

XC (Coed) Participation Statistics, Specific to 2023

XC Coed Participation Rates!

When considering the number of cross country runners relative to the population of the high school, one question presents itself: Which schools had the largest percentage of cross country runners walking their hallways in this season?

Due to space limitations and in consideration of shifting classifications, rather than 6A/5A/4A/3A/2A/1A, the public schools are grouped by student population as "Large" (1101+ students; 57 schools on this list), "Medium" (1100-451 students; 48 schools), and "Small" (450-150; 62 schools), and there is a separate list for all "Private Schools" (all sizes down to a minimum population of 300). The reason for the size cutoff is because the smaller the school, the more disproportionate an affect on the statistics per student-athlete relative to the larger schools. Similarly, private schools are separated out into their own category.

XC (Girls) Participation Statistics, Specific to 2023

XC Girls Participation Rates!

Rarely do teams have an equal number of girls and boys. This page is an effort to determine which teams have the highest percentage of their schools female population running cross country this season.

Due to space limitations and in consideration of shifting classifications, rather than 6A/5A/4A/3A/2A/1A, the public schools are grouped by student population as "Large" (1101+ students; 57 schools on this list), "Medium" (1100-451 students; 48 schools), and "Small" (450-150; 62 schools), and there is a separate list for all "Private Schools" (all sizes down to a minimum population of 300). The reason for the size cutoff is because the smaller the school, the more disproportionate an affect on the statistics per student-athlete relative to the larger schools. Similarly, private schools are separated out into their own category. For determining this percentage, a baseline assumption is that there is an equal split between the genders in the school population.
