When the HOA switch is in off position, turn the fan off.
When the HOA switch is in auto position, operate the fan subject to the unit enable signal, and unit operating modes defined below.
During startup, correlate the fan speed settings to set fan operating points as detailed below:
Set the Supply Fan Minimum Speed Setpoint (SF-CO-MIN) based on the scheduled fan minimum airflow.
Set the Supply Fan Maximum Speed Setpoint (SF-CO-MAX) based on the scheduled fan maximum airflow.
Utilize a soft-start sequence when first energizing the fan. Fan initial setpoint shall be equal to the Supply Fan Minimum Speed Setpoint (SF-CO-MIN). Start the fan at its initial setpoint and slowly ramp up its speed to the current speed setpoint.
When in Occupied Mode:
Energize the fan and increase fan speed to its initial setpoint. Fan remains energized when in Occupied Mode.
When in Cooling Mode:
Modulate fan between the Supply Fan Minimum Speed Setpoint (SF-CO-MIN) and the Supply Fan Maximum Speed Setpoint (SF-CO-MAX) to maintain the Zone Temperature (Z-T) at the Zone Temperature Cooling Setpoint (Z-T-C).
When in Minimum Cooling Mode:
Operate fan at the Supply Fan Minimum Speed Setpoint (SF-CO-MIN).
Minimum Cooling Mode operation takes precedence over Cooling Mode operation.
When in Heating Mode:
Modulate fan between the Supply Fan Minimum Speed Setpoint (SF-CO-MIN) and the Supply Fan Maximum Speed Setpoint (SF-CO-MAX) to maintain the Zone Temperature (Z-T) at the Zone Temperature Heating Setpoint (Z-T-H).

The controller shall use linear interpolation to define Outside Air Damper and Return Air Damper positions that ensure the desired Outside Airflow Setpoint (OA-AF-SP) is provided as the supply air fan speed changes.
During startup, correlate Outside Air Damper and Return Air Damper positions that yield the Outside Airflow Setpoint (OA-AF-SP) according to the following table:

Supply Fan Speed	OD Position	RD Position
SF-CO-MIN	OD-P1	RD-P1
SF-CO-MAX	OD-P2	RD-P2

Calculation of the Outside Air Damper Position Setpoint (OD-P-SP) based on the current Outside Airflow Setpoint (OA-AF-SP) and linear interpolation as follows:
At least once per minute while the zone is in Occupied mode, calculate Outside Air Damper Position Setpoint (OD-P-SP) as a linear interpolation between OD-P1 and OD-P2 based on the current fan speed.

CONTROL LOOPS
SUPPLY FAN CONTROL – VARIABLE SPEED (MULTI ZONE VAV)
When the HOA switch is in hand position, operate the fan at the speed set manually by the operator at the user interface of the drive.
When the HOA switch is in off position, turn the fan off.
When the HOA switch is in auto position, operate the fan subject to the unit enable signal, and unit operating modes defined below.
During startup, correlate the fan speed settings to set fan operating points as detailed below:
Set the Supply Fan Minimum Speed Setpoint (SF-CO-MIN) based on the scheduled fan minimum airflow.
Set the Supply Fan Maximum Speed Setpoint (SF-CO-MAX) based on the scheduled fan maximum airflow.
Utilize a soft-start sequence when first energizing the fan. Fan initial setpoint shall be equal to the Supply Fan Minimum Speed Setpoint (SF-CO-MIN). Start the fan at its initial setpoint and slowly ramp up its speed to the current speed setpoint.
When in Occupied Mode:
Energize the fan and increase fan speed to its initial setpoint. Fan remains energized when in Occupied Mode.
Modulate fan between the Supply Fan Minimum Speed Setpoint (SF-CO-MIN) and the Supply Fan Maximum Speed Setpoint (SF-CO-MAX) to maintain the Supply Air Duct Static Pressure (SA-DSP) at the Supply Air Duct Static Pressure Setpoint (SA-DSP-SP).
When in Unoccupied Mode:
Fan shall be permitted energize in response to requests for heating and cooling form the zone level.
Current Number of Requests Logic:
Heat/Cool requests are generated by the Mechanical Control System based on information from associated zone terminal units. Refer to the contract documents for more information on system associations.
For each individual associated zone unit, send a Zone "X" Heat/Cool Request (X-Z-T-R) when the current zone heating or cooling setpoint is not satisfied. This indicates that supply air is needed from the associated Air Handling Unit. Heating requests from Fan Powered Terminal units equipped with a heating coil and capable of recirculation shall be ignored.
Multiply each Zone "X" Heat/Cool Request (X-Z-T-R) by its Zone "X" Heat/Cool Request Weighting Factor (X-Z-T-W). The sum of weighted requests for every associated zone shall be recorded as the Supply Fan Request Total (SF-R).
When the Supply Fan Request Total (SF-R) is greater than the Supply Fan Number of Ignored Requests (T-I):
Energize the fan and increase fan speed to its initial setpoint.
Modulate fan between the Supply Fan Minimum Speed Setpoint (SF-CO-MIN) and the Supply Fan Maximum Speed Setpoint (SF-CO-MAX) to maintain the Supply Air Duct Static Pressure (SA-DSP) at the Supply Air Duct Static Pressure Setpoint (SA-DSP-SP).
When the Supply Fan Request Total (SF-R) is less than or equal to the Supply Fan Number of Ignored Requests (T-I):
Turn off the supply fan.
When in Economizer Mode:
Operate as described in Occupied Mode or Unoccupied Mode as applicable.
When in Freeze Protection Level 2 Mode:
Turn the fan off.

MIXED AIR DAMPERS – DAMPER POSITION TRACKING CONTROL
The mixed air damper assembly consists of an Outside Air Damper (OD) and Return Air Damper (RD) damper that modulate with an inversely proportional relationship.
The controller shall use linear interpolation to define Outside Air Damper and RD positions that ensure the desired Outside Airflow Setpoint (OA-AF-SP) is provided as the supply air fan speed changes.
During startup, correlate Outside Air Damper and RD positions that yield the Outside Airflow Setpoint (OA-AF-SP) according to the following table:

Supply Fan Speed	OD Position	RD Position
SF-CO-MIN	OD-P1	RD-P1
SF-CO-MAX	OD-P2	RD-P2

Calculation of the Outside Air Damper Position Setpoint (OD-P-SP) based on the current Outside Airflow Setpoint (OA-AF-SP) and linear interpolation as follows:
At least once per minute while the zone is in Occupied mode, calculate Outside Air Damper Position Setpoint (OD-P-SP) as a linear interpolation between OD-P1 and OD-P2 based on the current fan speed.
Calculation of the Return Air Damper Position Setpoint (RD-P-SP) based on the current Outside Airflow Setpoint (OA-AF-SP) using similar logic presented above.
When in Occupied Mode:
When in Economizer Mode:
Modulate the Outside Air Damper and Return Air Damper to maintain the Supply Air Temperature (SAT) at the Supply Air Temperature Setpoint (SAT-SP).
Outside Air Damper is permitted to modulate between the fully open position and the calculated Outside Air Damper Position Setpoint (OD-P-SP).
RD is permitted to modulate between the closed position and the calculated Return Air Damper Position Setpoint (RD-P-SP).
When not in Economizer Mode:
Modulate the Outside Air Damper to its calculated Outside Air Damper Position Setpoint (OD-P-SP) based on the Outside Airflow Setpoint (OA-AF-SP).
Modulate the Return Air Damper to its calculated Return Air Damper Position Setpoint (RD-P-SP) based on the Outside Airflow Setpoint (OA-AF-SP).
When in Unoccupied Mode:
When in Economizer Mode:
Modulate the Outside Air Damper and Return Air Damper to maintain the Supply Air Temperature (SAT) at the Supply Air Temperature Setpoint (SAT-SP).
The Outside Air Damper and Return Air Damper are permitted to modulate between the fully open and closed positions.
When not in Economizer Mode:
Close the Outside Air Damper. Open the Return Air Damper to its maximum position.
When in Freeze Protection Level 2 Mode:
Close the Outside Air Damper. Open the Return Air Damper to the fully open position.
Freeze Protection Mode takes precedence over any other active mode.
When in Optimum Start Mode:
When in Economizer Mode:
Operate as described in Occupied Mode.
When not in Economizer Mode:
Operate as described in Unoccupied Mode.

SUPPLY AIR FILTER MONITORING – RUN TIME
Provide time count labeled as Supply Air Dirty Filter Elapsed Time (DF-SA-ET). Increase time count to whenever the associated fan is on. Provide maintenance reminder for filter change when elapsed time is greater than or equal to Supply Air Dirty Filter Elapsed Time (DF-SA-ET) setpoint. Reset time count to zero when filters are changed.

MECHANICAL CONTROLS

SEQUENCE OF OPERATIONS
CENTRAL CHILLED WATER PLANT

This sequence of operations is organized into the following main categories: operating modes, control setpoint resets, safeties, overrides and interlocks, and component control loops. The operating modes describe the criteria that either enable or disable the various modes of operation. If a mode of operation is not listed within a component control loop section then that mode of operation has no direct influence on the operation of the component. The control setpoint reset section describes the logic and reference variables that will be used to reset control setpoints to a new value within its reset range. The safeties, overrides, and interlocks section outlines the hardwired interlocks that will be required to meet life safety requirements. Safeties and interlocks take precedence over all other control strategies outlined in this document. The control responses of each component for the various modes of operation are described in the component control loop sections.

The sequence of operations, the points list and control diagrams shall be used to provide a complete description of the control philosophy for the controlled equipment. Individual setpoint values, reset ranges, and alarm action levels are listed in the points list. Components and control sensor locations are graphically depicted on the control diagram. The controls contractor shall be responsible for coordinating any necessary time delay setpoints to establish stable system operation.

GENERAL DESCRIPTION
The chilled water plant sequence of operations shall modifies the existing constant primary flow chilled water to a constant volume primary with variable chilled water secondary configuration.

2 Refer to previous project for chiller controls. HEI project number - 225005449.

The test and balance contractor shall perform the following:
1. Ramp one pump from minimum speed to design speed and record the total amp draw from the pump at every 3 Hz interval.
2. Start another pump and repeat step 1 for the pumps operating simultaneously.
3. Repeat step 2 until the amp draw for all scheduled pumps operating simultaneously has been recorded.
The pump staging setpoints shall be determined from the rpm speed at which operating more pumps at the same flow rate draws less amperage than the current quantity of operating pumps.

1. Ramp the operating pumps down to minimum speed.
2. Turn the lag pump on.
3. Ramp the operating pumps together to meet setpoint.
When staging off a lag pump:
