

The following pay example is if you came in at the beginning of the year.

<b>Hourly Rate</b>		<b>Hours Per Day</b>		<b>Daily Rate</b>
\$21.56	X	5.00	=	\$107.80

<b>Daily Rate</b>		<b>Days Remaining in Assignment</b>		<b>Total Gross Prorated Salary</b>
\$107.80	X	183.00	=	\$19,727.40

<b>Total Gross Prorated Salary</b>		<b>Number of Pays Remaining</b>		<b>Monthly Gross Proration</b>
\$19,727.40	÷	12	=	\$1,643.95

This example shows that you would receive a monthly paycheck of 1/12 of your yearly salary, which equates to \$1,643.95.

However, if you came in midway through the year, your monthly paychecks would be as follows:

<b>Hourly Rate</b>		<b>Hours Per Day</b>		<b>Daily Rate</b>
\$21.56	X	5.00	=	\$107.80

<b>Daily Rate</b>		<b>Days Remaining in Assignment</b>		<b>Total Gross Prorated Salary</b>
\$107.80	X	93.00	=	\$10,025.40

<b>Total Gross Prorated Salary</b>		<b>Number of Pays Remaining</b>		<b>Monthly Gross Proration</b>
\$10,025.40	÷	8	=	\$1,253.18

It shows that coming in and working 93 days instead of the full year calendar of 183, you would earn \$10,025.40 total gross prorated salary. This example would spread that amount over 8 paychecks and would give you a monthly salary of \$1,253.18 per month.
