

## Hint

Reading the numbers on a protractor is determined by the direction in which you move from one ray of the angle to the other ray. Notice in the picture below that the vertex and the bottom ray of the angles are aligned with the center and  $0^\circ$  marks on the protractor. If you are not sure which number to use, think about the angle you are drawing. Is it less than  $90^\circ$  (acute) or more than  $90^\circ$  (obtuse)? Use that answer to guide your decision.
