Robot C Basic Screen Outline

Font Height Hotkey = CTRL and +/- to increase or decrease font height

The image shows a screenshot of the ROBOTC IDE interface with several callout boxes pointing to specific features:

- Fix Formatting:** Organizes/Tabs Code for easier reading (points to the Fix Formatting button in the toolbar).
- Motor and Sensor Setup:** Allows User to assign and rename properties of motors/sensors (points to the Motor and Sensor Setup button in the toolbar).
- Firmware:** Updates Operating (points to the Firmware Download button in the toolbar).
- Compile Program:** Checks the program for bugs (points to the Compile Program button in the toolbar).
- Download code to robot** (points to the Download to Robot button in the toolbar).
- Programming Area** (points to the main code editor window containing the following code):

```
1 |  
2 | task main()  
3 | {  
4 |  
5 |  
6 |  
7 | }
```
- Shortcut Coding Syntax:** Drag and drop coding into your program (points to the left sidebar containing a tree view of components like EV3 LED, Motors, Natural Language, Sensors, Sound, and Timing).
- Error and Compiling Info Box** (points to the Compiler Errors window at the bottom, which displays: "File ".\SourceFile004.c" compiled on Sep 14 2016 07:18:22").

Firmware

Definition: programming language that is placed as read-only memory that is able to run certain program types(I.E Firmware OS = Apple products; Firmware Android = Non-Apple Products)

1. Turn the EV3 Brick ON
2. Connect EV3 Lego Brick to the computer using the USB – Micro USB wire.
3. Adjust the firmware from function block (Labview) to structured text (Robot C)
 - a. Open Robot C for Lego Mindstorm 4.x
 - b. Drop Down Menu Robot > Platform Type > Lego Mindstorms > EV3
 - c. Drop Down Menu Robot > Download EV3 Linux Kernel

Tutorial 1: Make It Move

A. Make It Move

1. File > New > New File
2. Screen Layout

The screenshot shows the LEGO Mindstorms software interface with several annotations:

- Compile Program:** Checks for errors in the program code. (Points to the 'Compile Program' button in the toolbar)
- Download to Robot:** Sends code to EV3 Brick. (Points to the 'Download to Robot' button in the toolbar)
- Quick Select Syntax Commands:** Instead of typing commands; user can select options. (Points to the 'Control Structures' menu in the left sidebar)
- Main body of the program:** Braces represent the start and end of the program. (Points to the `task main()` block in the code editor)
- Compiler Information Bar:** Shows user what has been compiled and if there is any errors. (Points to the 'Compiler Errors' window at the bottom)

The code editor shows the following code:

```
1 |  
2 | task main()  
3 | {  
4 |  
5 |  
6 |  
7 | }
```

The 'Compiler Errors' window shows the following message:

```
File ".\SourceFile002.c" compiled on Sep 01 2016 21:16:42
```

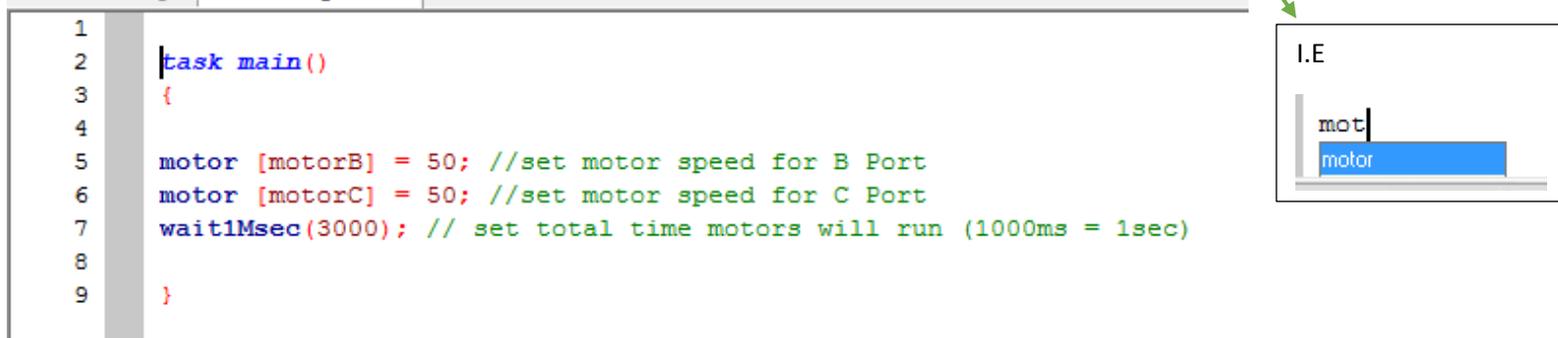

The status bar at the bottom indicates: Robot EV3 SourceFile002.c* R/W No compile errors Ln 1, Col 1

Robot C Programming Tutorial

By: Matthew Jourden
Engineering Program
Brighton High School

3. Write the following Program
 - a. May type all of the code or begin typing and drop down menus will appear to predict desired command

```
1
2 task main()
3 {
4
5     motor [motorB] = 50; //set motor speed for B Port
6     motor [motorC] = 50; //set motor speed for C Port
7     wait1Msec(3000); // set total time motors will run (1000ms = 1sec)
8
9 }
```

4. Compile the program to make sure there are no errors or bugs in the program
5. Connect the EV3 Brick to the PC using the USB cable > Select the **Download to Robot** > First time button is hit the software will ask you to save the source file and main file of the program. Navigate to the desired file location > Pop menu will appear > Click the Start button to start the program

Robot C Program 1: Make it Move

Write a Program that does the following. Move now faster than power setting of 25

1. Mark a start point with tape
2. Go forward as provided in the original program for 9 inches
3. Turn Right 90 degrees (Mark spot on the floor w/ tape)
4. Pause 2.5 seconds
5. Go forward 1.5 feet
6. Turn Left 45 Degrees (Mark spot on the floor w/ tape)
7. Pause for PI seconds (3.14 seconds)
8. Go Forward 2 feet
9. Pause 2.68 seconds
10. Move the robot in reverse back to the start point (Do not need to pause at the turns). Robot should come close to the original marked position on the floor.

Show program to Teacher.

Sensors

When using sensors or motors it is helpful to rename them to variable name that stands out and is easy to type.

For Example: Default name for a Touch Sensor maybe S1. Changing the variable name to Touch instead of S1 can be helpful when trying to debug the program.

Click on the **Motor Sensor Setup Icon** at the top part of the screen

The screenshot shows the 'Motors and Sensors Setup' window in a programming environment. The top toolbar includes icons for 'New File', 'Open File', 'Save', 'Fix Formatting', 'Motor and Sensor Setup', 'Firmware Download', 'Compile Program', and 'Download to Robot'. The 'Motor and Sensor Setup' icon is highlighted with a double-headed arrow.

The 'Motors and Sensors Setup' window has two tabs: 'Motors' and 'Sensors'. The 'Sensors' tab is active, showing a table with columns: 'Sensor Index', 'Name', 'Sensor Type', and 'Sensor Mode'. The 'Name' column has four empty text boxes. The 'Sensor Type' column has four dropdown menus, all set to 'No Sensor'. The 'Sensor Mode' column has four dropdown menus, all set to 'Not Applicable'. A callout box with an arrow points to the 'Name' column, containing the text: 'Assign Names to the different Sensor and Motor Ports'. Another callout box with an arrow points to the 'Sensor Type' column, containing the text: 'Assign the type of sensor/motor that will be used'.

The 'Motors' tab is also visible, showing a table with columns: 'Port', 'Name', 'Type', 'Reversed', 'Encoder', 'PID Control', and 'Drive Motor Side'. The 'Name' column has four empty text boxes. The 'Type' column has four dropdown menus, all set to 'EV3 Motor (Large)'. The 'Reversed' column has four checkboxes, all unchecked. The 'Encoder' column has four checkboxes, all checked. The 'PID Control' column has four checkboxes, all checked. The 'Drive Motor Side' column has four dropdown menus, all set to 'None'. A callout box with an arrow points to the 'Name' column, containing the text: 'Assign Names to the different Sensor and Motor Ports'. Another callout box with an arrow points to the 'Type' column, containing the text: 'Assign the type of sensor/motor that will be used'.

Robot C Programming Tutorial

By: Matthew Jourden
Engineering Program
Brighton High School

Coding: When coding with a sensor the syntax **SensorValue [SensorName]** will be used.

Example of If Statement for Touch Sensor is touched to turn off motors:

```
If (SensorValue [Touch] == 1)
{
motor [motorB] = 0;
motor [motorC] = 0;
}
```

Sensors Values

Port View on the EV3 Brick can be used to see what values are be returned for the sensor or the following code can be typed in the program to display data on the brick

Example is for Color Sensor (Code is in Bold; all other type are comments about the code)

```
// Write the amount of reflected light to the screen
// This is a value between 0 and 100, where 0 means no reflected
// light and 100 means all light is being reflected
displayBigTextLine(4, "Reflected: %d", SensorValue[Colour]);
Sleep (20); // Wait 20 ms to get 50 readings per second
```

Touch: 0 = Not Pressed

1= Pressed

Ultrasonic: Units cm distance

Color: Solid Colors or Light Reflected Percentage

Tutorial 2: Touch Sensor

1. Mount the Touch sensor to the front of your robot
2. When using the Touch Sensor there is two values 0 = not pressed and 1 = pressed. Using an If or While statements the programmer can make the robot do conduct different actions based on the inputted data.
3. Create a NEW Program
4. Sensor Setup
 - i. Robot > Motors and Sensors > Sensors Tab

Drop down menu allows user to select the type of sensor that is desired.

Name Sensor.
NOTE: Can use the name or Index within the code

ii. Apply > Ok

5. Write the following program

```
1 #pragma config(Sensor, S4, Touch, sensorEV3_Touch)
2 /*!!Code automatically generated by 'ROBOTC' configuration wizard
3
4 task main()
5 {
6     While (Touch == 0)
7     {
8         motor [motorB, 25]; // Shorthand for of motor [motorB] = 25;
9         motor [motorC, 25]; // Shorthand for of motor [motorC] = 25;
10        if (Sensorvalue [Touch] == 1)
11        {
12            motor [motorB, 0]; // Shorthand for of motor [motorB] = 0;
13            motor [motorC, 0]; // Shorthand for of motor [motorC] = 0;
14        }
15    }
16 }
```

6.

7. Upload the program and test the touch sensor with a barrier

Robot C Program 2: Touch Sensor

Write a program that will do the following

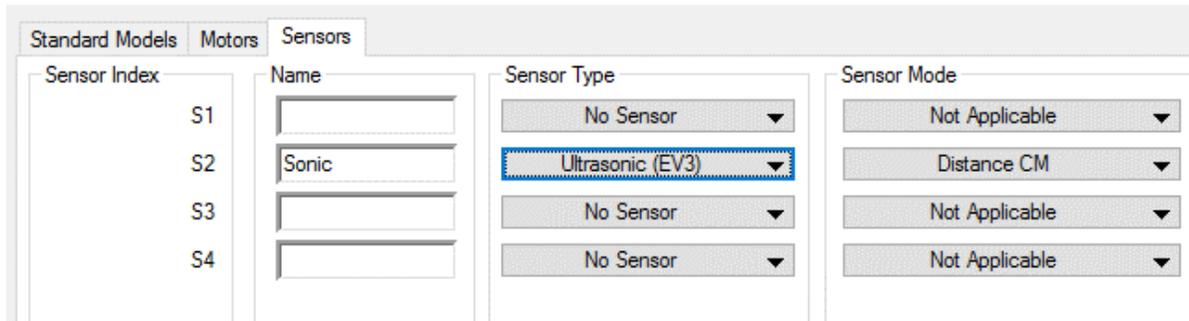

1. Touch sensor starts the robot going forward (Speed not greater than 25)
2. Touch sensor pressed a second time will stop the robot

Show Teacher upon completion

Tutorial 3: Ultrasonic Sensor

1. Setup: Set the Ultrasonic sensor in the Motor and Sensor Setup to Sonic . Be sure you place the name in the same port. See below for example. Ultra Sensor is set in Port 2.

Motors and Sensors Setup

2. Write the following program.
NOTE: the ultrasonic sensor works with default units of cm

```
1  #pragma config(Sensor, S2,      Sonic,      sensorEV3_Ultrasonic)
2  /**!!Code automatically generated by 'ROBOTC' configuration wizard          !!*/
3
4  task main()
5  {
6
7      while (true)
8      {
9          if (SensorValue [Sonic] >= 5)
10         {
11             motor (motorB) = 20;
12             motor (motorC) = 20;
13         }
14
15         else
16         {
17             motor (motorB) = 0;
18             motor (motorC) = 0;
19         }
20     }
21 }
```

While (true) loop is a way to run the program continuously without having a counter or end. In essence it is a forever loop

3. Upload and test the program

Tutorial 4: Color Sensor

1. Setup: Set the color sensor in the Motor and Sensor Setup to Colour (Note the word Color cannot be used because of a conflict with the sensor name and comparison code). Be sure you place the name in the same port. See below for example. Color Sensor is set in Port 3.

Sensor Index	Name	Sensor Type	Sensor Mode
S1		No Sensor	Not Applicable
S2		No Sensor	Not Applicable
S3	Colour	Color (EV3)	Reflected
S4		No Sensor	Not Applicable

Type the following program.

```

1  #pragma config(Sensor, S3, Colour, sensorEV3_Color)
2  /**!!Code automatically generated by 'ROBOTC' configuration wizard      !**//
3
4  task main()
5  {
6      while (true)//While (true) makes the software run continuously until the off button is pressed on the robot)
7      {
8          // Write the amount of reflected light to the screen
9          // This is a value between 0 and 100, where 0 means no reflected
10         // light and 100 means all light is being reflected
11         displayBigTextLine(4, "Reflected: %d", SensorValue[Colour]);
12
13         // Wait 20 ms to get 50 readings per second
14         sleep(20);
15
16         if (SensorValue [Colour] >= 40) //NOTE: Comparison Value for SensorValue [Colour]
17             //      is based on the lighth reflected percentage
18         {
19             motor [motorB] = 0;
20             motor [motorC] = 0;
21             wait1Msec (10);
22         }
23
24         else
25         {
26             motor [motorB] = 15;
27             motor [motorC] = 15;
28         }
29     }
30 }

```

Program should do the following

When a color sensor light reflection is greater than 40 then the motors will stop. If light reflection is less than 40 than the motors will move. Note: Depending on the surface the comparison value may have to be adjusted.

2. Modify the program accordingly to work on your surface.

Edit/Modify the program for the surface that you are working on so the robot will not fall of the table.

Robot C Programming Tutorial

By: Matthew Jourden
Engineering Program
Brighton High School

Robot C Program 3: Capstone

Design an attachment to your robot that will pick up the predefined object. BE sure to set the type of motor in the Motor and Sensors Setup menu. NOTE: Must use sensors for all movements; NO predefined distances/timing with the motors.

1. Design a gripper that will grab and move a desired object
2. Touch Sensor to Start the Robot
3. Color Sensor
 - a. Stop at 1st black line
 - b. Pause for 1.4 seconds
 - c. Turn Right
 - d. Stop at Edge of table
 - e. Pause for 1.4 seconds
 - f. Back up 2 wheel rotations
 - g. Turn Left
 - h. Drive to the object
4. Sense Object to be picked up (May use any type of sensor)
5. Drive to the drop off area.
6. Release object
7. Reverse robot without touching or knocking the object over
8. Stop
9. Return to the Start position
