

THE MANGROVE FORESTS

ABOUT THE FOREST

Mangrove forests grow in coastal areas. These trees are special because they grow in salty water. These forests are found in India, Asia and even in Florida!

RIVER BANK

Mangrove forests have important jobs. They prevent the river bank from wearing away by the rising tides and waves. The water they live in helps to form this special landform. Without the mangroves, the river bank would wear away.

LIFE IN THE ROOTS

Many animals call the mangroves home, including birds, fish, snakes, and even tigers! Some animals are only found here in the mangrove forests. They make their homes in the long roots that stretch deep into the water.
