load management technology to provide additional energy savings during unoccupied hours and weekends. The installation includes controllable electrical receptacles, building controllers, and a web-based application and software suite for programming, analytics, reporting, and a user-interface dashboard.

Implementation Cost: \$176,855

Energy Cost Savings: \$27,543

Annual Energy Reduction: 201,247 kWh

M&V Protocol: Option A

### **Detailed Description**

### **Existing Description**

Printers, vending machines, small appliances (e.g., water coolers, air conditioners), and other plug loads consume 15% to 20% of total commercial electricity. In a school environment, faculty, staff, and students have equipment and devices that are part of normal day for administering and teaching students. Short of unplugging devices when unneeded, energy is being drawn out even when power strips are being used.

### Recommended Improvements

NORESCO recommends implementing smart power receptacles that remove the need to unplug devices from the wall when the equipment is not in use. The system recommended by NORESCO uses a cloud-based software application to control whether the new smart receptacles will allow electrical power to be provided to the plugged in device, as well as measure the power when it is being used. The web-based software will communicate with the smart receptacles via building controllers and the existing City LAN infrastructure and WiFi in the buildings. The deployment of the equipment will be dependent upon the function, use, and occupant base of the buildings noted above.

The information on plug load use is provided to the building users in an interactive visual format. This feedback helps spread energy awareness to the building occupants and provides a sense of ownership as to how efficiently the building is operated.

### Scope of Work

NORESCO will install plug load equipment for equipment as listed in Table 1.

### City's Responsibilities

City shall be responsible for the removal or relocation of stored items in occupied spaces and mechanical rooms that interfere with work and staging areas. Customer shall clean mechanical room floors prior to start of work to assure they are free of oil, grease or other chemicals. Customer shall relocate furniture, file cabinets, or other obstructions in order to facilitate safe, unimpeded access to areas and equipment or otherwise interfere with the ESM implementation and installation process.

### Hazardous Materials Abatement Allowance

The scope of work (SOW) includes a project allowance in the amount of \$890,000 for testing and abatement of hazardous materials that may be encountered, including the abatement of lead and asbestos that may be encountered with this ESM. NORESCO may use this allowance for abatement at its discretion during the construction period. Any hazardous materials testing or abatement required for the completion of the SOW in excess of this allowance shall be the sole responsibility of the City. NORESCO makes no representations or warranties with respect to the amount or character of

hazardous materials that may be encountered in the SOW. NORESCO will provide the City with an accounting of this allowance prior to Final Acceptance of the project. Any funds remaining in the allowance may be allocated to additional work through execution of a change order or remitted to the City.

### Interface with Existing Systems & Operations

### Maintenance Procedures

The controllers will require no additional maintenance.

### **Special Operating Requirements**

There are no special operating requirements with the retrofitted receptacles. The software schedules and reports will need to be coordinated and set up with the City's input.

### **Equipment Information**

### Manufacturer & Type

NORESCO will install plug load controls provided by Best Energy Reduction Technologies, or approved equal.

 Best Energy Reduction Technologies, LLC, 840 1st Avenue, Suite 300, King of Prussia, PA 19406 www.bertbrain.com

### **Savings Calculations**

Below is the calculation methodology or formulae.

- Baseline Usage (kWh/yr) = Device kW × Operating Hours × % Load
- Estimated Usage (kWh/yr) = Device kW × Proposed Operating Hours × % Load
- Savings (kWh/yr) = Baseline Energy Usage Estimated Energy Usage

### **ESM 10:**

WALK-IN COOLER CONTROLS

### ESM 10: Walk-in Cooler Controls

**Benefits:** This measure will decrease energy consumption and increase reliability through reduced equipment run time.

Buildings: Chase School Crosby-Wallace Complex

Duggan School Generali School

Maloney School Rotella School

Sprague School Walsh School

Waterbury Arts Magnet School West Side School

Wilby-North End Complex Wilson School

**Summary:** NORESCO will install advanced controls and equipment on the walk-in coolers and freezers in the City's kitchens. The controls and equipment will optimize evaporator fan, door heater, compressor, and condensing unit operation. NORESCO will also replace low-efficiency fractional horsepower evaporator fan motors with high-efficiency electronically commutated motors.

Implementation Cost: \$147,462

Energy Cost Savings: \$13,115

Annual Energy Reduction: 97,771 kWh

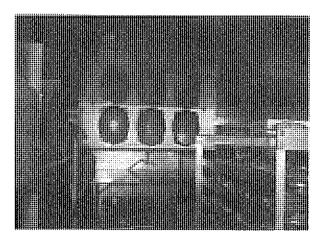

M&V Protocol: Option A

### **Detailed Description**

### Existing Description

The walk-in refrigeration units at twelve (12) of the school buildings have standard efficiency evaporator fans which are original to the units. These fans and the units' door heaters operate continuously, regardless of the load or conditions.

The fans are inside the walk-in units, and they draw air over the cooler evaporators to assist in heat transfer. The fans also maintain air movement to keep walk-in temperatures

Existing walk-in cooler evaporator and fans at Crosby-Wallace.

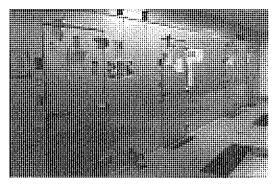

uniform. Typical fan motors are inefficient and add heat to the refrigerated spaces which, in turn, cause the refrigeration systems to work harder. The door heaters prevent frost build-up and potential

freezing up of the units' doors, which is likely to occur when humidity levels in the surrounding space are high.

### Recommended Improvements

NORESCO will add advanced controls and fan motors to the walk-in coolers and freezers in the selected kitchens. The controls will monitor the load in the walk-ins and regulate the operation of the evaporator fans and condensing units to match the load. Evaporator fans will no longer operate continuously, nor will the door heaters, which will be controlled based on the dew point temperatures in the surrounding storerooms. The controls also incorporate improved strategies for defrost cycles that will further reduce the energy consumption

The walk-in refrigeration units, like the ones at Waterbury Arts Magnet, will be more efficient with advanced controls and ECM fan motors.

associated with the walk-in units. Where the existing evaporator fan motors are standard efficiency, they will be replaced with super-efficient electronically commutated motors (ECM), which will use less power than standard efficiency motors and will reduce the ancillary cooling load in the walk-ins.

### Scope of Work

The proposed scope of work includes the installation of new evaporator fan controller(s), electronically commutated fan motor(s), and door heater(s) to control the refrigeration systems and door heaters on the walk-in cooler(s) and freezer(s) in each building, as noted in Table 1.

Table 1: Walk-in Cooler and Freezer Controls Summary

### City's Responsibilities

City shall be responsible for the removal or relocation of stored items in occupied spaces and mechanical rooms that interfere with work and staging areas. Customer shall clean mechanical room floors prior to start of work to assure they are free of oil, grease or other chemicals. Customer shall relocate furniture, file cabinets, or other obstructions in order to facilitate safe, unimpeded access to areas and equipment or otherwise interfere with the ESM implementation and installation process.

### Hazardous Materials Abatement Allowance

The scope of work (SOW) includes a project allowance in the amount of \$890,000 for testing and abatement of hazardous materials that may be encountered, including the abatement of lead and asbestos that may be encountered with this ESM. NORESCO may use this allowance for abatement at its discretion during the construction period. Any hazardous materials testing or abatement required for the completion of the SOW in excess of this allowance shall be the sole responsibility of the City. NORESCO makes no representations or warranties with respect to the amount or character of hazardous materials that may be encountered in the SOW. NORESCO will provide the City with an accounting of this allowance prior to Final Acceptance of the project. Any funds remaining in the allowance may be allocated to additional work through execution of a change order or remitted to the City.

### Interface with Existing Systems & Operations

### Maintenance Procedures

The reduced runtimes should add to the life of this equipment, potentially delaying future replacement costs. The controllers and new motors will require no additional maintenance than the existing cooler and freezer equipment.

### Special Operating Requirements

There are no special operating requirements.

### **Equipment Information**

### Manufacturer & Type

NORESCO will install CoolTrol® Cooler Control Systems, EC motors, and CoolTrol® Anti-Sweat Door Heater Controllers as summarized in Table 1, or approved equal.

 National Resource Management, 480 Neponset Street, Building 2, Canton, MA 02021, 800-377-8877, www.nrminc.com

### Savings Calculations

The primary sources of energy savings are the improved efficiency of the evaporator fans and motors, the reduced run-time of these fans, and the reduced operation of the door heaters. The affected energy use is calculated by multiplying evaporator fan run hours by the total fan kW and multiplying the door heater operating hours by the door heater kW. Savings are the difference between the current and proposed fan and door heater kWh.

Savings were calculated based on the following key assumptions:

- Evaporator fan and door heater electrical consumption
- Evaporator fan motor efficiency
- Evaporator fans and door heaters currently operate continuously
- Evaporator fan and door heater reduced operating hours

Electric savings were calculated as follows:

- Existing kWh = [(Existing Fan HP × 0.746 × Load) × Existing Fan Run Hours] + (Door Heater kW × Existing Heater Run Hours)
- Proposed kWh = [(Proposed Fan HP × 0.746 × Load) × Proposed Fan Run Hours] + (Door Heater kW × Proposed Heater Run Hours)
- kWh Savings = Existing kWh Proposed kWh

## ESM 11: STEAM BOILERS

### ESM 11: Steam Boilers

**Benefits:** This measure will increase the building's heating system reliability by replacing equipment that is past its useful life and provide redundancy in cases where the lead boiler has failed. New boilers have a smaller footprint than the existing boilers and will increase space in the mechanical rooms for more efficient equipment servicing. The new heating equipment will reduce natural gas consumption due to higher seasonal operating efficiencies, and current maintenance and service costs will be significantly reduced.

Buildings: Barnard Adult Education Bunker Hill School

Chase Building Chase School
Generali School Sprague School

Wilson School

**Summary:** NORESCO will install fourteen (14) new natural gas-fired steam boilers and ancillary heating system equipment in seven (7) buildings. The boilers will be equipped with high-efficiency natural gas burners and modulating controls. This new equipment will serve the buildings' current steam loads, as well provide a degree of redundancy if one of the boilers is down for service. Control of the new boilers will be integrated through the new energy management system (EMS) and provide web-accessible control and monitoring of the buildings' heating plants to facilities staff.

Implementation Cost: \$5,985,553

Energy Cost Savings: \$69,948

Annual Energy Reduction: 29,645 CCF

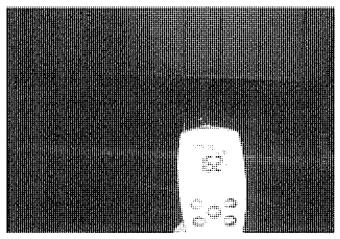

M&V Protocol: Option B

### **Detailed Description**

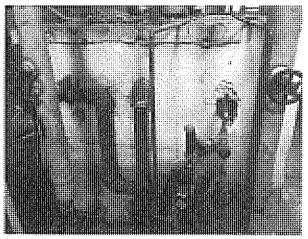

### Existing Description

The majority of the existing low pressure, natural gas-fired steam boilers in the buildings were installed thirty or more years ago and have reached or exceeded the end of their useful lives. The boilers are all cast iron sectional designs, manufactured by HB Smith or Weil-McLain. In each building, the existing boiler capacity exceeds the heating demand, and the burners have limited load matching or turn down capability, resulting in higher natural gas consumption due to low seasonal efficiency (high frequency of boiler cycling).

Old, un-insulated steam boiler at Bunker Hill School will be removed and replaced with new equipment.

Old, ACM containing condensate receiver and feed water tank at the Chase Building will be abated, removed and replaced with new equipment.

**Table 1: Summary of Existing Steam Boilers** 

	Number of Existing Boilers	Total Boiler Capacity (MBH)	Description
Barnard	2	5,733	One (1) HB Smith Mills 450 and one (1) HB Smith Series 28 cast iron sectional (not running), with 3,753 MBH and 2,000 MBH gas Power Flame burners, respectively
Bunker Hill	2	7,506	Two (2) HB Smith Mills 450 cast iron sectionals with 3,753 MBH gas Power Flame burners/each
Chase Building	1	4,200	One (1) HB Smith Mills 450 boiler with recently repaired/replaced sections with 4,200 MBH dual fuel Dunham Bush burner
Chase School	2	6,206	Two (2) HB Smith Series 28 cast iron sectionals with 3,103 Power Flame gas burners/each; one (1) boiler was pouring water out likely from a cracked or failed section(s)
Generali	2	6,206	One (1) HB Smith Series 28 and one (1) Weil Mc-Lain cast iron sectionals, with 3,103 MBH dual fuel Power Flame burners/each
Sprague	2	6,206	Two (2)Weil-McLain cast iron sectionals, with 3,103 MBH dual fuel Power Flame burners/each
Wilson	2	7,506	Two (2) HB Smith Series 28 cast iron sectionals with 3,753 Power Flame gas burners/each

### Recommended Improvements

NORESCO's approach to redesigning the boiler systems is to provide the most energy-efficient equipment while maintaining operational flexibility. To accomplish this, NORESCO will install new boilers with modulating burners, and auxiliaries such as new condensate receiver/feed water pump units, and chemical treatment systems. The boiler systems will be designed with equipment redundancy to provide heating load and operational reliability. Detailed design drawings of the scope of work, including equipment schedules and specifications are included in *Appendix 2: 35% Drawings*.

Table 2: Summary of New Boilers

	Number of New Boilers	Total New Boiler Capacity (MBH)	Description
Barnard	2	7,662	Two (2) new HB Smith Series 28HE steam boilers with high- efficiency modulating Power Flame burners with EMS control and Shipco/DMC dual pump feedwater/condensate receiver
Bunker Hill	2	7,662	Two (2) new HB Smith Series 28HE steam boilers with high- efficiency modulating Power Flame burners with EMS control and Shipco/DMC dual pump feedwater/condensate receiver
Chase Building	2	4,498	Two (2) new HB Smith Series 28HE steam boilers with high- efficiency modulating Power Flame burners with EMS control and Shipco/DMC dual pump feedwater/condensate receiver
Chase School	2	6,080	Two (2) new HB Smith Series 28HE steam boilers with high- efficiency modulating Power Flame burners with EMS control and Shipco/DMC dual pump feedwater/condensate receiver
Generali	2	6,080	Two (2) new HB Smith Series 28HE steam boilers with high- efficiency modulating Power Flame burners with EMS control and Shipco/DMC dual pump feedwater/condensate receiver
Sprague	2	4,498	Two (2) new HB Smith Series 28HE steam boilers with high- efficiency modulating Power Flame burners with EMS control and Shipco/DMC dual pump feedwater/condensate receiver
Wilson	2	7,662	Two (2) new HB Smith Series 28HE steam boilers with high- efficiency modulating Power Flame burners with EMS control and Shipco/DMC dual pump feedwater/condensate receiver

### Scope of Work

### Barnard

- Demolish and remove two (2) existing cast iron low pressure steam boilers, feedwater/ condensate receiver, vent line, surge tank, and associated piping, wiring, and accessories.
- Demolish and remove exhaust breeching back to the main header.

- Furnish and install two (2) new HB Smith model 28HE-S-15 low pressure steam boiler with modulating Power Flame natural gas burner.
- Furnish and install new condensate receiver and feedwater pump set, including new vent pipe.
- Furnish and install new boiler vent and connect to existing breeching.
- Furnish and install new outside air fan for combustion air, including ductwork and damper, and new steam heating coil in the combustion air duct.
- Furnish and install new exhaust air fan, including ductwork and damper.
- Furnish and install new electrical, natural gas line, steam and condensate piping, feed water piping to existing, and new EMS controls.
- Provide system startup, testing, commissioning, and owner training.

### Bunker Hill

- Demolish and remove two (2) existing cast iron low pressure steam boilers, feedwater/ condensate receiver, vent line, surge tank, and associated piping, wiring, and accessories.
- Demolish and remove exhaust breeching back to the main header.
- Furnish and install two (2) new HB Smith model 28HE-S-15 low pressure steam boiler with modulating Power Flame natural gas burner.
- Furnish and install new condensate receiver and feedwater pump set, including new vent pipe.
- Furnish and install new boiler vent and connect to existing breeching.
- Furnish and install new outside air fan for combustion air, including ductwork and damper, and new steam heating coil in the combustion air duct.
- Furnish and install new exhaust air fan, including ductwork and damper.
- Furnish and install new electrical, natural gas line, steam and condensate piping, feed water piping to existing, and new EMS controls.
- Provide system startup, testing, commissioning, and owner training.

### Chase Building

- Demolish and remove two (2) existing cast iron low pressure steam boilers, feedwater tank and pumps, vent line, and associated piping, wiring, and accessories.
- Demolish and remove exhaust breeching back to the main header.
- Furnish and install two (2) new HB Smith model 28HE-S-12 low pressure steam boiler with modulating Power Flame natural gas burner.
- Furnish and install new feedwater tank and dual pump set.
- Furnish and install new boiler vent and connect to existing breeching.
- Furnish and install new outside air fan for combustion air, including ductwork and damper.
- Furnish and install new electrical, natural gas line, steam and condensate piping, feed water piping to existing, and new EMS controls.
- Provide system startup, testing, commissioning, and owner training.

### Chase School

- Demolish and remove two (2) existing cast iron low pressure steam boilers, feedwater/ condensate receiver, vent line, surge tank, and associated piping, wiring, and accessories.
- Demolish and remove exhaust breeching back to the main header.
- Furnish and install two (2) new HB Smith model 28HE-S-12 low pressure steam boiler with modulating Power Flame natural gas burner.
- Furnish and install new condensate receiver and dual pump set, including new vent pipe.
- Furnish and install new feedwater tank and dual pump set.
- Furnish and install new boiler vent and connect to existing breeching.
- Furnish and install new outside air fan for combustion air, including ductwork and damper.
- Furnish and install (2) new horizontal steam unit heaters, including piping and electrical.
- Furnish and install new exhaust air fan, including ductwork and damper.
- Furnish and install new electrical, natural gas line, steam and condensate piping, feed water piping to existing, and new EMS controls.
- Provide system startup, testing, commissioning, and owner training.

### Generali

- Demolish and remove two (2) existing cast iron low pressure steam boilers, feedwater/ condensate receiver, vent line, surge tank, and associated piping, wiring, and accessories.
- Demolish and remove exhaust breeching back to the main header.
- Furnish and install two (2) new HB Smith model 28HE-S-9 low pressure steam boiler with modulating Power Flame natural gas burner.
- Furnish and install new condensate receiver and feedwater pump set, including new vent pipe.
- Furnish and install new boiler vent and connect to existing breeching.
- Furnish and install new outside air fan for combustion air, including ductwork and damper.
- Furnish and install new exhaust air fan, including ductwork and damper.
- Furnish and install new electrical, natural gas line, steam and condensate piping, feed water piping to existing, and new EMS controls.
- Provide system startup, testing, commissioning, and owner training.

### Sprague

- Demolish and remove two (2) existing cast iron low pressure steam boilers, feedwater/ condensate receiver, vent line, surge tank, and associated piping, wiring, and accessories.
- Demolish and remove exhaust breeching back to the main header.
- Furnish and install two (2) new HB Smith model 28HE-S-12 low pressure steam boiler with modulating Power Flame natural gas burner.
- Furnish and install new condensate receiver and feedwater pump set, including new vent pipe.
- Furnish and install new boiler vent and connect to existing breeching.
- Furnish and install new outside air fan for combustion air, including ductwork and damper, and new steam heating coil in the combustion air duct.
- Furnish and install new exhaust air fan, including ductwork and damper.

- Furnish and install new electrical, natural gas line, steam and condensate piping, feed water piping to existing, and new EMS controls.
- Provide system startup, testing, commissioning, and owner training.

### Wilson

- Demolish and remove two (2) existing cast iron low pressure steam boilers, feedwater/ condensate receiver, vent line, surge tank, and associated piping, wiring, and accessories.
- Demolish and remove exhaust breeching back to the main header.
- Furnish and install two (2) new HB Smith model 28HE-S-15 low pressure steam boiler with modulating Power Flame natural gas burner.
- Furnish and install new condensate receiver and feedwater pump set, including new vent pipe.
- Furnish and install new boiler vent and connect to existing breeching.
- Furnish and install new outside air fan for combustion air, including ductwork and damper, and new steam heating coil in the combustion air duct.
- Furnish and install new exhaust air fan, including ductwork and damper.
- Furnish and install new electrical, natural gas line, steam and condensate piping, feed water piping to existing, and new EMS controls.
- Provide system startup, testing, commissioning, and owner training.

### City's Responsibilities

City shall be responsible for the removal or relocation of stored items in occupied spaces and mechanical rooms that interfere with work and staging areas. Customer shall clean mechanical room floors prior to start of work to assure they are free of oil, grease or other chemicals. Customer shall relocate furniture, file cabinets, or other obstructions in order to facilitate safe, unimpeded access to areas and equipment or otherwise interfere with the ESM implementation and installation process.

### Hazardous Materials Abatement Allowance

The scope of work (SOW) includes a project allowance in the amount of \$890,000 for testing and abatement of hazardous materials that may be encountered, including the abatement of lead and asbestos that may be encountered with this ESM. NORESCO may use this allowance for abatement at its discretion during the construction period. Any hazardous materials testing or abatement required for the completion of the SOW in excess of this allowance shall be the sole responsibility of the City. NORESCO makes no representations or warranties with respect to the amount or character of hazardous materials that may be encountered in the SOW. NORESCO will provide the City with an accounting of this allowance prior to Final Acceptance of the project. Any funds remaining in the allowance may be allocated to additional work through execution of a change order or remitted to the City.

### Interface with Existing Systems & Operations

### Maintenance Procedures

The replacement of the existing boilers with new boilers and accessories will significantly reduce maintenance, service, and repair efforts and costs by removing equipment that is near the end or past its useful service life.

### **Special Operating Requirements**

There are no special operating or maintenance activities required for the new boilers that are not already required of the maintenance staff for the existing equipment, other than the addition of the chemical treatment systems, which will need to be regularly monitored and maintained.

### **Equipment Information**

### Manufacturer & Type

NORESCO will install boilers from the following manufacturer:

• HB Smith, 260 North Elm Street, Westfield, MA 01085, 413-562-9631, www.smithboiler.com

### **Savings Calculations**

The calculations for the savings from this boiler replacement ESM were based on calculations of building loads and heating system usage at various outside air temperatures over the course of a year. A simple approximation of the formulae used for this calculation is shown below.

- Heating Savings (for each hour of the year) = Hours × Heating Load × (1/Proposed Heating Efficiency - 1/Existing Heating Efficiency)
- Existing Heating Efficiency = 100% Existing Combustion Efficiency Existing Thermal
   Efficiency
- Proposed Heating Efficiency = Existing Boiler Efficiency = 100% Proposed Combustion
   Efficiency Proposed Thermal Efficiency

# **ESM 12:**

HOT WATER BOILERS & POOL HEATING SYSTEMS

# ESM 12: Hot Water Boilers & Pool Heating Systems

**Benefits:** This measure will improve the heating system reliability by replacing equipment that is past its useful life and provide redundancy in cases where the lead boiler is down for service or repairs. New boilers have a smaller footprint than the existing boilers and will increase space in the mechanical rooms for more efficient equipment servicing. The new heating systems will significantly reduce natural gas consumption due to higher seasonal operating efficiencies. With the addition of new hot water boilers, the steam boilers will no longer need to operate year round, thus extending their operating life as well as creating extended periods to perform routine preventative maintenance.

**Buildings:** Crosby-Wallace Complex Kennedy High School

West Side School Wilby-North End Complex

**Summary:** NORESCO will install a total of seven (7) gas steam boilers, seven (7) gas hot water boilers, two (2) gas pool heaters, one (1) pool heat exchanger, two (2) hot water heat exchangers, three (3) domestic hot water heat exchangers, pumps, feedwater tanks, and other ancillary heating system equipment in the four buildings listed. Heating systems will be redesigned and modernized to allow for high-efficiency condensing boilers and pool heaters to be incorporated with new steam boilers to provide optimized operations and efficiencies. The boilers will be a combination of high-efficiency condensing hot water boilers and steam boilers with high-efficiency natural gas burners and electronic combustion trim and  $O_2$  controls. This new equipment will serve the building space, domestic, and pool heating loads. Control of the new boilers will be integrated with the upgraded and expanded energy management system (EMS) and provide web-accessible monitoring and control of the buildings' heating plants to facilities personnel.

Implementation Cost: \$7,409,455

Energy Cost Savings: \$153,827

Annual Energy Reduction: 127,380 CCF

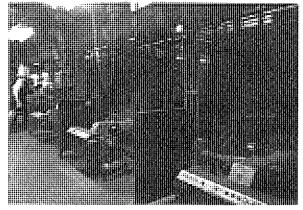

M&V Protocol: Option B

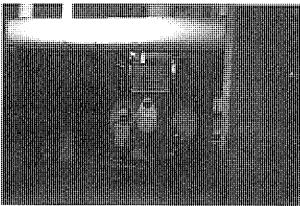

### **Detailed Description**

### **Existing Description**

The existing low pressure, natural gas-fired steam boilers were installed thirty (30) or more years ago and have reached the end of their useful life, and many have required recent expensive service and repairs to continue running. Some of the boilers are no longer operational. The boilers are a mix of fire tube and cast iron sectional designs. These boilers provide direct steam service to a variety of space heating systems in each building, as well as heating, domestic hot water (DHW), and pool water steam-to-hot water heat exchangers.

Sectional steam boilers at West Side Middle School

Fire-tube steam boiler at Wilby-North End Complex

As a result, these boilers need to operate year round. In each building, the existing boiler capacity exceeds the combined heating demands, and the burners have limited load matching and turn down capabilities, resulting in higher natural gas consumption due to low seasonal efficiency (high frequency of boiler cycling) during the non-heating season.

Table 1: Summary of Existing Steam Boiler, Pool, DHW, Perimeter Heating Systems

	Existing Steam Boilers	Total Boiler Capacity (MBH)	Hot Water Heating	Pool Heating	DHW Heating	Steam Boiler Data
Crosby-Wallace	3	31,380	НХ	НХ	НХ	Three (3) Cleaver Brooks CB600-250 fire-tube steam boilers with dual fuel CB burners
Wilby-North End	3	18,831	НХ	Gas	НΧ	Three (3) Cleaver Brooks CB600-150 fire-tube steam boilers with dual fuel CB burners
West Side	3	21,213	нх	НХ	НХ	Three (3) HB Smith Mills 4500 steam sectional boilers with dual fuel 7,071 MBH gas Power Flame burners
Kennedy	2	9,526	N/A	нх	Gas	One (1) new Weil-McLain Model 88 Series 2 steam boiler and one (1) old Weil- McLain sectional steam boiler each with 4,763 gas PowerFlame burners

### Recommended Improvements

NORESCO's approach to redesigning the boiler systems is to provide the most energy-efficient equipment while maintaining and improving operational flexibility. To accomplish this, NORESCO will install modulating, condensing hot water boilers in buildings where it is practical to do so. Many systems will be converted from using steam indirectly to hot water; however, the air handlers will continue to use steam from the steam boilers to allow the existing heating coils to remain in use and continue providing heat and freeze protection. The steam and hot water systems will be designed with sufficient capacity to ensure a degree of redundancy to provide operational assurance.

Condensing hot water boilers offer unparalleled energy efficiency with combustion efficiencies between 92% and 98%. Condensing boilers operate efficiently at part loads, so efficient operation will be maintained in the fall and spring as well as the winter. New steam boilers will include high-efficiency, modulating natural gas burners providing higher operating efficiencies across all heating loads, but will be designed to also maintain peak heating loads on design days in the winter.

The schools with both perimeter hot water systems and steam coils in the air handling units will receive both new heating hot water boilers and new steam boilers. This design allows hot water systems to be served by the high-efficiency condensing hot water boilers while maintaining steam boilers to serve the air handling unit heating coils. Kennedy and West Side will receive new gas-fired pool heaters, and West Side, Crosby-Wallace and Wilby-North End will receive new instantaneous indirect-fired domestic hot water heat exchangers. Crosby-Wallace will also have two (2) new steam-to-hot water heat exchangers installed in the building's "wing" pump rooms. As a result of all this work, the steam boilers will now only need to operate during the winter months, thus allowing for extended equipment life, optimized load matching and system efficiencies, and critical additional time for scheduled preventative maintenance and service during the summer months. In all four buildings, one existing steam boiler will remain to serve as an emergency backup in the unlikely scenario that the new boilers are down for repairs during the heating season.

In addition to the new steam and hot water boilers, instantaneous heat exchangers and pool heaters, the new heating systems will include new associated equipment such as feedwater tank and pump sets, heating/DHW/pool pumps, chemical treatment, combustion makeup air units and exhaust air fans, valving, piping, insulating, wiring, concrete slabs, and direct digital controls (DDC) integrated with the upgraded and expanded energy management system (EMS). Detailed design drawings of the scope of work, including equipment schedules and specifications are included in *Appendix 2: 35% Drawings*.

### City's Responsibilities

City shall be responsible for the removal or relocation of stored items in occupied spaces and mechanical rooms that interfere with work and staging areas. Customer shall clean mechanical room floors prior to start of work to assure they are free of oil, grease or other chemicals. Customer shall relocate furniture, file cabinets, or other obstructions in order to facilitate safe, unimpeded access to areas and equipment or otherwise interfere with the ESM implementation and installation process.

### Hazardous Materials Abatement Allowance

The scope of work (SOW) includes a project allowance in the amount of \$890,000 for testing and abatement of hazardous materials that may be encountered, including the abatement of lead and asbestos that may be encountered with this ESM. NORESCO may use this allowance for abatement at its discretion during the construction period. Any hazardous materials testing or abatement required for the completion of the SOW in excess of this allowance shall be the sole responsibility of the City. NORESCO makes no representations or warranties with respect to the amount or character of hazardous materials that may be encountered in the SOW. NORESCO will provide the City with an accounting of this allowance prior to Final Acceptance of the project. Any funds remaining in the allowance may be allocated to additional work through execution of a change order or remitted to the City.

Table 2: Summary of New Steam Boiler, Pool, DHW, and Perimeter Heating Systems

	Remaining Steam Bollers	New Steam Boilers	New Hot Water Boilers	Pool Heating	DHW Heating	New Equipment Data
Crosby-Wallace	<b>,</b>	72	2	ІРЕЖН	IDFWH	NORESCO to provide two (2) new low-pressure, gas-fired Cleaver-Brooks CBLE-250 steam boilers each rated for 8,369 MBH; two (2) new high-efficiency, gas-fired Aerco BMK condensing hot water boilers rated for 2,500 MBH/ea. to serve the perimeter heating load; one (1) 2,750 MBH DHW and one (1) 338 MBH Pool indirect-fired hot water heat exchangers.
Wilby-North End	-	2	3	Gas	IDFWH	NORESCO to provide two (2) new low-pressure, gas-fired Cleaver-Brooks CBLE-125 steam boilers each rated for 4,184 MBH; three (3) new high-efficiency, gas-fired Aerco BMK condensing hot water bollers rated for 3,000 MBH/ea. to serve the perimeter load; one (1) 2,750 MBH DHW indirect-fired hot water heat exchanger.
West Side		2	~	Gas	IDFWH	NORESCO to provide two (2) new low-pressure, gas-fired HB Smith 28HE-S18 high-efficiency steam boilers each rated for 5,553 MBH; two (2) new high-efficiency, gas-fired Aerco BMK condensing hot water boilers rated at 2,000 MBH/ea. to serve the perimeter load; one (1) 1,250 MBH DHW indirect-fired hot water heat exchanger; one (1) Lochinvar EnergyRite Model ERN402-A pool heater rated for 400 MBH.
Kermedy	÷	<u>-</u>	X	gs	G as s	NORESCO to provide one (1) new low-pressure, gas-fired HB Smith 28HE-S18 steam boiler rated for 5,553 MBH; one (1) high-efficiency, gas-fired Lochinvar EnergyRite Model ERN402-A pool heater rated for 400 MBH.

Note: IDFWH (Indirect-fired Instantaneous Water Heater) supplied by new hot water condensing boilers.

### Scope of Work

NORESCO will install two (2) new low-pressure, gas-fired Cleaver-Brooks fire tube steam boilers in each complex to serve the steam-fired air handler systems and other steam-fired systems. Additionally, two new high-efficiency, gas-fired Aerco condensing hot water boilers will be installed in each complex to serve the perimeter hot water and DHW loads. Crosby-Wallace will also receive a new high-efficiency, gas-fired Lochinvar pool heater similar to the boiler currently installed at Wilby-North End. New hot water piping and associated hot water pumps would be provided to connect the hot water boilers to the existing hot water distribution systems. New steam-to-hot water heat exchangers will be installed at Crosby-Wallace for the "wing" perimeter hot water loads. Gas, steam, condensate, and hot water piping will be provided to make the systems operational. Control of the new systems will be provided by the newly upgraded DDC EMS. A summary of the scope of work includes:

### Crosby-Wallace

- Demolish and remove two (2) existing Cleaver-Brooks CB-600-250 low pressure steam boilers and natural gas burners, feedwater tank and pump set, vent line, surge tank, and associated piping, wiring, and accessories.
- Demolish and remove exhaust breeching for the two boilers back to the main header.
- Demolish and remove one (1) perimeter hot water heat exchanger in the main boiler room, including piping back to the main steam header, condensate return, and hot water piping.
- Demolish and remove two (2) perimeter hot water exchangers in storage rooms A162 and E140.
- Demolish and remove existing makeup air unit, including piping back to the steam header.
- Abandon in place (2) main boiler room DHW heat exchangers, cutting back piping to facilitate new DHW heat exchanger installation.
- Abandon in place one (1) existing pool heat exchanger, valving off the steam at the isolation valve at the main steam header.
- Furnish and install two (2) new Cleaver-Brooks CBLE-250 low pressure steam boilers with integral burners. Install the new boilers on the existing boiler housekeeping pads and connect to existing electrical, natural gas lines, steam header, condensate piping, feed water piping, and new EMS controls.
- Furnish and install new boiler venting and connect to existing breeching.
- Furnish and install new feedwater tank and pump set.
- Furnish and install new blowdown separator tank and aftercooler, including water connection and vent piping to atmosphere.
- Furnish and install new water chemical treatment system.
- Furnish and install two (2) new perimeter hot water exchangers in storage rooms A162 and E140.
- Furnish and install two (2) new Aerco BMK2500 high-efficiency condensing hot water boilers, including 4" concrete housekeeping pads, including a 250-gallon buffer tank on a new 4" concrete housekeeping pad and insulated piping and valving to connect to existing piping.

- Connect to existing electrical, natural gas lines, existing boiler room perimeter hot water supply and return piping via a new primary loop hot water pump, and new EMS controls.
   Provide sealed combustion and breaching per manufacturer's specifications.
- Furnish and install one (1) new Aerco SP-150 2,750 MBH indirect-fired water heat exchanger with DDC and EMS interface for the domestic hot water heating and connect to existing piping, including new 4' concrete housekeeping pad.
- Furnish and install one (1) new plate and frame heat exchanger in the pool mechanical room, including new pump and supply/return piping from the main boiler room to the pool equipment room.
- Provide system startup, testing, commissioning, and owner training.

### Wilby-North End

- Demolish and remove two (2) existing Cleaver-Brooks CB-600-150 low pressure steam boilers and natural gas burners, feedwater tank and pump set, vent line, surge tank, and associated piping, wiring, and accessories.
- Demolish and remove exhaust breeching for the two boilers back to the main header.
- Abandon in place one (1) perimeter hot water heat exchanger in the main boiler room, cutting piping back to the main steam header, condensate return, and hot water piping to facilitate new hot water boiler installations.
- Demolish and remove existing makeup air unit, including piping back to the steam header.
- Abandon in place two (2) main boiler room DHW heat exchangers, cutting back piping to facilitate new DHW heat exchanger installation.
- Furnish and install two (2) new Cleaver-Brooks CBLE-125 low pressure steam boilers with integral burners. Install the new boilers on the existing boiler housekeeping pads and connect to existing electrical, natural gas lines, steam header, condensate piping, feed water piping, and new EMS controls.
- Furnish and install new boiler venting and connect to existing breeching.
- Furnish and install new feedwater tank and pump set.
- Furnish and install new blowdown separator tank and aftercooler, including water connection and vent piping to atmosphere.
- Furnish and install new water chemical treatment system.
- Furnish and install new makeup air unit, including piping back to the steam header.
- Furnish and install three (3) new Aerco BMK3000 high-efficiency condensing hot water boilers, including 4" concrete housekeeping pads, including a 250-gallon buffer tank on a new 4" concrete housekeeping pad and insulated piping and valving to connect to existing piping.
- Connect to existing electrical, natural gas lines, existing boiler room perimeter hot water supply and return piping via a new primary loop hot water pump, and new EMS controls.
   Provide sealed combustion and breaching per manufacturer's specifications.
- Furnish and install one (1) new Aerco SP-150 2,750 MBH indirect-fired water heat exchanger with DDC and EMS interface for the domestic hot water heating and connect to existing piping, including new 4" concrete housekeeping pad.

Provide system startup, testing, commissioning, and owner training.

### West Side and Kennedy

NORESCO will install one (1) new low-pressure, gas-fired HB Smith sectional steam boiler at Kennedy and two (2) new HB Smith sectional steam boilers at West Side to serve the steam-fired heating systems, complete with modulating Power Flame burners. For West Side, new high-efficiency, gas-fired Aerco condensing hot water boilers will be installed to serve perimeter and DHW hot water loads. West Side and Kennedy will also receive a new high-efficiency, gas-fired Lochinvar condensing hot water boiler to heat the pool. New hot water piping and associated hot water pumps will be provided to connect the hot water boilers to the existing hot water distribution systems. Existing steam-to-hot water heat exchangers will be repurposed to serve as a backups for the perimeter and DHW loads. Gas, steam, and hot water piping will be provided to make the system operational. Control of the boiler system will be provided by the new DDC EMS.

### West Side

- Demolish and remove two (2) existing cast iron low pressure steam boilers, feedwater/ condensate receiver, vent line, and associated piping, wiring, and accessories.
- Demolish and remove exhaust breeching back to the main header.
- Furnish and install two (2) new HB Smith model 28HE-S-18 low pressure steam boilers with modulating Power Flame natural gas burner.
- Install the new boiler on the existing boiler housekeeping pads and connect to existing electrical, natural gas line, steam header, condensate piping, and feed water piping.
- Furnish and install new feedwater tank and pump set, including new vent pipe.
- Furnish and install new Type "B" boiler vent and connect to existing breeching.
- Furnish and install new electrical, natural gas line, steam and condensate piping, feed water piping to existing, and new EMS controls.
- Furnish and install new water chemical treatment system.
- Furnish and install two (2) new Aerco BMK2000 high-efficiency condensing hot water boilers, including 4" concrete housekeeping pads, including a 250-gallon buffer tank on a new 4" concrete housekeeping pad and insulated piping and valving to connect to existing piping.
- Connect to existing electrical, natural gas lines, existing boiler room perimeter hot water supply and return piping via two (2) new primary loop hot water pump, and new EMS controls. Provide sealed combustion and breaching per manufacturer's specifications.
- Furnish and install one (1) new Aerco SP-150 2,750 MBH indirect-fired water heat exchanger with DDC and EMS interface for the domestic hot water heating and connect to existing piping, including new 4" concrete housekeeping pad.
- Furnish and install one (1) new Lochinvar EnergyRite Model ERN402-A pool water heater in pool mechanical room. Provide new housekeeping pad, electric service, gas piping, sealed combustion, and breaching per manufacturer's specifications.
- Provide system startup, testing, commissioning, and owner training.

### Kennedy

- Demolish and remove one (1) existing Weil-McLain cast iron low-pressure steam boiler and Power Flame burner.
- Demolish and remove exhaust breeching back to the main header.
- Furnish and install one (1) new HB Smith model 28HE-S-18 low pressure steam boiler with modulating Power Flame natural gas.
- Install the new boiler on the existing boiler housekeeping pads and connect to existing electrical, natural gas line, steam header, condensate piping, and feed water piping.
- Furnish and install new Type "B" boiler vent and connect to existing breeching.
- Furnish and install new electrical, natural gas line, steam and condensate piping, feed water piping to existing, and new EMS controls.
- Furnish and install new water chemical treatment system.
- Furnish and install one (1) new Lochinvar EnergyRite Model ERN402-A pool water heater in pool mechanical room, and connect to existing pool water pump set. Provide new housekeeping pad, electric service, gas piping, sealed combustion, and breaching per manufacturer's specifications.
- Provide system startup, testing, commissioning, and owner training.

### **Interface with Existing Systems & Operations**

### Maintenance Procedures

The new boilers and associated equipment will significantly reduce maintenance, service, and repair efforts and costs by removing equipment that is near the end or past its useful service life.

### Special Operating Requirements

There are no special operating or maintenance activities required for the new boilers that are not already required of the maintenance staff for existing equipment, other than the addition of the chemical treatment systems, which will need to be regularly monitored and maintained.

### **Equipment Information**

### Manufacturer & Type

NORESCO will install the following equipment:

- AERCO International, Inc., 100 Oritani Drive, Blauvelt, NY 10913, 845-580-8000, www.aerco.com
- Cleaver-Brooks, 221 Law Street, Thomasville, GA 31792, 800-250-5883, www.cleaverbrooks.com
- HB Smith, 260 North Elm Street, Westfield, MA 01085, 413-562-9631, www.smithboiler.com

### **Savings Calculations**

The calculations for the savings from this boiler replacement ESM were based on calculations of building loads and heating system usage at various outside air temperatures over the course of a year. A simple approximation of the formulae used for this calculation is shown below.

- Heating Savings (for each hour of the year) = Hours × Heating Load × (1/Proposed Heating Efficiency – 1/Existing Heating Efficiency)
- Existing Heating Efficiency = 100% Combustion Losses Radiant Jacket Losses Existing
   Distribution Losses
- Proposed Heating Efficiency = Existing Boiler Efficiency = 100% Proposed Combustion
   Losses Proposed Radiant Jacket Losses Proposed Distribution Losses

# **ESM 13:** SOLAR PHOTOVOLTAICS

### ESM 13: Solar Photovoltaics

**Benefits:** This measure will generate electricity from a renewable resource and offset a portion of the purchased electric consumption and peak demand. Solar photovoltaic (PV) systems will provide a visible source of renewable energy that demonstrates Waterbury's commitment to green technologies, sustainability, and environmental stewardship.

Buildings: Duggan School Police Headquarters

**Summary:** NORESCO will install solar PV array systems on the roofs of the two buildings listed above. The PV systems will include solar panels, racks, mounts, inverters, disconnects, and all cabling, wiring, and controls. Roofs on all buildings were evaluated, and the two buildings listed are included because the roofs are only a few years old or will be replaced by the time this project goes to construction.

Implementation Cost: \$305,489

Energy Cost Savings: \$27,863

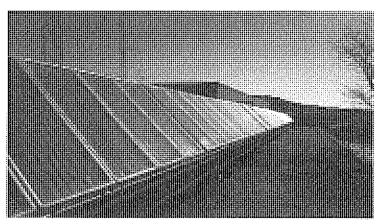

Annual Energy Reduction: 136,116 kWh

M&V Protocol: Option B

### **Detailed Description**

### **Existing Description**

The City of Waterbury has a 75-kilowatt (kW) solar photovoltaic (PV) array installed on the roof of the Gilmartin School. The Police Headquarters has a solar thermal heating system that has long since been decommissioned and abandoned in place, and has since been removed during the recent replacement of the roof.

Abandoned solar thermal panels will be replaced with solar photovoltaic arrays at Waterbury Police Headquarters.

### Recommended Improvements

The PV array systems will generate electricity from a renewable resource and offset a portion of the purchased electric consumption and peak demand for the City's facilities. The PV systems will reduce electricity purchased from Eversource while providing a visible source of renewable energy that

demonstrates the City's commitment to green technologies, sustainability, and environmental stewardship.

The PV systems will be eligible for Connecticut's Zero Emissions Renewable Energy Credit (ZREC) program through the utility, Eversource. This program allows qualified zero emissions generation projects to generate Class I renewable energy certificates (RECs) that can provide a revenue stream over 15 years for the project. The RECs would be bid during the IGEA and the price locked in with Eversource for 15 years; removing any risk of the REC value changing over the project repayment term. The proposed systems would all be classified under the small (< 100 kW) ZREC program.

### Scope of Work

This ESM involves direct current (DC), fixed PV systems to be mounted on the roofs. NORESCO will provide complete turnkey installation of the PV array systems. The PV systems will also include the DC to alternating current (AC) inverters, combiner boxes, AC and DC disconnects, metering, isolation transformers (if required), protective relays, grounding system, PV racking, automated controls, overcurrent protection, lightning protection, interconnecting wiring and conduits, display kiosks for each building lobby, and network connections. With the exception of the array at the Police Headquarters, which will utilize the existing structural steel previously used for the demolished solar thermal system, the systems will be installed using ballasted racking systems, which do not require any roof penetrations and will maintain the existing roof warranties.

### The scope of work includes:

- The proposed PV system designs are based on using Trina Solar TSM-PD14 305W72 cell
  multicrystalline PV modules. PV panels shall be independently certified to meet IEEE 1262 and
  UL 1703 Standards.
- Furnish and install the individual PV array panels for a nominal system size as detailed in Table 1 above (based on Standard Test Conditions, STC rating of modules).
- The PV systems shall be interconnected to existing distribution panel located in the buildings'
  main electrical rooms. NORESCO shall furnish and install required equipment and materials to
  connect to existing distribution panel(s).
- New circuit breakers shall be provided with the proper available interrupting current rating and trip settings required by the national electric code if the existing circuit breaker(s) are not reverse feed rated. Provide new reverse feed circuit breakers to the extent required to ensure the upstream overcurrent protection device(s) will trip during a fault.

- Furnish and install new conductors from the inverters to the existing distribution panels.
   Provide weatherproof penetration into each building. Electrical metallic tubing (EMT) may be used to route from buildings' entrances to the distribution panel.
- Furnish and install steel racking to mount the PV systems. Racking will be located to maximize solar collection. The metal racking will be electrically grounded.
- Installations will use mounting, racking systems, and hardware specifically designed for use with PV, incorporating rust and corrosion-resistant components and appropriately engineered to withstand anticipated structural, environmental, and wind loading conditions.
- Furnish and install solidly grounded systems in compliance with the National Electrical Code to include: bonded AC and DC grounding electrodes, bonding connections, bonding jumpers, grounded conductors, and equipment grounding straps.
- Furnish and install solar PV inverters and associated equipment. Inverters shall be selected appropriate to the PV array size and to match maximum efficiency with selected PV modules. Inverter shall be installed inside power plant and will be a NEMA 1 enclosure.
- The PV systems shall be interconnected to the buildings' electrical distribution systems. The
  PV systems will comply with current guidelines governing interconnection with the electrical
  distribution system, and any subsequent revisions to these guidelines.
- NORESCO will coordinate with Eversource and the City of Waterbury to submit the Interconnection Application and coordinate any required utility metering upgrades or installations required by the CL&P, including additional fees and equipment installation.
- Furnish and install lockable, utility-accessible AC disconnects as required per Eversource interconnection requirements.
- NORESCO will assist the City to obtain available Eversource and State of Connecticut renewable energy credits. This will include but not be limited to the following:
  - Submitting a Zero Emissions Renewable Energy Credit (ZREC) application to the local utility company (CL&P).
  - Administering documentation of system production to receive the ZREC credits for the term of the ZREC credit contract.
  - Sizing calculations, preliminary single line and other required drawings, inverter and transformer data, and other technical data required for submission of the Interconnect Application to the electric utility and Proof of Project Advancement Documentation necessary to formally reserve the energy credit funds with the rebate Program Administrator.
  - Provide warranty information on PV modules, inverters, and balance of system required to submit the ZREC claim documentation at completion of project.
  - Provide building department inspection report and any required breakdown cost documentation required to submit the ZREC claim documentation at completion of project.
  - Design, plans, drawings, general specifications, detail specifications, and modifications of standard designs and equipment.

- Complete bill of materials including, but not limited to, the complete PV arrays, inverters, array support structures and concrete footings, balance of systems, wire, and conduit.
- Component manufacturer and materials warranties.
- The overall PV systems' design and components will comply with relevant American Society for Testing and Materials (ASTM) standards, the Institute of Electrical and Electronics (IEEE) PV standards, the International Engineering Consortium (IEC) standards, Underwriters Laboratories (UL) standards, National Fire Protection Association (NFPA) and National Electrical Code (NEC) standards, the National Electrical Safety Code, Federal Communications Commission (FCC) electromagnetic interference standards, Connecticut State and Local Building Codes, and American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE) guidelines.
- The PV modules shall be UL listed and fire rated Class C or better if stand-alone or rack mounted systems.
- The electrical design will comply with the National Electrical Code (NEC) Article 690 and Article 705.
- The electrical design will comply with IEEE Standards 929-2000 Recommended Practice for Utility Interface of Photovoltaic (PV) Systems interconnection requirements.
- Electrical materials will be Underwriters' Laboratories listed.
- The electrical homeruns from the PV arrays will take the most direct and visually acceptable route to the interconnection point with the minimum disruption to surrounding structures.
- The PV systems Eversource interconnection will have isolation transformers, manuals, and lockable disconnects.
- The PV system inverters' electrical outputs at the Eversource connection points will be pure sine wave, 60 Hz, and match the Eversource voltage and phase.
- AC power and signal wires and conductors will be copper in rigid galvanized conduit and/or electrical metallic tubing (EMT) above grade.
- The systems will be earth-grounded and will have appropriate lightning and ground fault protection and other safety devices as necessary.

### City's Responsibilities

City shall be responsible for the removal or relocation of stored items in occupied spaces and mechanical rooms that interfere with work and staging areas. Customer shall clean mechanical room floors prior to start of work to assure they are free of oil, grease or other chemicals. Customer shall relocate furniture, file cabinets, or other obstructions in order to facilitate safe, unimpeded access to areas and equipment or otherwise interfere with the ESM implementation and installation process.

### Hazardous Materials Abatement Allowance

The scope of work (SOW) includes a project allowance in the amount of \$890,000 for testing and abatement of hazardous materials that may be encountered, including the abatement of lead and asbestos that may be encountered with this ESM. NORESCO may use this allowance for abatement at its discretion during the construction period. Any hazardous materials testing or abatement required

for the completion of the SOW in excess of this allowance shall be the sole responsibility of the City. NORESCO makes no representations or warranties with respect to the amount or character of hazardous materials that may be encountered in the SOW. NORESCO will provide the City with an accounting of this allowance prior to Final Acceptance of the project. Any funds remaining in the allowance may be allocated to additional work through execution of a change order or remitted to the City.

### Interface with Existing Systems & Operations

### Maintenance Procedures

The PV panels will require minimal maintenance from the City. The arrays should be cleaned and inspected as per the manufacturer's recommendations. The inverters, breakers, and balance of the systems should be inspected as per manufacturer's operation and maintenance (O&M) specifications.

### **Special Operating Requirements**

There are no special operating requirements.

### **Equipment Information**

### Manufacturer & Type

NORESCO will provide PV arrays manufactured by the following:

Trina Solar Limited through Greenskies Renewable Energy, LLC, 10 Main Street Extension,
 Suite E, Middletown, CT 06457, 860-398-5408, www.greenskies.com

### Savings Calculations

Solar photovoltaic system energy calculations were performed using the U.S. Department of Energy's National Renewable Energy Laboratory's (NREL) online software calculator, PV Watts®, to determine the individual PV system's output. The following data and assumptions were used to perform the calculations:

### Location and Station Identification

Reguested Location: Waterbury, Connecticut

Weather Data Source: HARTFORD BRAINARD FD, CT (TMY3)

Latitude: 41.93° NLongitude: 72.68° W

### PV System Specifications

DC Rating: Various kW

System Losses: 14%

Inverter Efficiency: 96%

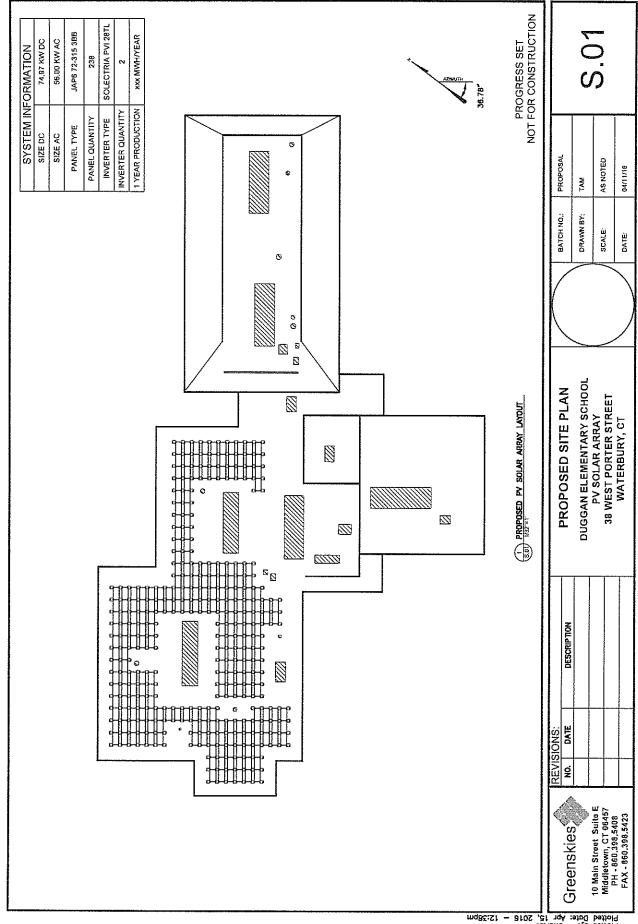

Array Type: Fixed (open rack)

Array Tilt: 5° (20° at Police Station which reuses solar thermal racking)

Array Azimuth: 180°

# ESM 14:

NEW ELECTRICAL SWITCHGEAR & BACKUP POWER GENERATION

# ESM 14: New Electrical Switchgear & Backup Power Generation

**Benefits:** This measure will increase the electrical reliability and safety in the Chase Building, while ensuring critical electrical services are provided without interruption. The new switchgear will bring the equipment up to the latest electrical code requirements and provide an additional 30 years of service.

Buildings:

Chase Building

**Summary:** NORESCO will install new electrical switchgear, backup emergency generator, and additional electrical infrastructure in the Chase Building to provide emergency power to the building's IT data center loads, and the fourth floor Emergency Operations Center (EOC).

Implementation Cost:

\$1,255,855

**Energy Cost Savings:** 

N/A

**Annual Energy Reduction:** 

N/A

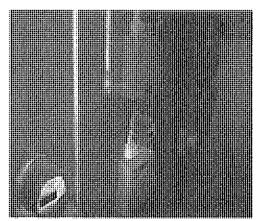

M&V Protocol:

N/A

### **Detailed Description**

### Existing Description

The electrical switchgear at the Chase Building was installed more than 30 years ago and is at the end of its useful service life. In this building, nothing operates without a reliable flow of electricity. Over time, a combination of water, dust, high humidity levels, and vibration caused a degradation of the building's switchgear. Moisture and dust combine to form an insulating layer on surfaces, reducing heat transfer from the components and increasing component operating temperatures. Similarly, moisture and dust coat components, restricting their movement and causing excessive wear.

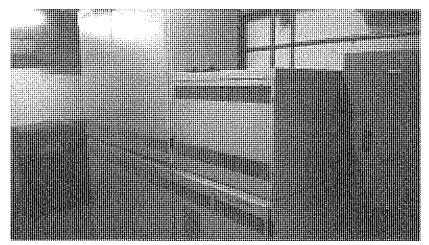

Multiple electric service meters will be consolidated into a single service meter

Annual cleaning and inspection of the switchgear is needed to maintain this equipment, and the switchgear in the Chase Building is long overdue for this maintenance, as confirmed with City Electrical Shop Foreman Tony Cicchiello. Additionally, in the Chase Building, there are actually two separate

utility service connections, each located at opposite ends of the building. As a result of the age of the building and its varied use over the years, the building presently has seven (7) utility meters.

Emergency lighting battery storage and inverter system will no longer need to be replaced every 5 years resulting in significant maintenance savings

### Recommended Improvements

NORESCO will replace the main switchgear in the Chase Building with a new 3000A, 208/120V switchboard; remove a 1200A fused distribution panel in the main electrical room and rewire the loads directly to the newly installed switchboard; remove the existing 800A secondary service meter (7th meter) and its panel board in East Basement; and install a new 800A panelboard and connect it into the new main switchboard. The switchgear will have the conductors disconnected and then reconnected when the new equipment is installed. The installation of the new switchgear is expected to occur over one weekend to minimize disruption to the facility.

NORESCO recommends installing a new 200 kW (actual installed capacity to be determined during final design), natural gas standby/emergency generator in an outdoor enclosure. This generator will provide backup power for emergency lights, IT equipment in the main IT room and the IDF room on the third floor, and other critical loads to be identified during final design. The generator will also backup the building's Waterbury Fire Department's Emergency Operation Center (EOC) area on the fourth floor.

Detailed design drawings of the scope of work, including equipment schedules and specifications, are included in *Appendix 2: 35% Drawings* (see drawings E-001, EA-101 and EA-201 dated June 1, 2016).

Page | 2

### Scope of Work

NORESCO will furnish and install new 60 hertz, 3-phase, 4-wire switchgear, as noted in Table 1.

### Table 1: Scope of Work for the Chase Building

Voltage	Amperes
120/208V	3,000A

### General Conditions

- NORESCO will field verify existing site conditions prior to conducting electrical demolition and installation. A licensed professional engineer licensed in the state of Connecticut will produce completed signed and sealed electrical drawings and specifications of the demolition, coordination and new installation per scope of work outlined in this document.
- An installation phasing plan and provisions to provide additional backup generation as required by the facility during the construction phase will be provided.

### New Switchgear Installation

- Disconnect existing feeders serving main switchboard. Disconnect the feeders served by the main switchboards serving the existing connected loads. Existing conductors will be retained for reconnection to replacement electrical equipment.
- Remove the existing 3000A, 208/120V main switchboard and associated six (6) utility meters.
- Dispose of the existing switchboard. NORESCO will rearrange existing conduit stub outs as required to match new electrical cabinet configuration.
- New switchgear will be rated to withstand expected short circuit current based on short circuit analysis.
- Provide and install a new 3000A, 208/120V main switchboard and one (1) single revenue meter.
- Existing conductors will be reconnected to serve the switchboard and existing loads. Damaged conductors will be replaced with new conductors of same size and type. Existing conduits will be reused.
- Remove existing 1200A fused distribution panelboard in main electrical room and wire directly into new main switchboard.
- Remove existing 800A secondary service meter (7th meter) and its panel board in East Basement.
- Provide and install a new 800A panelboard and connect into new main switchboard.

### Back Up Generation

- Provide a 208V/120V, natural gas fired standby/emergency generator, in a packaged sound attenuated, outdoor enclosure (installed capacity to be determined during final design).
- Provide concrete foundation for the new generator.

- Provide two (2) automatic transfer switches:
  - One (1) 400 A for essential IT loads, IT room air conditioning units in the IT room on the third floor, IDF room on the third floor, the boilers, and the Fire Department EOC area on the fourth floor
  - One (1) 100 A for emergency lights, replacing the existing battery-powered inverter system
- Remove existing emergency lighting inverter system in the basement.
- For the Fire Department EOC area, individual branch circuits will have to be field verified and wired to designated emergency power panel-3 on the fourth floor.
- Consolidate existing IT room circuits in new panelboards as indicated on EA-101, replacing existing panelboards in the backroom of the IT area on third floor.
- NORESCO will provide and install required grounding system per the National Electric Code, including but not limited to equipment grounding conductors, grounding electrodes, and ground bonding.

### City's Responsibilities

City shall be responsible for the removal or relocation of stored items in occupied spaces and mechanical rooms that interfere with work and staging areas. Customer shall clean mechanical room floors prior to start of work to assure they are free of oil, grease or other chemicals. Customer shall relocate furniture, file cabinets, or other obstructions in order to facilitate safe, unimpeded access to areas and equipment or otherwise interfere with the ESM implementation and installation process.

### Hazardous Materials Abatement Allowance

The scope of work (SOW) includes a project allowance in the amount of \$890,000 for testing and abatement of hazardous materials that may be encountered, including the abatement of lead and asbestos that may be encountered with this ESM. NORESCO may use this allowance for abatement at its discretion during the construction period. Any hazardous materials testing or abatement required for the completion of the SOW in excess of this allowance shall be the sole responsibility of the City. NORESCO makes no representations or warranties with respect to the amount or character of hazardous materials that may be encountered in the SOW. NORESCO will provide the City with an accounting of this allowance prior to Final Acceptance of the project. Any funds remaining in the allowance may be allocated to additional work through execution of a change order or remitted to the City.

### Design Allowance

The SOW Sum includes a design allowance in the amount of \$50,000 for ESM 14 that may be used to add additional scope to that measure after execution of the Contract at the request of the City. Use of this allowance will be authorized by execution of a change order by both Parties. Any funds remaining in the allowance may also be allocated to additional work at the City's request through execution of a change order or remitted to the City at the end of the Interim Period.

### Interface with Existing Systems & Operations

### Maintenance Procedures

There are no special maintenance procedures for the new electrical equipment.

### **Special Operating Requirements**

The new systems offer a high level of control but will operate simply and effectively. Following installation, NORESCO will provide a review of the system controls and features, explaining and demonstrating their use. It should be quickly realized that the units work much better than the old ones and without any special operating requirements.

### **Equipment Information**

### Manufacturer & Type

Switchgear and circuit breakers will be from the appropriate product lines of Eaton Cutler Hammer, Schneider Electric, or equal. The actual equipment selected will depend upon detailed design requirements and product availability.

- Eaton Cutler Hammer, 1111 Superior Avenue, Cleveland, OH 44114, 216-523-5000 www.eaton.com
- Schneider Electric, 1415 Roselle Road, Palatine, IL 60067, 847-397-2600, www.squared.com

### **Savings Calculations**

Not applicable for this ESM.

# **SECTION D:**

MEASUREMENT & VERIFICATION

## D. MEASUREMENT AND VERIFICATION

NORESCO develops measurement and verification (M&V) plans based on International Performance Measurement and Verification Protocol (IPMVP) and standards established by the Federal Energy Management Program (FEMP) of the U.S. Department of Energy. NORESCO's approach to development of M&V plans minimizes risk and maximizes return through a cost-benefit analysis that dictates which ESMs will employ more labor-intensive and costly methods and those ESMs that can be measured and verified using less costly methods. Table E-1 is a summary of the M&V protocols offered by NORESCO.

Table E-1: Summary of Measurement and Verification Protocols

Option	Description	How Savings Are Calculated
: <b>A</b>	Performance factors are determined with spot or short-term measurements and operational factors are stipulated based on analysis of historical data or spot/short-term measurements. Performance factors and proper operation are measured or checked annually.	Engineering calculations using spot or short-term measurements, computer simulations, and/or historical data.
В	Savings are determined by short-term or continuous measurements taken throughout the term of the contract at the device or system level. Both performance and operations factors are monitored.	Engineering calculations using metered data.
С	After project completion, savings are determined at the "whole-building" or facility level using current year and historical utility meter or submeter data.	Analysis of utility meter (or sub-meter) data using techniques from simple comparison to multivariate (hourly or monthly) regression analysis.
D	Savings are determined through simulation of facility components and/or the whole facility.	Calibrated energy simulation/modeling; calibrated with utility billing data and/or end-use metering.

NORESCO offers the following firm annual savings guarantee for each ESM, as noted in Table E-2. Table E-3, which follows, includes the M&V summary plan for this project.

Table E-2: M&V Option and Annual Savings Guarantee for Each Energy Savings Measure
