

Mandeville High BLOOD DRIVE

October 23rd 8:30am - 2pm Auditorium-LOBBY

All donors receive a VIP pass pass to the Mortuary Haunted House

Speed up your donation by filling out your medical questionnaire using FastLane before you arrive!

Dear Parents,

Thirty minutes is all it takes to save a life. You are capable of saving the lives of accident victims, adults and children with cancer, and newborn babies who need blood transfusions just hours after coming into this world. The Blood Center asks that you consider those who need your help.

Donating blood is a responsibility that belongs to each and every person in the community. With the support of your family, we can help assure a safe, adequate blood supply. Parents wishing to donate blood will be able to go the head of the line.

Requirements for Donating Blood:

- 17 year-olds must weigh at least 110 lbs. and have a signed school permission slip.
- 16 year-olds must weigh at least 130 lbs., have a signed school permission slip **AND** a signed 16 year-old permission slip.
- If you are an athlete check with your coach about donating blood.

MUST eat a good meal before donating and bring a Picture ID

T-shirt to donors!

General Information about Blood Donations

The Blood Center is the primary supplier of blood, blood components and plosma derivatives to local bospitals throughout South Louisiana and parts of the Mississippi Gulf Coast. Each day, The Blood Center must collect 300 - 350 pints of blood in order to maintain a stable area blood supply. Because the need for blood is constant and ongoing, and at times can even be critical, our community partners and denors remain a reliable source to help ensure that blood is always available for patients who need it. We welcome your blood donation if you are 16 or older, currently in good health, and meet the dimation suitability criteria. Donors who are 16 years old must return this form, signed by a parent or legal guardian, before donating blood. All donors must show ID containing name, birth date and/or photo on the day of donation.

Informed Consent - Blood Donation for Minor

racknowledge that I have read and understand the information provided in this document, and I give permission for my child to donate blood and/or blood components.

Please print in blue or black ink.

Common Questions About Blood Donation

Q: Who might use blood?

A: Everybody, in fact, it's estimated that six out of every 10 people will need blood or blood components during their lives.

Q: Is it safe? Does it hurt?

A: Donating blood is safe. All materials are used once, then discarded. You cannot get AIDS or any other infectious disease by denating blood. Most people feel fine after they give. The actual needle stick (venipuncture) hurts no more than a pinch,

Q: How much can I give?

A: Every donor is evaluated individually with safety in mind! When you donate whole blood, one pint is collected. Depending on your gender, height, weight and total blood volume, you can give up to 2 pints in an automated blood collection. For example, one donor may be able to donate two units of Red Blood Cells, another may donate one unit of Platelets and one unit of Plasma.

Q: How long will it take?

A: The entire donation process takes about 45 minutes; automated donations take longer. The time includes the interview process before and refreshments after the donation. For the donor's safety, the donor must remain in the refreshment area a minimum of 10 minutes following the donation.

Before You Donate

- · Please ear a healthy meal before donating, even if you do not normally eat three meals a day,
- Drink plenty of water or other fluids (excluding soda, tea and/or coffee) starting a couple of days hefore you donate.
- Drink 16oz water 10-30 minutes before donating

Blood Donor Suitability

The Blood Center makes a determination as to the suitability of all blood donors based on a physical examination, donor interview, and disease testing. During the donor interview, sensitive and personal information is obtained from the donor. These questions include questions about the donor's medical condition, health status, and exposure to infectious diseases. It is important that questions be answered fully and truthfully.

Major Blood Components

Red Blood Cells carry oxygen to all parts of the body and are used to treat patients who have anemia or who have lost blood due to injury or surgery.

Platelets help control bleeding, Platelets are commonly used to treat patients with leukemia or cancer who are undergoing chemotherapy and bone marrow transplants.

Plasma is the liquid portion of the blood, it contains clotting factors and vital proteins used to treat critically ill patients who have suffered significant blood loss.

Whole Blood Donation

Blood is collected from a vein in the arm into a bag specially designed to store blood. Typically, each donated unit is separated into multiple components, most often Red Blood Cells, Plasma, and Platelets. Whole blood donation is the most common way to donate blood.

Automated Blood Donation

With automated blood collection, The Blood Center can collect the exact components that patients need, and can collect more of these specific components then can be separated from a unit of whole blood. Blood is collected from a vein in the arm and passed through an apheresis instrument that separates the blood is components. While the blood is being collected, a small amount of anticoagulant (citrate) is added to the blood to prevent clotting during the procedure. After the targeted component(s) is/are collected, the remainder of the blood is returned to the donor. The donor will receive a saline solution to help replace fluid lost during the automated collection. The body naturally replaces the components that are donated: plasma-within several hours, platelets within 24 hours, and red cells in several weeks.

Adverse Reactions to Donating Blood

While both the whole blood and automated collection processes are normally pleasant experiences, it is possible that short-term side effects can occur such as dizziness, skin irritation, nausea, vomiting, bruising, or fainting. Although remote, it is also possible that bruising around the vein, an infection, or nerve damage can develop during or after phlebetomy, which is the process of drawing the blood. On rare occasions, more severe reactions such as seizures can occur with more serious and long-term complications. In addition, during automated blood collections some common side effects that are easily resolved are due to the anticoagulant and include numbness and tingling sensations, muscle cramping, and chills. Our staff is specially trained to respond to donor reactions.

Testing of Donated Blood

Donated blood will undergo testing for viral agents and diseases including, but not limited to, HIV and Hepatitis C. Abnormal test results will be reported to the donor and to the donor's parent or legal guardian, if the donor has not yet reached his or her seventeenth birthday. This information is confidential and will not be disclosed to anyone unless specifically authorized by the donor and the donor's parent or legal guardian or required by law. A positive test result for an infectious disease may be reported to the state health department or as otherwise required by law, where exposure to others may be involved.
