

Marietta City Schools
2024–2025 District Unit Planner

Science Grade 7

Unit title	Genetics	MYP year	2	Unit duration (hrs)	40 Hours
------------	----------	----------	---	---------------------	----------

Mastering Content and Skills through INQUIRY (Establishing the purpose of the Unit): *What will students learn?*

GA DoE Standards

Standards

S7L3. Obtain, evaluate, and communicate information to explain how organisms reproduce either sexually or asexually and transfer genetic information to determine the traits of their offspring.

- Construct an explanation supported with scientific evidence of the role of genes and chromosomes in the process of inheriting a specific trait.
- Develop and use a model to describe how asexual reproduction can result in offspring with identical genetic information while sexual reproduction results in genetic variation. (Clarification statement: Models could include, but are not limited to, the use of monohybrid Punnett squares to demonstrate the heritability of genes and the resulting genetic variation, identification of heterozygous and homozygous, and comparison of genotype and phenotype.)
- Ask questions to gather and synthesize information about the ways humans influence the inheritance of desired traits in organisms through selective breeding. (Clarification statement: The element specifically addresses artificial selection and the ways in which it is fundamentally different from natural selection.)

Prior Student Knowledge: (REFLECTION – PRIOR TO TEACHING THE UNIT)

In 5th grade, students are expected to:

S5L2. Obtain, evaluate, and communicate information showing that some characteristics of organisms are inherited and other characteristics are acquired.

- Ask questions to compare and contrast instincts and learned behaviors.
- Ask questions to compare and contrast inherited and acquired physical traits (*Classification statement:* Punnett Squares and genetics are taught in future grades.)

Concepts/Skills to be Mastered by Students

- Genes and Chromosomes
- Sexual and Asexual Reproduction
- Inheritance of Traits & Variation of traits
- Selective breeding (artificial selection)

Key Vocabulary: (KNOWLEDGE & SKILLS)

Heredity, DNA, chromosomes, genes, alleles, traits, genotype, phenotype, dominant, recessive, homozygous dominant, heterozygous, homozygous recessive, sexual reproduction, meiosis, asexual reproduction, binary fission, budding, clone, offspring, artificial selection, selective breeding, reproduce, reproduction, transfer, genetics, genetic information, genetic variation, Punnett square, heritability, inheritance

Year-Long Anchoring Phenomena: (LEARNING PROCESS)

Humans have the ability to positively and/or negatively impact biological and ecological systems.

Unit Phenomena (LEARNING PROCESS)

How is my phenotype influenced by my parents' genotypes?

Possible Preconceptions/Misconceptions: (REFLECTION – PRIOR TO TEACHING THE UNIT)

- Students often confuse the relationship between DNA, chromosomes, genes, and alleles.
- Students often confuse genotype with phenotype.
- Students may have a misconception that a dominant trait equates to being more common in the population.
- Students may interpret a heterozygous genotype as having characteristics of both alleles (incomplete dominance). This is not discussed until high school biology.
- Students may need additional support in terms of calculating ratios and percentages in Punnett Square analysis.

Key concept	Related concept(s)	Global context
<p align="center">Relationships</p> <p>Relationships are the connections and associations between properties, objects, people and ideas— including the human community's connections with the world in which we live. Any change in relationship brings consequences—some of which may occur on a small scale, while others may be far-reaching, affecting large networks and systems such as human societies and the planetary ecosystem.</p>	<p>Patterns (MYP/CCC) Transformation (MYP)</p>	<p align="center">Identities and relationships</p> <p>Who we are: an inquiry into the nature of the self; beliefs and values; personal, physical, mental, social and spiritual health; human relationships including families, friends, communities and cultures; rights and responsibilities; what it means to be human.</p>

Statement of inquiry

The relationship between chromosomes, genes, alleles, and traits can be understood by examining patterns of inheritance.

Inquiry questions

Factual

- What are chromosomes, genes, alleles, and traits?
- How are dominant and recessive alleles different?
- What is a Punnett Square?
- What are the different possibilities of genotypes?

What is selective breeding/artificial selection?

What is the difference between sexual and asexual reproduction?

Conceptual

What is the relationship between DNA, chromosomes, genes, alleles, and traits?

What role do chromosomes, genes, and alleles play in heredity?

How are our traits determined?

How does genotype relate to phenotype?

Why do some offspring look more like their parents than others?

What determines whether offspring will or will not have genetic variation?

How can I use a Punnett Square to determine the likelihood of offspring inheriting a certain genotype and displaying a certain phenotype?

Debatable

Where do we draw the line with artificial selection/selective breeding?

Should we genetically modify organisms for various purposes?

Should parents be able to use what we know about heredity and genetics to pre-select traits for their offspring?

MYP Objectives	Assessment Tasks	
<i>What specific MYP objectives will be addressed during this unit?</i>	<i>Relationship between summative assessment task(s) and statement of inquiry:</i>	<i>List of common formative and summative assessments.</i>
Science: Criterion A: Knowing and Understanding i. describe scientific knowledge Criterion D: Reflecting on the Impacts of Science iii. apply scientific language effectively	SOI: The relationship between chromosomes, genes, alleles, and traits can be understood by examining patterns of inheritance. In the summative assessment, students are tasked with using various models to examine, predict, and determine patterns of inheritance. Students use Punnett Squares to determine possible allele combinations of offspring when provided with the genotypes and/or phenotypes of the parents. They may also determine parent genotypes based on offspring genotypes. Students interpret models of binary fission and meiosis to identify similarities and differences between inheritance in asexual and sexual reproduction. Students also investigate scenarios to determine how selective breeding uses patterns of inheritance to produce offspring with desired traits.	<p>Formative Assessment(s): Genetics CFA Punnett Square CFA</p> <p>Summative Assessment(s): Genetics Unit Assessment Paper I and Paper II (Science A,D)</p>

Approaches to learning (ATL)

Category: Thinking

Cluster: Critical Thinking

Skill Indicator: Use models and simulations to explore complex systems and issues. Gather and organize relevant information to formulate an argument.
