

The following pay example is if you came in at the beginning of the year.

Gross Contract Salary		Full Year Work Days		Daily Rate
\$44,023.00	÷	184	=	\$239.26

Daily Rate		Days Remaining in Assignment		Total Gross Prorated Salary
\$239.26	x	184.00	=	\$44,023.00

Total Gross Prorated Salary		Number of Pays Remaining		Monthly Gross Proration
\$44,023.00	÷	12	=	\$3,840.05

This example shows you would receive a monthly paycheck of 1/12 of your yearly salary, which equates to \$3,840.05.

However, if you came in midway through the year, your monthly paychecks would be as follows:

Gross Contract Salary		Full Year Work Days		Daily Rate
\$44,023.00	÷	184	=	\$239.26

Daily Rate		Days Remaining in Assignment		Total Gross Prorated Salary
\$239.26	x	94.00	=	\$22,490.00

Total Gross Prorated Salary		Number of Pays Remaining		Monthly Gross Proration
\$22,490.00	÷	8	=	\$2,811.25

It shows that coming in and working 94 days instead of the full year calendar of 184, you would earn \$22,490 total gross prorated salary. This example would spread that amount over 8 paychecks and would give you a monthly salary of \$2,811.25 per month.
