Summer 2023 Algebra 1 Summer Packet

Completion of this packet is required for all students enrolled in Algebra 1 for the upcoming school year. It looks long because it has review examples – you only need to do the circled problems. In addition to this packet, students are expected to have memorized the following:

- Multiplication facts to 12 x 12
- Perfect squares and square roots up to 15x15

The expectation for Algebra 1 is that you do your work <u>in pencil</u> on separate lined paper, copying each problem and showing all of your work neatly. <u>At SJCP, no work = no credit!</u> Clearly number each topic and problem. <u>Calculators are NOT permitted.</u>

Each page of the packet summarizes a concept with examples. Use those examples if you have trouble remembering how to do any of the problems. When you have finished the packet, check your answers against the answer key provided. Rework incorrect problems in a red or green pen until you are able to reach the correct answer. If you get stuck, use an old textbook, the internet, or one of the following websites:

www.purplemath.com www.khanacademy.org www.mathbitsnotebook.com www.mathantics.com

On the first day of school, this packet will be checked for completion, which includes neat and complete work on lined paper, and corrections made with a colored pen. A test on multiplication facts, perfect squares and square roots, and the material in this packet will be given during the first few days of school as your first test grade of the year. The score on this test is a strong indicator of success sin this class, and you may be required to attend mandatory tutoring if you score less than 75% on the test. Content from the packet will not be reviewed during class time.

For Algebra 1, the following materials will be required:

- Two thin and two chisel tip black Expo markers (to be with student in class at all times)
- Graphing calculator (TI-84 Plus or TI-84 Plus CE). Casio calculators are not permitted.
- 1" Binder plus a spiral or composition notebook dedicated to math. Notebooks and binders
 may be collected from time to time for grading, so your binder and notebook must be
 dedicated to math)
- Red and green pens for checking and correcting work
- Pencils (pens are not permitted for math work, even if erasable)
- Highlighters (2 colors)
- 6-inch or 12-inch ruler
- Graph paper and loose leaf paper

Good luck, pace yourself, and have a great summer!

Prime Factorization

Because 3 is a factor of 24 and 3 • 8 = 24, 8 is also a factor of 24. The pair 3, 8 is called a factor pair of 24.

The prime factorization of a composite number is the number written as a product of its prime factors. You can use factor pairs and a factor tree to help find the prime factorization of a number. The factor tree is complete when only prime factors appear in the product.

Example 1 A classroom has 42 students. The teacher arranges the students in rows. Each row has the same number of students. How many possible arrangements are there?

Use the factor pairs of 42 to find the number of arrangements.

$$42 = 1 \cdot 42$$

1 row of 42 or 42 rows of 1

$$42 = 2 \cdot 21$$

2 rows of 21 or 21 rows of 2

$$42 = 3 \cdot 14$$

3 rows of 14 or 14 rows of 3

$$42 = 6 \cdot 7$$

6 rows of 7 or 7 rows of 6

There are 8 possible arrangements: 1 row of 42, 42 rows of 1, 2 rows of 21, 21 rows of 2, 3 rows of 14, 14 rows of 3, 6 rows of 7, or 7 rows of 6.

Example 2 Write the prime factorization of 54.

Choose any factor pair of 54 to begin the factor tree.

Tree 1

54 \(\)
(3) • 18 Find a factor pair and draw "branches."

2.

Find factors until each branch ends at a prime factor.

Circle the prime factors as you find them.

$$3 \cdot 3$$

 $54 = 3 \cdot 2 \cdot 3 \cdot 3$

Tree 2

2) • 27

The prime factorization of 54 is 2 • 3 • 3 • 3, or 2 • 3³.

Practice

12. 126

- 13. 154
- (14.) 310

Find the greatest perfect square that is a factor of the number.

- 15. 117
- 16. 150

17. 539

936

19. EXERCISE An exercise class has 28 participants. The instructor arranges the participants in rows. Each row has the same number of participants. How many possible arrangements are there?

Greatest Common Factor

Factors that are shared by two or more numbers are called **common factors**. The greatest of the common factors is called the **greatest common factor** (GCF). There are several different ways to find the GCF of two or more numbers.

Example 1 Find the greatest common factor (GCF) of 56 and 104.

Method 1 List the factors of each number. Then circle the common factors.

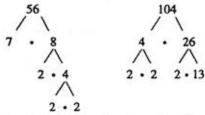

Factors of 56: (12)(17,8) 14, 28, 56

Factors of 104: (1)(2)(4)(8) 13, 26, 52, 104

The common factors are 1, 2, 4, and 8. The greatest of these common factors is 8.

► So, the GCF of 56 and 104 is 8.

Method 2 Make a factor tree for each number.

Write the prime factorization of each number. Then circle the common prime factors. The GCF is the product of the common prime factors.

$$56 = (2) \cdot (2) \cdot (2) \cdot 7$$

$$104 = (2) \cdot (2) \cdot (2) \cdot 13$$

So, the GCF of 56 and 104 is $2 \cdot 2 \cdot 2 = 8$.

Practice

Check your answers at BigIdeasMath.com.

Find the GCF of the numbers using the two methods shown above.

- 1. 30, 45
- (2) 12, 54
- 3. 16, 96
- 4. 42,98

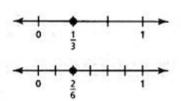

- 5. 27, 66
- 6. 50, 160
- 7. 21,70
- (8) 76, 95

- 9. 60, 84
- 10. 60, 120, 210
- 11. 44, 64, 100
- 12. 15, 28, 7
- 13. Write a set of two numbers that have a GCF of 20. Explain how you found your answer.
- 14.) Write a set of three numbers that have a GCF of 25. Explain how you found your answer.
- 15.) BOUQUETS A florist is making identical bouquets using 90 white roses, 60 red roses, and 45 pink roses.

 What is the greatest number of bouquets that the florist can make if no roses are left over? How many of each color are in each bouquet?
- 16. FABRIC You have two pieces of fabric. One piece is 6 feet wide and the other piece is 7.5 feet wide. You want to cut both pieces into strips of equal width that are as wide as possible. How wide should you cut the strips of fabric?

Equivalent Fractions and Simplifying Fractions

The number lines show the graphs of two fractions, $\frac{1}{3}$ and $\frac{2}{6}$. These fractions represent the same number. Two fractions that represent the same number are called **equivalent fractions**. To write equivalent fractions, you can multiply or divide the numerator and the denominator by the same nonzero number.

Example 1 Write two fractions that are equivalent to $\frac{8}{12}$.

Multiply the numerator and denominator by 2.

$$\frac{8}{12} = \frac{8 \cdot 2}{12 \cdot 2} = \frac{16}{24}$$

$$\frac{8}{12} = \frac{8 \div 2}{12 \div 2} = \frac{4}{6}$$

Two equivalent fractions are $\frac{16}{24}$ and $\frac{4}{6}$.

A fraction is in simplest form when its numerator and its denominator have no common factors besides 1.

Example 2 Write the fraction $\frac{18}{24}$ in simplest form.

Divide the numerator and denominator by 6, the greatest common factor of 18 and 24.

$$\frac{18}{24} = \frac{18 \div 6}{24 \div 6} = \frac{3}{4}$$

$$ightharpoonup \frac{18}{24}$$
 in simplest form is $\frac{3}{4}$.

Practice

Check your answers at BigldeasMath.com.

Write two fractions that are equivalent to the given fraction.

2.
$$\frac{3}{7}$$

3.
$$\frac{10}{15}$$

4.
$$\frac{16}{20}$$

5.
$$\frac{9}{30}$$

$$(6)^{\frac{1}{8}}$$

7.
$$\frac{9}{16}$$

$$\frac{12}{14}$$

Write the fraction in simplest form.

9.
$$\frac{18}{27}$$

10.
$$\frac{3}{18}$$

11.
$$\frac{35}{50}$$

12.
$$\frac{14}{32}$$

13.
$$\frac{4}{36}$$

$$(14)\frac{48}{80}$$

15.
$$\frac{24}{63}$$

16.
$$\frac{33}{88}$$

17.
$$\frac{45}{100}$$

18.
$$\frac{60}{150}$$

$$19.\frac{48}{96}$$

20.
$$\frac{110}{170}$$

- 21. Is the fraction $\frac{45}{61}$ in simplest form? Explain.
- 22.) Write five fractions that each simplify to one-ninth.
- 23. SLEEP It is recommended that 10- to 17-year old students should sleep about 9 hours each night. What fraction of the day is this? Write your answer in simplest form.

Adding and Subtracting Fractions

To add or subtract two fractions with like denominators, write the sum or difference of the numerators over the denominator.

Adding or Subtracting Fractions with Like Denominators

$$\frac{a}{c} + \frac{b}{c} = \frac{a+b}{c}$$
, where $c \neq 0$ $\frac{a}{c} - \frac{b}{c} = \frac{a-b}{c}$, where $c \neq 0$

$$\frac{a}{c} - \frac{b}{c} = \frac{a-b}{c}$$
, where $c \neq 0$

Example 1 Find $\frac{7}{12} + \frac{1}{12}$.

$$\frac{7}{12} + \frac{1}{12} = \frac{7+1}{12}$$

Add the numerators.

$$=\frac{8}{12}$$
, or $\frac{2}{3}$ Simplify.

Example 2 Find $\frac{7}{9} - \frac{2}{9}$.

$$\frac{7}{9} - \frac{2}{9} = \frac{7-2}{9}$$

Subtract the numerators.

$$=\frac{5}{9}$$

Simplify.

To add or subtract two fractions with unlike denominators, first write equivalent fractions with a common denominator. There are two methods you can use.

Adding or Subtracting Fractions with Unlike Denominators

Method 1 Multiply the numerator and the denominator of each fraction by the denominator of the other fraction.

Method 2 Use the least common denominator (LCD). The LCD of two or more fractions is the least common multiple (LCM) of the denominators.

Example 3 Find
$$\frac{1}{8} + \frac{5}{6}$$
.

Example 4 Find
$$5\frac{3}{4} - 1\frac{7}{10}$$
.

Method 1:
$$\frac{1}{8} + \frac{5}{6} = \frac{1 \cdot 6}{8 \cdot 6} + \frac{5 \cdot 8}{6 \cdot 8}$$

Rewrite using a common denominator of $8 \cdot 6 = 48$.

Method 2: Rewrite the difference as $\frac{23}{4} - \frac{17}{10}$.

=
$$\frac{6}{48} + \frac{40}{48}$$
 Multiply.
= $\frac{46}{48}$, or $\frac{23}{24}$ Simplify.

The LCM of 4 and 10 is 20. So, the LCD is 20.

$$\frac{23}{4} - \frac{17}{10} = \frac{23 \cdot 5}{4 \cdot 5} - \frac{17 \cdot 2}{10 \cdot 2}$$
 Rewrite using the LCD, 20.
$$= \frac{115}{20} - \frac{34}{20}$$
 Multiply.
$$= \frac{81}{20}, \text{ or } 4\frac{1}{20}$$
 Simplify.

Practice

Check your answers at BigIdeasMath.com.

Evaluate.

1.
$$\frac{1}{14} + \frac{5}{14}$$

2.
$$\frac{2}{5} + \frac{1}{5}$$

3.
$$\frac{9}{10} - \frac{1}{10}$$

4.
$$\frac{11}{16} - \frac{3}{16}$$

5.
$$\frac{5}{8} + \frac{7}{8}$$

6.
$$\frac{1}{6} + \frac{1}{6}$$

7.
$$\frac{7}{9} + \frac{2}{3}$$

8.
$$\frac{3}{5} + \frac{4}{7}$$

$$9.\frac{3}{4} - \frac{1}{6}$$

10.
$$\frac{7}{12} - \frac{5}{9}$$

$$(11) \frac{9}{10} - \frac{9}{6}$$

12.
$$\frac{5}{12} + \frac{11}{16}$$

13.
$$2\frac{3}{5} + 1\frac{2}{5}$$

14.
$$4\frac{6}{7} - 2\frac{4}{7}$$

15.
$$5\frac{5}{12} + 3\frac{3}{8}$$

16.
$$8\frac{1}{3} - 3\frac{2}{11}$$

17.
$$\frac{1}{2} + 3\frac{2}{9}$$

18.
$$4\frac{3}{14} - \frac{1}{7}$$

$$(19.)\frac{2}{7} + \frac{3}{4} + \frac{1}{2}$$

$$(20)$$
 $\frac{13}{16} - \frac{1}{4} - \frac{1}{4}$

21.
$$2\frac{1}{6} - \frac{5}{9} + \frac{2}{3}$$

Multiplying and Dividing Fractions

To multiply two fractions, multiply the numerators and multiply the denominators.

Multiplying Fractions
$$\frac{a}{b} \cdot \frac{c}{d} = \frac{a \cdot c}{b \cdot d}, \text{ where } b, d \neq 0$$

Example 1 Find $\frac{2}{5} \cdot \frac{3}{6}$.

$$\frac{2}{5} \cdot \frac{3}{8} = \frac{2 \cdot 3}{5 \cdot 8}$$

$$12 \cdot 3$$

Multiply the numerators. Multiply the denominators.

$$=\frac{1}{8\cdot 3}$$

Divide out common factors.

$$=\frac{3}{20}$$

Simplify.

Example 2 Find $5\frac{1}{2} \cdot \frac{3}{4}$.

$$5\frac{1}{2} \cdot \frac{3}{4} = \frac{11}{2} \cdot \frac{3}{4}$$
 Rewrite $5\frac{1}{2}$ as $\frac{11}{2}$.

$$=\frac{11\cdot 3}{2\cdot 4}$$

Multiply the numerators. Multiply the denominators.

$$=\frac{33}{8}$$
, or $4\frac{1}{8}$ Simplify.

Two numbers whose product is 1 are reciprocals. To write the reciprocal of a number, write the number as a fraction. Then invert the fraction. Every number except 0 has a reciprocal.

To divide a number by a fraction, multiply the number by the reciprocal of the fraction.

Dividing Fractions
$$\frac{a}{b} \div \frac{c}{d} = \frac{a}{b} \cdot \frac{d}{c} = \frac{a \cdot d}{b \cdot c}, \text{ where } b, c, d \neq 0$$

Example 3 Find $\frac{3}{7} \div \frac{5}{6}$.

$$\frac{3}{7} \div \frac{5}{6} = \frac{3}{7} \cdot \frac{6}{5}$$

$$= \frac{3 \cdot 6}{7 \cdot 5}$$
Multiply by the reciprocal of $\frac{5}{6}$, which is $\frac{6}{5}$.

$$= \frac{3 \cdot 6}{7 \cdot 5}$$
Multiply.

$$= \frac{18}{26}$$
Simplify.

Example 4 Find $8 \div 2\frac{1}{3}$.

$$8 \div 2\frac{1}{3} = 8 \div \frac{7}{3}$$
Rewrite $2\frac{1}{3}$ as $\frac{7}{3}$.
$$= 8 \cdot \frac{3}{7}$$
Multiply by the reciprocal of $\frac{7}{3}$, which is $\frac{3}{7}$.
$$= \frac{8 \cdot 3}{7}$$
Multiply.
$$= \frac{24}{7}$$
, or $3\frac{3}{7}$ Simplify.

Practice

Operations with Integers

Adding and Subtracting Integers

The absolute value of an integer is the distance between the number and 0 on a number line. The absolute value of a number x is written as |x|.

Example 1 Find the absolute value of -5.

So,
$$|-5| = 5$$
.

Rules for Adding and Subtracting Integers

Adding:

To add integers with the same sign, add the absolute values of the integers. Then use the common sign.

To add integers with different signs, subtract the lesser absolute value from the greater absolute value. Then use the sign of the integer with the greater absolute value.

Subtracting: To subtract an integer, add its opposite.

Example 2 Find (a) -3 + (-8) and (b) -9 + 6.

a.
$$-3 + (-8) = -11$$
 Add $|-3|$ and $|-8|$. Use the common sign.

b.
$$-9 + 6 = -3$$
 $|-9| > |6|$. So, subtract $|6|$ from $|-9|$. Use the sign of -9 .

► The sum is -11.

The sum is −3.

Example 3 Find (a) 5 - (-12) and (b) 1 - 7.

a.
$$5 - (-12) = 5 + 12$$
 Add the opposite of -12 .
= 17 Add.

b.
$$1 - 7 = 1 + (-7)$$
 Add the opposite of 7.
= -6 Add.

The difference is 17.

➤ The difference is -6.

Example 4 Simplify |-14 - (-10)|.

$$-14 - (-10) = |-14 + 10|$$
 Add the opposite of -10 .
 $= |-4|$ Add.
 $= 4$ Find the absolute value.

So,
$$|-14 - (-10)| = 4$$
.

Operations with Integers

Multiplying and Dividing Integers

Rules for Multiplying and Dividing Integers

Multiplying and Dividing: The product or quotient of two integers with the same sign is positive.

The product or quotient of two integers with different signs is negative.

Example 5 Find (a) $-7 \cdot (-1)$ and (b) $-9 \cdot 4$.

- a. -7 (-1) = 7 The integers have the same sign, so the product is positive.
 - The product is 7.

Example 6 Find (a) 18 \div (-2) and (b) -25 \div (-5).

- **a.** $18 \div (-2) = -9$ The integers have different signs, so the quotient is negative.
 - ► The quotient is -9.

- **b.** $-9 \cdot 4 = -36$ The integers have different signs, so the product is negative.
 - ➤ The product is -36.

b. $-25 \div (-5) = 5$ The integers have the same sign, so the quotient is positive.

The quotient is 5.

Practice

Check your answers at BigIdeasMath.com.

Find the absolute value.

Evaluate.

10.
$$-8 + 20$$

$$(-8 + (-3) + 6)$$

Simplify the expression.

Evaluate.

22.
$$-33 \div (-3)$$

$$(27) \frac{0}{-12}$$

$$(29) \frac{-16}{-1}$$

- 33. ELEVATION The highest elevation in California is 14,494 feet, on Mount Whitney. The lowest elevation in California is -282 feet in Death Valley. Find the range of elevations in California.
- 34. GOLF The table shows a golfer's score for each round of a tournament. Find the golfer's total score and the golfer's mean score per round.

	Round 1	Round 2	Round 3	
Score	-3	-4	+1	

Operations with Rational Numbers

To add, subtract, multiply, or divide rational numbers, use the same rules for signs as you used

Example 1 Find (a) $-\frac{5}{6} + \frac{2}{3}$ and (b) 7.3 - (-4.8).

a. Write the fractions with the same denominator, then add.

$$-\frac{5}{6} + \frac{2}{3} = -\frac{5}{6} + \frac{4}{6} = \frac{-5+4}{6} = \frac{-1}{6} = -\frac{1}{6}$$

b. To subtract a rational number, add its opposite.

$$7.3 - (-4.8) = 7.3 + 4.8 = 12.1$$

The opposite of -4.8 is 4.8.

Example 2 Find (a) 2.25 • 8, (b) -2.25 • (-8), and (c) -2.25 • 8.

a.
$$2.25 \cdot 8 = 18$$
 b. $-2.25 \cdot (-8) = 18$

c.
$$-2.25 \cdot 8 = -18$$

Example 3 Find $-\frac{4}{9} \div \frac{3}{4}$.

To divide by a fraction, multiply by its reciprocal.

$$-\frac{4}{9} \div \frac{3}{4} = -\frac{4}{9} \cdot \frac{4}{3} = -\frac{4 \cdot 4}{9 \cdot 3} = -\frac{16}{27}$$
 The reciprocal of $\frac{3}{4}$ is $\frac{4}{3}$.

The reciprocal of
$$\frac{3}{4}$$
 is $\frac{4}{3}$.

Practice

$$(14)$$
 $-\frac{3}{4} \cdot \frac{7}{12}$

(15)
$$\frac{5}{8} \div \left(-\frac{1}{4}\right)$$

$$\frac{16}{7} \div \frac{4}{7} \div$$

- 17. TEMPERATURE The temperature at midnight is shown. The outside temperature decreases 2.3°C over the next two hours. What is the outside temperature at 2 A.M.?
- 18. SNOWFALL In January, a city's snowfall was \(\frac{5}{8}\) foot below the historical average. In February, the snowfall was $\frac{3}{4}$ foot above the historical average. Was the city's snowfall in the two-month period above or below the historical average? By how much?

Evaluating Algebraic Expressions

An algebraic expression is an expression that may contain numbers, operations, and one or more symbols. A symbol that represents one or more numbers is called a variable. To evaluate an algebraic expression, substitute a number for each variable. Then use the order of operations to find the value of the numerical expression.

Example 1 Evaluate each expression when x = 3.

a.
$$5x + 7$$

$$5x + 7 = 5(3) + 7$$
 Substitute 3 for x.
= 15 + 7 Multiply.
= 22 Add.

b.
$$14 - x^2$$

$$14 - x^2 = 14 - 3^2$$
 Substitute 3 for x.
= 14 - 9 Evaluate power.
= 5 Subtract.

c.
$$2x^2 - 8x + 4$$

$$2x^2 - 8x + 4 = 2(3)^2 - 8(3) + 4$$
 Substitute 3 for x.
 $= 2(9) - 8(3) + 4$ Evaluate power.
 $= 18 - 24 + 4$ Multiply.
 $= -2$ Simplify.

Example 2 Evaluate each expression when x = -2 and y = 6.

a.
$$7x - 5y$$

 $7x - 5y = 7(-2) - 5(6)$
 $= -14 - 30$
 $= -44$

b.
$$x^2 - 2xy + y^2$$

 $x^2 - 2xy + y^2 = (-2)^2 - 2(-2)(6) + 6^2$
 $= 4 - 2(-2)(6) + 36$
 $= 4 - (-24) + 36$

Practice

Check your answers at BigIdeasMath.com.

Evaluate the expression when x = 2 and y = -3.

1.
$$3x + 10$$

$$3.5 - y^2$$

4.
$$4x^2 + 9$$

5.
$$y^2 + 8y - 4$$

6.
$$-3x^2 - x + 7$$

1.
$$3x + 10$$
 2. $14 - 2y$ 3. $5 - y^2$ 4. $4x^2 + 9$ 5. $y^2 + 8y - 4$ 6. $-3x^2 - x + 7$ 7. $0.75x - 4x - 1.5$ 8. $3(y + 8 - 4y)$

8.
$$3(y + 8 - 4y)$$

9.
$$2x + 3y$$

11.
$$4x^2 + 3y$$
 12. $x^2 - y^2$

12.
$$x^2 - y^2$$

(13.)
$$y - x + y^2$$

$$(14) x^2y^2 + xy$$

$$15) \frac{x+y}{y-x}$$

$$16. \ \frac{2x+y}{xy}$$

Copy and complete the table.

-4x + 1					

19. MONEY You earn 8x + 7y dollars for working x hours at a restaurant and y hours at a bus station. How much do you earn for working 12 hours at the restaurant and 16 hours at the bus station?

Properties of Equality

Addition Property of Equality

Words When you add the same number to each side of an equation, the two sides remain equal.

Numbers
$$6 + 4 = 6 + 4$$

$$10 = 10$$

Algebra
$$x - 5 + 5 = 3 + 5$$

$$x = 8$$

Subtraction Property of Equality

Words When you subtract the same number from each side of an equation, the two sides remain equal.

Numbers
$$7 - 2 = 7 - 2$$

Algebra
$$y + 3 - 3 = 1 - 3$$

$$y = -2$$

Multiplication Property of Equality

Words When you multiply each side of an equation by the same nonzero number, the two sides remain equal.

Numbers
$$\frac{6}{3} \cdot 3 = 2 \cdot 3$$

Algebra
$$\frac{z}{3} \cdot 3 = 2 \cdot 3$$

Division Property of Equality

Words When you divide each side of an equation by the same nonzero number, the two sides remain equal.

Numbers
$$6 \cdot 2 \div 2 = 12 \div 2$$

$$6 = 6$$

Algebra
$$\frac{2w}{2} = \frac{12}{2}$$

Example 1 Solve each equation. Tell which algebraic property of equality you used.

a.
$$c-3=-2$$

$$c-3+3=-2+3$$

Addition Property of Equality

Simplify.

The solution is c = 1. The property is the Addition Property of Equality.

b.
$$\frac{d}{\epsilon} = 7$$

$$\frac{d}{5} \cdot 5 = 7 \cdot 5$$

Multiplication Property of Equality

$$d = 35$$

Simplify

The solution is d = 35. The property is the Multiplication Property of Equality.

Practice

Check your answers at BigldeasMath.com.

Solve the equation. Tell which algebraic property of equality you used.

1.
$$h-6=2$$

2.
$$\frac{j}{3} = 9$$

(3.)
$$k + 8 = -9$$

4.
$$4m = 12$$

5.
$$n+2=6$$

6.
$$\frac{p}{6} = -2$$

$$(7.)q - 3 = -8$$

8.
$$8r = 48$$

9.
$$s + 9 = 9$$

$$(10.)$$
 $6t = 48$

11.
$$w + 3 = 29$$

$$(12.)\frac{z}{7} = 7$$

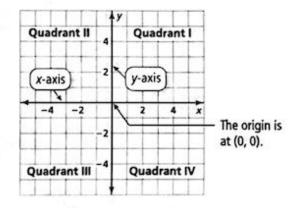

The Coordinate Plane

A coordinate plane is formed by the intersection of a horizontal number line and a vertical number line.

The number lines intersect at the origin and separate the coordinate plane into four regions called quadrants.

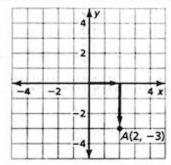

An ordered pair is used to locate a point in a coordinate plane.

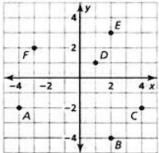

Example 1 Plot the point A(2, -3) in a coordinate plane. Example 2 What ordered pair corresponds to point A? Describe the location of the point,

Start at the origin. Move 2 units right and 3 units down. Then plot the point. The point is in Quadrant IV.

Point A is 4 units to the left of the origin and 2 units down. So, the x-coordinate is -4 and the y-coordinate is -2.

► The ordered pair (-4, -2) corresponds to point A.

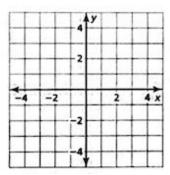

Practice

Plot the ordered pair in a coordinate plane. Describe the location of the point.

$$(2)$$
 $B(-2,2)$

8.
$$H(4,\frac{1}{2})$$

Check your answers at BigIdeasMath.com.

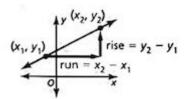

Use the graph in Example 2 to answer the questions.

- 9. What ordered pair corresponds to point C?
- 10. What ordered pair corresponds to point F?

Slope of a Line

The slope of a nonvertical line is the ratio of vertical change (rise) to horizontal change (run) between any two points on the line. If a line in the coordinate plane passes through points (x_1, y_1) and (x_2, y_2) , then the slope m is

$$m = \frac{\text{rise}}{\text{run}} = \frac{\text{change in } y}{\text{change in } x} = \frac{y_2 - y_1}{x_2 - x_1}.$$

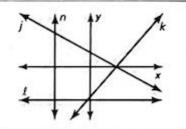

Slopes of Lines in the Coordinate Plane

Negative slope: falls from left to right, as in line j

Positive slope: rises from left to right, as in line k

Zero slope (slope of 0): horizontal, as in line &

Undefined slope: vertical, as in line n

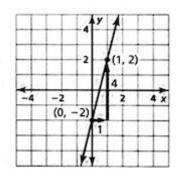

Example 1 Find the slope of the line shown.

Let $(x_1, y_1) = (0, -2)$ and $(x_2, y_2) = (1, 2)$.

slope =
$$\frac{y_2 - y_1}{x_2 - x_1}$$
 Write formula for slope.

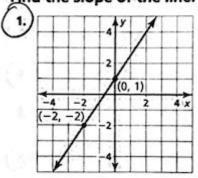

$$=\frac{2-(-2)}{1-0}$$
 Substitute.

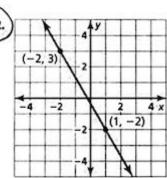

Simplify.

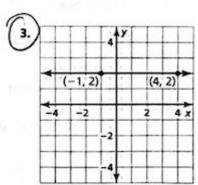

Practice

Find the slope of the line.

Check your answers at BigIdeasMath.com.

Adding and Subtracting Polynomials

To add polynomials, add like terms. You can use a vertical or a horizontal format.

Example 1 Find each sum.

a.
$$(5x^2 + 3x - 7) + (x^2 + 2)$$

Use a vertical format. Align like terms vertically and add.

$$\begin{array}{r}
 5x^2 + 3x - 7 \\
 + x^2 + 2 \\
 \hline
 6x^2 + 3x - 5
 \end{array}$$

b.
$$(-4x^3 - x + 1) + (2x^2 + 8x - 9)$$

Use a horizontal format. Group like terms and simplify.

$$(-4x^3 - x + 1) + (2x^2 + 8x - 9) = (-4x^3 + 2x^3) + (-x + 8x) + (1 - 9)$$
$$= -2x^3 + 7x - 8$$

To subtract a polynomial, add its opposite. To find the opposite of a polynomial, multiply each of its terms by -1.

Example 2 Find each difference.

a.
$$(6x^3 - 2x - 5) - (-x^3 + 3x^2 + 4)$$

Use a vertical format. Align like terms vertically and subtract.

b.
$$(5x^2 + 7x - 3) - (4x^2 - + 2x - 1)$$

Use a horizontal format. Group like terms and simplify.

$$(5x^2 + 7x - 3) - (4x^2 - + 2x - 1) = 5x^2 + 7x - 3 - 4x^2 + 2x + 1$$
$$= (5x^2 - 4x^2) + (7x + 2x) + (-3 + 1)$$
$$= x^2 + 9x - 2$$

Practice

Check your answers at BigIdeasMath.com.

Find the sum or difference.

$$(-8x+2)+(-10x-7)$$

(3)
$$(x^2 - 2x - 6) + (6x^2 + x + 8)$$

5. $(-7x^3 - x^2 + 10) - (3x^2 + 2x - 2)$
(7) $(x^2 + 4x + 1) + (-x^2 - 1)$
9. $(2x^3 - 5) - (-8x^2 - 5x)$

5.
$$(-7x^3 - x^2 + 10) - (3x^2 + 2x - 2)$$

$$(7)(x^2+4x+1)+(-x^2-1)$$

9.
$$(2x^3-5)-(-8x^2-5x)$$

$$(2.)(x^3+9x)-(4x^3-x)$$

4.
$$(2x^3 + 5x^2 - x) + (x^3 - 10x^2 + 5x)$$

$$(6.)(x^3 + 8x + 3) - (-x^3 + 2x^2 - 5)$$

8.
$$(3x^3-2x^2)-(5x^3-x^2-x)$$

10.
$$(-x^2-4)+(x^3-4x^2)$$

The Distributive Property

To multiply a sum or difference by a number, multiply each number in the sum or difference by the number outside the parentheses, then evaluate.

Distributive Property

With addition: 5(7 + 3) = 5(7) + 5(3)

$$a(b+c) = a(b) + a(c)$$

With subtraction: 5(7-3) = 5(7) - 5(3)

$$a(b-c) = a(b) - a(c)$$

Example 2 Simplify each expression.

a.
$$6(x+9)$$

$$6(x+9) = 6(x) + 6(9)$$

$$= 6x + 54$$

b.
$$10(12+z+7)$$

$$10(12 + z + 7) = 10(12) + 10(z) + 10(7)$$

$$= 120 + 10z + 70$$

$$= 10z + 190$$

c.
$$16(8w - 3)$$

$$16(8w - 3) = 16(8w) - 16(3)$$

$$= 128w - 48$$

d.
$$5(4m-3n-1)$$

$$5(4m - 3n - 1) = 5(4m) - 5(3n) - 5(1)$$

$$=20m-15n-5$$

Practice

Check your answers at BigldeasMath.com.

Evaluate.

1.
$$25(7 + 11)$$

2.
$$4(13-5)$$

3.
$$9(16+7-8)$$

Simplify the expression.

5.
$$4(y + 7)$$

6.
$$-2(z+5)$$

7.
$$5(b-11)$$

$$(8)$$
 $-8(d-1)$

9.
$$12(4a + 13)$$

10.
$$9(20 + 17m)$$

12.
$$-7(-2n-9)$$

13.
$$3(x+4+9)$$

15.
$$8(p-6-5)$$

16.
$$-10(4 + v - 1)$$

17.
$$7(2x+7+9y)$$

$$(18)$$
 $-4(4r-s+17)$ 19. $-3(-12-3d-8)$

19.
$$-3(-12-3d-8)$$

20.
$$2-6(2n-9)$$

21.
$$1.5(6c + 10d + 3)$$

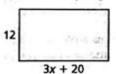

$$(22)$$
 $\frac{3}{4}(q + \frac{1}{6} + \frac{7}{8})$

23.
$$-2.4(5h-10+4)$$

24.
$$0.5(2.6x + 5.8)$$

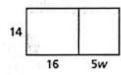

Write and simplify an expression for the area of the rectangle.

7.

9.

Powers and Exponents

A power is a product of repeated factors. The base of a power is the common factor. The exponent of a power indicates the number of times the base is used as a factor.

base
$$\left(\frac{2}{5}\right)^3 = \frac{2}{5} \cdot \frac{2}{5} \cdot \frac{2}{5}$$
 exponent power $\frac{2}{5}$ is used as factor 3 times

Example 1 Write each product using exponents.

a.
$$(-9) \cdot (-9) \cdot (-9) \cdot (-9) \cdot (-9)$$

Because -9 is used as a factor 5 times, its exponent is 5.

So,
$$(-9) \cdot (-9) \cdot (-9) \cdot (-9) \cdot (-9) = (-9)^5$$
.

Because π is used as a factor 2 times, its exponent is 2. Because h is used as a factor 3 times, its exponent is 3.

So,
$$\pi \cdot \pi \cdot h \cdot h \cdot h = \pi^2 h^3$$
.

Example 2 Evaluate each expression.

$$(-5)^4 = (-5) \cdot (-5) \cdot (-5) \cdot (-5)$$

= 625

Write as repeated multiplication.

Simplify.

$$-5^4 = -(5 \cdot 5 \cdot 5 \cdot 5)$$
$$= -625$$

Write as repeated multiplication.

Practice

Check your answers at BigIdeasMath.com.

Write the product using exponents.

$$(-n) \cdot (-n) \cdot (-n) \cdot (-n)$$

Evaluate the expression.

$$\bigcirc \left(\frac{3}{4}\right)^3$$

$$(10)$$
 $(-\frac{1}{2})^3$

11. VOLUME Write an expression involving a power that represents the volume (in cubic centimeters) of the die shown. Then find the volume.

Perimeter and Area of Figures

Perimeter and Area of Polygons

The perimeter P of a figure is the distance around the figure. The area A of a figure is the number of square units enclosed by the figure.

Perimeter and Area

Square

Rectangle

$$P = 4s$$

$$P = 2\ell + 2w$$

Triangle

$$P = a + b + c$$

$$A = \frac{1}{2}bh$$

Parallelogram

Trapezoid

$$A = bh$$

$$A = \frac{1}{2}h(b_1 + b_2)$$

Example 1 Find the perimeter and area of the figure.

$$P = 2\ell + 2w = 2(7) + 2(5)$$

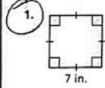

$$A = \ell w$$
$$= 7(5)$$

Practice

Check your answers at BigldeasMath.com.

Find the perimeter and area of the figure.

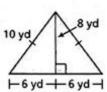

Find the area of the figure.

7.

Use a geometric formula to solve the problem.

- 9. A triangle has a base of 7 feet and an area of 63 square feet. Find the height.
- 10. A rectangle has a length of 6 inches and a perimeter of 28 inches. Find the width.
