In order to establish a community in which the preservation of the environment is a top priority, people must begin to assess and change the way they visualize the material world. Sustainability can be applied by the community as a whole, by businesses, and by individuals. Each level has started taking initiative in realizing the need for sustainability beyond basic environmental awareness. People are voicing concerns about organizations that aren't effectively managing wastes, resources and emissions. Parallel to this concern is the future prospect of greenhouse gas emission regulations for businesses. The continued practice of Ignoring sustainability usues also leads to record heat waves, disastrous storms, increased energy prices, and global insecurity. The awareness of these realizations influence individuals to align sustainability goals with business strategies: creating new business values, improving corporate image, reducing risk, and attracting and retaining employees.

of the environment. Whether sustainability is practiced by a community as a whole or businesses, it needs to be compounded by individual participation within these organizations. In the following report, a business model for Eco-Scape will be provided. The business model will improve the level of sustainability within communities by providing steady revenue, employment opportunities, and offering a number of services that promote a sustainability in citizens with green values. Throughout the remainder of this report, this business model will be discussed in terms of the price of the business (sustainable communities and beyond), the product itself (in four service segments), the pricing (financial analysis), and the promotion strategy (heavy advertising and use of public relations). Through the implementation of this business model communities can expect to experience value through the stable revenues, employment opportunities and the spreading of green values that Eco-Scape provides.

Eco-Scape will be placed in a very specific portion of the market: sustainable communities. In order to fully understand the level impact and pressing need for a business model like Eco-Scape, it is important to first understand the current nature of sustainable communities. In the changing world today, the switch to sustainable and green practices has become imperatives. According to *American City & County Magazine*, "each time we build a road or a bridge the way we've been doing it, we're committing ourselves to 50 to 75 more years of doing business as usual". Once these practices are integrated into the daily life of a community, value can be seen in its effects on the economy, the environment, and people's quality of life (Jackson).

Sustainable communities are becoming increasingly important as more world citizens realize the damaging effects of the world's harsh treatment of the environment. The three core concepts that establish a successful sustainable community are donned as the "three E's" of sustainability and include economy, equity, and environment (Jackson, 2009). These three factors must work together in harmony in order for communities to be successful over an extended period of time.

Participants or residents of a sustainable community must consider how their community "meets the needs of the present generation without sacrificing the ability of future generations to meet their needs" (Beatley, 2009). Some of the most important green practices for green and clean cities include sustainable transport, energy efficiency, green building, recycling and zero waste techniques, but the challenge is finding the strengths in each practice and how they can act together (Beatley, 2009).

Proponents on the green movement argue that one community in one place is not enough to create change. In order to make any significant difference, people need "tools and practices that can be repeated across space and time" (Weich, 2010). It is clear that the development of sustainable communities is a crucial issue for the future of our society as a whole and should be necognized as such. The realization of the relevance of this issue should encourage citles large and small to make a commitment to change and to the health and sustainability of future generations.

Being sustainable and eco-friendly is not a cheap venture. It involves a large investment of both the time and money of members of the community. When attempting to support a family of their own, the idea of additional resources allocated toward the community can be burdensome to residents. The resources needed are based around six central needs of the sustainable communities.

These six core needs of the community include water, shelter, energy, food, infrastructure, and jobs. Considering the nature of a soft the community to accommonity to include mater, shelter, energy, food, infrastructure, and jobs. Considering the nature of a soft the community is to mater in an enduring manner, rather than implementing a temporary fix for the problem. The only way for a community to accommodate these needs is through a significant allocation of funds. In most communities, this idea of funding is the major roadblock.

The generation of a steady revenue will help to sustain the basic needs of these communities. As this steady inflow of cash is collected and builds, the community can satisfy its needs and no longer worry about the day-to-day survival of the community

ine mercury news

SAN JOSE, Calif. — As an inferno roared toward the town of Paradise in November, police Lieutenant Anthony Borgman desperately tried to reach Cal Fire for information about its progress.

But his cell phone was useless, silenced by damage and loss of power to cell towers and electrical lines. The phones of many of the town's residents also went mute, preventing them from giving or getting information that could have saved lives.

Residents trapped, 911 down as Hurricane Ian makes landfall in Florida
