Course Description

The Physical Science Cherokee Teaching & Learning Standards provide students the necessary skills to have a richer knowledge base in physical science. The standards in this course are designed as a survey of the core ideas in the physical sciences. Those core ideas will be studied in more depth during the chemistry and physics courses. The physical science standards include abstract concepts such as the conceptualization of the structure of atoms and the role they play in determining the properties of materials, motion and forces, the conservation of energy and matter, wave behavior, electricity, and the relationship between electricity and magnetism. The idea of radioactive decay is limited to the understanding of whole half-lives and how a constant proportional rate of decay is consistent with declining measures that only gradually approach to zero. Students investigate physical science concepts through the study of phenomena, experiences in laboratory settings, and field work.

Science standards integrate the three dimensions of **Science and Engineering Practices (SEPs)**, **Crosscutting Concepts (CCCs)**, and **Disciplinary Core Ideas (DCIs)** to provide a comprehensive framework that emphasizes active engagement, interdisciplinary connections, and core scientific principles. Together, they show how science standards engage *students* in obtaining, evaluating, and communicating information.

<table>
<tr><th>Science and Engineering Practices</th><th>Crosscutting Concepts</th><th>Disciplinary Core Ideas</th></tr>
<tr><td>Asking Questions (Science) and Defining Problems (Engineering)</td><td rowspan="2">Patterns</td><td rowspan="2">Engineering, Technology, and the Application of Science (TLS)</td></tr>
<tr><td>Developing and Using Models</td><td>Cause and Effect: Mechanism and Explanation</td></tr>
<tr><td>Planning and Carrying Out Investigations</td><td>Scale, Proportion, and Quantity</td><td rowspan="2">Physical Science (PS)</td></tr>
<tr><td>Analyzing and Interpreting Data</td><td>Systems and System Models</td></tr>
<tr><td>Mathematics and Computational Thinking</td><td rowspan="2">Energy and Matter:
Flows, Cycles, and Conservation</td><td rowspan="2">Life Science (L)</td></tr>
<tr><td>Constructing Explanations (Science) and Designing Solutions (Engineering)</td></tr>
<tr><td>Engaging in Argument from Evidence</td><td>Structure and Function</td><td rowspan="2">Earth and Space Science (E)</td></tr>
<tr><td>Obtaining, Evaluating, and Communicating Information</td><td>Stability and Change</td></tr>
</table>

Science and Engineering Practices are fundamental approaches that scientists and engineers use to investigate the natural world and solve practical problems. **Crosscutting Concepts** in science are overarching themes that bridge various disciplines, helping students and researchers see connections and deepen their understanding of the natural world. **Disciplinary Core Ideas** are fundamental concepts that students need to understand to develop a deep knowledge of science across various disciplines.

Thinking Like a Scientist

Thinking Like a Scientist standards represent scientific thinking skills that should be incorporated throughout the entire course.

Overarching Standard

TLS6-8: Advance scientific thinking through the scientific method, critical analysis, and collaborative investigations.

Supporting Standards for Student Mastery

TLS6-8.a: Master and apply scientific vocabulary and concepts.

TLS6-8.b: Develop and test hypotheses using systematic observations and experiments.

TLS6-8.c: Use advanced tools and technology (e.g., sensors, probes, software) for data collection and analysis.

TLS6-8.d: Collaborate to analyze findings and present detailed scientific arguments and reports.

Semester 1 (August – December)

Unit 1 – Atomic Structure and the Periodic Table (4 weeks)

In this unit, students will study the Periodic Table to understand the relative properties of elements, focusing on patterns of atomic structure. Students will analyze data to identify trends, develop models to compare atomic structures, and use the Periodic Table to predict element properties.

Overarching Standard for Unit 1

PS1: Obtain, evaluate, and communicate information from the Periodic Table to explain the relative properties of elements based on patterns of atomic structure.

PS1.b: Analyze and interpret data to determine trends of the following:

- Number of valence electrons
- Types of ions formed by main group elements (cation and anion)
- Location and properties of metals, nonmetals, and metalloids
- Phases at room temperature

Supporting Standards for Student Mastery in Unit 1

PS1.a: Develop and use models to compare and contrast the structure of atoms, ions and isotopes.

(*Clarification statement*: Properties include atomic number, atomic mass and the location and charge of subatomic particles.)

PS1.c: Use the Periodic Table as a model to predict the above properties of main group elements.

- Explain why elements are grouped into families.

Milestones Achievement Level Descriptors for Unit 1

Beginning	Developing	Proficient	Distinguished
Can identify the structure of the atom.	Can recognize models that show the differences between atoms, ions, and isotopes.	Can develop and use models to compare and contrast the structure of atoms, ions and isotopes.	Can justify models to compare and contrast the structure of atoms, ions and isotopes.
Can recognize that the following data trends exist: number of valence electrons; types of ions formed by main group elements; location and properties of metals, nonmetals, and metalloids; and phases at room temperature.	Can use data to describe trends of the following: number of valence electrons; types of ions formed by main group elements; location and properties of metals, nonmetals, and metalloids; and phases at room temperature.	Can analyze and interpret simple data to determine trends of the following: number of valence electrons; types of ions formed by main group elements; location and properties of metals, nonmetals, and metalloids; and phases at room temperature.	Can analyze and interpret complex data to make comparisons in trends of the following: number of valence electrons; types of ions formed by main group elements; location and properties of metals, nonmetals, and metalloids; and phases at room temperature.
Can use the Periodic Table as a model to locate the main group elements.	Can use the Periodic Table as a model to identify some properties of the main group elements.	Can use the Periodic Table as a model to predict the properties of main group elements.	Can use the Periodic Table as a model to analyze the properties of main group elements.

Unit 2A – Bonding (2.5 weeks)

In this unit, students will explore how atoms bond to form stable compounds and how matter is conserved during chemical reactions. Students will learn to use the IUPAC nomenclature for chemical names and formulas, develop models of chemical equations, and investigate the properties of ionic and covalent compounds.

Overarching Standards for Unit 2A

PS2: Obtain, evaluate, and communicate information to explain how atoms bond to form stable compounds.

PS2.c: Use the International Union of Pure and Applied Chemistry (IUPAC) nomenclature for translating between chemical names and chemical formulas.
(*Clarification statement*: Limited to binary covalent and binary ionic, containing main group elements, compounds but excludes polyatomic ions.)

PS3: Obtain, evaluate, and communicate information to support the Law of Conservation of Matter.

PS3.b: Develop and use a model of a chemical equation to illustrate how the total number of atoms is conserved during a chemical reaction.
(*Clarification statement*: Limited to chemical equations that include binary ionic and covalent compounds and will not include equations containing polyatomic ions.)

Supporting Standards for Student Mastery in Unit 2A

PS2.a: Analyze and interpret data to predict properties of ionic and covalent compounds.
(*Clarification statement*: Properties are limited to types of bonds formed, elemental composition, melting point, boiling point, and conductivity.)

PS2.b: Develop and use models to predict formulas for stable, binary ionic compounds based on balance of charges.

PS3.a: Plan and carry out investigations to generate evidence supporting the claim that mass is conserved during a chemical reaction.
(*Clarification statement*: Limited to synthesis, decomposition, single replacement, and double replacement reactions.)

Milestones Achievement Level Descriptors for Unit 2A

Beginning	Developing	Proficient	Distinguished
Can use data to identify properties of ionic and covalent compounds.	Can use data to recognize that there are differences in the properties of ionic and covalent compounds.	Can analyze and interpret data to predict properties of ionic and covalent compounds.	Can compare properties of ionic and covalent compounds using evidence from data.
Can use models to relate stable, binary ionic compounds to the balance of charges.	Can write formulas for stable, binary ionic compounds based on balance of charges.	Can develop and use models to predict formulas for stable, binary ionic compounds based on balance of charges.	Can refine models to predict formulas for stable, binary ionic compounds based on balance of charges.
Can recognize that the International Union of Pure and Applied Chemistry (IUPAC) nomenclature is used to name chemicals.	Can use the International Union of Pure and Applied Chemistry (IUPAC) nomenclature to identify the names of simple chemicals.	Can use the International Union of Pure and Applied Chemistry (IUPAC) nomenclature for translating between simple binary chemical names and chemical formulas (one to one chemical compounds).	Can use the International Union of Pure and Applied Chemistry (IUPAC) nomenclature for translating between complex binary chemical names and chemical formulas (compounds with subscripts).

Unit 2B – Reactions (2.5 weeks)

In this unit, students will investigate chemical reactions by developing models of chemical equations, using IUPAC nomenclature for chemical names and formulas, and explaining conservation of matter. Students will investigate properties and behaviors of ionic and covalent compounds during chemical reactions.

Overarching Standards for Unit 2B

PS2: Obtain, evaluate, and communicate information to explain how atoms bond to form stable compounds.

PS2.c: Use the International Union of Pure and Applied Chemistry (IUPAC) nomenclature for translating between chemical names and chemical formulas.
(*Clarification statement*: Limited to binary covalent and binary ionic, containing main group elements, compounds but excludes polyatomic ions.)

PS3: Obtain, evaluate, and communicate information to support the Law of Conservation of Matter.

PS3.b: Develop and use a model of a chemical equation to illustrate how the total number of atoms is conserved during a chemical reaction.

(*Clarification statement*: Limited to chemical equations that include binary ionic and covalent compounds and will not include equations containing polyatomic ions.)

Supporting Standards for Student Mastery in Unit 2B

PS2.a: Analyze and interpret data to predict properties of ionic and covalent compounds.
(*Clarification statement*: Properties are limited to types of bonds formed, elemental composition, melting point, boiling point, and conductivity.)

PS2.b: Develop and use models to predict formulas for stable, binary ionic compounds based on balance of charges.

PS3.a: Plan and carry out investigations to generate evidence supporting the claim that mass is conserved during a chemical reaction.
(*Clarification statement*: Limited to synthesis, decomposition, single replacement, and double replacement reactions.)

Milestones Achievement Level Descriptors for Unit 2B

Beginning	Developing	Proficient	Distinguished
Can use data to identify properties of ionic and covalent compounds.	Can use data to recognize that there are differences in the properties of ionic and covalent compounds.	Can analyze and interpret data to predict properties of ionic and covalent compounds.	Can compare properties of ionic and covalent compounds using evidence from data.
Can use models to relate stable, binary ionic compounds to the balance of charges.	Can write formulas for stable, binary ionic compounds based on balance of charges.	Can develop and use models to predict formulas for stable, binary ionic compounds based on balance of charges.	Can refine models to predict formulas for stable, binary ionic compounds based on balance of charges.
Can recognize that the International Union of Pure and Applied Chemistry (IUPAC) nomenclature is used to name chemicals.	Can use the International Union of Pure and Applied Chemistry (IUPAC) nomenclature to identify the names of simple chemicals.	Can use the International Union of Pure and Applied Chemistry (IUPAC) nomenclature for translating between simple binary chemical names and chemical formulas (one to one chemical compounds).	Can use the International Union of Pure and Applied Chemistry (IUPAC) nomenclature for translating between complex binary chemical names and chemical formulas (compounds with subscripts).

Unit 3A – Properties of Matter: Acids/Bases, and Solutions (2.5 weeks)

In this unit, students will develop models to explain solution properties, conduct experiments to determine how various factors affect solubility, and analyze data from solubility curves. Students will study the structure and properties of acids and bases and carry out investigations to classify common substances as acidic, basic, or neutral.

Overarching Standards for Unit 3A

PS6: Obtain, evaluate, and communicate information to explain the properties of solutions.

PS6.a: Develop and use models to explain the properties (solute/solvent, conductivity, and concentration) of solutions.

Supporting Standards for Student Mastery in Unit 3A

PS6.b: Plan and carry out investigations to determine how temperature, surface area, and agitation affect the rate solutes dissolve in a specific solvent.

PS6.c: Analyze and interpret data from a solubility curve to determine the effect of temperature on solubility.

PS6.d: Obtain and communicate information to explain the relationship between the structure and properties (e.g., pH, and color change in the presence of an indicator) of acids and bases.

(*Clarification statement*: Limited to only the structure of simple acids and bases (e.g., HCl and NaOH) that demonstrates the presence of an H+ or OH-.

PS6.e: Plan and carry out investigations to detect patterns in order to classify common household substances as acidic, basic, or neutral.

Milestones Achievement Level Descriptors for Unit 3A

Beginning	Developing	Proficient	Distinguished
Can recognize a solution.	Can use models to describe the properties of solutions.	Can develop and use models to explain the properties (solute/solvent, conductivity, and concentration) of solutions.	Can justify models to explain the properties of solutions.
Can recognize that surface area, and agitation affect the rate solutes dissolve in a specific solvent.	Can explain how temperature, surface area, and agitation affect the rate solutes dissolve in a specific solvent.	Can plan and carry out investigations to determine how temperature, surface area, and agitation affect the rate solutes dissolve in a specific solvent.	Can refine investigations to determine how temperature, surface area, and agitation affect the rate solutes dissolve in a specific solvent.
Can recognize that there is a relationship between temperature and solubility.	Can identify the effect of temperature on solubility.	Can analyze and interpret data from a solubility curve to determine the effect of temperature on solubility.	Can use data to graph a solubility curve that can be used to determine the effect of temperature on solubility.
Can recognize that the structure of acids and bases determine their properties.	Can identify relationships between the structure and properties of acids and bases.	Can obtain and communicate information that can be used to explain the relationship between the structure and properties (e.g., pH, and color change in the presence of an indicator) of acids and bases.	Can analyze information that can be used to explain the relationship between the structure and properties of acids and bases.
Can recognize that household substances can be classified as acidic, basic, or neutral.	Can describe patterns in information provided to classify common household substances as acidic, basic, or neutral.	Can plan and carry out investigations to detect patterns in order to classify common household substances as acidic, basic, or neutral.	Can refine investigations to detect patterns in order to classify common household substances as acidic, basic, or neutral.

Unit 3B – Properties of Matter: States and Gas Laws (2.5 weeks)

In this unit, students will explore the phases of matter, focusing on atomic and molecular motion. Students will investigate the relationships among temperature, pressure, volume, and density of gases in closed systems.

Overarching Standards for Unit 3B

PS5: Obtain, evaluate, and communicate information to compare and contrast the phases of matter as they relate to atomic and molecular motion.

PS5.b: Plan and carry out investigations to identify the relationships among temperature, pressure, volume, and density of gases in closed systems.
(*Clarification statement*: Using specific Gas laws to perform calculations is beyond the scope of this standard; emphasis should focus on the conceptual understanding of the behavior of gases rather than calculations.)

Supporting Standards for Student Mastery in Unit 3B

PS5.a: Ask questions to compare and contrast models (including phase diagrams) depicting the particle arrangement and motion in solids, liquids, gases, and plasmas.

Milestones Achievement Level Descriptors for Unit 3B

Beginning	Developing	Proficient	Distinguished
Can use a model to identify particle arrangement and motion in solids, liquids, gases, and plasmas.	Can compare and contrast models depicting the particle arrangement and motion in solids, liquids, gases, and plasmas.	Can ask questions to compare and contrast models depicting the particle arrangement and motion in solids, liquids, gases, and plasmas.	Can refine questions to analyze models depicting the particle arrangement and motion in solids, liquids, gases, and plasmas.
Can recognize that relationships exist among temperature, pressure, volume, and density of gases in closed systems.	Can carry out investigations to identify the relationships among temperature, pressure, volume, and density of gases in closed systems.	Can plan and carry out investigations to identify the relationships among temperature, pressure, volume, and density of gases in closed systems.	Can communicate findings from investigations to identify the relationships among temperature, pressure, volume, and density of gases in closed systems.

Unit 4 – Nuclear Energy (4 weeks)

In this unit, students will learn about the changes in nuclear structure due to fission, fusion, and radioactive decay. Students will develop models to illustrate how the nucleus changes during fission and fusion processes. They will use mathematical and computational thinking to understand and calculate half-life in the context of radioactive decay. This information will be used to construct evidence-based arguments to evaluate the applications, benefits, and potential problems of using nuclear energy as an alternative energy source.

Overarching Standard for Unit 4

PS4: Obtain, evaluate, and communicate information to explain the changes in nuclear structure as a result of fission, fusion, and radioactive decay.

PS4.a: Develop a model that illustrates how the nucleus changes as a result of fission and fusion.

- Identify and correctly use isotope notation.

Supporting Standards for Student Mastery in Unit 4

PS4.b: Use mathematics and computational thinking to explain the process of half-life as it relates to radioactive decay. (*Clarification statement*: Limited to calculations that include whole half-lives. Students should interpret data showing decay of radioactive elements to determine half-life.)

PS4.c: Construct arguments based on evidence about the applications, benefits, and problems of nuclear energy as an alternative energy source.

Milestones Achievement Level Descriptors for Unit 4

Beginning	Developing	Proficient	Distinguished
Can use a model to recognize that the nucleus changes as a result of fission and fusion.	Can explain how the nucleus changes as a result of fission and fusion using a model.	Can develop a model that illustrates how the nucleus changes as a result of fission and fusion.	Can compare models that illustrate how the nucleus changes as a result of fission and fusion.
Can recognize the relationship between half-life and radioactive decay.	Can explain the process of half-life as it relates to radioactive decay.	Can use mathematics and computational thinking to explain the process of half-life as it relates to radioactive decay.	Can apply mathematics and computational thinking to create examples that explain the process of half-life as it relates to radioactive decay.
Can identify evidence that supports nuclear energy as an alternative energy source.	Can compare and contrast evidence about the applications, benefits, and problems of nuclear energy as an alternative energy source.	Can construct arguments based on evidence about the applications, benefits, and problems of nuclear energy as an alternative energy source.	Can analyze and defend arguments based on evidence about the applications, benefits, and problems of nuclear energy as an alternative energy source.

Semester 2 (January - May)

Unit 5 – Kinematics (1-2 weeks)

In this unit, students will explore the relationships among force, mass, and motion and analyze data to understand the relationship between mass and gravitational force on falling objects. Students will plan and carry out investigations to analyze the motion of objects using mathematical and graphical models, including concepts such as distance, displacement, speed, velocity, time, and acceleration.

Overarching Standard for Unit 5

PS8: Obtain, evaluate, and communicate information to explain the relationships among force, mass, and motion.

PS8.a: Plan and carry out an investigation to analyze the motion of an object using mathematical and graphical models.
(*Clarification statement*: Mathematical and graphical models could include distance, displacement, speed, velocity, time, and acceleration.)

- Analyze position vs. time graphs to describe the motion.
- Analyze velocity vs. time graphs to describe the motion.
- Calculate velocity by determining the slope of a line on a position vs. time graph.
- Determine average acceleration from the slope of a velocity vs. time graph.

Supporting Standards for Student Mastery in Unit 5

PS8.c: Analyze and interpret data to identify the relationship between mass and gravitational force for falling objects.

Milestones Achievement Level Descriptors for Unit 5

Beginning	Developing	Proficient	Distinguished
Can recognize that the motion of an object can be explored using mathematical and graphical models.	Can describe an investigation used to analyze the motion of an object.	Can plan and carry out an investigation to analyze the motion of an object using mathematical and graphical models.	Can refine an investigation used to analyze the motion of an object using mathematical and graphical models.
Can recognize that a relationship exists between mass and gravitational force for falling objects.	Can explain the relationship between mass and gravitational force for falling objects.	Can construct an explanation based on experimental evidence to support the claims presented in Newton's three laws of motion.	Can make inferences and/or predictions based on analysis and interpretation of data to identify the relationship between mass and gravitational force for falling objects.

Unit 6 – Force and Motion (2-3 weeks)

Students will establish relationships among force, mass, and motion by constructing explanations based on experimental evidence to support Newton's three laws of motion. They will explore how these laws demonstrate the interactions among force, mass, velocity, and acceleration and will analyze and interpret data to identify the relationship between mass and gravitational force on falling objects.

Overarching Standard for Unit 6

PS8: Obtain, evaluate, and communicate information to explain the relationships among force, mass, and motion.

PS8.b: Construct an explanation based on experimental evidence to support the claims presented in Newton's three laws of motion. (*Clarification statement*: Evidence could demonstrate relationships among force, mass, velocity, and acceleration.)

- Determine when an object is in equilibrium using free body diagrams. Determine movement of an object based on net force and direction of forces.

Supporting Standards for Student Mastery in Unit 6

PS8.c: Analyze and interpret data to identify the relationship between mass and gravitational force for falling objects.

Milestones Achievement Level Descriptors for Unit 6

Beginning	Developing	Proficient	Distinguished
Can recognize Newton's three laws of motion.	Can provide examples of Newton's three laws of motion.	Can construct an explanation based on experimental evidence to support the claims presented in Newton's three laws of motion.	Can refine explanations based on experimental evidence to support the claims presented in Newton's three laws of motion.
Can recognize that a relationship exists between mass and gravitational force for falling objects.	Can explain the relationship between mass and gravitational force for falling objects.	Can construct an explanation based on experimental evidence to support the claims presented in Newton's three laws of motion.	Can make inferences and/or predictions based on analysis and interpretation of data to identify the relationship between mass and gravitational force for falling objects.

Unit 7 – Energy (3-4 weeks)

In this unit, students will investigate the flow of energy within different systems, constructing explanations for energy transformations. Students will plan and carry out experiments to understand how molecular motion is related to thermal energy changes through conduction, convection, and radiation. They will also analyze and interpret specific heat data to determine the best materials for practical applications like insulation and cooking. Students will examine heating and cooling curves to explain the flow of energy during phase changes and use mathematical and computational thinking to understand the relationships between work, mechanical advantage, and simple machines.

Overarching Standard for Unit 7

PS7: Obtain, evaluate, and communicate information to explain transformations and flow of energy within a system.

PS7.a: Construct explanations for energy transformations within a system.
(*Clarification statement*: Types of energy to be addressed include chemical, mechanical, electromagnetic, light, sound, thermal, electrical, and nuclear.)

Supporting Standards for Student Mastery in Unit 7

PS7.b: Plan and carry out investigations to describe how molecular motion relates to thermal energy changes in terms of conduction, convection, and radiation.

PS7.c: Analyze and interpret specific heat data to justify the selection of a material for a practical application (e.g., insulators and cooking vessels).

PS7.d: Analyze and interpret data to explain the flow of energy during phase changes using heating/cooling curves.

PS8.d: Use mathematics and computational thinking to identify the relationships between work, mechanical advantage, and simple machines.

Milestones Achievement Level Descriptors for Unit 7

Beginning	Developing	Proficient	Distinguished
Can recognize an example of an energy transformation.	Can identify energy transformations within a system.	Can construct explanations for energy transformations within a system.	Can refine explanations for energy transformations within a system.
Can recognize that molecular motion relates to thermal energy changes.	Can explain how molecular motion relates to thermal energy changes in terms of conduction, convection, and radiation.	Can plan and carry out investigations to describe how molecular motion relates to thermal energy changes in terms of conduction, convection, and radiation.	Can refine investigations to describe how molecular motion relates to thermal energy changes in terms of conduction, convection, and radiation.
Can define the terms insulator and conductor as they relate to the transfer of energy.	Can explain why certain materials are better at insulation and conduction than others.	Can analyze and interpret specific heat data to justify the selection of a material for a practical application (e.g., insulators and cooking vessels).	Can compare multiple sources of specific heat data to justify the selection of materials for practical applications across multiple contexts.
Can recognize that the flow of energy changes during phase change.	Can explain the flow of energy during specific phase changes.	Can analyze and interpret data to explain the flow of energy during phase changes using heating/cooling curves.	Can make inferences and/or predictions based on analysis and interpretation of data to explain the flow of energy during phase changes using heating/cooling curves.
Can define the terms work and mechanical advantage, and identify simple machines.	Can explain the relationships between work, mechanical advantage, and simple machines.	Can use mathematics and computational thinking to identify the relationships between work, mechanical advantage, and simple machines.	Can use mathematics and computational thinking to compare and analyze the relationships between work, mechanical advantage, and simple machines.

Unit 8 – Waves (3-4 weeks)

In this unit, students will explore the properties of waves, analyzing and interpreting data to understand the relationships among wavelength, frequency, and energy in electromagnetic waves, as well as amplitude and energy in mechanical waves. They will develop models based on experimental evidence and illustrate the phenomena of reflection, refraction, interference, and diffraction. Students will also analyze how different media affect the speed of sound and light waves, and use models to explain the changes in sound waves associated with the Doppler Effect.

Overarching Standard for Unit 8

PS9: Obtain, evaluate, and communicate information to explain the properties of waves.

PS9.a: Analyze and interpret data to identify the relationships among wavelength, frequency, and energy in electromagnetic waves and amplitude and energy in mechanical waves.

Supporting Standards for Student Mastery in Unit 8

PS9.b: Ask questions to compare and contrast the characteristics of electromagnetic and mechanical waves.

PS9.c: Develop models based on experimental evidence that illustrate the phenomena of reflection, refraction, interference, and diffraction.

PS9.d: Analyze and interpret data to explain how different media affect the speed of sound and light waves.

PS9.e: Develop and use models to explain the changes in sound waves associated with the Doppler Effect.

Milestones Achievement Level Descriptors for Unit 8

Beginning	Developing	Proficient	Distinguished
Can recognize that relationships exist among wavelength, frequency, and energy in electromagnetic waves and amplitude and energy in mechanical waves.	Can identify the relationships among wavelength, frequency, and energy in electromagnetic waves and amplitude and energy in mechanical waves.	Can analyze and interpret data to identify the relationships among wavelength, frequency, and energy in electromagnetic waves and amplitude and energy in mechanical waves.	Can analyze and interpret data to compare the relationships among wavelength, frequency, and energy in electromagnetic waves and amplitude and energy in mechanical waves.
Can classify waves as electromagnetic or mechanical.	Can describe the characteristics of electromagnetic and mechanical waves.	Can ask questions to compare and contrast the characteristics of electromagnetic and mechanical waves.	Can refine questions to compare and contrast the characteristics of electromagnetic and mechanical waves.
Can recognize examples of reflection, refraction, interference, and diffraction.	Can describe the concepts of reflection, refraction, interference, and diffraction.	Can develop models based on experimental evidence that illustrate the phenomena of reflection, refraction, interference, and diffraction.	Can Justify models based on experimental evidence that illustrate the phenomena of reflection, refraction, interference, and diffraction.
Can recognize that different media affect the speed of sound and light waves.	Can identify how different media affect the speed of sound and light waves.	Can analyze and interpret data to explain how different media affect the speed of sound and light waves.	Can make inferences and/or predictions based on analysis and interpretation of data to explain how different media affect the speed of sound and light waves.
Can describe the basic concept of the Doppler effect.	Can explain the changes in sound waves associated with the Doppler effect.	Can develop and use models to explain the changes in sound waves associated with the Doppler effect.	Can justify models to explain the changes in sound waves associated with the Doppler effect.

Unit 9 – Electricity and Magnetism (2-3 weeks)

In this unit, students will investigate properties and relationships between electricity and magnetism to understand movement of electrical charges, using examples such as electromagnets, simple motors, and generators. By applying mathematical and computational thinking, students will analyze the relationships among voltage, current, and resistance. They will develop and use models to illustrate and explain the flow of current and electrons in simple series and parallel circuits.

Overarching Standard for Unit 9

PS10: Obtain, evaluate, and communicate information to explain the properties of and relationships between electricity and magnetism.

PS10.c: Plan and carry out investigations to determine the relationship between magnetism and the movement of electrical charge. (*Clarification statement*: Investigations could include electromagnets, simple motors, and generators.)

Supporting Standards for Student Mastery in Unit 9

PS10.a: Use mathematical and computational thinking to support a claim regarding relationships among voltage, current, and resistance.

- Calculate Ohm's Law

PS10.b: Develop and use models to illustrate and explain the conventional flow (direct and alternating) of current and the flow of electrons in simple series and parallel circuits.

(*Clarification statement*: Advantages and disadvantages of series and parallel circuits should be addressed.)

Milestones Achievement Level Descriptors for Unit 9

Beginning	Developing	Proficient	Distinguished
Can define the terms voltage, current, and resistance.	Can identify the relationships among voltage, current, and resistance.	Can use mathematical and computational thinking to support a claim regarding relationships among voltage, current, and resistance.	Can produce and analyze graphical displays to support a claim regarding relationships among voltage, current, and resistance.
Can identify examples of simple series and parallel circuits.	Can describe the conventional flow of current and the flow of electrons in simple series and parallel circuits.	Can develop and use models to illustrate and explain the conventional flow (direct and alternating) of current and the flow of electrons in simple series and parallel circuits.	Can justify models to illustrate and explain the conventional flow of current and the flow of electrons in simple series and parallel circuits.
Can recognize that a relationship exists between magnetism and the movement of electrical charge.	Can describe the relationship between magnetism and the movement of electrical charge.	Can plan and carry out investigations to determine the relationship between magnetism and the movement of electrical charge.	Can refine investigations to determine the relationship between magnetism and the movement of electrical charge.

Milestones Review and Capstone Project (4 weeks)

This unit is designed to consolidate and reinforce the key scientific concepts and skills that eighth grade students have learned throughout the year. This review period will help prepare students for the Georgia Milestones assessment by revisiting core standards through engaging, hands-on activities and comprehensive review sessions. The capstone project will provide an opportunity for students to apply their knowledge in a real-world context, demonstrating their understanding of scientific principles and their ability to communicate information effectively.

Overarching Standards

PS1. Obtain, evaluate, and communicate information from the Periodic Table to explain the relative properties of elements based on patterns of atomic structure.

PS2. Obtain, evaluate, and communicate information to explain how atoms bond to form stable compounds.

PS3. Obtain, evaluate, and communicate information to support the Law of Conservation of Matter.

PS4. Obtain, evaluate, and communicate information to explain the changes in nuclear structure as a result of fission, fusion and radioactive decay.

PS5. Obtain, evaluate, and communicate information to compare and contrast the phases of matter as they relate to atomic and molecular motion.

PS6. Obtain, evaluate, and communicate information to explain the properties of solutions.

PS7. Obtain, evaluate, and communicate information to explain transformations and flow of energy within a system.

PS8. Obtain, evaluate, and communicate information to explain the relationships among force, mass, and motion.

PS9. Obtain, evaluate, and communicate information to explain the properties of waves.

PS10. Obtain, evaluate, and communicate information to explain the properties of and relationships between electricity and magnetism.
