Executive Summary

Introduction and Background

Manteca Unified School District has contracted with Davis Demographics to develop and analyze demographic data relevant to the district's facility planning efforts. The scope of contracted work includes updating district mapping files, analyzing the district using the previous four years of geocoded student data files, developing, and researching pertinent demographic data in and around the district, identifying current and future residential development plans and preparing a ten-year student population forecast.

The purpose of this report is to identify and inform the district of the demographic trends occurring within the community, how these trends may affect future student populations, and to assist in illustrating facility adjustments that may be necessary to accommodate the potential student population shifts, to assist the district in evaluating future site requirements and the need for potential attendance area boundary changes.

Davis Demographics, a non-biased third-party consultant, has been contracted to prepare and maintain a ten-year demographic study. In this study, Davis Demographics produced detailed neighborhood and attendance area population forecasts based on the residential address of students. Davis Demographics bases its forecasts on the belief that school facility planning is more accurate when facilities are located where the greatest number of students reside. This study is intended to help the district notice specific demographic trends that could assist them in making informed decisions regarding long-range planning efforts.

The Sources of Data section details how the two sources of data – geographic and non-geographic -- are collected and used in the ten-year student population forecast model.

The Forecast Methodology section discusses, in detail, how the factors used in the study were calculated, and why they were used. These factors include area birthrates and their effect on incoming kindergarten classes, the effects of student mobility, student yield factors based on historic housing data and trends, and a detailed review of future residential development within the district.

The Student Resident Forecast Summary sections offer a review of this year's student resident forecast results. These sections include the district-wide student population forecast summary and a forecasted resident student population summary for both the existing attendance areas and the individual study areas from which they were calculated.

While reading this report, it is important to remember that it is based on data gathered at the time of the study. Due to potential population shifts, changes in development plans, fluctuating funding opportunities, and district priorities, all findings presented in this report are subject to change.

Key Items in the District-Wide Analysis:

- Overall, the student population for Manteca Unified School District is projected to increase by 4,811 resident grade TK-12 students over the next 10 years reflecting a growth rate of 19% over the forecasted time span.
- The TK-8 resident student population is forecasted to increase by 17% over the next ten years.
- The district high school population is also expected to increase by 23% by SY 2033 as larger class sizes graduate.
- Forecasted growth in student population is mainly attributed to the planned residential development due to be constructed and occupied over the next 10 years. There are approximately 6,405 active and planned units in the MUSD boundary with estimated construction timelines over the next 10 years.
- The rise in births in 2022 when compared to 2021 is contributing to higher forecasted incoming kindergarten classes starting in fall 2027.

EXECUTIVE SUMMARY

The following chart summarizes the forecasted student populations from SY2023 to SY2033.

Table 1: District Summary

Forecast based on student data processed 10/4/2023.

1. Methodology

Data Sources

Geographic Map Data

Five (5) geographic data layers were modified or created for use in the ten-year student population forecasts:

STREET CENTERLINE DATA/PARCELS

Street centerline/parcel data files are utilized during the geocoding process of the student data. The geocoding process places a point on the map for every student in the exact location the student resides. Each student is geocoded to the parcels by their given residence address. This enables Davis Demographics to analyze student data geographically. Another vital utilization of the digital street database is in the construction of study areas. Freeways, major streets, and neighborhood streets are generally used as boundaries for the study areas.

STUDY AREAS

Study areas are small geographic areas – such as neighborhoods or portions of neighborhoods – that are considered the building blocks of school district attendance areas. Study areas are geographically defined following logical boundaries within a school district, such as freeways, streets, railroad tracks, or green space. Each study area is then coded with the corresponding elementary, middle, and high school that the students in the area are assigned to attend. By gathering information about the district at the study area level, Davis Demographics and MUSD can closely monitor growth and demographic trends in regions and identify the potential need for boundary or facility adjustments. Currently, 337 study areas make up the school district.

SCHOOLS

School facility information, including school names, addresses, unique identifying codes, grade ranges, and capacities, was provided to Davis Demographics by district staff.

PLANNED RESIDENTIAL DEVELOPMENT

Residential development data was obtained through discussions with the local municipalities. Davis Demographics researched possible new developments that could impact future student counts and reviewed the information with school district staff. This data includes the development name, location, housing type, and the total number of units within the development. The planned residential development information is subject to changes in the marketplace; therefore, this data should be reevaluated annually. Davis Demographics and Manteca Unified School District were monitoring projects closely during this study.

1. METHODOLOGY

STUDENT DATA

- a. **HISTORIC STUDENT DATA** - Historic population data is used to compare past student population trends as well as the effects of mobility (movement of students in or out of existing housing) throughout the district.
- b. **CURRENT STUDENT DATA** - A student data file representing student membership as of Fall 2023 was provided to Davis Demographics by district staff. This data was summarized by grade level and each student was located by residential address to identify current study area populations. This data is used as a baseline for student population forecasts. The forecasts encompass the next ten years from SY2024-25 through SY2033-34.
- c. **STUDENT ACCOUNTING** - The Student Verification Form indicates the total student enrollment as of 10/4/2023, and the number of students used in the ten-year student population forecasts. The forecast model is based on student residence and typically excludes students residing outside of the district's boundaries.

Forecast Methodology

Davis Demographics has created ten-year, residence-based, modified cohort forecasts for each study area in MUSD. The forecast methodology used in this study combines historic student population counts, past and present demographic characteristics, and planned residential development to forecast future student populations at the study- area level. District-wide and school-level forecasts are summarized from the individual study area forecasts.

TEN-YEAR FORECASTS

Projections are calculated ten years from the date of the forecast for several reasons. The planning horizon for any type of facility is typically no less than five years, often longer. Ten years is usually enough to adequately plan for any new facility. Forecasts beyond ten years are based on speculation due to the lack of reliable information on birth rates, new home construction, and economic conditions.

RESIDENCE-BASED

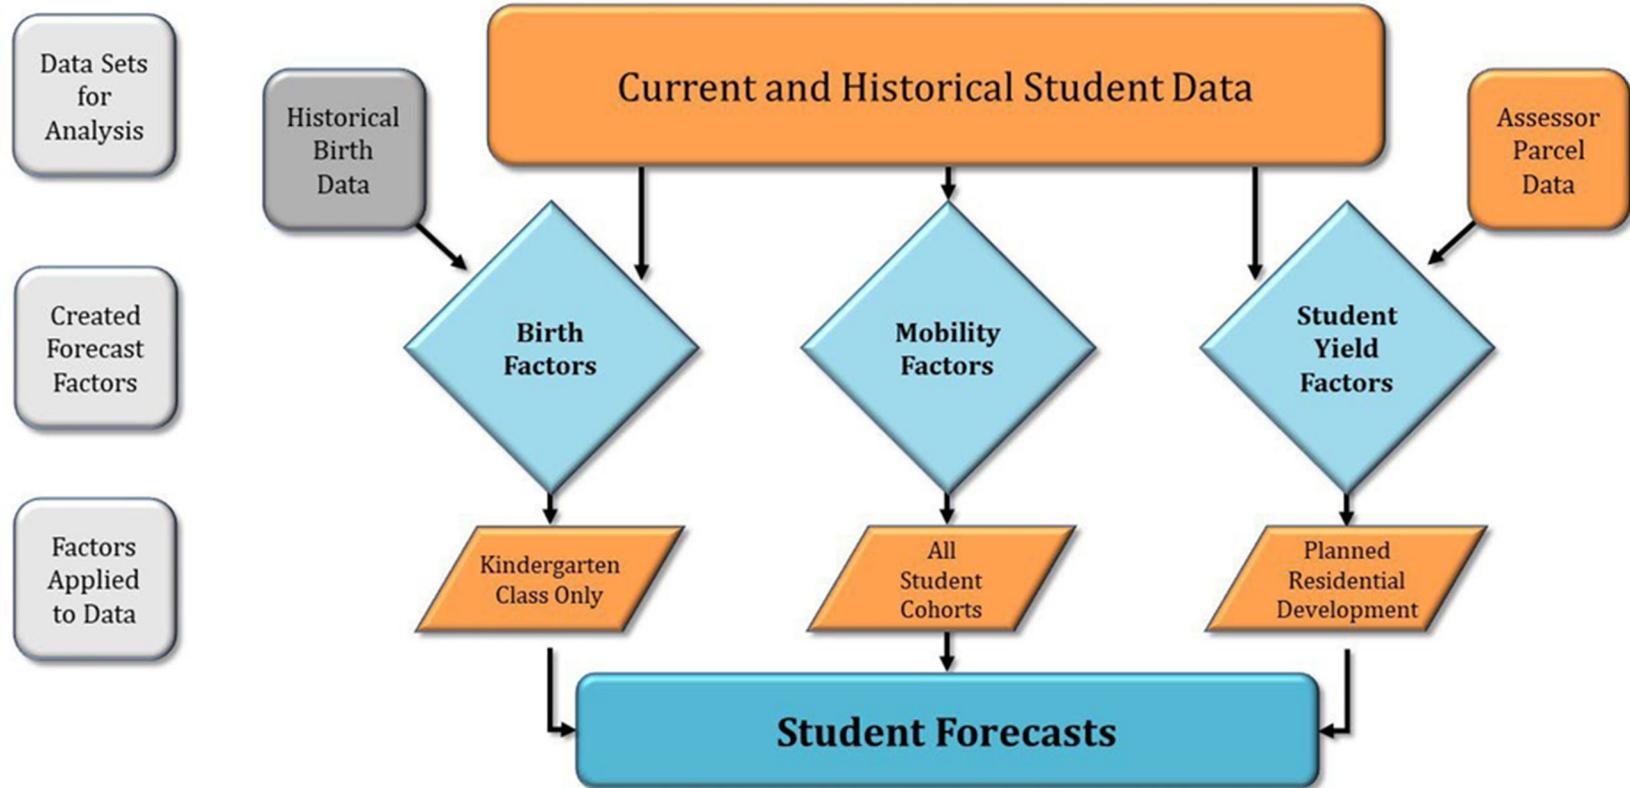

These forecasts are based on where the students reside and where they are assigned to attend school. To provide the most accurate estimate of where future school facilities may be needed, Davis Demographics uses the location of where the students reside as opposed to their school of enrollment because we believe that school facility planning is more accurate when facilities are located where the greatest number of students reside. The best way to plan for future student population shifts is to know where the next group of students will be living.

Typically, district-generated forecasts are based on school enrollments and are forecasted for staffing and budgetary needs. However, this method is often inadequate for long-range planning needs, such as the location of future school facilities, because the location of the students is not taken into consideration. A school's enrollment can fluctuate annually not only due to population trends but also due to variables in the curriculum, program changes, school administration, and open-enrollment policies. These variables can skew the apparent need for new or additional facilities in an area.

MODIFIED COHORT

The method used by Davis Demographics is unique because it modifies a standard cohort forecast with demographic factors and student residential location. For each year of the forecast, 12th grade students graduate and continuing students' progress through to the next grade level. This normal progression of students is modified by the forecast variables detailed below.

Chart 1: Forecasts by Residence Flowchart

Forecast Variables

There are three primary variables that can directly influence a forecast: birthrates, mobility, and student yield factors. If all variables register at a lower level, they suggest a decrease in the district's population. Conversely, higher variables typically signal growth within the district. Frequently, it's a blend of both scenarios. For instance, national birth rates may be on the decline, but a district can maintain stability or expansion by fostering adequate development to counterbalance the decreasing birth trend.

Birth Rates

Davis Demographics uses the birth data correlating to the district boundary and applies the data accordingly. The assumption underlying the use of birth statistics from year to year is that increases or decreases in the number of births in the area will translate to increases or decreases in future kindergarten enrollment. For example, the SY2023 kindergarten class in MUSD was born five years previous in 2018. Any subsequent changes in births in 2019 compared to 2018 and 2020 to 2018, etc. would result in similar increases or decreases in future kindergarten class sizes.

Incoming kindergarten classes for existing homes are estimated by comparing changes in past births in the area. Davis Demographics assumes the current kindergarten class was born five years prior in 2018. Future incoming kindergarten classes are estimated by comparing the number of births in 2018 to the number of births in 2019 through 2022. Davis Demographics compared the total births in 2018 to the total births in 2019 to determine a factor for next year's kindergarten class (SY2024-25). The 2018 births were compared to 2020 (SY2025-26 K class), 2018 to 2021 (SY2026-27 K class), and on.

Student Mobility Factors

Student mobility factors further refine the ten-year student population forecasts. Mobility refers to the increase or decrease in the movement of students within and out of the district boundary's existing housing. Mobility is a spatial cohort survival rate meaning that it calculates the movement of students from grade in that geographic area. Mobility factors consider apartment movement within the district, housing resales, foreclosures, movement out of the district, and high school dropout rates. Mobility, like a cohort, is applied as a percentage of increase/decrease to each grade for every year of the Forecasts.

A net increase or decrease of zero students over time is represented by a factor of **1.000** or a 100% pass-through rate. A net student loss is represented by a factor less than 1.000 (such as **.96** or a -4% net loss) and a net gain by a factor greater than **1.000** (such as **1.05** or a 5% net increase).

HOW IS MOBILITY APPLIED?

$$\begin{array}{rcl} & 100 & \text{Kindergarten students in SY2022-23} \\ \text{Example: } & \times & \mathbf{1.12} \quad (\text{August Knodt ES 1}^{\text{st}}\text{-grade mobility}) \\ & = & 112 \quad \text{1}^{\text{st}}\text{-grade students in SY2023-24} \end{array}$$

Davis Demographics used current elementary school attendance areas as the basis to calculate Mobility Factors. Using small geographic areas helps identify and focus on trends within the district.

Student Yield Factors (SYF)

The Student Yield Factors, when applied to planned residential development units, determine how many additional students will be generated from new construction within the district.

Two sets of data are required to calculate Student Yield Factors: a current student file provided by MUSD and current housing unit data. In a full SYF Study, the geocoded student data file is overlaid with the housing data to determine how many students reside in each housing type. This allows Davis Demographics to associate each student with a specific housing unit. A full SYF study is recommended every 2-5 depending on the amount of residential growth of the district, the economy or life altering events, such as a pandemic.

The SYF is an important tool for school districts to use in planning for future enrollment growth. By knowing the SYF for different types of housing, districts can get a better idea of how many students they can expect to enroll in the future. This information can be used to make decisions about staffing, facilities, and programming.

Davis Demographics calculated three different Student Yield Factors; for the different residential unit types scheduled for construction(district-wide), for units built within the past 6 years (district-wide). Please note that no MFA units were built during this time span. Davis Demographics, therefore, had to revert to 2004-2005 to find a sampling of 26 MFA units that were built. Upon examining the results, Davis Demographics determined that the Student Yield Factors for units built within the last 6 years (district-wide) for apartments and 5 years for Single Family Detached homes would most accurately estimate the number of students new housing would yield. These units are similar in size and location to the planned residential development. Since there was not enough sampling for MFA units, Davis used a combined APT/MFA unit sampling to come up with an MFA SYF. It was decided to apply that SYF to the planned residential development within the District over the next ten years. This sample should reflect a reasonable number of students expected from planned residential developments. These factors were updated as of Fall 2023.

TABLE 4: STUDENT YIELD FACTORS

2023

Unit Type	Number of Units	Number of Students				Yield Factors				Unit Type
		K-6	7-8	9-12	K-12	K-6	7-8	9-12	K-12

APT	741	59	14	20	93	0.080	0.019	0.027	0.126	APT
MFA/APT	767	63	17	25	105	0.082	0.022	0.033	0.137	MFA/APT

***A sample of 26 MFA (Townhomes) (built 2004-2006) units located off W Alameda St and Pearl Pl along with the apartment sampling were used in the survey for the MFA/APT Survey.*

****A sample of apartments built within the last 6 years were used in this survey.*

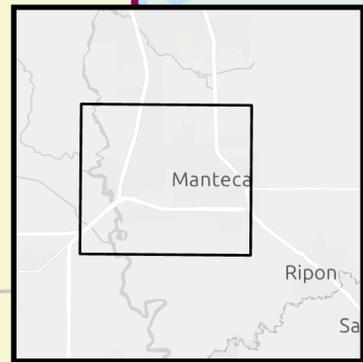

****SFD Unit totals include units built within the last 5 years and exclude age restricted units*

Planned Residential Development

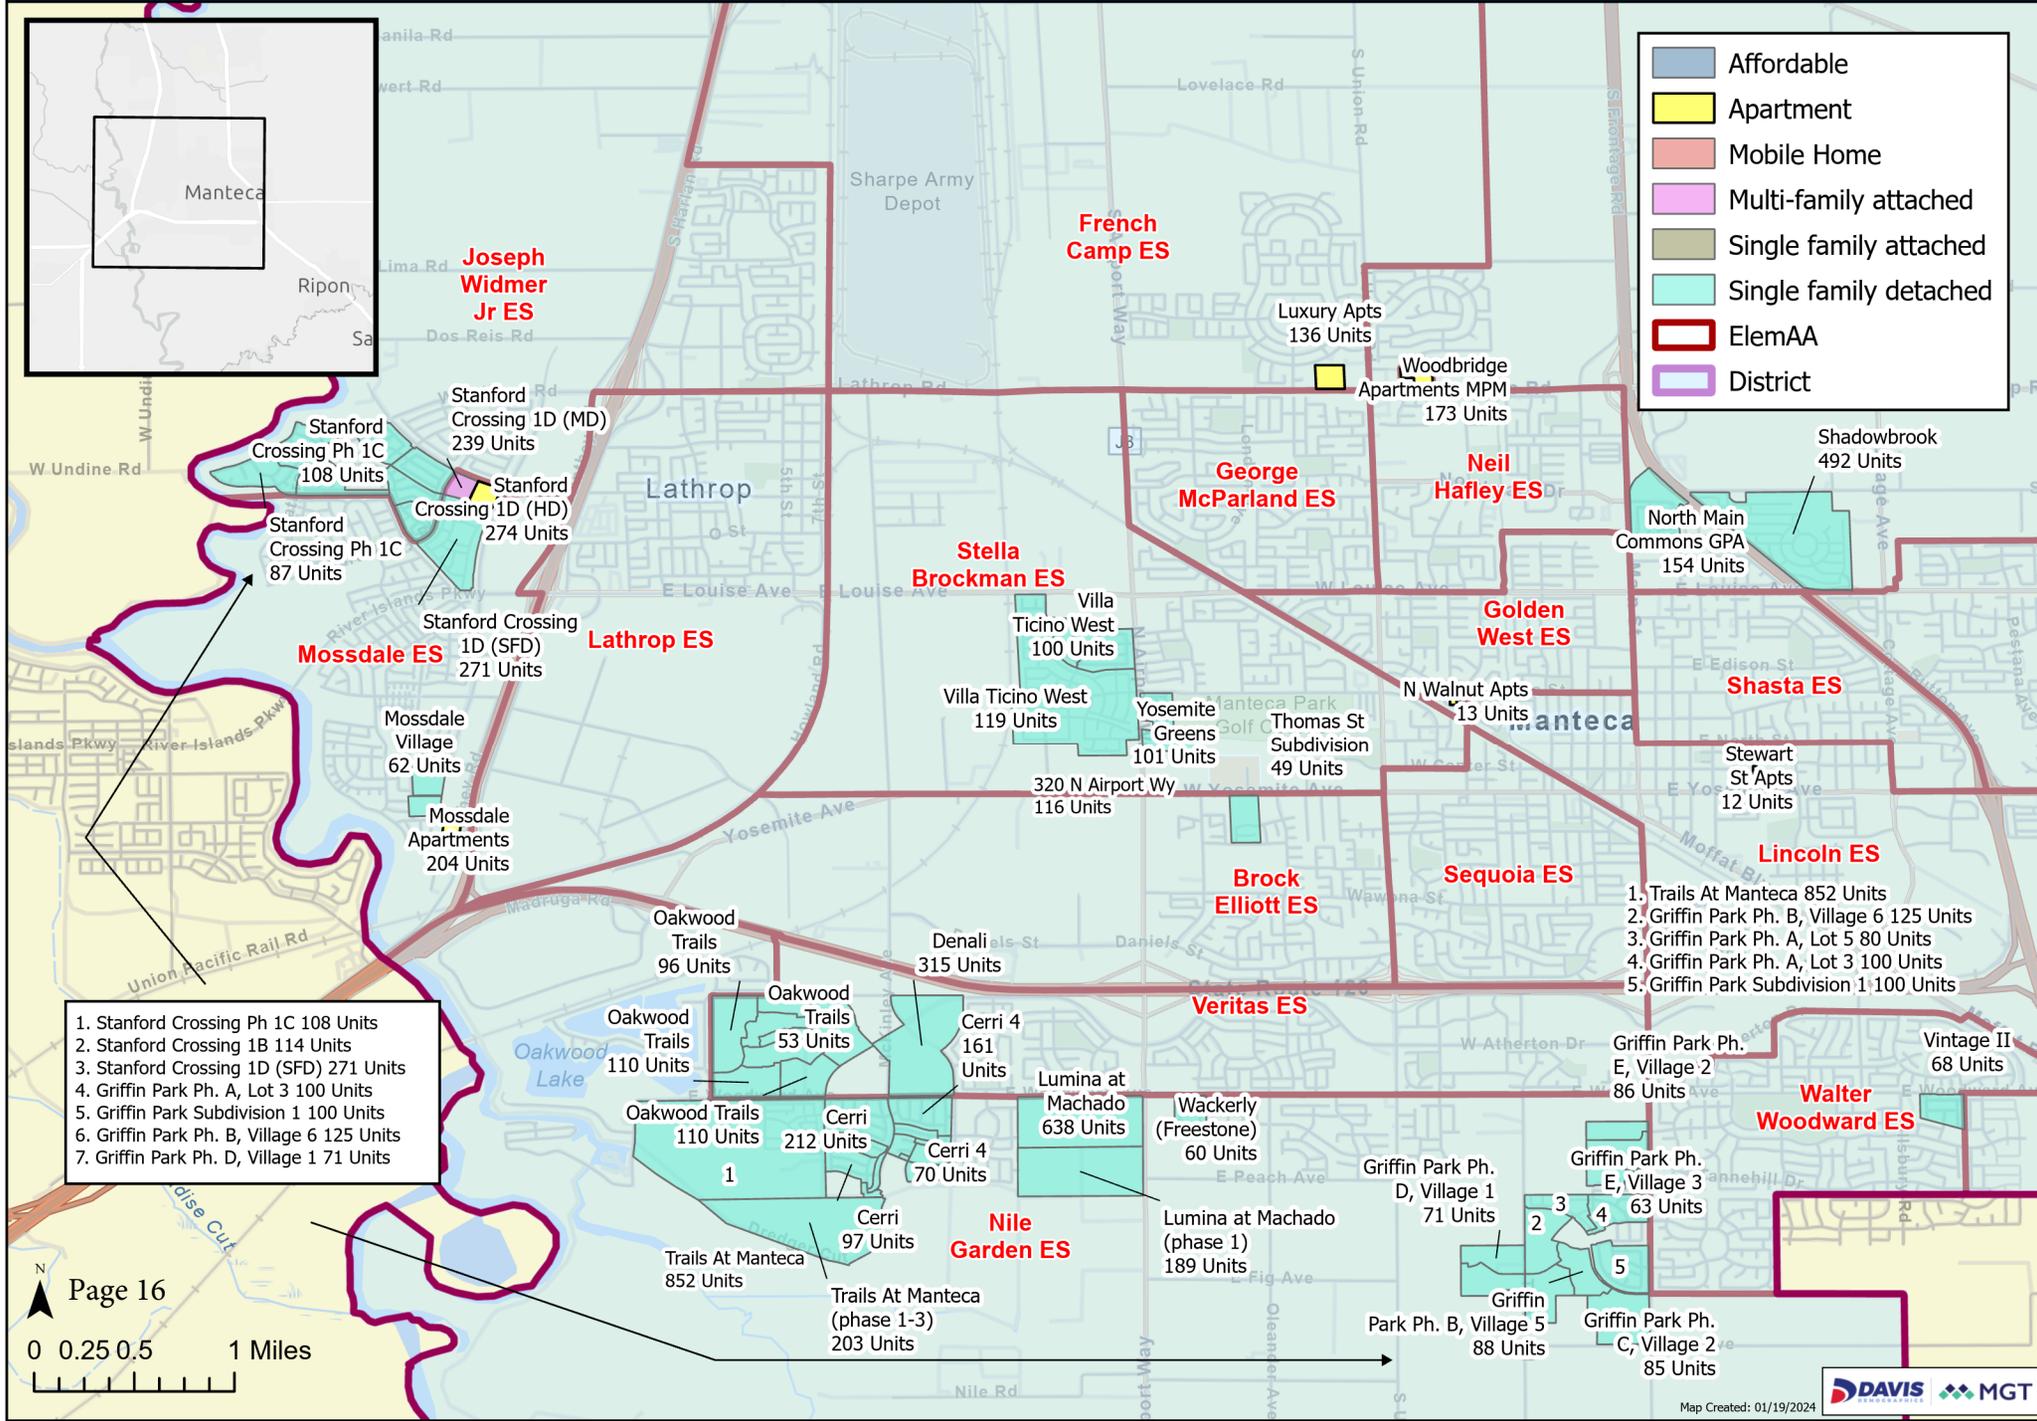

Closely related to the Student Yield Factors are planned residential development units. Planned residential development data is collected to determine the number of new residential units that will be built over the time frame of the student population forecasts. Davis Demographics collected information from city planning departments, district staff, as well as project developers regarding planned or active construction.

2. Student Information

The forecast relies on student data as its cornerstone. Initially, we gather the latest four years of student information. Engaging in quality checks, including verification through Student Verification forms, we collaborate closely with the district to validate the accuracy of the acquired data. Subsequently, we move on to geocoding the students based on their home addresses. This process allows us to conduct spatial analyses such as creating a Student Density map, Attendance Matrices, and ultimately generating the Student Forecast.

Map 2: Resident Student Density SY 2023/24

Attendance Matrix

An attendance matrix has been included to provide a better understanding of where students reside and where they attend school. **Remember, Davis Demographics forecasts are based on where the students reside, not where the student is enrolled. This method allows Davis Demographics to provide the most accurate forecast of where shifts in student population may occur and changes to future facilities (if necessary) should be located.** Because Davis Demographics forecasts are based on where the students reside, the figures we use as a base for each school’s resident forecast may be slightly higher or lower than the actual reported enrollment for each school. The best way to plan for future facilities is to know where the next group of students will be coming from, not necessarily which school they are currently attending.

Attendance matrices act as a “check and balance” for student accounting, illustrating where the students reside (in what School of Residence) based upon their geocoded address and which school they attend (School of Attendance) based upon District provided student data. It is essential to show how the students used in the forecasts match up to the district’s records of enrollment for each school. Furthermore, intra-district transferring patterns can be determined by comparing School of Residence data to the School of Attendance data. The student counts used in the matrix represent MUSD’s enrollment as of Fall 2023.

Reading the Matrix

The Attendance Matrix lists the school and its SY 23-24 fall enrollment in the first row. The columns provide the number of students attending (enrolled) at a school and where they live. They can be enrolled at one site, but they live in another assignment area other than the identified school. For example, August Knodt ES had an enrollment of 668 students on 10/4/2023. Of those 668 students, 558 are resident students attending classes from the August Knodt ES attendance area (column labeled August Knodt ES). Continuing down the column, the matrix shows 1 student living in the Brock Elliot ES area, 10 in the George Komure attendance area, and so forth. The total number of elementary students living within the district and enrolled at August Knodt ES is 611, with 7 students from outside the district boundaries, which you see in the “Out of District Students” row beneath the matrices.

To determine where all students currently living in the August Knodt attendance area are enrolled, simply follow the row labeled August Knodt ES. The first cell identifies 611 elementary students living in the August Knodt ES attendance area, 558 of which are enrolled at August Knodt ES. August Knodt resident students can be found enrolled at the other campuses along the top of the chart.

3. District-Wide Student Population Forecasts

The student population is forecasted out ten years for each of the study areas, attendance areas, and for the entire Manteca Unified School District. The district-wide summary enables the district to see a broad overview of future population shifts and what effect these shifts may have on existing and future facilities. Each attendance area is summarized to give a local view of population changes and identify variances within the district.

Together, these forecast summaries present the means for identifying the timing of future population shifts and overall facility adjustments needed to accommodate these shifts. Study areas and their forecasted resident students can be shifted between schools to assist in balancing enrollment through boundary changes, grade-level reassignments, or other means identified to better utilize school facilities. Forecasts provided in this report are based on students who live in the district Fall 2023.

Forecast Trends

The building blocks of the forecasts are the individual study areas. There are currently a total of 337 study areas in the Manteca Unified School District. The attendance areas and district summary are simply the compilation of all the study areas. For each study area, the student counts are forecasted over ten years (Current: SY2023-24; Forecasted: SY2024-25 through SY2033-34).

The Manteca Unified School District is projected to grow over the next ten years. It is expected to climb from a total of 16,969 Tk-8 students to 19,913 Tk-8 students by 2033. This amounts to an increase of 2,944 Tk-8 students over a 10-year period. Growth is also expected to occur in the District's High School student population as well, as an additional 1,867 grade 9-12 students are projected during the same period. In the end, the District can expect to see its high school student enrollment reach 9,781 students by 2033. This amounts to a total increase of 4,811 Tk-12 students through 2033. The projected growth is attributed to 2 key factors. The most important of these two factors is the amount of planned residential development that may get built over the next 10 years. Conversations with district staff, city planners, and developers call for 6,405 units to be built by 2033 that will help drive student population growth. High mobility factors within areas of the school district also indicate that there is currently an in-migration pattern of school-aged children within some of the existing neighborhoods of the school district. Additionally, the number of births in fall 2022 climbed significantly when compared to fall 2021 which could result with higher incoming kindergarten classes as soon as fall 2027.

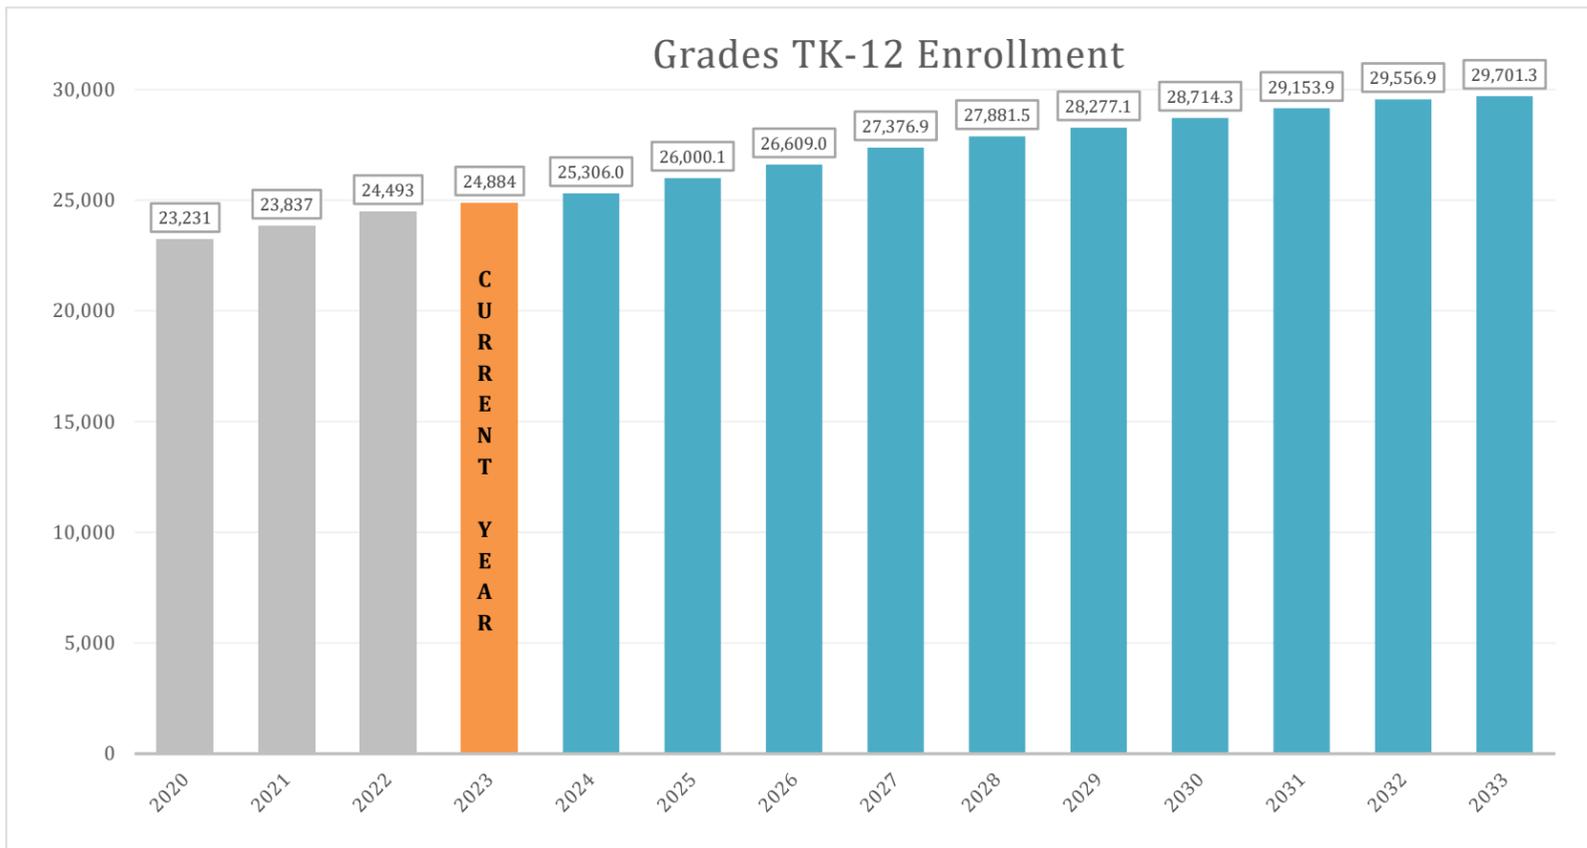

It is important to understand that the projections in this report are based upon factors and development plans as they existed in Fall of 2023. These factors are all subject to changes in market conditions that fluctuate quickly. It is recommended that school districts revisit their projections on an annual basis to ensure that the latest trends are captured and applied to the population forecast.

Map 3: Elementary Attendance Areas

Map 5: High School Attendance Areas

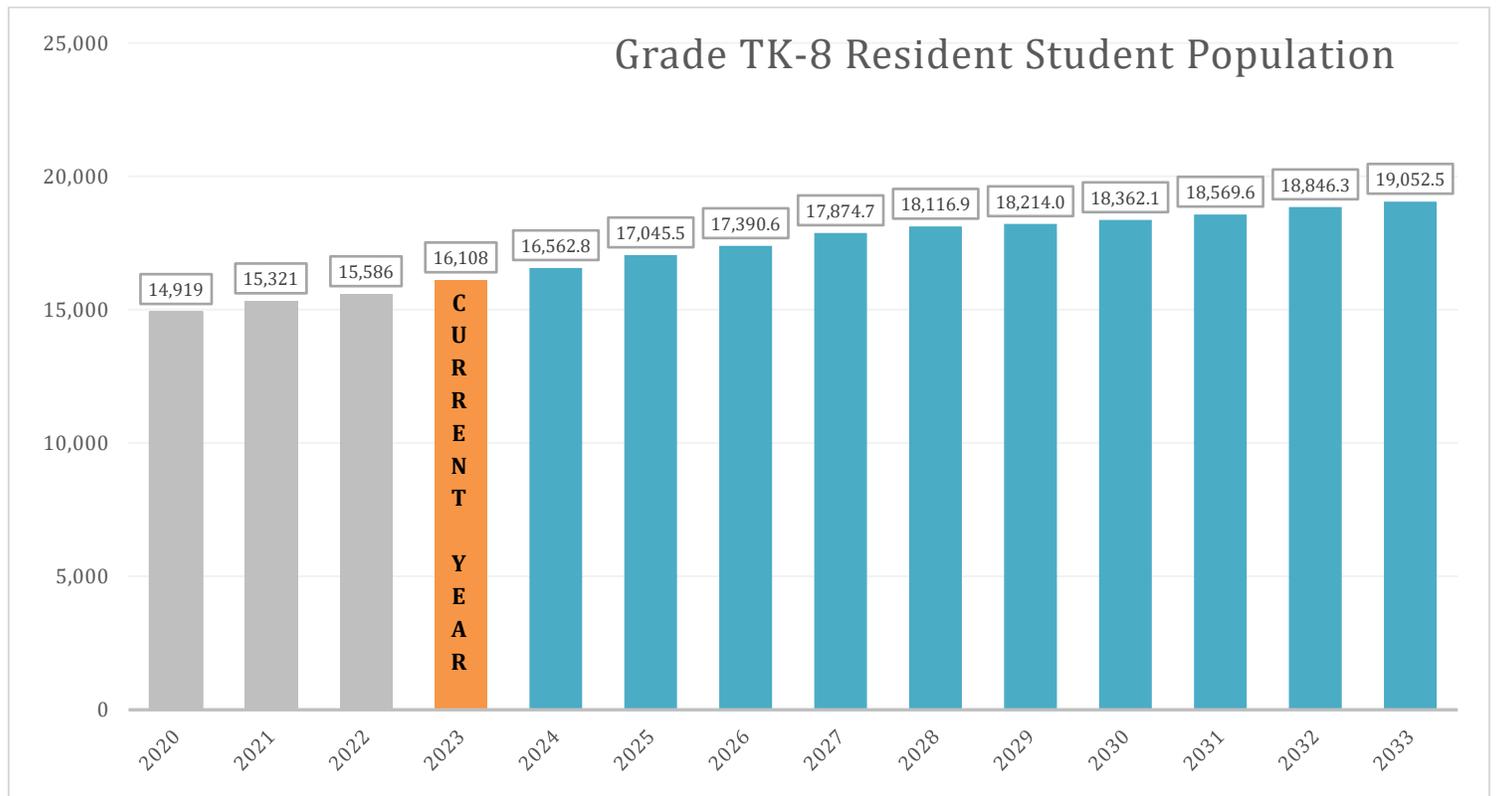

4. Attendance Area Forecasts

Trend Summaries by Elementary and High School Areas

Elementary Attendance Area (TK-8) Student Population Forecast Trends

The overall elementary (grades Tk-8) student population is expected to increase by 2,949 students at the end of the projection period in 2033. The projected growth for the District will be mainly attributed to the residential development currently planned for the region. Areas that will see new units constructed in the coming years are expected to see the largest gains. By 2032, 12 of the District’s 20 elementary attendance areas will see net gains in their resident student populations.

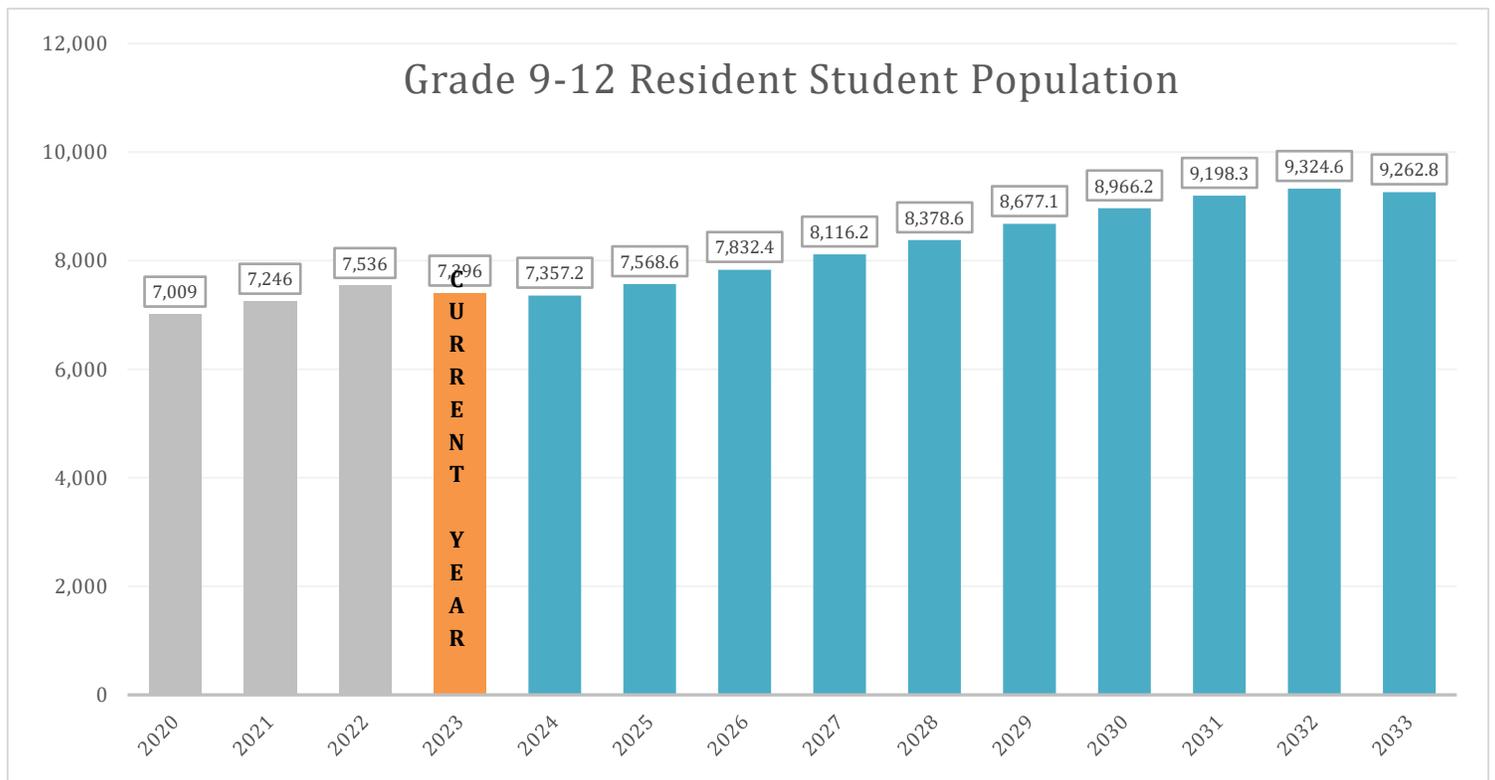

CHART 4: GRADES TK-8 RESIDENT STUDENT FORECAST

High School Attendance Area (9-12) Student Population Forecast Trends

High school student enrollment is projected to see growth over the next 10 years. By 2033 the District can expect to see 9,262 grade 9-12 students living within and enrolled in MUSD. This amounts to an increase of 1,867 students over the projection period. Over the next 10 years, Sierra High School is expected to have the largest net gain as it is projected to see an additional 1,774 resident students added to its resident student population by 2033. Lathrop High School’s attendance area is expected to add 268 students by 2032. Manteca HS could experience a net decline of 111 grade 9-12 resident students through 2033. The Weston Ranch HS may see the largest losses in resident student population over the next 10 years (334 grade 9-12 students). East Union High School’s resident student population is projected to grow with forecasted increase of 269 students. The overall district-wide projected growth in the resident high school student population is mainly due to the significant amount of residential development that is scheduled for construction within the projected time frame.

The Tinnin and Lathrop Early Education Centers are due to open in 2026

The Tinnin Early Education Center will house the grade TK and K student population within the Nile, Veritas, and Woodward boundaries.

The Lathrop Early Education Center will house the grade TK and K student population within the Joseph Widmer, Lathrop, and Mossdale boundaries.

Above projections are based on regular resident students. They do not include out of district, special day class, or PK Students.

Out of district, SDC, PK and PK students need to be added back into each attendance area forecast so that these students are accounted for in district wide facility needs analysis

Appendix A: Census Data

DEMOGRAPHIC AND INCOME PROFILE PROVIDED BY CENSUS

Data provided on the following pages is based on geographically related information from Manteca Unified School District based on a third-party source using Esri analytics in combination with Census information and American Community Survey. This information is provided by Davis Demographics as supplemental information about the district. Davis did not research nor guarantee the accuracy of the Census data. Demographic and Income Profile Provided by Census.

METHODOLOGY STATEMENT

- **Demographic and Income Profile / Community Profile:** Esri forecasts for 2023 and 2028. Esri Updated Demographics are point estimates representing July 1 of the current and forecast years. The following table summarizes the updated demographic variables. Also included are select averages, medians, aggregates, and per capita values.
- **American Community Survey (ACS) Housing Summary:** Esri provides reports, data enrichment, and thematic mapping for ACS estimates in standard geographies, current ZIP codes, and user-defined polygons. Reports include two summary profiles, Population, and Housing. Esri's reports/maps are designed to simplify the data and enhance its usability with reliability thresholds. ACS data provide much of the information previously available through the decennial census. ACS uses a continuous measurement or "rolling" sample, in which a small percent of the population is sampled every month. The ACS is updated and released more frequently than the decennial census—every year instead of every ten years. Smaller sample sizes and variable collection times have introduced a margin of error into their estimates.
- **Tapestry Segmentation:** provides an accurate, detailed description of America's neighborhoods—U.S. residential areas are divided into 67 distinctive segments based on their socioeconomic and demographic composition—then further classifies the segments into LifeMode and Urbanization Groups. Each year, the population and household count by Tapestry segment are updated. While most geographic areas retain their original Tapestry Segment assignment, select areas may be assigned a new market segment when research uncovers new or significant local growth. The entire Tapestry Segmentation system is refreshed every three to five years, resulting in a more comprehensive reassignment in rapidly changing neighborhoods. Tapestry is a geodemographic segmentation system that integrates consumer traits with residential characteristics to identify markets and classify US neighborhoods. Neighborhoods with the most similar characteristics are grouped together, while neighborhoods with divergent characteristics are separated. Internally homogenous, externally heterogeneous market segments depict consumers' lifestyles and life stages. Tapestry Segmentation combines the "who" of lifestyle demography with the "where" of local geography to create a classification model with 67 distinct, behavioral market segments.

With No Person w/Disability	22,736	72.1%	955	High

Data Note: N/A means not available. Population by Ratio of Income to Poverty Level represents persons for whom poverty status is determined. Household income represents income in 2021, adjusted for inflation.

2017-2021 ACS Estimate: The American Community Survey (ACS) replaces census sample data. Esri is releasing the 2017-2021 ACS estimates, five-year period data collected monthly from January 1, 2017 through December 31, 2021. Although the ACS includes many of the subjects previously covered by the decennial census sample, there are significant differences between the two surveys including fundamental differences in survey design and residency rules.

Margin of error (MOE): The MOE is a measure of the variability of the estimate due to sampling error. MOEs enable the data user to measure the range of uncertainty for each estimate with 90 percent confidence. The range of uncertainty is called the confidence interval, and it is calculated by taking the estimate +/- the MOE. For example, if the ACS reports an estimate of 100 with an MOE of +/- 20, then you can be 90 percent certain the value for the whole population falls between 80 and 120.

Reliability: These symbols represent threshold values that Esri has established from the Coefficients of Variation (CV) to designate the usability of the estimates. The CV measures the amount of sampling error relative to the size of the estimate, expressed as a percentage.

- High Reliability: Small CVs (less than or equal to 12 percent) are flagged green to indicate that the sampling error is small relative to the estimate and the estimate is reasonably reliable.
- Medium Reliability: Estimates with CVs between 12 and 40 are flagged yellow-use with caution.
- Low Reliability: Large CVs (over 40 percent) are flagged red to indicate that the sampling error is large relative to the estimate. The estimate is considered very unreliable.

Top Ten Tapestry Segments Site vs. U.S.

Data Note: This report identifies neighborhood segments in the area, and describes the socioeconomic quality of the immediate neighborhood. The index is a comparison of the percent of households or Total Population 18+ in the area, by Tapestry segment, to the percent of households or Total Population 18+ in the United States, by segment. An index of 100 is the US average.

Appendix: TK Forecasts and Methodology

Universal Transitional Kindergarten Forecast by Zip Code Explanation

The universal transitional kindergarten forecasts (tk) forecasts account for the state of California’s recent AB130 universal tk implementation.

1. The total number of fall 2023 tk students living within the district boundary and each of the zip code boundaries was identified (The number in the orange row within columns B and D).
2. The birth rates in “Column A” were calculated by comparing births in 2019 to births in 2020-2022 representing incoming transitional kindergarten classes for fall 2024-2026. The average birthrate for fall 2024-2026 was used for fall 2027-2033 due to the lack of birth information for those years. These birth rates helped calculate the percent change in births between 2019 and 2020-2022 to help forecast the tk classes from fall 2024-2033. The birth rates were multiplied by the current year’s tk student population to help forecast incoming tk students within each zip code boundary (Column B) for fall 2024-33. (The number in the orange row in “Column B” was multiplied by the percentages in “Column A.”)
3. Currently, only 4-year-olds that turn 5 from September 2nd to April 2nd are eligible for tk. Universal tk as a result of AB 130, came into effect in fall 2022.

The state of California’s minimum requirement is for an additional 2 months of eligibility for grade tk to be phased in each year from 2022 to 2024 and the remaining 3 months in 2025 until all 4-year-olds are eligible for the grade tk program.

4. “Column C” shows the estimated additional tk students that should be phased in based on the 2 and 3-month historical average tk enrollment (2020-2023) within each corresponding zip code.
5. The additional tk students within “Column C” were added accordingly to the forecasted tk enrollment for fall 2022 through fall 2033 (Columns B + C = Column D).
6. Please take a look at the green column (Column D) in the zip code table for the tk forecasts within each zip code.
7. Individual elementary attendance area tk forecast listings are shown following the tk- forecast by zip code. The tk-forecasts by elementary attendance area are derived from the tk forecast tables by zip code.
