

Living Environment Current Event Paper

Directions: Find a biology related article in the newspaper, current periodical, or on the web. Make sure the article is not more than two years old (hence the word “current”). You will need a copy of the article to hand in with your paper. After reading the article, write a one paragraph summary on the main content. Make sure it is a paragraph and not just one or two sentences!

For paragraph number two, discuss who or what is affected the most by the findings in the article. Use your knowledge of science to predict or speculate on how someone or something might be affected by this new finding.

For the third paragraph discuss how this article might have an effect on your life. Simply stating “This article has no effect on my life” is unacceptable! Be creative in stating how you might be affected now or in the near future.

As you already know these papers count for ten percent of your grade. This could be the difference between an A or a B, or passing and failing. This does not have to be typed (but that would be nice). Just make sure that your writing is legible!
