

## NCDPI Unpacked Content with OCS Priority Standards Identified

### Eighth Grade i-Ready Classroom Mathematics

2022 Alignment

#### Introduction

#### Purpose:

- Ensure educators understand the expectations of the standards
- Facilitate discussion among teachers
- Encourage coherence in the sequence, pacing and units of study for grade-level curricula
- Used to understand and teach the NCSCOS

#### Standards:

<ul> <li>OCS Priority Standards: the most important standards within a domain that are deemed the highest priority or most important for students to learn based on:</li> <li>Endurance</li> <li>Leverage</li> <li>Readiness</li> <li>Assessment</li> </ul>	<ul> <li>Supporting Standards:</li> <li>Taught in context of the priority standards but do not receive the same emphasis or degree of instruction</li> <li>Support, enhance or connect to the priority standards</li> </ul>
---	---

#### Lesson 0 – First 5 days of Math Instruction:

- Try-Discuss-Connect Routine engages students in mathematical practices and supports student-to-student discourse.
- Language Routines Three Reads supports use of Tier III academic vocabulary
- **Teacher Moves** instructional strategies that help facilitate discussions:
  - Turn and Talk
  - Individual Think Time
  - Four Rs: Repeat, Rephrase, Reword, Record

#### **Standards for Mathematical Practice:**

- Teaching approach that guides effective instruction
- Develops a mathematical mindset
- Creates real-world problem-solvers
- Builds mathematical communication

### 8<sup>th</sup> Grade OCS Priority Standards

#### **Standards for Mathematical Practice**

Practice	Explanation and Example
1. Make sense of problems and persevere in solving them.	In grade 8, students solve real world problems through the application of algebraic and geometric concepts. Students seek the meaning of a problem and look for efficient ways to represent and solve it. They may check their thinking by asking themselves, "What is the most efficient way to solve the problem?", "Does this make sense?", and "Can I solve the problem in a different way?"
2. Reason abstractly and quantitatively.	In grade 8, students represent a wide variety of real world contexts through the use of real numbers and variables in mathematical expressions, equations, and inequalities. They examine patterns in data and assess the degree to which the pattern models a line. Students contextualize to understand the meaning of the number or variable as related to the problem and decontextualize to manipulate symbolic representations by applying properties of operations.
3. Construct viable arguments and critique the reasoning of others.	In grade 8, students construct arguments using verbal or written explanations accompanied by expressions, equations, inequalities, models, and graphs, tables, and other data displays (i.e. box plots, dot plots, histograms, etc.). They further refine their mathematical communication skills through mathematical discussions in which they critically evaluate their own thinking and the thinking of other students. They pose questions like "How did you get that?", "Why is that true?" "Does that always work?" They explain their thinking to others and respond to others' thinking.
4. Model with mathematics.	In grade 8, students model problem situations symbolically, graphically, tabularly, and contextually. Students form expressions, equations, or inequalities from real world contexts and connect symbolic and graphical representations. Students solve systems of linear equations and compare properties of functions provided in different forms. Students use scatterplots to represent data and describe associations between variables. Students need many opportunities to connect and explain the connections between the different representations. They should be able to use all of these representations as appropriate to a problem context.

Practice	Explanation and Example
5. Use appropriate tools strategically.	Students consider available tools (including estimation and technology) when solving a mathematical problem and decide when certain tools might be helpful. For instance, students in grade 8 may translate a set of data given in tabular form to a graphical representation to compare it to another data set. Students might draw pictures, use applets, or write equations to show the relationships between the angles created by a transversal.
6. Attend to precision.	In grade 8, students continue to refine their mathematical communication skills by using clear and precise language in their discussions with others and in their own reasoning. Students use appropriate terminology when referring to the number system, functions, geometric figures, and data displays.
7. Look for and make use of structure.	Students routinely seek patterns or structures to model and solve problems. In grade 8, students apply properties to generate equivalent expressions and solve equations. Students examine patterns in tables and graphs to generate equations and describe relationships. Additionally, students experimentally verify the effects of transformations and describe them in terms of congruence and similarity.
8. Look for and express regularity in repeated reasoning.	In grade 8, students use repeated reasoning to understand algorithms and make generalizations about patterns. Students use iterative processes to determine more precise rational approximations for irrational numbers. They analyze patterns of repeating decimals to identify the corresponding fraction. Students flexibly make connections between covariance, rates, and representations showing the relationships between quantities.

Clarification	Checking for Understanding
The focus of this standard is on the conceptual development of <b>similar</b> <b>figures</b> . Similar figures have congruent angles and proportional corresponding side lengths. Two figures are <i>similar</i> if there is a sequence of dilations and rigid motions that places one figure directly on top of another (Progressions for CCSSM Geometry, Grade 7-8, HS, 2016). Given two similar figures, students explore the proportional relationship between corresponding characteristics of the figures, such as lengths of line segments, and angle measures as they develop a definition for similar figures. In 8 <sup>th</sup> grade, dilations are restricted from the origin. The coordinate plane can be used as a tool to develop understanding of this concept because it gives a visual image of the correspondence between the two figures. Additionally, transparencies or tracing paper can be used to show the congruency of the angles, while measurement tools can be used to examine the proportional relationships between edge lengths.	Triangle ABC undergoes a series of some of the following transformations to become triangle DEF: <ul> <li>Rotation</li> <li>Reflection</li> <li>Translation</li> <li>Dilation</li> </ul> <li>Is triangle DEF always, sometimes or never similar to triangle ABC? Justify your response. (Adapted from SBAC)</li>
	<ul> <li>Given the dilation ∆ ABC → ∆ A'B'C', what is the scale factor?</li> <li>a. Verify proportionality using both the dimensions and the coordinates of the figures.</li> </ul>

*In the following example*, the blue triangle and the purple triangle are similar. Students should explore the angle and side length relationships by using transformations to map one triangle onto another. Mapping each angle in the purple triangle to the corresponding angle in the blue triangle can help students see the proportionality of the sides and congruence of the angles.

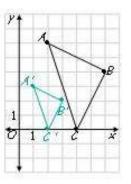

Students use mathematical language to distinguish the figures, noting that the figure prior to the transformation is called the **pre-image** (e.g. Figure A) and the post-transformation figure is called the **image** (e.g. Figure A').

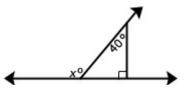

Students also examine two figures to identify the rigid transformation(s) that produced the image from the preimage. Students recognize the symbol for similarity (~) and write statements of similarity.

b. Verify that the center of dilation is at the origin.

transformations because they preserve size and shape of a geometric figure.	Rotation 270° (counter-clockwise)	$(x, y) \rightarrow ($ , $)$
Translations, reflections and rotations are <b>rigid</b> transformations.	Dilation (Scale up)	$(x, y) \rightarrow ($ , $)$
	Dilation (Scale down)	$(x, y) \rightarrow ($ , )
<b>Translations</b> Translations move the object so that every point of the object moves in the same direction as well as the same distance. In a translation, the translated object is <i>congruent</i> to its pre-image.		

#### For example,

 $\Delta ABC$  has been translated 7 units  $\rightarrow$  and 3 units  $\uparrow$ .

To get from A (1,5) to A' (8,8), move point A 7 units  $\rightarrow$  (from x = 1 to x = 8) and 3 units  $\uparrow$  (from y = 5 to y = 8).

Points *B* and *C* also move in the same direction (7 units  $\rightarrow$  and 3 units  $\uparrow$ ), resulting in the same changes to each coordinate.

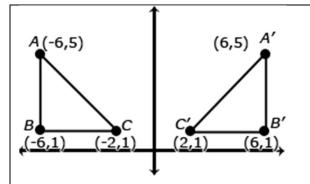

#### Reflections

A reflection is the "flipping" of an

object

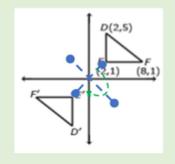

over a line, known as the "line of reflection". In the 8<sup>th</sup> grade, students will only reflect over the *x*- and *y*-axis. Students recognize that when an object is reflected across the *y*-axis, the reflected *x*-coordinate is the opposite of the pre-image *x*-coordinate. Students can then infer what happens when reflected across the *x*-axis. Likewise, a reflection across the *x*-axis would change a pre-image coordinate A (-6, 5) to the image coordinate of A'(-6,-5).

The figure below is reflected across the *y*-axis. Compare point A(-6, 5) to point A'(6, 5), *B* to *B'*, and *C* to *C'*.

#### Rotations

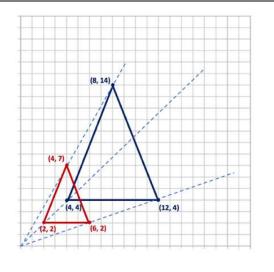

A rotation is a transformation performed by "spinning" the figure around a fixed point known as the center of rotation. The figure may be rotated clockwise or counterclockwise up to 360° (at 8<sup>th</sup> grade, rotations will be around the origin and a multiple of 90°). Students know that lines passing through the point of rotation, map onto themselves when rotated 180°, however lines that are rotated 180° that do not pass through the point of rotation create parallel lines.

*For example*, consider when triangle *DEF* is rotated 180° clockwise about the origin. The coordinates of triangle *DEF* are , , and . When rotated 180° about the origin, the new coordinates are , and . In this case, each coordinate is the opposite of its pre-image (see figure). Notice that corresponding sides of the image and preimage are parallel.

#### Dilations

Building on understanding of scale factor in earlier grades, students learn that a dilation is a transformation that moves each point along a ray which starts from a fixed center and multiplies distances from this center by a common scale factor. Dilations enlarge (scale factors greater than one) or reduce (scale factors less than one) the size of a figure by the specified factor.

Students recognize the relationship between the coordinates of the preimage, the image and the scale factor for a dilation from the origin. In 8<sup>th</sup> grade, dilations are limited from the origin.

#### Supporting Standard: NC.8.G.4

Understand congruence and similarity using physical models, transparencies, or geometry software.

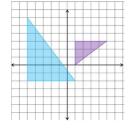

NC.8.G.4 Use transformations to define similarity.

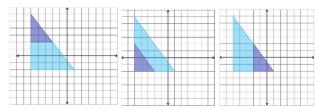

- Verify experimentally the properties of dilations that create similar figures.
- Understand that a two-dimensional figure is similar to another if the second can be obtained from the first by a sequence of rotations, reflections, translations, and dilations.
- Given two similar two-dimensional figures, describe a sequence that exhibits the similarity between them.

Clarification	Checking for Understanding

In 7 <sup>th</sup> grade, students learned to solve multistep one-variable equations and inequalities, with the variable on one side. In 8 <sup>th</sup> grade, students will build upon this understanding to solve one-variable equations and inequalities with the same variable on both sides. Students recognize and explain when linear equations have one solution, infinitely many solutions, or no solution without completing the solving process. Linear inequalities may have infinitely many solutions or no solution. For example, x + 5 < 2x + 8 - x has no solution. This inequality has no solution as 5 is not greater than 8. Students justify their answer with mathematical reasoning, including the use of the properties of equality.	Determine the number of solutions for each of the following. If there is only one solution, determine the solution. a) $\frac{1}{2}(2p+9) = -p+5$ b) $5-3q = 4 - \frac{2}{3}(4.5q-1.5)$ c) $8-2(n+3) = n+7-3n$ d) $\frac{1}{5}g + \frac{2}{5} = 1\frac{1}{5}g - 2\left(4 + \frac{2}{5}\right)$ In the following equation, a and b represent integers. 2x + a = 5 - bx What values of $a$ and $b$ would create an equation with just one solution? What values of $a$ and $b$ would create an equation with no solutions? What values of $a$ and $b$ would create an equation with infinitely many solutions? Solve the following and graph the solutions on a number line: a) $3x - 2 > 9 + 5x$ b) $\frac{5+2y}{4} \ge \frac{y+3}{2}$ c) $\frac{2}{3}h + 9 < 8\left(\frac{1}{3}h - 2\right)$ d) $\frac{1}{5}(13 - 20x) \le -14 - 4x$ Two companies are competing for a contract to make the programs for the high school football games. Solve real-world and mathematical problems leading to systems of linear equations by graphing the equations. Solve simple cases by inspection. Students write a system of equations to represent a word problem. Word problems will be presented in a way that students can write the equation directly into slope-intercept form. Students recognize the structure of equations and by inspection recognize when the equations will produce one solution, no solution or infinitely many solutions.	a) $b = \frac{2}{3}a + 1$ $b = -\frac{1}{3}a + 7$ b) $y = \frac{3}{7}x - 4$ $y = \frac{3}{7}x + 1$

#### OCS Priority Standard: NC.8.F.4

#### Use functions to model relationships between quantities.

NC.8.F.4 Analyze functions that model linear relationships.

- Understand that a linear relationship can be generalized by y = mx + b.
- Write an equation in slope-intercept form to model a linear relationship by determining the rate of change and the initial value, given at least two (x, y) values or a graph.
- Construct a graph of a linear relationship given an equation in slope-intercept form.
- Interpret the rate of change and initial value of a linear function in terms of the situation it models, and in terms of the slope and y-intercept of its graph or a table of values.

Clarification		Checking for Und	lerstanding	
Analyzing linear functions is a major focus for 8 <sup>th</sup> gra students have worked with proportional relationship of linear functions. Understand that a linear relationship can be general In previous grades, students created tables, graphs, proportional relationships. Students can build from the knowledge to the larger generalization of linear function In 7 <sup>th</sup> grade, students learned that in a proportional relationship, the <i>y</i> -coordinate when x = 1 is the unit rate and built an understanding of the equation of a proportional relationship ( <i>see</i> <i>NC.7.RP.2</i> ).	and equation: this previous ctions. x (input)         0         1         2         3		Write an equation that models the linear relationship in the graph.	

Construct a graph of a linear relationship given an equation in slopeintercept form.

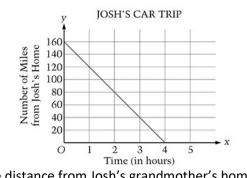

Student create the graphical representation of linear function, given a linear equation in slope-intercept form, using the initial value and rate of change. Students will choose an appropriate scale to graph a linear function.

Interpret the rate of change and initial value of a linear function in terms of the situation it models, and in terms of the slope and *y*-intercept of its graph or a table of values.

Students give meaning to the rate of change and the initial value of a linear function based on a context. The linear function can be given in a variety of representations, including verbal descriptions, tables, graphs, and equations.

Students use terms such as slope and *y*-intercept to describe a graphical representation of a linear function and correlate their meaning to the rate of change and initial value, where the input is 0. Students should use the units from a context appropriately in their description of rate of change and initial value.

The linear graph below describes Josh's car trip from his grandmother's home directly to his home.

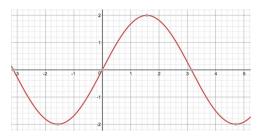

a) What is the distance from Josh's grandmother's home to his home?

b) How long did it take for Josh to make the trip?

c) What was Josh's average speed for the trip? Explain how you know. Adapted from NAEP – Released Item (2011) Question ID: 2011-8M8 #15 M169901

#### OCS Priority Standard: NC.8.EE.1

#### Work with radicals and integer exponents.

NC.8.EE.1 Develop and apply the properties of integer exponents to generate equivalent numerical expressions.

NC.8.EE.1 Develop and apply the properties of integer exponents to generate equivalent numerical expressions.		
Clarification	Checking for Understanding	
Students first worked with whole number exponents in 6 <sup>th</sup> grade. At this grade level, students will build upon that knowledge to understand the properties of integer exponents and numerical bases and patterns of repeated multiplication and division. Students use their understanding of exponents as repeated multiplication to develop and create equivalent expressions and justify the following properties: • $5^3 \cdot 5^4 = 5^{3+4} = 5^7$ • $\frac{5^3}{5^4} = 5^{3-4} = 5^{-1} = \frac{1}{5}$ • $(5^3)^4 = 5^{3\cdot4} = 5^{12}$ • $5^3 \cdot 2^3 = (5 \cdot 2)^3 = (10)^3$ • $5^0 = 1$ • $5^{-3} = \frac{1}{5^3} = \frac{1}{125}$ Eighth grade is the first time students raise negative numbers to a power. Students recognize that negative numbers raised to an even power produce different products when parenthesis are used. For example, $-4^2$ and $(-4)^2$ have products of $-16$ and $16$ respectively. Students are not expected to know the names of the properties of exponents.	Rewrite the following expressions so that each expression does not contain an exponent. a) $\frac{2^3}{5^2}$ b) $\frac{2^2}{2^6}$ c) $6^0$ d) $\frac{3^{-2}}{2^4}$ e) $(3^2)(3^4)$ f) $(4^3)^2$ g) $-(\frac{2}{3})^2$ h) $(-\frac{5}{4})^2 \cdot (\frac{2}{5})^{-3}$ j) $12^7 \cdot 12^{-7}$

This standard uses the Pythagorean Theorem as an application to find the distance between two non-vertical and non-horizontal points on a line. Students build on work from 6 <sup>th</sup> grade where they found distances between vertical and horizontal lines in the coordinate plane. Given two points, students are able to draw a line connecting the points and create a right triangle using the points. Students understand that the line segment between the two points is the length of the hypotenuse of the right	Draw the right triangle where $\overline{AB}$ is the hypotenuse? What is the length of $\overline{AB}$ ?

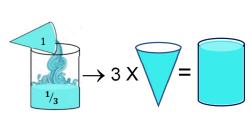

#### OCS Priority Standard: NC.8.G.9

Solve real-world and mathematical problems involving volume of cylinders, cones and spheres.

**NC.8.G.9** Understand how the formulas for the volumes of cones, cylinders, and spheres are related and use the relationship to solve real-world and mathematical problems.

Clarification			Checking for Understanding		
This standard focuses on the volume formulas for 3-dimensional shapes related to circles (cones, cylinders and spheres). Students have already worked with volume of cubes and rectangular prisms. They apply these same understandings beginning with cylinders.					
For a cylinder, students understand that the volume represents a "stack" or layers of area of the base. So, they apply the generalized formula $V = Bh$ , where <i>B</i> represents the area of the base and <i>h</i> represents the height of the stack.	$ \begin{array}{c}                                     $	Height $V = \pi r^2 h$	James wanted to plant pansies in his new planter. He wondered how much potting soil he should buy to fill it. Use the measurements in the diagram below to determine the planter's volume.	100 cm cylindrical planter	

For a cone, students understand that the volume of a cylinder is 3 times the volume of a cone

 $\rightarrow$ 

**Note:** The height of the cylinder is twice the radius of the sphere.

having the same base area and height OR that the volume of a cone is 1/3 the volume of a cylinder having the same base area and height.

Therefore,  $V_{cone} = \frac{1}{3}\pi r^2 OR V_{cone} = \frac{\pi r^2}{3}$ .

A sphere can be enclosed within a cylinder, which has the same radius and height of the sphere. If the sphere is flattened, it will fill  $\frac{2}{3}$  of the cylinder.

Based on this model, students

understand that the volume of a sphere is 2/3 the volume of a cylinder with the same radius and height. The height of the cylinder is the same as the diameter of the sphere or 2r.

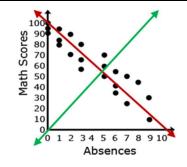

We can derive the volume formula for a sphere: Beginning with the *cylinder* formula  $\mathbb{P} V = \pi r^2 h$ ; Multiply the *cylinder* formula by  $\frac{2}{3}\mathbb{P} V = \frac{2}{3}\pi r^2 h$ ; Substitute 2r for the height  $\mathbb{P} V = \frac{2}{3}\pi r^2(2r)$ ; Therefore,  $V_{sphere} = \frac{4}{3}\pi r^3$ . How much yogurt is needed to fill the cone to the right? Express your answers in terms of Pi.

Approximately, how much air would be needed to fill a soccer ball with a radius of 14 cm?

Investigate patterns of association in bivariate data.	a to investigate patterns of association between two quantities. Investigate and linear association. Checking for Understanding
This standard focuses on graphing and interpreting two-variable (bivariate) qualitative/measurement data. Students will build on previous experiences, such as graphing ordered pairs on the coordinate plane and analyzing the relationships between quantitative variables. Students will extend their understanding by investigating patterns of association between the variables. This includes recognizing associations that are both linear and non-linear, which differ from no association. Students also recognize when clusters and/or gaps are present in the data. Finally, students can identify points that are deviations from associated data noting them as outliers.	The music sales (in billions) for the years 1999-2009 is displayed in the scatter plot. What are the pattern(s) of association for the music sales in the decade between 1999 and 2009? Explain.
	Data for 10 students' Math and Science scores are provided in the chart. Describe what the data says about the association between the Math and Science scores.
	Student #         1         2         3         4         5         6         7         8         9         10
	Math Score         64         50         85         34         56         24         72         63         42         93           Science Score         68         70         83         33         60         27         74         63         40         96

Students understand that a straight line can represent a scatter plot with what appears to be a linear association. If a linear relationship is suspected,

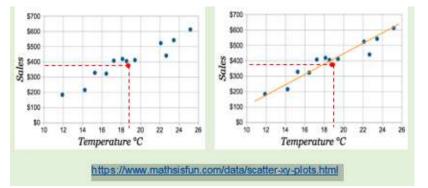

points on either side of the line.

53

students draw the linear model that represents the *direction* of the association in the scatter plot minimizing the distance between the actual *y*-value and the predicted *y*-value (represented on the line) for each point.

The centroid (mean of x-values, mean of y-values) is a point on the estimated model line. Using this point as a pivot point can help students to determine the placement of the line. This is an informal understanding to assist students in the construction of the line. The line may or may not go through any or all of the data points. The use of linear regression is NOT expected.

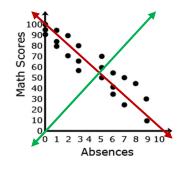

**For example,** the following graph represents the ice cream sales of a local ice cream shop versus the noon temperature for 12 days. The association appears to be positive meaning that as the temperature increased, the ice cream sales increased also. The red dot (Figure 1) represents the average temperature and sales (18.7, 402). The line is drawn to reflect the direction (positive) of the association and as close as possible to all data points in the scatterplot.

Furthermore, students notice any data values that fall outside the general pattern of associated data.

#### Absences Math Scores

Given the scatter plot from students' math scores and absences, which line best models the association of the data? Explain.

#### OCS Priority Standard: NC.8.SP.3

#### Investigate patterns of association in bivariate data.

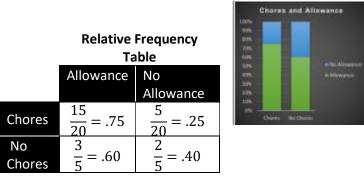

NC.8.SP.3 Use the equation of a linear model to solve problems in the context of bivariate quantitative data, interpreting the slope and y-intercept.

Clarification	Checking for Understanding			
This standard is a modeling standard. Students model linear relationships using linear equations. Students can interpret the coefficient (slope) and constant (y-intercept) of the equation in the context of the problem.	Given the scatter plot and line for student math scores and absences, select two points to write the linear equation for the line. Interpret the slope and <i>y</i> -intercept in context of the problem.			
This standard extends understandings from previous grade levels where students have graphed and created equations of quantitative relationships (NC.6.EE.9, NC.7.RP.2c).	100 00 00 00 00 00 00 00 00 00 00 00 00			
Students have also interpreted the meaning of points ( <i>x</i> , <i>y</i> ) and quantities (rates) within proportional relationships (NC.7.RP.2d). Additionally, students apply this same understanding to non-proportional relationships (NC.8.F.4) where all points are collinear. This standard is extended to work with scatter	30 20 10 0 1 2 3 4 5 6 7 8 9 10			
plots, where the points generally are non-collinear, and students have to select appropriate points to write the equation of the line.	Absences			
Supporting Standard: NC.8.SP.4				
<ul> <li>Investigate patterns of association in bivariate data.</li> <li>NC.8.SP.4 Understand that patterns of association can also be seen in bivariate way table.</li> <li>Construct and interpret a two-way table summarizing data on two cate</li> <li>Use relative frequencies calculated for rows or columns to describe post</li> </ul>	gorical variables collected from the same subjects.			
Clarification	Checking for Understanding			
This standard extends understandings of bivariate numerical data to bivariate <i>categorical</i> data. Students understand that a two-way table provides a way to organize data between two categorical variables.	<ul> <li>Kayla asked 10 students in her class whether they owned a dog, a cat or both.</li> <li>Complete the table below with the frequencies using the following relative frequencies:</li> <li>40% of the students own a dog</li> </ul>			
Students have experience with categorical data from elementary school and relative frequencies in 7 <sup>th</sup> grade. They will extend this understanding to developing two-way tables of frequencies and relative frequencies.	<ul> <li>30% of the students own a cat</li> <li>10% of the students own both</li> <li>Yes</li> <li>Yes</li> <li>No</li> </ul>			
Students will examine patterns of association in categorical data by examining the relative frequencies in a two-way table. Students recognize	Totals 10			

similarity between populations.

**For example,** the tables below represent data from a survey of 25 students to determine if there is an association between allowance and chores. Since there is a difference in the relative frequencies, there appears to be an association between doing chores and receiving allowance.

Frequency Table					
	Allowance No				
		Allowance	Total		
Chores	15	5	20		
No Chores	3	2	5		
Total	18	7	25		

The segmented bar graph is a visual display of the data. Since the green bar decreases for those not doing chores, there appears to be an association between doing chores and receiving allowance for this group of students. Additionally, not doing chores is associated with not receiving allowance.

Students DO NOT need to create segmented bar graphs; this visual is used to aid in understanding.

OCS Priority Standard: NC.8.F.4

Use functions to model relationships between quantities.

NC.8.F.4 Analyze functions that model linear relationships.

• Understand that a linear relationship can be generalized by y = mx + b.

All the students at a middle school were asked to identify their favorite academic subject and whether they were in 7th grade or 8th grade. Here are the results:

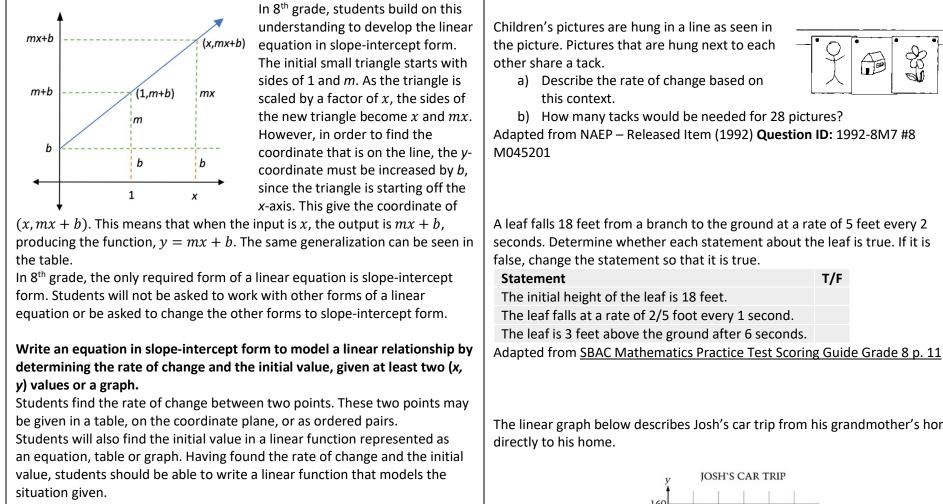

Favorite Subject by Grade						
Grade	English	History	Math/Science	Other	Total	
7 <sup>th</sup> Grade	38	36	28	14	116	
8 <sup>th</sup> Grade	47	45	72	18	182	
Totals	85	81	100	32	298	

Is there an association between favorite academic subject and grade for students at this school? Support your answer by calculating appropriate row relative frequencies using the given data.

Illustrative Mathematics: What's Your Favorite Subject?

- Write an equation in slope-intercept form to model a linear relationship by determining the rate of change and the initial value, given at least two (x, y) values or a graph.
- Construct a graph of a linear relationship given an equation in slope-intercept form.
- Interpret the rate of change and initial value of a linear function in terms of the situation it models, and in terms of the slope and y-intercept of its graph or a table of values.

Clarification		Checking for Understanding	
Analyzing linear functions is a major focus for 8 <sup>th</sup> grade. In previous grades, students have worked with proportional relationships, which are a subset of linear functions. This means that some of the properties of a proportional relationship can be generalized to linear functions, while some properties are specific to proportional relationships. Understand that a linear relationship can be generalized by $y = mx + b$ . In previous grades, students created tables, graphs, and equations from		f table.	
proportional relationships. Students created tables, graphs, and equations from proportional relationships. Students can build from this previous knowledge to the larger generalization of linear functions. In 7 <sup>th</sup> grade, students learned that in a proportional relationship, the <i>y</i> -coordinate when $x = 1$ is the unit rate and built an understanding of the equation of a proportional relationship (see <i>NC.7.RP.2</i> ). $\frac{x (input)  y (output)}{0 \qquad b}$		Write an equation that models the linear relationship in the graph. $ \frac{4^{y}}{\sqrt{4}} + \sqrt{4}, 5^{y}} $ Write an equation for the line that has a rate of change of $\frac{1}{2}$ and passes though the point (-2, 5).	
			The company charges \$45 a day for the car as well as charging a one-time \$25 fee for the car's navigation system (GPS). Write a function for the cost in dollars, <i>c</i> , and the number of days, <i>d</i> , the car was rented.

This standard does not imply that students should memorize the slope formula or use a purely algebraic approach to find an equation. Students should be able to use patterns and other representation to find the initial value and rate of change.

Construct a graph of a linear relationship given an equation in slopeintercept form.

The linear graph below describes Josh's car trip from his grandmother's home

Student create the graphical representation of linear function, given a linear equation in slope-intercept form, using the initial value and rate of change. Students will choose an appropriate scale to graph a linear function.	<ul> <li>a) What is the distance from Josh's grandmother's home to his home?</li> <li>b) How long did it take for Josh to make the trip?</li> <li>c) What was Josh's average speed for the trip? Explain how you know.</li> </ul>
Interpret the rate of change and initial value of a linear function in terms of the situation it models, and in terms of the slope and y-intercept of its graph or a table of values. Students give meaning to the rate of change and the initial value of a linear function based on a context. The linear function can be given in a variety of representations, including verbal descriptions, tables, graphs, and equations. Students use terms such as slope and y-intercept to describe a graphical representation of a linear function and correlate their meaning to the rate of change and initial value, where the input is 0. Students should use the units from a context appropriately in their description of rate of change and initial	Adapted from NAEP – Released Item (2011) Question ID: 2011-8M8 #15 M169901
value.

Remember Retrieve knowledge from long-term memory, recognize, recall, locate, identify	<ul> <li>Recall, observe, &amp; recognize facts, principles, properties</li> <li>Recall/ identify conversions among representations or numbers (e.g., customary and metric measures)</li> </ul>	Use these Hess CRM curricular examples with most mathematics or science assignments or assessments.		
Understand Construct meaning, clarify, paraphrase, represent, translate, illustrate, give ex- amples, classify, categorize, summarize, generalize, infer a logical conclusion), predict, compare/contrast, match like ideas, explain, construct models	<ul> <li>Evaluate an expression</li> <li>Locate points on a grid or number on number line</li> <li>Solve a one-step problem</li> <li>Represent math relationships in words, pictures, or symbols</li> <li>Read, write, compare decimals in scientific notation</li> </ul>	<ul> <li>Specify and explain relationships (e.g., non-examples/examples; cause-effect)</li> <li>Make and record observations</li> <li>Explain steps followed</li> <li>Summarize results or concepts</li> <li>Make basic inferences or logical predictions from data/observations</li> <li>Use models /diagrams to represent or explain mathematical concepts</li> <li>Make and explain estimates</li> </ul>	<ul> <li>o Use concepts to solve non-routine problems</li> <li>o Explain, generalize, or connect ideas using supporting evidence</li> <li>o Make and justify conjectures</li> <li>o Explain thinking/reasoning when more than one solution or approach is possible</li> <li>o Explain phenomena in terms of concepts</li> </ul>	<ul> <li>Relate mathematical or scientific concepts to other content areas, other domains, or other concepts</li> <li>Develop generalizations of the results obtained and the strategies used (from investigation or readings) and apply them to new problem situations</li> </ul>
Apply Carry out or use a procedure in a given situation; carry out (apply to a familiar task), or use (apply) to an unfamiliar task	<ul> <li>o Follow simple procedures (recipe-type directions)</li> <li>o Calculate, measure, apply a rule (e.g., rounding)</li> <li>o Apply algorithm or formula (e.g., area, perimeter)</li> <li>o Solve linear equations</li> <li>o Make conversions among repre- sentations or numbers, or within and between customary and metric measures</li> </ul>	<ul> <li>Select a procedure according to criteria and perform it</li> <li>Solve routine problem applying multiple concepts or decision points</li> <li>Retrieve information from a table, graph, or figure and use it solve a problem requiring multiple steps</li> <li>Translate between tables, graphs, words, and symbolic notations (e.g., graph data from a table)</li> <li>Construct models given criteria</li> </ul>	<ul> <li>Design investigation for a specific purpose or research question</li> <li>Conduct a designed investigation</li> <li>Use concepts to solve non-routine problems</li> <li>Use &amp; show reasoning, planning, and evidence</li> <li>Translate between problem &amp; symbolic notation when not a direct translation</li> </ul>	<ul> <li>Select or devise approach among many alternatives to solve a problem</li> <li>Conduct a project that specifies a problem, identifies solution paths, solves the problem, and reports results</li> </ul>
Analyze Break into constituent parts, determine how parts relate, differentiate between relevant-irrelevant, distinguish, focus, select, organize, outline, find coher- ence, deconstruct	<ul> <li>Retrieve information from a table or graph to answer a question</li> <li>Identify whether specific information is contained in graphic representations (e.g., table, graph, T-chart, diagram)</li> <li>Identify a pattern/trend</li> </ul>	<ul> <li>o Categorize, classify materials, data, figures based on characteristics</li> <li>o Organize or order data</li> <li>o Compare/ contrast figures ordata</li> <li>o Select appropriate graph and organize &amp; display data</li> <li>o Interpret data from a simple graph</li> <li>o Extend a pattern</li> </ul>	<ul> <li>o Compare information within or across data sets or texts</li> <li>o Analyze and draw conclusions from data, citing evidence</li> <li>o Generalize a pattern</li> <li>o Interpret data from complex graph</li> <li>o Analyze similarities/differences between procedures or solutions</li> </ul>	o Analyze multiple sources of evidence o Analyze complex/abstract themes o Gather, analyze, and evaluate information
Evaluate Make judgments based on criteria, check, detect inconsistencies or fallacies, judge, critique	"UG" –unsubstantiatedgeneralizations = stating an opinion without providing any support for it!		<ul> <li>o Cite evidence and develop a logical argumentfor concepts or solutions</li> <li>o Describe, compare, and contrast solution methods</li> <li>o Verify reasonableness of results</li> </ul>	<ul> <li>Gather, analyze, &amp; evaluate information to draw conclusions</li> <li>Apply understanding in a novel way, provide argument or justification for the application</li> </ul>
<b>Create</b> Reorganize elements into new patterns/structures, generate, hypothesize, design, plan, produce	o Brainstorm ideas, concepts, or perspectives related to a topic	o Generate conjectures or hypotheses based on observations or prior knowledge and experience	<ul> <li>o Synthesize information within one data set, source, or text</li> <li>o Formulate an original problem given a situation</li> <li>o Develop a scientific/mathematical model for a complex situation</li> </ul>	<ul> <li>Synthesize information acrossmultiple sources or texts</li> <li>Design a mathematical model to inform and solve a practical or abstract situation</li> </ul>
