### **EXECUTIVE SUMMARY**

The Demographic and Enrollment Analysis update for the Gilbert Unified School District (District) incorporates information on enrollment, demographic trends, housing occupancy rates, household characteristics and residential development into 10-year projections of enrollment. In addition to the District-wide enrollment forecasts, projections are developed for small-area planning geographies, referred to as "grids", that are generally a quarter of a square mile in developed and developing areas, and sometimes larger in the periphery. The grids divide the District into 224 sub-areas that are consistent with current school attendance areas and provide sufficient detail to support facility and attendance area planning activities.

Some of the main findings and conclusions from this report include:

- These projections are being prepared amid the early months of the COVID-19 pandemic. While there will certainly be some level of long-term economic and demographic impacts associated with this event, it is simply too early to predict what those specific quantitative impacts might be and how they will affect District enrollment. Currently, we expect that Fall 2020/21 District enrollment levels will not be significantly impacted since short-term demographic changes will be minimal and any new housing impacting enrollment for next year is already under construction. The bigger enrollment impacts may be felt in 2021/22 due to the recession that will likely result from the economic impacts of the COVID-19 pandemic; however, such a recession may still be relatively minor in metropolitan Phoenix
- Total K-12 enrollment in the District was 34,544 in the fall of the 2019/20 school year, representing a slight increase of nearly 200 students (0.6 percent) over the previous year. This enrollment was the result of a 480-student increase in out-of-District enrollment, which was partially offset by a 290-student decline in in-District enrollment. The decrease in enrollment over the past five years was largely due to a drop in in-District enrollment, which has declined by nearly six percent (1,800 students) since 2014/15; out-of-District enrollment, which currently accounts for about 15 percent of total District enrollment, declined by just three percent (150 students) during the same time period but has increased the last two years which has offset the in-District losses.
- Of the 5,250 out-of-District students that were enrolled in 2019/20, 60 percent came from Mesa Unified School District and the Higley Unified School District. Compared to 2018/19, the number of out-of-District students enrolled in the District increased by 481 students this year due to strong gains in the number of students that were attracted from both the Mesa Unified School District and the Chandler Unified School District. This year the strongest annual out-of-District enrollment increases occurred in the 11th and 12<sup>th</sup> grades. Overall, out-of-District enrollment growth in the four high school grades accounted for the majority (53 percent) of the annual increase in total out-of-District enrollment.
- Between 2000 and 2019, the share of the population under 5 years of age fell from 10 percent of the total population to 6.9 percent, due to the aging of the existing population and the sharp decline in birth rates that accompanied the recession. Persons in the 25 to 44 age group, which is most closely correlated with having young children, constituted about 36 percent of the total population in 2000 but fell to 28 percent in 2019. Meanwhile, the population aged 45 to 64 years has grown significantly, increasing from about 17 percent to 25 percent; this growth has fueled the increase in enrollment at the high school level during the same period. Between 2010 and 2019, the share of householders under the age of 45 dropped from 46 percent to 43 percent; this is another sign of an aging population that can result in fewer young children and an increase in older children. In 2000 there were over 3 persons per household on average in the District, a reflection of the young families that moved into new subdivisions at the edge of the metropolitan region. By 2019 the population per household fell to 2.75 persons as the District matured and new, entry-level housing became more limited in the District.

- There are 15 charter schools operating within the District and 25 charter schools within one mile of District boundaries; combined, these schools serve nearly 19,900 students. Enrollment in grades K-8 comprises the vast majority (80 percent) of the 19,900 charter students in the area; this is down from a share of roughly 85 percent that had persisted for several years. In just the past three years, nearby charter enrollment has increased by 38 percent (3,400 students), while in-District charter enrollment increased by 13 percent (850 students) during the same period. In both cases, the share of 9-12 students has steadily increased since 2016/17; high school students now account for nearly 20 percent of total local charter enrollment (up from 14 percent three years ago).
- While 0.585 school-age persons are being generated per household, the District only enrolls 0.397 students per household, resulting in an E-P ratio of 0.800, or 80 percent in 2019/20. The net difference between the school-age population and total District enrollment includes the loss of some 13,900 in-District school-age persons to other providers and the gain of nearly 5,300 students at District schools from outside of the District. In the past 19 years, the District's net E-P ratio has fallen by more than 14 percent (from .934 to .801), or roughly 0.61 percent per year. However, the rate has been steady the last two years due to large increases in the number of students from outside the District.
- The continued decline in school-age population per household is expected to result in a net gain of only 580 school-age persons during the 10-year period. When the projected school-age population is combined with the District's falling E-P ratio, a loss of about 3,400 students is projected by 2029/30 (roughly 10 percent of 2019/20 enrollment), yielding total enrollment of 31,160 K-12 students.
- By 2024/25, 19 of the 26 elementary attendance areas are projected to experience some degree of enrollment decline; these losses are somewhat offset by gains in the remaining attendance areas, particularly the Finley Farms (+254 students) attendance area, resulting in a net loss of 190 in-District students for the period; with the addition of roughly 270 new out-of-District students, total enrollment is projected to increase by about 80 students by 2024/25. In the second five-year period, all but two attendance areas are expected to decline, resulting in a loss of 750 in-District students for the period; the only gains during this period are in the Boulder Creek (+320 students) and Meridian (+85 students) attendance areas. Out-of-District enrollment is also projected to decrease by roughly 100 students, resulting in a net decrease of another 850 K-6 students by 2029/30.
- Over the first five years all of the junior high attendance areas are projected see enrollment declines. Including a slight decline in out-of-District enrollment, enrollment is expected to drop by about 750 students by 2024/25. In the second half of the projection period, enrollment losses are projected to moderate somewhat; an enrollment increase in the Desert Ridge Junior High attendance area (+80 students) and slight increase in out-of-District enrollment is projected to partially offset losses in the remaining attendance, resulting in a net decrease of another 260 students for the period.
- During the first five-year period, an enrollment increase in the Highland High School (+70 students) attendance area is expected to partially offset losses in the remaining attendance areas; the largest loss this period is projected for the Gilbert attendance area (-220 students). The projected in-District enrollment losses combine with a 50-student decrease in out-of-District enrollment to yield a net loss of 560 students by 2024/25. During the second half of the projection period, out-of-District enrollment is expected to increase slightly (70 students), but in-District 9-12 enrollment losses accelerate; only the Desert Ridge attendance area is projected to see a gain of about 110 students. The largest decrease during the second five-year period is forecast for the Highland (430 students) attendance area. A net loss of 1,120 in-District students combined with the increase in out-of-District enrollment results in a net loss of an additional 1,050 high school students during the second half of the projection period.

## 1.0 Introduction

The Demographic and Enrollment Analysis for the Gilbert Unified School District (District) incorporates information on enrollment, demographic trends, housing occupancy rates, household characteristics and residential development into 10-year District-level and small-area projections of enrollment by grade. The District-level projections use long-term demographic and housing trends for the District and projected trends for the region in a macroeconomic, top-down analysis of enrollment.

In addition to the District-wide enrollment forecasts, projections are developed for small-area planning geographies (grids) that are generally one-quarter of a square mile, as shown on **Map 1**. The District is divided into 224 grids that can be combined to represent current school attendance areas and provide sufficient detail to support future facility and attendance area planning activities. Small-area enrollment projections are developed by combining the location by grid of current students in the District with the expected number of housing additions, and the students generated from that new housing.

The balance of this report is separated into four sections: Existing Conditions, Residential Development, District Projections, and Sub-District Projections. Section 2, Existing Conditions, provides a historical context for interpreting the current District enrollment levels and a detailed review of student distribution by grade and geography.

Section 3, Residential Development, presents information on current construction activity, vacancy rates and the potential future supply of new housing by unit type. It provides estimates for the timing of construction based on current activity, ownership and zoning status for vacant land available for residential development and area growth forecasts.

District Projections are provided in Section 4. These enrollment projections are created by combining the expected residential housing additions with the existing District population, accounting for regional and local trends in socioeconomic conditions and forecasts.

Section 5, Sub-District Projections, describes the anticipated change in enrollment within the District based on many factors, including additions to housing inventory, occupancy rates and population per household trends. These projections are created by combining the grid location of current students in the District with the expected number of housing additions, the school-age persons generated from them, and the likely share of those persons that will attend a District school. The small-area projections are aggregated by current attendance area in order to provide baseline projections, but they can also be summed to examine alternative attendance areas. These projections are then adjusted to predict enrollment by school based on the current relationship between where students live and where they attend school.

The information and observations contained in this report are based on our present knowledge of the land use and development patterns of the area under analysis, the current physical and socioeconomic conditions of the affected areas, and regional forecasts. Estimates and projections made in this report are based on hypothetical assumptions. However, even if the assumptions outlined in this report occur, there will usually be differences between the estimates and projections and the actual results because events and circumstances frequently do not occur precisely as expected. Applied Economics is under no obligation to update this report for events occurring after the date of its release.

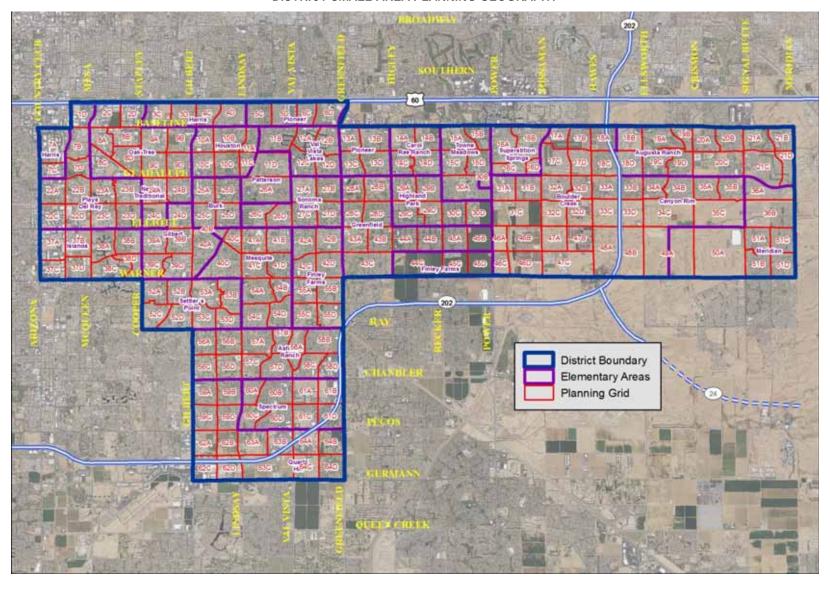

#### **SPECIAL NOTE**

These projections are being prepared amid the early weeks of the COVID-19 pandemic. While there will certainly be some level of long-term economic and demographic impacts associated with this event, it is simply too early to predict what those specific quantitative impacts might be and how they will affect District enrollment. Currently, we expect that Fall 2020/21 District enrollment levels will not be significantly impacted by COVID-19 since short-term demographic changes will be minimal and any new housing impacting enrollment for next year is already under construction. However, Fall 2020/21 enrollment will likely be down significantly as a large new charter school opens in the District. The bigger enrollment impacts from COVID-19 may be felt in 2021/22 due to the recession that will likely result from the economic impacts of the pandemic; such a recession may still be relatively minor in metropolitan Phoenix given the strong position of growth and shortage of new housing that prevailed in the area prior to the outbreak. We plan to provide more direction to our clients on this topic in the form of on-line forums as events unfold.

DISTRICT SMALL-AREA PLANNING GEOGRAPHY

# 2.0 EXISTING CONDITIONS

#### 2.1 DISTRICT ENROLLMENT

Total Kindergarten through 12<sup>th</sup> grade (K-12) enrollment in the District was 34,544 in the fall of the 2019/20 school year, representing a slight increase of nearly 200 students (0.6 percent) over the previous year. This is the first enrollment increase that the District has experienced in 10 years, and it was the result of a 480-student increase (10.1 percent) in out-of-District enrollment, which was partially offset by a 290-student decline (1.0 percent) in in-District enrollment.

As illustrated by Figure 1, the District experienced substantial growth in the early 2000s, with an average increase of around 1,900 students per year between 2000/01 and 2004/05. Over the following five years growth slowed considerably, but enrollment continued to increase by a few hundred students per year. From 2010/11 through 2018/19, K-12 enrollment declined by an average of 400 students every year; despite the fact that roughly 8,600 new housing units were added, the total enrollment loss for the nineyear period was nearly 4,000 students.

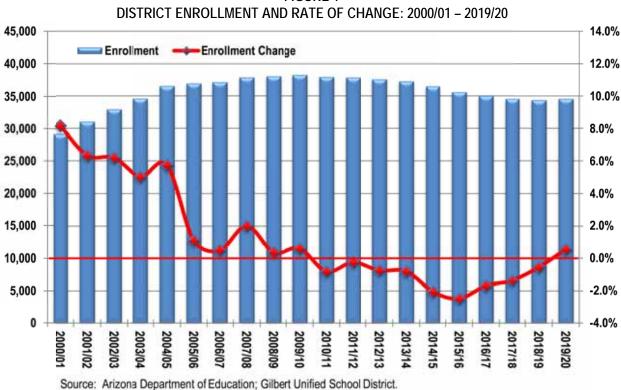

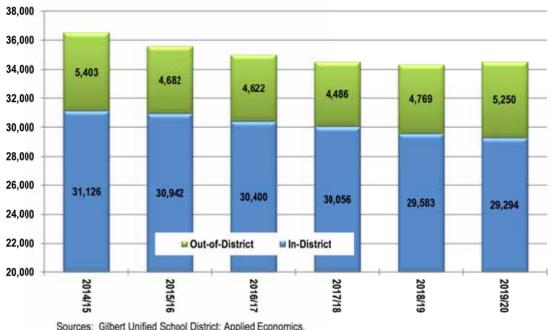

FIGURE 1

As illustrated in Figure 2, the decrease in enrollment over the past five years was largely due to a drop in in-District enrollment, which has declined by nearly six percent (1,800 students) since 2014/15; out-of-District enrollment, which currently accounts for about 15 percent of total District enrollment (5,250 students), declined by just three percent (150 students) during the same time period but has increased the last two years which has offset the in-District losses.

FIGURE 2 SOURCE OF DISTRICT ENROLLMENT: 2014/15 - 2019/20

Sources: Gilbert Unified School District; Applied Economics.

The breakdown of enrollment by grade cohort provides a good understanding of past and current enrollment characteristics and lends insight into structural trends that will continue to shape enrollment in the coming years. For this purpose, the grades are grouped into the following cohorts: Kindergarten through 2<sup>nd</sup> grade (K-2), 3<sup>rd</sup> through 5<sup>th</sup> grade (3-5), 6<sup>th</sup> through 8<sup>th</sup> grade (6-8) and 9<sup>th</sup> through 12<sup>th</sup> grade (9-12). By showing the average enrollment per grade in **Figure 3**, the differences between the three- and four-grade groupings are normalized.

Enrollment in each cohort was relatively equal at the beginning of the study period, with the exception of the 9-12 cohort which contained about 260 fewer students per grade level than the other three cohorts. Beginning in 2003/04, the K-2, 3-5 and 6-8 cohorts began to level off, while the 9-12 cohort continued to grow due to the aging of the younger families that moved into the District in the 1990s and early 2000s.

As the influx of young families slowed and the resident population continued to age, District enrollment growth slowed and each grade cohort reacted to the changes in the preceding cohort. By 2010/11, per grade enrollment in all of the primary (K-8) cohorts was in decline. In 2016/17 the effect reached the 9-12 cohort, causing average enrollment in the cohort to decline for several years. For the first time since 2015/16, per-grade 9-12 enrollment increased slightly (0.6 percent) this year. Only the K-2 cohort has experienced increases in average enrollment in each of the last three years; the growth this year was more substantial, as average enrollment per grade in the K-2 cohort increased by nearly five percent (100 students per grade) over 2018/19. With nearly 3,100 students per grade, the 9-12 remains the largest of the cohorts, followed by the 6-8 cohort (2,700 students per grade); due to continued declines in 3-5 enrollment, the youngest cohorts are now virtually the same size, with approximately 2,300 students per grade in each cohort.

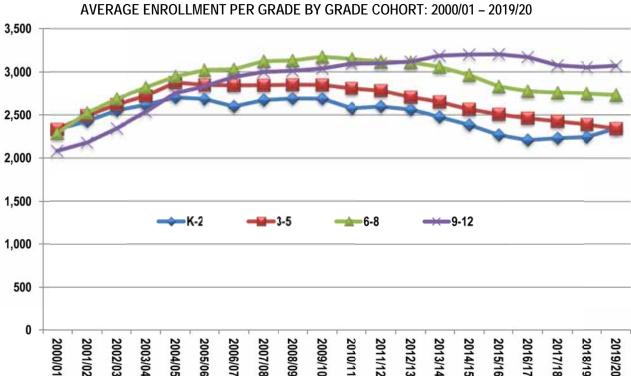

FIGURE 3
AVERAGE ENROLLMENT PER GRADE BY GRADE COHORT: 2000/01 – 2019/20

In addition to the distribution of enrollment by grade cohort, the geographic distribution of enrollment provides valuable insight into other conditions and trends impacting the District. **Map 2** shows the current location of students attending District schools, including those living in the immediately surrounding area. This map illustrates the impact of open enrollment policies, as the District continues to attract numerous students from a large number of areas outside its boundaries.

Source: Arizona Department of Education; Gilbert Unified School District; Applied Economics.

**Table 1,** shows the source of out-of-District enrollment by grade for the current school year. In all, the 5,250 out-of-District students that were enrolled in 2019/20 came from more than 15 metro area school districts. However, 60 percent of those out-of-District students came from Mesa Unified School District (38 percent or roughly 2,000 K-12 students) and Higley Unified School District (22 percent or more than 1,100 K-12 students).

Compared to 2018/19, the number of out-of-District students enrolled in the District increased by 481 students this year. This increase was largely due to strong gains in the number of students that were attracted from both the Mesa Unified School District (+249 students) and the Chandler Unified School District (+128 students); in addition, the number of students that enrolled in the District from the Apache Junction Unified School District this year (291 K-12 students) was 30 percent (66 students) higher than 2018/19. As expected, out-of-District enrollment increases are stronger in Kindergarten, 7<sup>th</sup> and 9<sup>th</sup> grade, when students are most likely to transition from one school to another; however, this year the strongest annual out-of-District enrollment increases occurred in the 11th and 12<sup>th</sup> grades, which is quite surprising given that most students do not change schools so close to the end of high school. Overall, out-of-District enrollment growth in the four high school grades accounted for the majority (53 percent) of the annual increase in total out-of-District enrollment.

Sources: Gilbert Public Schools, 2019; Applied Economics, 2020.

**Table 2** shows where out-of-District students enrolled in 2019/20 and clearly illustrates the fact that out-of-District enrollment is concentrated in the District's high schools. With 600 students, Desert Ridge High School had the largest out-of-District enrollment this year and last year. Total out-of-District enrollment at Desert Ridge is unchanged from last year due to the fact that gains in 11<sup>th</sup> and 12<sup>th</sup> grade enrollment were offset by strong losses in 9<sup>th</sup> grade out-of-District enrollment, likely due to the fact that the newly opened Eastmark High School in the Queen Creek Unified School District is attracting students back into that district. Out-of-District enrollment losses also occurred at Desert Ridge Junior High School this year since Eastmark High School currently serves 7<sup>th</sup> and 8<sup>th</sup> grade classes.

Highland High School saw a large increase in out-of-District enrollment this year (28 percent) and enrolled the second largest number of out-of-District students (428 students) in 2019/20; this is somewhat unexpected since the school has been closed to open enrollment recently. With the addition of 63 students this year (a 22 percent increase), Campo Verde High School had the third largest enrollment of out-of-District students in 2019/20. Mesquite High School also enjoyed a 19 percent increase (32 students) in the number of out-of-District students that were enrolled this year.

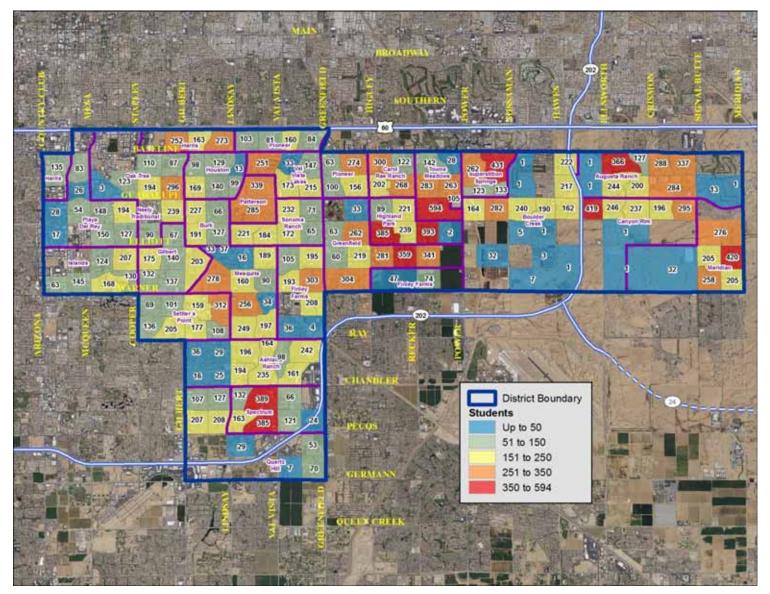

Map 3 normalizes the distribution of the student point data by showing the number of students in each grid. This map shows a dispersed population with several pockets of higher student concentrations, generally in areas with newer housing developments.

Both the point location and grid-level data are useful in examining changes in enrollment. **Map 4** shows the change in enrollment by planning grid over the past five years, during which time aggregate K-12 losses totaled almost 2,000 students. While areas of decline are widespread, pockets of enrollment growth are concentrated in the central portion of the District, generally between Greenfield and Sossaman Roads.

**Map 5** shows the change in enrollment by planning grid over just the past year. It clearly illustrates that recent enrollment gains are somewhat more widespread and stronger than indicated by the longer-term trends shown in Map 4.

#### 2.2 DEMOGRAPHIC TRENDS

**Table 3** contains Census data on population and housing in the District for 2000 and 2010, along with estimates for 2019 based on demographic and housing trends and ACS data. Changes in population, age distribution, ethnic composition and housing characteristics can help explain recent enrollment trends, as well as changes in the character of the area. The compound annual rate of change is provided to allow for comparison between the two periods.

Between 1990 and 2000, the total population in the District increased by over 200 percent, from about 43,000 to 135,000 persons. While that enormous rate of increase was not sustained, the population grew another 36 percent by 2010, with the bulk of the increase occurring during the first half of the decade. Total population in 2019 was about 203,000, 10 percent higher than the 2010 Census figure; this equates to an annual growth rate of just 1.1 percent, down from 3.2 percent per year between 2000 and 2010.

Between 2000 and 2019, as the large number of young families that arrived in the District during the 1990s continued to age, the share of the population under 5 years of aged fell from 10 percent of the total population to 6.9 percent. Along with the aging of the existing population, this drop is indicative of the sharp decline in birth rates that accompanied the recession. The share of the population between 5 and 17 years of age has remained relatively unchanged, falling from about 23 to 21 percent, with a slight compositional shift toward the 14 to 17 age group. Those in the 25 to 44 age group, the group that is typically most closely correlated with having young children, constituted about 36 percent of the total population in 2000 but fell to 28 percent in 2019. Meanwhile, the population aged 45 to 64 years has grown significantly, increasing from about 17 percent to 25 percent; this growth has fueled the increase in enrollment at the high school level during the same period. Between 2010 and 2019, the population over 44 years increased by nearly 13,400 persons, or almost 23 percent.

Housing occupancy has increased slightly since 2000, rising from roughly 93 percent to almost 94 percent in 2019. However, the percentage of owner-occupied housing has fallen from 78 percent in 2000 to about 66 percent in 2019. This can be attributed to the consequences of the housing market collapse, when many people lost homes to foreclosure and a large number of previously owner-occupied properties became rental units. The downward trend in ownership is widespread and not specific to the District. While multifamily housing only accounts for 19 percent of the housing supply, the roughly 3,500 units added between 2010 and 2019 account for 37 percent of the total increase in housing supply during that period.

There is a strong correlation between householder age and the presence of children in a household. Between 2010 and 2019, the share of householders under the age of 45 dropped from 46 percent to 43 percent; this is another sign of an aging population that can result in fewer young children and an increase in older children. Another emblematic consequence of an aging population is a decline in the population per household. In 2000 there were over 3 persons per household on average in the District, a reflection of the young families that moved into new subdivisions at the edge of the metropolitan region. By 2019 the population per household fell to 2.75 persons as the District matured and new, entry-level housing became more limited in the District.

#### 2.3 CHARTER AND PRIVATE SCHOOL ENROLLMENT

Public school districts face increasing competition for students due to an expanding number of charter and private schools, as well as neighboring public school districts through open enrollment. Given that newly-opened schools can have an immediate impact on District enrollment, it is important that enrollment data for these alternative providers is as up-to-date as possible in order to fully assess their impact on the District. Charter schools report enrollment to the state, as do district schools, but due to a one-year lag in the data reported to the Arizona Department of Education, charter enrollment for the 2018/19 school year is the most recent available. However, 40<sup>th</sup> day Average Daily Membership (ADM) data is available for 2019/20 and, while the figures differ from actual headcount data, the relationship between the two figures by school and grade is consistent enough to derive 2019/20 headcount estimates with a high degree of accuracy.

There are currently 15 charter schools serving K-12 students within the District, and an additional 25 charter schools within one mile of District boundaries. Combined, these schools serve nearly 19,900 students, as listed on **Table 4**. The largest of the charters in the District is Eduprize Schools Gilbert; with enrollment of nearly 1,900 students, it is roughly twice the size of any other in-District charter school; in addition, two in-District schools serve more than 800 students each (Noah Webster-Mesa and Legacy Traditional-East Mesa). Overall average enrollment per in-District charter school is about 500 K-12 students. The largest school located within one mile of the District's boundaries is American Leadership Academy-Gilbert North, which opened in the fall of the 2017-18 school year; this campus, located on Higley Road, is home to two schools that enroll a combined total of roughly 2,300 K-12 students. In addition, three other nearby charter schools enroll 800 or more K-12 students each. Two charter schools that opened in 2018/19, Legacy Traditional School-East Mesa and Leman Academy of Excellence-East Mesa, now enroll roughly 1,000 K-8 students at the two campuses.

Enrollment in grades K-8 comprises the vast majority (80 percent) of the 19,900 charter students in the area; this is down from a share of roughly 85 percent that had persisted for several years. Over the past three years, area charter schools have increased their 9-12 enrollment by more than 1,700 students, or nearly 78 percent. Charter enrollment growth has compounded the issue of aging-in-place that is occurring throughout the District and contributed to the waning enrollment at both the elementary and high school level.

The locations of non-District schools are shown on **Map 6**, which also depicts the District's elementary attendance areas. As previously mentioned, 25 of the 40 charter schools are located just outside of the District, but within one mile of its boundaries. Additionally, five of the 15 charter schools operating within District boundaries are situated on the District side of a boundary road, while 12 of the 25 charter schools that are technically located outside District boundaries can be found on boundary roads. In theory, these schools are more likely to draw students from neighboring districts than those located further inside the District, but this is not a certainty. The data suggests that there is a complex flow of students in the area, both incoming and outgoing, between District, neighboring public districts, charter schools and private schools.

MAP 6
GILBERT AREA SCHOOLS BY TYPE

**Table 5** shows charter school enrollment at the elementary and high school levels over the past ten years. The total number of charter schools located in and nearby the District has increased steadily since the 2010/11 school year, accompanied by comparable gains in net enrollment. In just the past three years, nearby charter enrollment has increased by 38 percent (adding 3,400 K-12 students), while in-District charter enrollment increased by 13 percent (850 students) during the same period. In both cases, the share of 9-12 students has steadily increased since 2016/17; high school students now account for nearly 20 percent of total local charter enrollment (up from 14 percent three years ago).

<sup>\* 2019-20</sup> ADM

Overall, total enrollment in area charter schools has grown by more than 10,800 students, or 118 percent, over the past 10 years. It is important to point out that not all of the students attending these charter schools reside within the District, but their tremendous growth is undoubtedly a factor in the decline of District enrollment, especially at the elementary level.

**Figure 4** shows that the enrollment growth in local charter schools has been heavily concentrated in the elementary grades. Of the 10,800-student increase since the 2009/10, roughly 81 percent have been K-8 students, and this group now comprises around 80 percent of enrollment in District-area charter schools. However, 9-12 charter enrollment growth rates have risen significantly in the past three years, posting increases of 19 percent in 2017/18, 32 percent last year and nearly 13 percent this year; these rates are much higher than the five percent annual average growth in 9-12 charter enrollment that was realized between 2012/13 and 2016/17. Since 2016/17, the average annual growth rate for area K-8 charter enrollment has fluctuated considerably, ranging from 4.6 percent in 2016/17 to 12.7 percent in 2018/19 and just 0.7 percent this year.

FIGURE 4
DISTRIBUTION OF CHARTER ENROLLMENT BY GRADE COHORT: 2010/11 – 2019/20

Private schools do not have the same reporting requirements as charter or district schools, so data is often less accessible, although private school enrollment tends to be more stable than charter schools. The Private School Survey conducted by the National Center for Education Statistics is the only consistent source of private school enrollment data and it is only updated every 2 years; the 2017/18 enrollment figures provided by the survey are the most current that are available. Currently, there are five private schools operating in the District and serving nearly 500 students (**Table 6**). In addition, there is one private school located within one mile of the District's boundary, Gilbert Christian School, which enrolls more than 1,200 K-12 students.

TABLE 6
ENROLLMENT IN LOCAL PRIVATE SCHOOLS BY SCHOOL

				Grades	Total
School Name	Address	City	Zip	Offered	K-12

# 3.0 RESIDENTIAL DEVELOPMENT

#### 3.1 HOUSING CONSTRUCTION

Residential development in the District has been strong in recent years, as can be seen below on **Table 7**. The residential building permits shown below are grouped into housing categories that reflect correlations between the types of housing and the age structure of the households likely to occupy them. Group quarter facilities, such as nursing homes, are not included as either retirement or multifamily housing.

Single family housing is diverse due to a range of available density levels. In 2009/10 about 80 percent of the housing in the District was single family between 2 and 4.5 lots-per-acre; by 2018/19 that category only accounted for 38 percent of the total due to the addition of increasing amounts of high-density products, both single family and multifamily, in the last two to three years. Apartment construction has become increasingly strong, especially in the San Tan Village area. Multifamily housing has accounted for 35 percent of total activity in the last ten years, which is fairly high for a suburban area. Age-restricted housing continues to be a stable component, but Sunland Springs is nearly built-out.

Viewing the calendar year building permits by quarter (**Table 7A**) provides an alternate view of recent activity. Only single family (non-age-restricted) permits are shown due to the long lead times and construction periods involved with multifamily projects, which can distort short-term appearances.

Permit activity has grown significantly since 2017. The lower levels experienced in 2018 are largely the result of subdivisions at Morrison Ranch and Mulberry building out. In the case of Morrison Ranch, housing absorption exceeded the ability to open new replacement subdivisions. Notable also is the increase each quarter during 2019 since the third and fourth quarters typically have the lowest level of activity.

Recent development activity in the District is illustrated on **Map 7** with housing permits for 2019 marked in green. The heaviest clusters of activity are at Eastmark and Morrison Ranch, with smaller concentrations in other areas in the eastern portion of the District and in the San Tan Village area. There has not been much individual lot construction but there have been a number of small infill projects throughout the District. These are frequently the result of zoning changes to planned commercial parcels due to changes in the retail environment.

#### 3.2 FUTURE DEVELOPMENT POTENTIAL

The identified residential potential in the District is estimated to be about 18,000 units. This includes defined projects and raw land with development potential beyond a practical ten-year horizon. **Table 8** shows projected unit counts by type of product and the estimated time period that construction **could begin** on lots within those projects, although developments are generally under construction over a number of years. The Infill category generally includes rural lots and small custom projects that are likely to be under development intermittently over a number of years. Both the unit potential and the timing estimates on this table will change as new information is acquired.

The exhaustion of vacant land, especially large development parcels, has created a situation where less than half of the total potential in the District is single family housing. Of the single family estimate, over 4,000 lots are located at Eastmark and the recently approved Hawes Crossing development; another 900 lots are split between Morrison Ranch and the adjacent Warner Meadows development. Multifamily development is expected to continue to be a major housing component in the District, but single family rental projects may take over some portion of that market.

#### 3.2.1 MARKET CONDITIONS

The State of Arizona continues to grow, with a population gain of 111,800 persons between July 2018 and July 2019. The Phoenix metropolitan area was the leading growth area of the state, accounting for 78 percent of the state population growth increasing by an average of 83,600 persons annually over the past five years. The City of Phoenix remains the fifth most-populous city and is currently the fastest growing city in the nation based on recent Census data. According to a Forbes article from May 2019, this growth is attributed to a "business-friendly environment, plentiful job opportunities and affordable cost of living".

Housing prices in the Phoenix metro area compare favorably to other markets that are in competition for young, tech employees that now make up a significant part of the economy. While Seattle, Austin, and San Jose have much stronger tech growth, they also have significantly higher housing costs. Data from the National Association of Realtors provides a comparison. In the first quarter of 2019 the median sales price of existing single family houses in the U.S. was \$254,800 versus \$384,300 in the Western region. The Seattle median price was \$497,000, or 129 percent of the Western region price. At \$303,400 Austin was just 79 percent of the Western region median. San Jose was 317 percent above the Western region price with a median of \$1,220,000. The Phoenix median price of \$276,400 is only 72 percent of the Western region and 108 percent of the U.S. median, which is a favorable position for people considering a move within the west or nationally.

The great recession distorted the local housing market in several ways. Because of financial limitations the local housing market shifted both geographically and in type. Entry-level markets were especially impacted as housing starts in some areas of the metro region were seriously curtailed. The housing market has largely recovered with strong new construction activity taking place throughout the metro region, although activity in parts of Pinal County continues to be limited.

The impacts on housing diversity can be seen in the charts to the right, which show residential completion data for Maricopa County. In 2011, low-density executive housing accounted for about half of all residential completions in developments. This segment includes developments with fewer than 3.5 lots-per-acre and is typically a move-up market. In contrast, typical suburban housing only accounted for 29 percent of completions. This is the inverse of a normal market and a reflection of the distorted economic and lending conditions existed during that recession.

By 2018 there were two notable market shifts. The single family market recovered as suburban densities increased and low-density properties accounted for a smaller proportion of new construction. The other significant change is the shift in metro area multifamily housing that has occurred as the market has recovered from the recession. New growth has been concentrated in high-amenity, high-rent properties that are generally located in urban centers or along major transportation corridors.

Overall, residential growth in the Phoenix metro region is expected to remain strong. While the economy is expected to slow in the next year, a major recession is not likely unless there is a significant disruptive action. The coronavirus pandemic may well provide that disruption but it is too early to accurately determine the overall impacts other than the obvious near-term disorder. The Phoenix metro area should be less susceptible to negative impacts due to the structural changes in the local economy and more measured increases in construction activity and housing prices that have occurred during the prolonged recovery period. Residential growth is expected to be more diverse both geographically and by housing type and price, though some parts of the region still lack sufficient diversity to provide an adequate buffer against future market downturns.

#### 3.2.2 DEVELOPMENT PROJECTS

The residential market in the District has expanded in volume and product segmentation as it has matured. The presence of a variety of housing options leads to diversity in the market, which tends to increase stability and support a wider range of resident populations. **Table 9** provides additional detail on the economic characteristics of some of the developments in or near the District which reflect the buying populace. This table is not a comprehensive listing of all projects, but does show that the District is widely represented, except for entry-level products. Generally speaking, the southeast Valley is a move-up housing market, but this is somewhat offset by the amount of multifamily housing offered in the District.

Source: Builder websites; Applied Economics, March 23, 2020.

Prior to the Covid-19 pandemic the local housing market was experiencing increased demand with limited supply; the underlying market has been healthy but it is now undergoing a sudden disruptive event. Pending sales began to decline in late March 2020 and sales are expected to continue to decline, most sharply in the late spring and summer months. However, website traffic has remained strong, indicating continued buyer interest, and supply, which was already low, has declined further over the past year.

Although it is too early to know with any level of certainty, the current consensus is to expect a sharp slowing in residential sales followed by a relatively steady recovery as consumer confidence improves and mortgage interest rates remain low. Lower levels of construction activity should be expected at the very end of 2019/20 and through most of 2020/21, as builders engage in less speculative construction and keep inventories in check. In general, the District will grow more slowly in the near-term, but overall growth trends should continue due to the fact that there is a strong local residential market. There may be some delay in opening new subdivisions but most major projects in the District are already active or have

grading or infrastructure underway; some projects have already been delayed due to ongoing labor shortages and the wet weather conditions experienced during the winter and early spring months. In some cases builders may complete the preparations and delay actual housing starts, but that would allow for a rapid resumption of activity when conditions and demand improve.

Future housing growth will be divided between single family and multifamily, and between the eastern and western areas of the District (using Greenfield Road as a line of separation). The eastern portion of the District will have more single family housing in master planned communities while the western area will have more multifamily growth and small infill projects.

Morrison Ranch has absorbed 3,200 single family housing units since production was initiated in 2004. This has been a highly successful community that is now entering its final phase at Lakeview Trails South. Construction of the first phase began in 2018; the initial Meritage Homes parcel is already built-out and two others are nearing completion. Grading infrastructure and installation (right) for the final five parcels at the northwest corner of Warner and Recker Roads is well advanced, with house construction commencing in summer 2020. Taylor Morrison and Toll Brothers will likely be the first to begin vertical construction, with

Maracay and Fulton Homes starting soon after. There are 330 lots in this final phase of the development, and build-out is expected in 2022. Two multifamily parcels also remain with a potential yield of about 450 units, but these parcels are not expected to be developed in the near-term.

On the east side of Recker at Warner Road, Lennar Homes plans to begin land preparation for Warner Meadows by June 2020, with house construction to commence about a year later. This 486-unit project contains five product lines, from fairly low density units to attached single family options. Absorption is anticipated to be high and build-out is expected by 2024.

Construction activity inside the District at Eastmark is currently very strong with seven active builders in multiple subdivisions, but work will slow significantly in 2020/21 as the active subdivisions are built-out and activity shifts to parcels to the south that are outside of the District. Land and infrastructure preparation is ongoing on those parcels, although there may be a short pause before housing construction begins. There are several hundred lots in the parcels south of Warner and it is anticipated to be about 2023 before active house construction re-enters the District and single family build-out is expected late in the projection period.

Hawes Crossing, a 1,100-acre plan at Warner Road and the Loop 202, was approved by the Mesa City Council in April 2020. Current planning envisions an estimated 5,800 housing units split between single and multifamily, with much of the single family as high density products. It should be expected that the unit counts will likely decrease as parcels of land are platted. The land is still under multiple ownerships, including the State Land Department, and while infrastructure access should be fairly straightforward, there may be some issues transitioning the land from dairy farms to residential uses. It is not expected that housing development will begin before the middle of the projection period. Since this represents some of the last remaining large parcels of residential land in the vicinity, growth levels are likely to be strong and activity will continue well past the end of the projection period.

The San Tan Village area has been very active recently. The Annecy project of single family, attached housing at San Tan Village Parkway (just south of Williams Field Road) is an example of the development in the area. This 863-unit project originally opened in 2005/06 but was dormant by 2008 due to the housing market collapse. It remained idle until 2017 when Lennar Homes resumed construction on one parcel and Maracay Homes began work on another. The Lennar parcel is now built-out, while Maracay is completing one parcel and starting another (right). A final 251-unit parcel is being graded and is scheduled to open in February 2021. Final build-out of the remaining 350 units is expected in 2024.

Two apartment complexes totaling 680 units are currently under construction along San Tan Village Parkway. Two additional nearby projects with 515 units are anticipated to be added in the next two to five years, and P.B. Bell's Acero apartment complex near Val Vista and Germann Roads is in review; this new 328-unit project is expected to start construction in the next year. While there are no known current plans, it should be anticipated that some of the vacant land in the San Tan vicinity currently zoned for retail use may be changed to residential uses.

On Ray Road, between Gilbert and Greenfield Roads, are five projects that illustrate current and potential infill housing projects in the District. Cobblestone Villas (at Gilbert Road) consists of 68 lots on 11 acres that were built-out in 2019. At Lindsay Road is Seasons at Springview, a Richmond American project with 53 lots on 11 acres, where house construction began May 2020. At Val Vista Road are two active projects by New Village Homes: Andalucia Villas (101 lots on 11 acres) and Hampton Court (56 single family rental units on 5 acres). At Greenfield Road, Bungalows on Ray is planned for 159 single family rental units on 14 acres by Cavan Companies. Most, if not all, of these projects are on land that was once planned for retail use.

Infill projects elsewhere include Enclave at Madera Parc (at Cooper and Elliott Roads), where Porchlight Homes is installing infrastructure for a 52-lot subdivision. On Gilbert Road near Baseline is another Bungalows project, with 165 units that is expected to start in two to three years. Aspire Heritage is located next to downtown with plans to start within a year on 32 lots on less than three acres.

Overall, single family housing activity is expected to be strong over the next three years but then continually decline as projects build-out and vacant land is exhausted. Multifamily development is expected to remain fairly stable throughout the projection period.

# 4.0 DISTRICT PROJECTIONS

#### 4.1 HOUSING AND POPULATION

**Table 10** provides annual housing, household and population projections for the District through 2029/30 based on the annual absorption of new housing units and real estate market and demographic trends. The housing unit construction schedule developed for the 10-year period is based on recent and forecast construction trends, land availability and ownership, and data reflecting economic growth trends in the District and the Southeast Valley. The projections call for the addition of 11,190 housing units over the next ten years, a 14 percent increase over the nearly 78,700 units that currently make up the District's housing inventory. The majority of new units added during the projection period are expected to be multifamily (nearly 5,800 units or 51 percent), while more than 5,400 of the new units are projected to be single family; by 2029/30 the District's housing inventory is expected to total nearly 89,900 units.

**Bolding Indicates Actuals** 

The increased presence of multifamily housing may enable younger families to live in the nearly 10,300 new households in the District by 2029/30. Although the population per household is expected to decline by about five percent over the next ten years, due to the aging of the population and the influx of multifamily units, the additional households are projected to yield a total District population of 218,900 people by 2029/30. This 15,700-person addition equates to an increase of 7.7 percent over 2019/20, or about 0.8 percent per year on average.

#### 4.2 DISTRICT ENROLLMENT

In addition to the volume and market orientation of household growth, trends in per-household student generation and capture rates are key factors used in determining future enrollment levels. The first factor, student generation rate, refers to the expected number of school-age persons (aged 5 to 17 years old) per household. As shown in **Table 11**, the District currently has about 43,200 school-age persons, implying an average generation rate of 0.585 school-age persons per household. This rate has fallen by about 17 percent since 2000/01 due to the aging of the existing population, the addition of multifamily housing and newer, more expensive single family housing (which has attracted older households with fewer school-age children).

<sup>\*</sup> Population age 5 through 17, corresponds with Kindergarten through 12th grade.

The second factor affecting enrollment projections is the ratio between the District's K-12 enrollment and the number of school-age persons living in the District, expressed as a percentage and referred to herein as the Enrollment-Population (E-P) ratio. Due to the growing number of educational alternatives and open enrollment policies, the E-P ratio has become increasingly important when conducting enrollment projections. While 0.585 school-age persons are being generated per household, the District only enrolls 0.397 students per household, resulting in an E-P ratio of 0.800, or 80 percent in 2019/20.

Please note that in this analysis the E-P ratio is based on the *net difference* between the school-age population and total District enrollment. The net difference includes the loss of some 13,900 in-District school-age persons to other providers and the gain of nearly 5,300 students at District schools from outside of the District. As illustrated in **Figure 5**, the difference between the school-age population and total enrollment has been increasing steadily in the District. In the past 19 years, the District's net E-P ratio has fallen by more than 14 percent (from .934 to .801), or roughly 0.61 percent per year. However, the rate has been steady the last two years due to large increases in the number of students from outside the District.

This in-District EP ratio can also be used to assess how successful the District is in capturing that portion of the school-age population that resides within the District by eliminating the addition of students that are enrolled but live outside of the District's boundaries. In this case, the E-P ratio is based on the net difference between the school-age population and *in-District* enrollment. In 2019/20, in-District enrollment totaled 29,294 students, resulting in a net difference of 13,882 persons and an in-District E-P ratio of 67.8 percent, which is considerably lower than the net E-P ratio (80 percent) that is based on the District's total enrollment. Since 2014/15, the in-District E-P ratio has decreased by nearly seven percent (or about 1.29 percent per year), as shown in **Figure 6**.

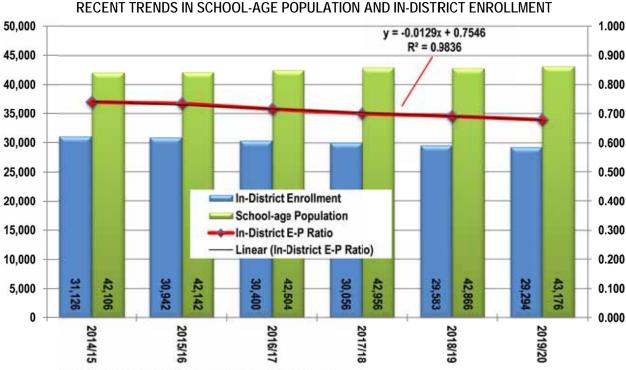

FIGURE 6
RECENT TRENDS IN SCHOOL-AGE POPULATION AND IN-DISTRICT ENROLLMENT

Sources: Gilbert Unified School District; Applied Economics.

The E-P ratio may fluctuate upward or downward depending on the real or perceived quality of education offered by the District, the number, convenience, and perceived value of other education options, and a myriad of other factors that are beyond the scope of this study. However, we are not aware of any school districts in Arizona that have experienced a meaningful E-P ratio increase over the past fifteen years, and nearly all have experienced some level of decline. As a result, the enrollment projections contained herein have been formulated under three scenarios.

The "Long-Term Trend," as presented in **Table 12**, assumes a more gradual decline of the in-District E-P ratio (from 67.8 to 61.8 percent). The "Short-Term Trend," detailed in **Table 13**, assumes a more aggressive decline of the in-District E-P ratio (from 67.8 to 55.9 percent). Finally, the "Mid-Point" projection (**Table 14**) uses an E-P-ratio that reflects the mid-point between the Long-Term and Short-Term Trend E-P ratios for the in-District portion of enrollment (from 67.8 to 58.8 percent). Out-of-District enrollment is the same in each scenario and is presumed to increase slightly during the first half of the projection period and then stabilize somewhat during the second half as growth in the school-age population of the Southeast Valley slows and eventually begins to decline.

Bolding indicates historical data.

Despite the projected addition of nearly 10,300 households by 2029/30, the continued decline in schoolage population per household is expected to result in a net gain of only 580 school-age persons during the 10-year period. When the projected school-age population is combined with a falling in-District E-P ratio, each scenario projects a drop in total enrollment by 2029/30 but at varying rates of decline. **Figure 7** compares the K-12 enrollment projections by scenario, illustrating the magnitude of the various assumptions regarding the in-District E-P ratio over time. As the presence of alternative providers has grown, the E-P ratio has increasingly become one of the most important factors affecting projections, and in many districts it is the most important factor in determining enrollment. For discussion purposes, the analyses presented in the remainder of this report are based on the assumptions presented in the Mid-Point projection scenario.

<sup>\*</sup> Population age 5 through 17, corresponds with Kindergarten through 12th grade.

# FIGURE 7 DISTRICT ENROLLMENT: 2019/20 - 2029/30 ALTERNATIVE E-P RATIO SCENARIOS

## 4.3 ENROLLMENT BY LEVEL

**Table 15** provides a more detailed review of recent past and projected enrollment changes by showing enrollment by grade cohort, in this case employing a K-6, 7-8 and 9-12 cohort summation. Assuming a moderate E-P ratio decline, the District is expected to experience a loss of about 3,400 students by 2029/30 (roughly 10 percent of 2019/20 enrollment), yielding total enrollment of 31,160 K-12 students. Losses in the first half of the projection period are expected to average about 0.7 percent per year; during the second five-year period, enrollment declines are expected to accelerate slightly, averaging 1.3 percent per year.

K-6 enrollment is projected to fluctuate slightly during the first half of the projection period but remain nearly unchanged by 2024/25. Declines are expected to accelerate during the second five-year period, averaging one percent per year, resulting in an overall decrease in K-6 enrollment of nearly 800 students (4.6 percent) by 2029/30.

Enrollment in the 7-8 cohort is projected to decline sharply during the first five years of the projection period (peaking at 6.1 percent in 2023/24 and averaging 2.7 percent per year) as the lagged effects of smaller K-6 classes (due to the aging of the area's population and persisting low birth rates stemming from the recession) are expected to begin impacting enrollment in the upper elementary grades. Despite a brief period of enrollment increases at the beginning of the second five-year period, 7-8 enrollment is expected to decline further during the final years of the projection period. By 2029/30, 7-8 enrollment is projected to total roughly 4,700 students, representing a decline of nearly 17.5 percent (1,000 students) over the next 10 years.

TABLE 15 ENROLLMENT PROJECTIONS BY LEVEL MID-POINT FORECAST

		Enrollment	by Level			K-12 Total

Source: Applied Economics, 2020. **Bolding indicates actuals**.

In the coming years, the 9-12 grade cohort will be less affected by new housing additions and any increases that do result will be offset by the advancement of smaller in-coming classes, partly due to the birthrate plunge during the Great Recession; in addition, recent trends suggest that the effect of alternative providers on high school enrollment will likely be more significant than in the past. As a result, 9-12 enrollment is projected to increase slightly over the next two years and then decline by an average of two percent per year throughout the rest of the projection period. By 2029/30, 9-12 enrollment is projected to decline by about 1,600 students (or 13 percent), dropping to 10,670 students by the end of the period.

# **5.0 SUB-DISTRICT PROJECTIONS**

Sub-District enrollment projections are based on the current number of students in each study grid, the expected occupancy of existing housing units and absorption of new housing units, and the expected student generation from existing and newly created households. Expected levels of District-wide absorption are allocated to new residential developments on a project-by-project basis. Absorption is first allocated to active residential projects and then to vacant land planned for residential development, according to the development schedule assigned to each project or project part. Using this data, annual projections of enrollment by grade through 2029/30 for each grid area were developed.

The grid-level projections are then aggregated by attendance area and used to cross-check the District enrollment projections. Matrices showing the relationship between where students live and where they attend school are provided for each elementary, middle and high school attendance area. Finally, these relationships are combined with the attendance area projections to forecast enrollment by school.

## 5.1 PLANNING GRID PROJECTIONS

The projected changes in the number of students by grid over the next two five-year periods are depicted on **Maps 10 and 11**. The planning grids are color coded according to the degree of change, with increasing saturations of red for positive change and blue for negative change.

During the first five years of the projection period, concentrations of enrollment growth are generally limited to areas of new development east of Greenfield Road, particularly in Morrison Ranch and Eastmark. Although there are some pockets of strong growth scattered throughout the western half of the District, enrollment losses are widespread throughout the District during this period and can be attributed to a combination of factors, including competition from charter schools and the aging of the existing households. During the second five-year period, enrollment losses are expected to intensify and become even more widespread; the growth areas that remain become even more concentrated in the eastern half of the District, following development along Warner Road at Hawes Crossing and Eastmark.

## 5.2 ENROLLMENT BY ATTENDANCE AREA VERSUS SCHOOL

The school attendance areas used to aggregate the planning grid-level projections for the District are shown on **Maps 12** and **13**, representing the elementary and secondary attendance areas, respectively.

The variations between enrollment by attendance area and enrollment by school are detailed in **Tables 16** and **17**. These matrix tables show the movement of students between schools, both within and outside District. Reading the table across shows the number of students attending a school from each attendance area (listed numerically across the top row as defined in the first column) and from outside the District. Reading down the columns details where students living in each attendance area choose to go to school. The number of students attending the school in their designated attendance area is shaded in green. For example, at the elementary level (**Table 16**) there are 559 students attending Ashland Ranch who reside in the Ashland Ranch attendance area, 2 students who resides in the Boulder Creek attendance area, 1 from the Burk attendance area, 4 from the Finley Farms attendance area, 5 from the Gilbert attendance area, 4 from the Greenfield attendance area, and so on.

The number of students attending from outside the District is listed, along with the total number of students who attend the school and the total number of District students residing in the attendance area. The *Net Difference* column is calculated by subtracting the *Total Reside* from the *Total Attendance*. Note that the *Total Attendance* includes students who reside outside of the District, and the *Total Reside* only includes resident students enrolled in District schools. A school with a positive *Net Difference* is considered to be "importing" students, whereas a school with a negative *Net Difference* is considered to be "exporting" students.

**Table 16** details the movement of District elementary students between schools, as well as the distribution of students from outside of the District that cause the differences between enrollment by attendance area and enrollment by school. The matrix shows that of the 14,120 resident students attending District elementary schools, 75.2 percent attend the school designated by the attendance area in which they reside; Meridian and Superstition Springs retained the highest share of resident students (87 percent each) and Gilbert had the lowest share (51 percent). Quartz Hill has the largest net import of students (258), followed closely by Patterson (249). Six other schools had net imports of more than 100 students each. Of the 313 students attending Quartz Hill who do not reside in the attendance area, 217 reside outside District boundaries, which is the most of any elementary school by a large margin. Five schools have a net export of students, the largest of which is Boulder Creek, where 301 students who reside in the attendance area attend a different elementary school within the District; this year, 127 elementary students residing in the Boulder Creek attendance area chose to attend Superstition Springs Elementary instead. Neely Traditional does not have a defined attendance area, but draws students from every other attendance area. Overall, the District attracts more than 2,400 elementary students from outside its boundaries.

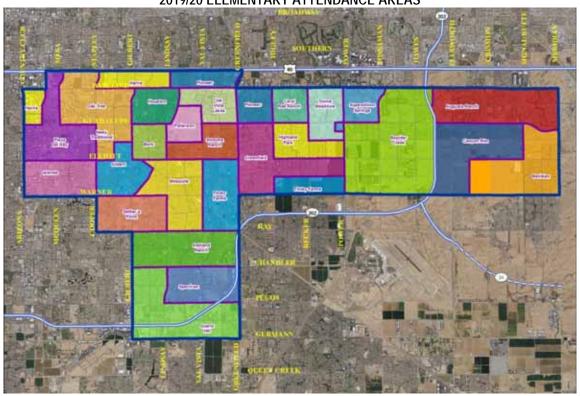

The movement of District middle and high school students between residence and school of attendance is summarized in **Table 17.** At the middle school level, 84.9 percent of resident students attend their designated school. Of the schools with defined attendance areas, South Valley Junior High School had the highest net import of students (291), followed closely by Highland Junior High (273). Of Highland Junior High's 1,006 resident students, 90.4 percent choose to attend the school, while only 60.6 percent of Mesquite's resident students chose to attend the school. Desert Ridge has the highest out-of-District enrollment among the junior high schools (208 students), and four other middle schools each enroll more than 100 out-of-District students. Mesquite Junior High is currently the only junior high school experiencing a net export, with 339 fewer students attending the school than residing in the attendance area. Overall, the District attracted 746 junior high students from outside its boundaries.

Of the District's 10,189 resident high school students, 8,221 (80.7 percent) attend the school associated with their attendance area. Highland High School had the largest net enrollment gain (686 students) among high schools with defined attendance areas, due in large part to the addition of 428 out-of-District students. Desert Ridge High School also experienced a net enrollment gain (473 students), but it was due entirely to the addition of 600 out-of-District students; of the 2,144 students that reside in the Desert Ridge attendance area, 1,928 also attended the school but 140 other resident students chose to attend Highland High School instead. Mesquite had a net enrollment loss of 164 students this year, despite enrolling 275 out-of-District students. In total, the District attracts nearly 2,100 high school students from outside of the District's boundaries. Across all of the grade levels, nearly 79 percent of resident students chose to attend the school associated with their attendance area of residence in 2019/20.

## 5.3 ATTENDANCE AREA AND SCHOOL PROJECTIONS

**Table 18** shows elementary enrollment by attendance area for the past five school years, as well as projections through 2029/30 based on the Mid-Point projection scenario. The enrollment values are color coded relative to the share of total enrollment by year, with higher values in shades of red and lower values in shades of blue. In the annual total columns, the color saturation increases with the degree to which the value is higher or lower than the average for that year. In the change columns, the saturation increases with the value's distance from zero.

By 2029/30, the District is projected to experience a loss of nearly 800 elementary students, all of which is expected to occur in the second five-year period. This 10-year net loss is partially offset by a nearly 200-student increase in out-of-District enrollment, all of which is expected to occur in the first half of the projection period. This is a notable distinction because of the 1,000-student decrease in K-6 enrollment between 2014/15 and 2019/20 about 33 percent (327 students) of the enrollment drop was due to a loss of out-of-District students.

During the first half of the projection period, 19 of the 26 elementary attendance areas are projected to experience some degree of enrollment decline. These declines are somewhat offset by gains in the remaining attendance areas, particularly the Finley Farms (+254 students) attendance area, resulting in a net loss of 190 in-District K-6 students for the period; with the addition of roughly 270 new out-of-District students, however, total enrollment is projected to increase by about 80 students by 2024/25. In the second half of the projection period, all but two attendance areas are expected to decline, resulting in a loss of 750 in-District K-6 students for the period; the only gains during this period are in the Boulder Creek (+320 students) and Meridian (+85 students) attendance areas. Out-of-District enrollment is also projected to decrease by roughly 100 students during this period, resulting in a net decrease of another 850 K-6 students by 2029/30.

Ten-year enrollment projections for the junior and high school attendance areas are shown on **Table 19**. District junior high school attendance area enrollment is expected to decline by about 1,000 students over the next ten years; the majority of these losses (75 percent) are expected to occur during the first five-year period. By 2029/30, the largest enrollment declines are expected in the Highland (-330 students), Mesquite (-250 students) and South Valley (-210 students) attendance areas; out-of-District enrollment is expected to decline during the first five-year period and then rebound in the second, ending the period down just slightly in 2029/30.

Over the initial five years, all of the junior high attendance areas are projected see enrollment declines, with losses ranging from about 40 students (Greenfield) to nearly 230 students (Highland). Including a slight decline in out-of-District enrollment, enrollment is expected to decline by about 750 students by 2024/25. In the second half of the projection period, junior high school enrollment losses are projected to continue but moderate somewhat; an enrollment increase in the Desert Ridge Junior High attendance area (+80 students) and slight increase in out-of-District enrollment is projected to partially offset losses in the remaining attendance, resulting in a net decrease of another 260 students for the period.

Significant enrollment declines are projected for the 10-year period at the high school level, particularly in the second half of the period. Declines in every attendance area and in out-of-District enrollment are expected to result in the loss of 1,600 high school students by 2029/30. All of the attendance areas, except Desert Ridge High (-50 students), are expected to experience losses of 300 or more students by the end of the period; the largest 10-year loss is projected for the Gilbert High attendance area (-570 students).

During the first five-year period, an enrollment increase in the Highland High (+70 students) attendance area is expected to partially offset losses in the remaining attendance areas; the largest loss during this

period is projected for the Gilbert High attendance area (-220 students). The projected in-District enrollment losses combine with a 50-student decrease in out-of-District 9-12 enrollment to yield a net loss of 560 high school students by 2024/25. During the second half of the projection period, out-of-District enrollment is expected to increase slightly (70 students), but in-District enrollment losses are projected to accelerate; only the Desert Ridge High attendance area is projected to see a gain of about 110 students during this period. The largest decrease during the second five-year period is forecast for the Highland High (430 students) attendance area. A net loss of 1,120 in-District students combined with the increase in out-of-District enrollment results in a net loss of an additional 1,050 high school students during the second half of the projection period.

The observed trends in school enrollment versus attendance area enrollment for the past five years are used to create projections of enrollment by school. While intra-District movement patterns tend to hold steady for several years, the potential for new alternative providers, special programs, and a host of other factors can cause these relationships to shift over time. Therefore, the projections by school for the long-term, 5 to 10 years into the future, should be used with caution. The projections of enrollment by school provided in **Tables 20 and 21** reflect the same pattern of change as the attendance areas, therefore no further description of these results is provided.
