

**THE RED OAKS
SCHOOL**

PARENT CURRICULUM GUIDE

**2022-2023 Early Childhood Program
(Ages 3-6)**

Early Childhood at The Red Oaks School

The three-year Early Childhood curriculum is predicated on the belief that three- to six-year-olds have an incredible capacity to learn and accomplish and are capable of astonishing things that go well beyond common expectations. Our classrooms are multi-age allowing each student to progress at his/her optimal pace. There is a decided emphasis on igniting the natural enjoyment of learning. Students leave the Early Childhood program skilled, relaxed, and confident in their abilities.

The course of study is based on Montessori principles, using ingeniously designed hands-on materials, specific to the Montessori method, that are self-correcting and sequentially presented to each student individually. Self-correcting materials are those that can be “checked” and therefore completed independently by the student. For example, if there is an extra piece of a material left unused, the student is able to determine that a correction is needed and can continue to work with that material until mastery is achieved without waiting for teacher intervention. This builds confidence and allows each student to progress at his/her own pace. Classroom environments are designed to encourage independence. They are carefully planned, prepared, and maintained to ensure that students have materials available to challenge them as they progress through carefully sequenced activities and experiences.

Typically, children choose their work from the materials their teachers have prepared for them and have made available on the shelves of the classroom. Teachers may help guide student choice as a result of the observations and notes collected with regard to each individual student’s progress and work habits. Core areas of the classroom include Practical Life, Sensorial, Math, and Language, and Cultural Studies. In addition to developing solid academic skills, children learn about other cultures and the world around them. Music, Art, World Languages, and Physical Education are all important elements of the program.

Specific Areas of Study:

Practical Life

The term “Practical Life” is used to describe activities in the Montessori classroom which enable young children to perform simple everyday tasks for themselves. The key purpose of the Practical Life area is to facilitate growth in independence, concentration, and coordination. Materials and activities empower children to care for themselves and their surroundings. Materials are aesthetically pleasing and are designed to promote the development and growth of fine and gross motor skills, control of movement, and hand-eye coordination. Many of these activities have additional subtle purposes as well. For example, materials are often arranged and used in a “left to right” and “top to bottom” pattern in an effort to indirectly prepare students for reading and writing, while small grains used in a transferring activity require students to exercise the same pincer grip later used to correctly hold a pencil.

On any given day, students can be seen buttoning, snapping, zipping, and buckling specially designed frames as they practice the skills needed to dress. Others may be observed pouring water from various sized vessels, transferring spoons of rice between bowls, tweezing and arranging small items, grasping objects with tongs, or washing tables with sudsy sponges as they learn how to handle real utensils used in everyday life.

“Grace and Courtesy” lessons are those activities that help students develop a sense of classroom citizenship. Teachers model positive and appropriate social skills both formally and informally throughout the day. They can be seen role-playing how a child might resolve conflict, appropriately interrupt a conversation, or greet classmates upon arrival. The consistent use of respectful language such as “please” and “thank you” is an integral part of daily classroom life. In addition, teachers spend time giving lessons on walking carefully, carrying objects, and moving gracefully in the classroom.

Sensorial

The Sensorial materials in a Montessori classroom are designed specifically to hone the senses, enabling children to discriminate subtle differences. This type of discrimination prepares students to approach, analyze, and problem solve. It is the bedrock of mathematical thinking and logical reasoning.

Each activity isolates a specific sense and encourages practice and precision. Visual discrimination is sharpened as a student deliberately builds a prescribed pattern with wooden rods that vary only in length. Precision is required to match and then organize barely distinguishable shades of color on tablets designed for this purpose alone. Auditory discrimination is challenged when students are required to match and order cylinders that emit a variety of sounds and tones.

THE RED OAKS SCHOOL PARENT CURRICULUM GUIDE: EARLY CHILDHOOD

In addition to honing the student's use of his/her senses, the Sensorial materials provide countless opportunities for teachers to both model and present, in formal lessons, a rich vocabulary that students can later use to describe or explain relationships ("long, longer, longest," "heavy, heavier, heaviest"). Teachers play games, asking students to retrieve the "heaviest" or "lightest" cube. Students trace, observe, and use accurate nomenclature like "sphere" and "trapezoid" when working with polygons and 3D solids designed for the Sensorial area of the classroom.

The students are constantly exposed to concrete examples of the concepts they will later need to be able to understand in the abstract. The "longest side" of a triangle they trace may later become a "hypotenuse" on the page in front of them. The terms "similar" and "different" will be far from new as they remember how they searched through a stack of fabrics for two identical swatches. Honing the senses equips students to make sense of their immediate surroundings and gives them the tools for future learning and the language to express ideas in precise and accurate terms.

Language

The ROS Montessori Language curriculum addresses both expressive and receptive language skills. Rich spoken language is modeled and practiced and students progress through carefully planned activities as they prepare to read and write fluently. Teachers read rich literature and maintain a "print-rich" environment as a nod to Montessori's belief that many young children can read early and well.

The Montessori Language materials are sequential and presented to children individually as soon as they have the necessary preceding skills. A student's journey to fluency begins with multi-sensory materials designed to reinforce the sound/symbol relationship. Students trace sandpaper alphabetic symbols and practice pronouncing the correlating sounds. Lower case letters are used in an effort to expose students to those symbols most common in reading experiences. Associating sounds to those symbols rather than letter names allows for a quick and natural pathway to writing and reading.

THE RED OAKS SCHOOL PARENT CURRICULUM GUIDE: EARLY CHILDHOOD

Students arrange the alphabetic symbols of a “moveable alphabet” to form words. This encoding or “writing” with specially designed letters allows students to compose words and sentences without having to master the use of a pencil prior to doing so. This construction of language leads seamlessly to the blending of sounds needed for reading or “decoding.”

Simultaneously, students prepare to write; practicing their pencil grip and the strokes necessary for proper letter formation, employing left-right and top to bottom patterns. For example, they feel the sandpaper letters using their tactile sense, and they trace the geometric shapes of the metal inserts. They may trace letters in sand or in water and practice placing symbols appropriately on lines to solidify correct placement.

While the students continue to practice letter formation and placement, they are introduced to the Red Oaks Writing program. It draws various ideas from *Write from the Beginning*, a developmental writing program that employs *Thinking Maps*. The activities encourage students to expand, organize and illustrate their thoughts through the drawing of detailed pictures. After achieving some mastery of letter formation, the student is introduced to the concept of a word and then a sentence. As the writing progresses, the use of inventive (phonetic) spelling is common and age-appropriate.

Thinking Maps are tools that help students organize their thoughts, categorize, compare and contrast, sequence, and select pertinent facts from all of the information they have collected about a particular subject.

Throughout this entire process, teachers initiate oral language games to reinforce sound/symbol relationships as well as build the phonemic awareness needed to both decipher and construct words. For instance, a teacher will often gather a small group of children asking them to deconstruct the sounds of various items collected on a tray.

Once a student is able to read various phonetic word families, he/she is then introduced to phonograms like “th” and “sh,” blends, and various vowel combinations using similar multi-sensory materials. Concepts continue to be presented individually as each student is ready.

Students practice reading short and long vowel books and sight words. In addition, they work on reading comprehension and answering simple questions pertaining to the story.

The ROS student's journey through the acquisition of language is deliberate and individualized. The materials are constantly adjusted to meet the needs of each individual student.

Math

The Math materials in the Montessori classroom are carefully designed to both represent concepts and encourage needed repetition and practice. The materials are presented to students individually as each student masters the prerequisites necessary for success. The materials are presented in a sequential manner and each experience builds upon prior learning.

Each classroom is equipped with materials that reach far beyond common early childhood expectations. Each piece of material serves a specific purpose and demonstrates a specific concept of skill. Maria Montessori believed that allowing students to touch, count, build, and solve in a concrete manner enabled them to understand mathematical concepts typically reserved for older students.

Students typically begin their journey perfecting one-to-one correspondence, counting materials that encourage accuracy and perseverance. Because the materials are self-correcting, students can count and recount until their process is precise and accurate. Students "feel" ten before they learn to recognize the symbol that represents ten. This type of concrete experience enables students to accurately estimate and reason logically as they progress. As students count and group wooden spindles, the idea of a quantity being a "set" or a "collection of ones" facilitates deep and lasting understanding.

Soon after a student has a firm understanding of quantities and an accurate method of determining quantities, symbols are introduced. The materials used to introduce numerals are the same multi-sensory materials employed to introduce the alphabetic symbols. Sandpaper numbers are traced and students can be heard and seen rehearsing and ordering them in a variety of games and activities. They practice correct stroke formation in the same manner in

THE RED OAKS SCHOOL PARENT CURRICULUM GUIDE: EARLY CHILDHOOD

which they practiced their alphabetic symbols. Numbers are treated as a language and teachers model mathematical verbiage and thinking throughout the day.

The deliberate joining of symbols and quantities after both have been mastered separately ensures a true understanding of concepts beyond rote verbalization. Students can be seen counting and matching quantities to symbols using a wide variety of materials specifically prepared for this purpose. They “build” or compose quantities with materials designed to emphasize a number’s composition. For example, bars of ten beads joined together are used when building teens to show the unique relationship teens have with the number ten. The student literally “sees” twelve as “10 and 2.” In deference to Montessori’s commitment to both engage and challenge students, counting materials reach beyond the numbers 1-10 into the teens and beyond. Students have opportunities to employ beaded materials that demonstrate place value into the thousands.

Operational functions are demonstrated with both large and small quantities to emphasize the idea that “addition is joining” and “subtraction is taking away or separating.” For example, you may see students counting single beads, bars of ten beads, squares of one hundred beads, and cubes made of 1,000 beads in an effort to determine a sum after joining two piles of “golden bead” material with a friend on a rug. Cards designed to construct numerals well into the thousands are used to show quantities.

Students prepare for multiplication when they count specially designed chains made of bars of beads. You will hear students counting by five, “five, ten, etc.” as they lay their hands on each bar of five beads. This kind of concrete preparation for later application is a hallmark of Montessori math programs.

Cultural Studies

At the Primary level, we have a two-pronged approach to the cultural curriculum – Science and Geography. The purpose of this area is to connect the children to the world around them, encourage their natural curiosity, help them develop essential thinking and learning skills, and guide them on their way to becoming stewards of the environment and responsible global citizens.

Science

The purpose of the science curriculum is to arouse the children’s imagination and curiosity and to teach them to question the world around them. Students develop critical thinking skills such as recognizing the importance of the parts to the whole, sequencing, classifying and comparing and contrasting. They apply these learned skills in various situations – all of which help develop an independent learner/thinker. Through experimentation, children learn to question, observe, predict, and problem solve, introducing them to the scientific method. The students’ grasps of concepts and their abilities are assessed through observation during activities and discussions following the activity.

The Science curriculum aims to capitalize on the children’s sense of wonder and natural curiosity about nature and animals. This is done through the introduction to basic botany and zoology. First, the children are introduced to the “big picture” in a very concrete, multisensory manner. The concepts are presented through the various activities on the science shelves and reinforced in other areas of the classroom when appropriate. Gradually, teachers start to narrow it down and focus on certain aspects of the big picture. The activities are designed with the multi-age group in mind. The activities progressively build in complexity according to the children’s growing abilities.

The following concepts are introduced through the Primary cycle: the four elements (land, air, water, fire); classification of living and non-living things; classification of living things into plants or animals; life cycle of plants; life cycle of animals; classification of animals into vertebrate or invertebrate; classification of vertebrates into their five groups (fish, amphibians, reptiles, birds, and mammals).

According to the Next Generation Science Standards, students grades K-5 should begin to develop an understanding of the four scientific disciplinary core ideas:

- physical sciences
- life sciences
- earth and space sciences
- engineering, technology

In the early grades, students need to be able to recognize patterns and formulate answers to questions about the world around them.

Grade Level	Science Expectations
K	Students are expected to develop understanding of patterns and variations in local weather and the purpose of weather forecasting to prepare for, and respond to, severe weather.
K	Students are able to apply an understanding of the effects of different strengths or different directions of pushes and pulls on the motion of an object to analyze a design solution.
K	Students are also expected to develop understanding of what plants and animals (including humans) need to survive and the relationship between their needs and where they live. - Concepts covered in geography with the continent coverage
K	The crosscutting concepts of patterns; cause and effect; systems and system models; interdependence of science, engineering, and technology; and the influence of engineering, technology, and science on society and the natural world are called out as organizing concepts for these disciplinary core ideas.
K	Students are expected to demonstrate grade-appropriate proficiency in asking questions, developing and using models, planning and carrying out investigations, analyzing and interpreting data, designing solutions, engaging in argument from evidence, and obtaining, evaluating, and communicating information.

Geography

The purpose of the Geography curriculum is to help children, at an early age, gain a sense of their place in the world. They learn that people all around the world have the same basic needs: food, shelter, language, clothing, transportation, and currency. The manner in which people fulfill these needs depends on where they live and what they have available. The curriculum starts with the “big picture.” Earth is made of land (continents) and water (oceans). In the fall, we start with North America, the continent on which we live. The children are introduced to its location, the names of some of the countries, and its animals. Throughout the unit, the children develop and employ many essential skills in a series of varied activities. The

THE RED OAKS SCHOOL PARENT CURRICULUM GUIDE: EARLY CHILDHOOD

material is introduced to the children in a very concrete, multisensory and sequential manner. It is presented in various degrees of complexity matching their abilities.

The rest of the continents are introduced over the course of the school year. The unit on each continent follows a similar sequence of topics and activities covered in the North America unit. The children are encouraged to make connections and determine differences and similarities. The purpose, again, is to impress on the children that we all have the same basic needs even though we might go about fulfilling them in different ways.

The Geography curriculum lays the foundation for global citizens who have respect and empathy for their fellow man, wherever he lives. Our community service projects are closely linked to the units we cover in the curriculum. Through these projects, the children become aware that in our society, as well as in other countries, not everyone is able to fulfill their basic needs adequately. Some of the projects are locally based, while others are tied to the continents we study. In either case, the children experience the joy of giving.

Spanish

In the Primary level, the students are introduced to Spanish following the Syntalk Method. Using self-explanatory symbol cards, the students learn to speak before they start to read and write. They feel immediately empowered and can, from the start, articulate useful and relevant sentences, for example: "Rosa eats a cake, Rosa plays with the dog," etc.

The colorful symbol cards allow them:

- oral proficiency, learning to pronounce the words correctly
- vocabulary build-up and memorization
- awareness of subject-verb-object sentence structure sequence.

THE RED OAKS SCHOOL PARENT CURRICULUM GUIDE: EARLY CHILDHOOD

Each class is divided into three parts:

- Greeting song/conversation: Students are greeted with a song. The students will then engage in basic conversation with the teacher on topics that include proper greeting, weather, name and age, among others.
- Symtalk method cards: The cards will be used to make and “read” sentences, building and expanding the vocabulary, learning and using correct sentence structure.
- Song/ movement (3/4 year olds): Students will learn songs in Spanish relating to a variety of themes.

Activity book: Kindergartners will work on the Symtalk *Español 2* which will reinforce the material learned with the Symtalk cards. They will start reading and writing, identifying the vocabulary from a word bank. The Kindergartners learn colors, vocabulary, and are introduced to noun and adjective agreement.

This year, our cultural study will be about Spain. We will focus on learning about this country through lessons, songs, books, traditional stories and dance. Additionally, there will be a Spanish assembly in the spring highlighting what students have learned through the year.

Art

Art is one way students at ROS can explore differences and similarities in cultures, traditions, and philosophies. Our integrated approach extends from the classroom Cultural Studies and allows children to relate to and create works that echo the very peoples and places they are learning about in class.

Through the fine arts program at Red Oaks, the students participate in a vigorous study of the arts which is comprised of the following components:

- Art production – Involves critical thinking and imaginative processes, and the expression of the heart, mind, and hand.
- Art history - An examination of art and artists and their contributions to society. We ask the questions: “Why was art created?” “How was it used?” “What is the purpose?”
- Art criticism and aesthetics - Involves the students responding to, interpreting, and then applying critical thinking to their own art and the work of others. We ask the questions: “What was the artist trying to say?” “How did you come to that conclusion?” “How can the art be changed?”

The Primary art curriculum begins to examine creative thinking and builds fundamental skills and techniques that are foundational in these early developmental stages. The art curriculum encourages students through experimental and guided learning opportunities and through an

exploratory use of materials. Beginning with the basic elements of art, students learn the importance of line, color, and shape, and conduct a series of multimedia projects that draw inspiration from the world around them. Methods include drawing, painting, collage, and mixed media and students work toward artistic literacy.

Music

Music at ROS is both expressive and explorative. Students consider music from a wide variety of sources in an effort to understand and foster respect for cultures extending far beyond their experiences. Simultaneously, students learn fundamental skills to engender confidence and creative spirits. Students' early musical experiences help to set the stage for the perseverance needed for later study and practice.

There are three principles that guide the Music Program at The Red Oaks School:

- Children respond intuitively to rhythm and melody.
- Musical sounds are created by musical actions upon an instrument.
- Musical concepts are discussed only after they have been experienced.

The Primary Music program consists of a carefully prepared series of experiences that include singing, listening, moving, and playing instruments. Through these activities, children explore many elements of music, such as rhythm, melody, harmony, timbre, and form. Primary Music classes address the application of skills that are still being developed. Musically, students learn to match pitch, follow beat, and respond to musical cues. Additionally, they increase their attention spans, improve their motor skills, and practice appropriate socialization. Throughout the year, lessons and activities will foster artistic literacy through the processes of creating, performing, responding, and connecting.

Physical Education

The Red Oaks Physical Education curriculum is designed to help develop the physical literacy of students. The International Physical Literacy Association (2017) describes physical literacy as, "the motivation, confidence, physical competence, knowledge and understanding to value and take responsibility for engagement in physical activities for life."

Given that physical literacy is a lifelong process, we aim to develop a strong base of fundamental movement skills with our Early Childhood students. Fundamental movement skills are basic movement skills taught through a variety of individual and group games and activities that engage children and motivate them to continue participating in physical activity. These basic movement skills include:

- Locomotor (walk, run, dodge, jump, hop, skip)
- Non-locomotor (land, rotate, balance)

THE RED OAKS SCHOOL PARENT CURRICULUM GUIDE: EARLY CHILDHOOD

- Manipulative (throw, catch, kick, strike with an implement)

These basic skills are not only fun but also serve the purpose of teaching the essential skills required as a foundation for more complex physical activities and sports. It is of utmost importance that all children develop a good base of these skills before the onset of puberty to optimize both future performance and lifelong physical activity (City of Richmond, 2015).

Our units of instruction for this school year are as follows:

- Locomotor movement skills
- Throwing and catching
- Movement Composition (Gymnastics & Dance)
- Striking and Dribbling

Embedded within these units of instruction are opportunities for Early Childhood students to continue to develop their teamwork, cooperation, communication, and problem-solving skills through a variety of games and activities.
