

MATH SUMMER PACKET

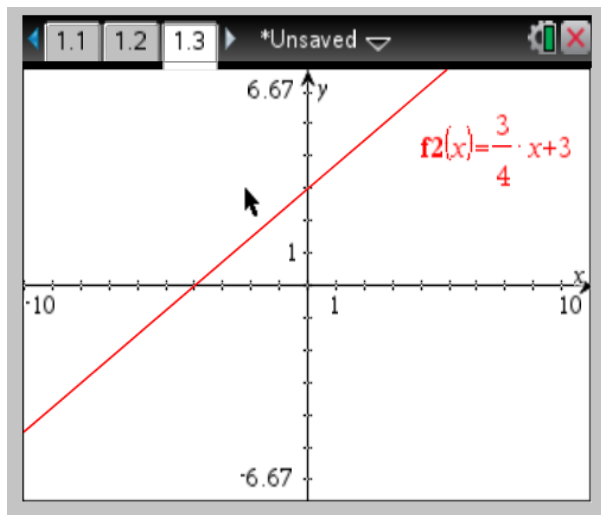

INSTRUCTIONF FOR THE TI-NSPIRE CX CALCULATOR

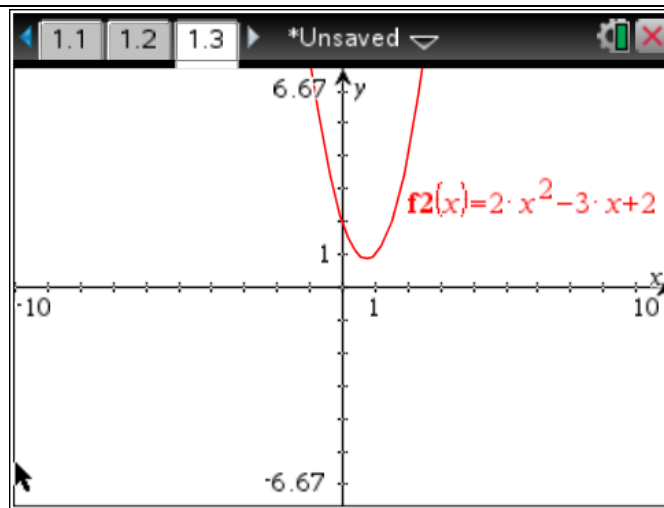

I. Using your graphing calculator (Keystrokes below are based on using a TI-Nspire calculator):

A. Be able to do **basic graphing**

a) Graph $y = \frac{3}{4}x + 3$

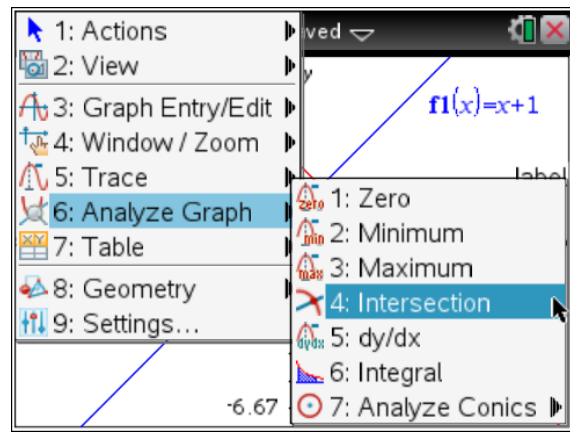

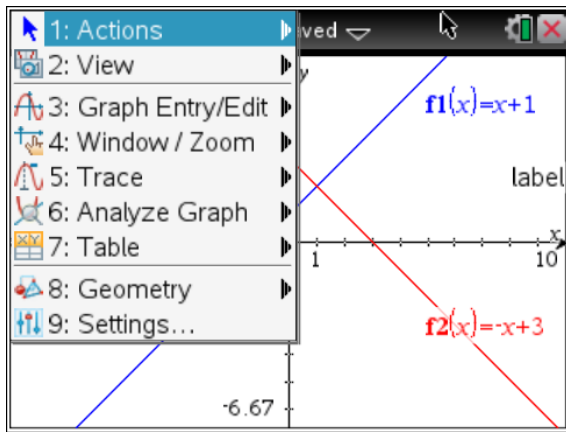

b) Graph $y = 2x^2 - 3x + 3$

- c) Find the intersection of the lines $y - x = 1$ using the intersection function on your calculator. .
 $y + x = 3$
 $y = x + 1$
 $y = -x + 3$
1. Solve the above Equations for y. 2. Graph on calculator

3. Press **Menu**. 4. Highlight **Analyze Graph** and **Intersection**.

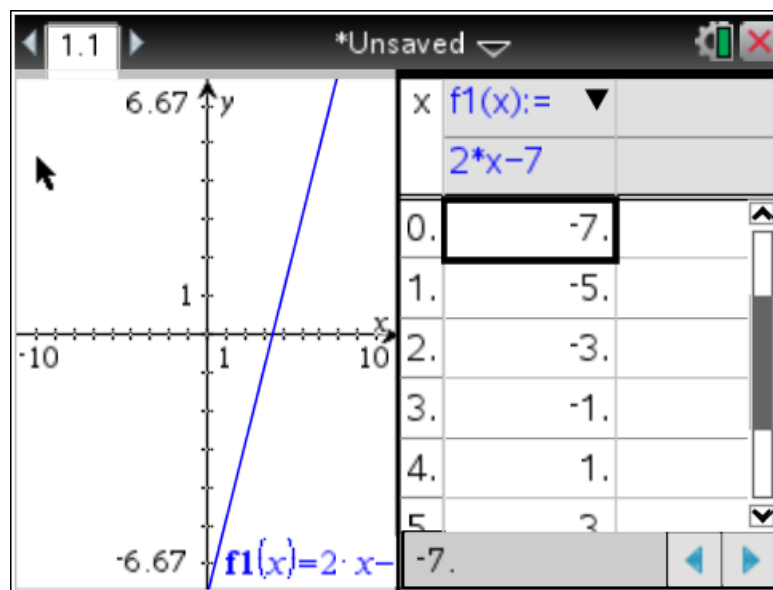

5. Using the cursor, highlight the upper and lower bounds and hit enter.

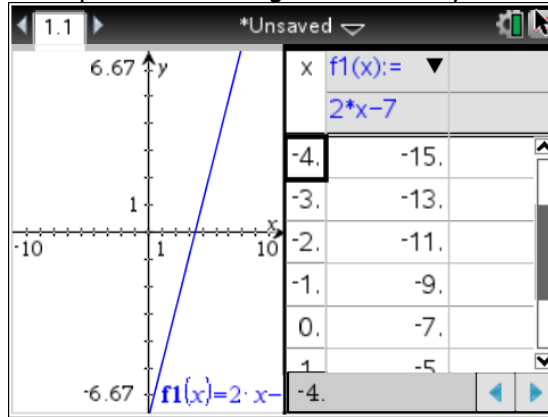

6. The x and y coordinates appear at the bottom of the screen. The solution to the system is (1,2)

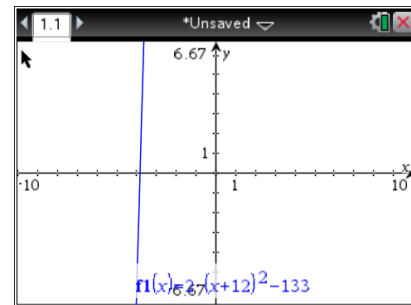

d) Find values **using tables**. 1. Graph the line $y = 2x - 7$ 2. Access the table by pressing **menu** and **Table** or use **CNTRL T**.

3. You can move up and down using the arrow keys while on the table.

e) To see the graph of $f(x) = 2(x+12)^2 - 133$, be able to **set the window manually**, using both your knowledge of functions and of the calculator.

To set the window so you can see the function, go to **Menu, Window/Zoom, and Window Settings**. Now, set your window by changing the values to look like the ones below.

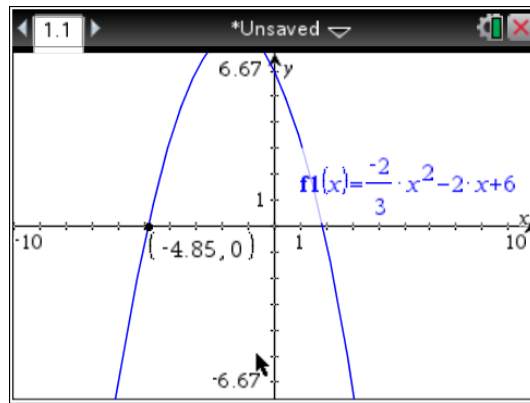

Your graph should look like the one at the left.

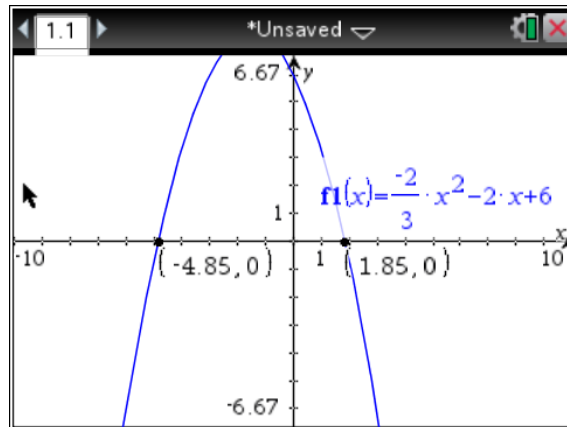

Be able to find the **zeros**, (also known as **roots** or **x-intercepts**) using the calculation menu.

Problem: Find the zeros of $f(x) = \frac{2}{3}x^2 - 2x + 6$

1. Enter the function into the calculator as a graph
2. Press **Menu, Analyze Graph, and Zero**.
3. Highlight the upper and lower bounds and hit enter.

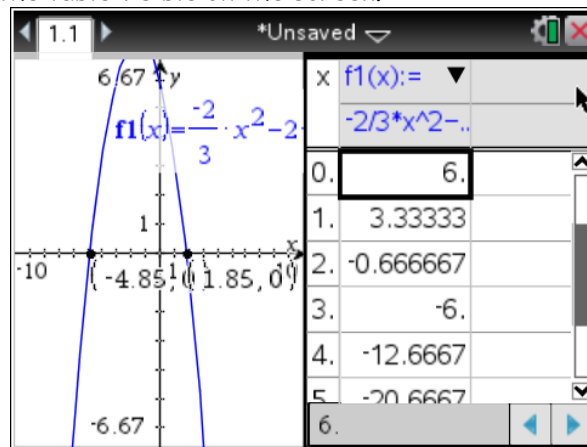

4. Repeat steps 2 and 3 to find the second zero.

C. Know how to use the Table Set function.

1. First, use CTRL T to get the table visible on the screen.

2. Access the Table Set function by pressing **Menu, Table, Edit Table Settings**. You can change the TABLE so that the x-value increases by different increments by changed the Table Step. You can also change the x-value to start with by changing Table Start.
