    b. Fixed-temperature sensing shall be independent of rate-of-rise sensing and shall be settable at fire-alarm control unit to operate at 135 or 155 deg F.
    c. Provide multiple levels of detection sensitivity for each sensor.

B. Photoelectric Smoke Detectors:

1. Detector address shall be accessible from fire-alarm control unit and shall be able to identify the detector's location within the system and its sensitivity setting.
2. An operator at fire-alarm control unit, having the designated access level, shall be able to manually access the following for each detector:

    a. Primary status.
    b. Device type.
    c. Present average value.
    d. Present sensitivity selected.
    e. Sensor range (normal, dirty, etc.).

C. Ionization Smoke Detector:

1. Detector address shall be accessible from fire-alarm control unit and shall be able to identify the detector's location within the system and its sensitivity setting.
2. An operator at fire-alarm control unit, having the designated access level, shall be able to manually access the following for each detector:

    a. Primary status.
    b. Device type.
    c. Present average value.
    d. Present sensitivity selected.
    e. Sensor range (normal, dirty, etc.).

D. Duct Smoke Detectors: Photoelectric type complying with UL 268A.

1. Detector address shall be accessible from fire-alarm control unit and shall be able to identify the detector's location within the system and its sensitivity setting.
2. An operator at fire-alarm control unit, having the designated access level, shall be able to manually access the following for each detector:

    a. Primary status.
    b. Device type.
    c. Present average value.
    d. Present sensitivity selected.
    e. Sensor range (normal, dirty, etc.).

3. Weatherproof Duct Housing Enclosure: NEMA 250, Type 4X; NRTL listed for use with the supplied detector.

4. Each sensor shall have multiple levels of detection sensitivity.
5. Sampling Tubes: Design and dimensions as recommended by manufacturer for specific duct size, air velocity, and installation conditions where applied.
6. Relay Fan Shutdown: Rated to interrupt fan motor-control circuit.
7. Remote Test Switch: With keyed switch and LED indicator.

2.5 HEAT DETECTORS

A. General Requirements for Heat Detectors: Comply with UL 521.

B. Heat Detector, Combination Type: Actuated by either a fixed temperature of 135 deg F or a rate of rise that exceeds 15 deg F per minute unless otherwise indicated.

1. Mounting: Twist-lock base interchangeable with smoke-detector bases.
2. Integral Addressable Module: Arranged to communicate detector status (normal, alarm, or trouble) to fire-alarm control unit.

C. Heat Detector, Fixed-Temperature Type: Actuated by temperature that exceeds a fixed temperature of 190 deg F.

1. Mounting: Twist-lock base interchangeable with smoke-detector bases.
2. Integral Addressable Module: Arranged to communicate detector status (normal, alarm, or trouble) to fire-alarm control unit.

2.6 CARBON MONOXIDE DETECTORS

A. General Requirements for System-type Carbon Monoxide Detectors:

1. Comply with UL 2075 and UL 2034; operating at 24-V dc, nominal.
2. Electrochemical sensing technology.
3. Detectors shall be two-wire type.
4. Integral Addressable Module: Arranged to communicate detector status (normal, alarm, or trouble) to fire-alarm control unit.
5. Self-Restoring: Detectors do not require resetting or readjustment after actuation to restore them to normal operation.

B. Integral Visual-Indicating Light: LED type indicating detector has operated and power-on status.

2.7 NOTIFICATION APPLIANCES

A. General Requirements for Notification Appliances: Connected to notification appliance signal circuits, zoned as indicated, equipped for mounting as indicated and with screw terminals for system connections.

1. Combination Devices: Factory-integrated audible and visible devices in a single-mounting assembly, equipped for mounting as indicated and with screw terminals for system connections.

B. Horns: Electric-vibrating-polarized type, 24-V dc; with provision for housing the operating mechanism behind a grille. Comply with UL 464. Horns shall produce a sound-pressure level of 90 dBA, measured 10 feet from the horn, using the coded signal prescribed in UL 464 test protocol.

C. Visible Notification Appliances: Xenon strobe lights comply with UL 1971, with clear or nominal white polycarbonate lens mounted on an aluminum faceplate. The word "FIRE" is engraved in minimum 1-inch-high letters on the lens.

1. Rated Light Output: 15/30/75/110 cd, selectable in the field.
2. Mounting: Wall mounted unless otherwise indicated.
3. For units with guards to prevent physical damage, light output ratings shall be determined with guards in place.
4. Flashing shall be in a temporal pattern, synchronized with other units.
5. Strobe Leads: Factory connected to screw terminals.
6. Mounting Faceplate: Factory finished, red.

D. Voice/Tone Notification Appliances (Speakers):

1. Appliances shall comply with UL 1480 and shall be listed and labeled by an NRTL.
2. High-Range Units: Rated 2 to 15 W.
3. Low-Range Units: Rated 1 to 2 W.
4. Mounting: Flush.
5. Matching Transformers: Tap range matched to acoustical environment of speaker location.

2.8 FIREFIGHTERS' TWO-WAY TELEPHONE COMMUNICATION (AREA OF REFUGE)

A. System shall be hands free and shall comply with the Americans with Disabilities Act providing two-way voice communications to a constantly attended location.

B. Units shall have dual audio and visual alarms.

C. System shall provide supervision of area stations and wiring.

D. System shall be furnished complete with all relay cards, amplifiers, etc as required for operation. System shall also be furnished with battery backup or shall be tied to fire alarm system for battery backup. Adjust fire alarm battery capacity accordingly. Equipment enclosures shall be surface mount type.

E. Furnish specified Cornell system or equal by Housing Devices, Inc. Master unit shall have spare capacity as indicated on Drawings.

2.9 MAGNETIC DOOR HOLDERS

A. Description: Units are equipped for wall or floor mounting as indicated and are complete with matching doorplate. Projection of holder and armature must be coordinated with other hardware and wall conditions to ensure that door sits parallel to wall when fully open. Where magnetic holders are used on fire-rated doors, they must be wired into the fire control panel for fail-safe operation.

1. Electromagnet: Requires no more than 3 W to develop 25-lbf holding force.
2. Wall-Mounted Units: Flush mounted unless otherwise indicated.
3. Rating: 120-V ac; or 24-V ac or dc.

B. Material and Finish: Match door hardware.

C. Acceptable Manufacturers and/or Products: LCN, Rixson, Sargent

2.10 REMOTE ANNUNCIATOR

A. Description: Annunciator functions shall match those of fire-alarm control unit for alarm, supervisory, and trouble indications. Manual switching functions shall match those of fire-alarm control unit, including acknowledging, silencing, resetting, and testing.

1. Mounting: Flush cabinet, NEMA 250, Type 1.

B. Display Type and Functional Performance: Alphanumeric display and LED indicating lights shall match those of fire-alarm control unit. Provide controls to acknowledge, silence, reset, and test functions for alarm, supervisory, and trouble signals.

2.11 ADDRESSABLE INTERFACE DEVICE

A. Description: Microelectronic monitor module, NRTL listed for use in providing a system address for alarm-initiating devices for wired applications with normally open contacts.

B. Integral Relay: Capable of providing a direct signal to elevator controller to initiate elevator recall, to circuit-breaker shunt trip for power shutdown and other functions as required.

2.12 DIGITAL ALARM COMMUNICATOR TRANSMITTER

A. Digital alarm communicator transmitter shall be acceptable to the remote central station and shall comply with UL 632 and be listed and labeled by an NRTL.

B. Functional Performance: Unit shall receive an alarm, supervisory, or trouble signal from fire-alarm control unit and automatically capture two (2) telephone lines and dial a preset number for a remote central station. When contact is made with central station(s), signals shall be transmitted. If service on one (1) of the lines is interrupted for longer than 45 seconds, transmitter shall initiate a local trouble signal and transmit the signal indicating loss of telephone line to the remote alarm receiving station over the remaining line. Transmitter shall automatically report telephone service restoration to the central station. If service is lost on both telephone lines, transmitter shall initiate the local trouble signal.

C. Local functions and display at the digital alarm communicator transmitter shall include the following:

1. Verification that both telephone lines are available.
2. Programming device.
3. LED display.
4. Manual test report function and manual transmission clear indication.
5. Communications failure with the central station or fire-alarm control unit.

D. Digital data transmission shall include the following:

1. Address of the alarm-initiating device.
2. Address of the supervisory signal.
3. Address of the trouble-initiating device.
4. Loss of ac supply or loss of power.
5. Low battery.
6. Abnormal test signal.
7. Communication bus failure.

E. Control panel and NAC panel shall receive 120 VAC power via a dedicated branch circuit protected in accordance with the National Electric Code.

1. The system shall support one hundred percent (100%) of notification and initiating devices in alarm or operated at the same time, under both primary (AC) and secondary (battery) power conditions.
2. System shall be provided with sufficient battery capacity to operate the entire system upon loss of normal 120 VAC power in a normal supervisory mode for a period of 60 hours with 5 minutes of alarm operation at the end of this period. Any system cabinets furnished with independent power supplies and/or batteries shall also meet these requirements.
3. System shall automatically transfer to standby batteries upon power failure. All battery charging and recharging operations shall be automatic.
4. All circuits requiring system operating power shall be 24 VDC and shall be individually fused or equivalently protected at the control unit.
5. The incoming power to the system shall be supervised so that any power failure must be audibly and visibly indicated at the control unit and the annunciator. A green "power on" LED shall be displayed continuously while incoming power is present.
6. If a “LOW BATTERY” condition is left unattended a second stage “DEPLETED BATTERY” trouble condition shall be audibly and visibly reported at the control unit indicating the batteries are below the listed system operating voltage.
7. The system batteries shall be supervised so that a low battery condition or disconnection of the battery shall be audibly and visibly indicated at the control unit and the annunciator.

F. Self-Test: Conducted automatically every 24 hours with report transmitted to central station.

2.13 DEVICE GUARDS

A. Description: Welded wire mesh of size and shape for the manual station, smoke detector, gong, or other device requiring protection.

1. Factory fabricated and furnished by manufacturer of device.
2. Finish: Paint of color to match the protected device.

PART 3 - EXECUTION

3.1 COMMISSIONING OF SYSTEMS AND EQUIPMENT

A. Engage a factory-authorized service representative or technician who is familiar with this project to participate and assist, if necessary, in the functional performance testing of the equipment include in this Division with the Commissioning Agent.

3.2 EQUIPMENT INSTALLATION

A. Comply with NFPA 72 for installation of fire-alarm equipment.

B. Equipment Mounting: Install fire-alarm control unit on wall with tops of cabinets not more than 72 inches above the finished floor.

C. Smoke- or Heat-Detector Spacing:

1. Smooth ceiling spacing shall not exceed 30 feet.
2. Spacing of detectors for irregular areas, for irregular ceiling construction, and for high ceiling areas shall be determined according to Appendix A in NFPA 72.
3. HVAC: Locate detectors not closer than 3 feet from air-supply diffuser or return-air opening.

4. Lighting Fixtures: Locate detectors not closer than 12 inches from any part of a lighting fixture.

D. Duct Smoke Detectors: Comply with NFPA 72 and NFPA 90A. Install sampling tubes so they extend the full width of duct.

E. Carbon Monoxide Detectors: Comply with NFPA 720. Install per manufacturer's instructions and as remotely located from the heating appliance as possible (within room). Detectors shall be individually addressablly monitored and programmed to initiate a supervisory signal.

F. Heat Detectors in Elevator Shafts: Coordinate temperature rating and location with sprinkler rating and location.

G. Remote Status and Alarm Indicators: Install near each smoke detector and each sprinkler water-flow switch and valve-tamper switch that is not readily visible from normal viewing position.

H. Audible Alarm-Indicating Devices: Install not less than 6 inches below the ceiling. Install bells and horns on flush-mounted back boxes with the device-operating mechanism concealed behind a grille.

I. Visible Alarm-Indicating Devices: Install adjacent to each alarm bell or alarm horn and at least 6 inches below the ceiling.

J. Device Location-Indicating Lights: Locate in public space near the device they monitor.

K. Annunciator: Install with top of panel not more than 72 inches above the finished floor.

3.3 CONNECTIONS

A. For fire-protection systems related to doors in fire-rated walls and partitions and to doors in smoke partitions, comply with requirements in Section 087100 "Door Hardware." Connect hardware and devices to fire-alarm system.

1. Verify that hardware and devices are NRTL listed for use with fire-alarm system in this Section before making connections.

B. Make addressable connections with a supervised interface device to the following devices and systems. Install the interface device less than 3 feet from the device controlled. Make an addressable confirmation connection when such feedback is available at the device or system being controlled.

1. Smoke dampers in air ducts of designated air-conditioning duct systems.
2. Alarm-initiating connection to elevator recall system and components.
3. Alarm-initiating connection to activate emergency shutoffs for gas and fuel supplies.
4. Supervisory connections at valve supervisory switches.
5. Supervisory connections at low-air-pressure switch of each dry-pipe sprinkler system.
6. Supervisory connections at elevator shunt trip breaker.

3.4 IDENTIFICATION

A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

B. Install framed instructions in a location visible from fire-alarm control unit.

3.5 GROUNDING

A. Ground fire-alarm control unit and associated circuits; comply with IEEE 1100. Install a ground wire from main service ground to fire-alarm control unit.

3.6 FIELD QUALITY CONTROL

A. Field tests shall be witnessed by authorities having jurisdiction.

B. Perform tests and inspections.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

C. Tests and Inspections:

1. Visual Inspection: Conduct visual inspection prior to testing.

a. Inspection shall be based on completed Record Drawings and system documentation that is required by NFPA 72 in its "Completion Documents, Preparation" Table in the "Documentation" Section of the "Fundamentals of Fire Alarm Systems" Chapter.
b. Comply with "Visual Inspection Frequencies" Table in the "Inspection" Section of the "Inspection, Testing and Maintenance" Chapter in NFPA 72; retain the "Initial/Reacceptance" column and list only the installed components.

2. System Testing: Comply with "Test Methods" Table in the "Testing" Section of the "Inspection, Testing and Maintenance" Chapter in NFPA 72.
3. Test carbon monoxide detectors in accordance with NFPA 720.
4. Test audible appliances for the public operating mode according to manufacturer's written instructions. Perform the test using a portable sound-level meter complying with Type 2 requirements in ANSI S1.4.
5. Test audible appliances for the private operating mode according to manufacturer's written instructions.
6. Test visible appliances for the public operating mode according to manufacturer's written instructions.
7. Factory-authorized service representative shall prepare the "Fire Alarm System Record of Completion" in the "Documentation" Section of the "Fundamentals of Fire Alarm Systems" Chapter in NFPA 72 and the "Inspection and Testing Form" in the "Records" Section of the "Inspection, Testing and Maintenance" Chapter in NFPA 72.

D. Reacceptance Testing: Perform reacceptance testing to verify the proper operation of added or replaced devices and appliances.

E. Fire-alarm system will be considered defective if it does not pass tests and inspections.

F. Prepare test and inspection reports.

G. Maintenance Test and Inspection: Perform tests and inspections listed for weekly, monthly, quarterly, and semiannual periods. Use forms developed for initial tests and inspections.

H. Annual Test and Inspection: One (1) year after date of Substantial Completion, test fire-alarm system complying with visual and testing inspection requirements in NFPA 72. Use forms developed for initial tests and inspections.

3.7 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain fire-alarm system.

END OF SECTION 283111

SECTION 310800 - EARTHWORK

PART 1 - GENERAL

1.1 DESCRIPTION

A. General: Perform earthwork in accordance with the Contract Documents.

B. Work Included: Work of this Section includes all labor, materials, equipment, and services necessary to complete the excavation, foundations, subgrade preparation, filling and grading as shown on the Drawings and specified herein including, but not limited to the following:

1. Removal and replacement beneath the building pad, foundations, utilities, and hardscape features as detailed in the project geotechnical report.
2. All earth excavation to the bottom of foundations, walls, pits, slabs, manholes, etc. as required and indicated on the Contract Drawings, or to a lower elevation to achieve required bearing capacity, as directed by the Owner's Geotechnical Engineer.
3. Excavation, filling and rough grading of site area at adjacent structures and roadways as required and within the Contract Limit Line.
4. Excavation, filling, grading and compacting to required elevations for all floors, slabs on grade, and structural slabs.
5. Excavation, filling, grading and compacting to required elevations for appurtenances and site work.
6. Filling and compacting of soil below foundation slab-on-grades, behind below grade walls, and beneath structural slabs.
7. Legal disposing off the site, of surplus excavated materials unsuitable for filling or backfilling.
8. Pumping and dewatering as required for work of this section and for foundation work.
9. Subgrade preparation for foundations.
10. Protection and monitoring of adjacent structures, structures to remain, utilities, and pavements.
11. Other labor and materials as may be reasonably inferred to be required to make the work under this Section complete.

C. The contractor shall coordinate all earthwork activities such that all slab, foundation, utilities, and hardscape features bear on natural/competent material, are improved with ground improvement elements, or are addressed through a removal and replacement program. See geotechnical report.

1.2 RELATED SECTIONS

A. 033001 – Cast-in-Place Concrete

B. 034500 – Precast Concrete

C. 312500 – Soil Erosion and Sediment Control

D. 312316 – Excavation, Backfill, and Subgrade Preparation

E. 312333 – Trench Excavation and Backfill for Utilities

F. 310913 - Monitoring

G. Construction Drawings and Documents

1.3 REFERENCES

A. General: All work and materials under this section shall conform to the latest revision of the following standard specifications, where not otherwise required by the Contract Documents.

American Society for Testing and Materials (ASTM) – latest edition.

1. C 136 Test for Sieve Analysis of Fine and Coarse Aggregates.
2. D 422 Method for Particle Size Analysis of Soils.
3. D 1140 Test for Amount of Material in Soils Finer than No. 200 (75 mm) Sieve.
4. D 1556 Test for Density and Unit Weight of Soil in Place by the Sand-Cone Method.
5. D 1557 Test for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft3) (Modified Proctor).
6. D 2216 Laboratory Determination of Moisture content of Soil and Rock Mass.
7. D 2487 Classification of Soils for Engineering Purposes (Unified Soil Classification System).
8. D 6938 Tests Methods for In-Place Density and Water Content of Soil and Soil- Aggregate in Place by Nuclear Methods (Shallow Depth).
9. D 4253 Test Method of Maximum Index Density and Unit Weight of Soils Using a Vibratory Table.
10. D 4254 Test Methods for Minimum Index Density and Unit Weight of Soils and Calculations of Relative Density.
11. D 4318 Test for Plastic Limit, Liquid Limit, and Plasticity Index of Soils.
12. D 1883 Test Method for California Bearing ratio (CBR) of Laboratory Compacted Soils.

B. American Association of State Highway and Transportation Officials (AASHTO) – Latest edition.

1. T 88 Mechanical Analysis of Soils.

C. All work shall comply with the requirements of the 2022 Connecticut State Building Code (IBC 2021), and the requirements and regulations of any other Federal, State, or Local ordinances having jurisdiction.

D. All work and materials under this section shall conform to the following references:

1. Geotechnical Engineering Study, prepared by Langan

E. Connecticut Department of Energy and Environmental Protection (CTDEEP) Guidelines for Soil Erosion and Sediment Control.

F. Connecticut Department of Energy and Environmental Protection (CTDEEP) General Permit for the Discharge of Stormwater and Dewatering Wastewaters from Construction Activities.

G. Connecticut Department of Transportation (CTDOT) Standard Specifications for Roads, Bridges and Incidental Construction, latest edition.

H. Applicable local, state, and federal rules, ordinances, laws and regulations.

1.4 SUBMITTALS

A. Within ten days after award of the contract, the Contractor shall submit a schedule detailing the sequence, and time of completion of all phases of work under this section.

B. At least two weeks in advance of imported fill use, the Contractor shall submit the following laboratory test data and a 25-pound soil sample to the Owner's Geotechnical Engineer for review and approval:

1. Contractor to submit test reports on borrow material as follows:

    a. Moisture and Density (modified proctor) Relationship: ASTM D1557.
    b. Mechanical Analysis: AASHTO T-88.
    c. Moisture content in accordance with ASTM D 2216.
    d. Relative Density: ASTM D4254.
    e. California Bearing Ratio (CBR): ASTM D1883, if utilized as subgrade material beneath paved areas.
    f. Plasticity Index: ASTM 4318.
    g. Test for Sieve Analysis of Fine and Coarse Aggregates: C 136.

2. Include data for all samples indicating the exact location and methods of transportation and placement of all materials.

3. Submit documentation for each of the imported material certifying them as “Clean Fill” in accordance with Part 2, Section 2.1, Article A of this specification and in accordance with Specification 02 6113.

C. The contractor shall submit the name of each material supplier and specific type and source of each material. Any change in source or soil type throughout the job requires approval of the Builder and the Owner’s Consultants.

D. Samples: Submit a 12 inch by 12 inch sample of geosynthetic filter fabric and material cut sheet.

E. Underpinning Shop Drawings:

1. Submit detailed shop drawings and calculations, to be reviewed by the Owner’s Geotechnical Engineer, of earthwork procedures and sequences including temporary underpinning systems, if required.
2. The underpinning drawings shall bear the signature and seal of a Professional Engineer registered in the State of Connecticut.

F. Dewatering: The contractor shall prepare dewatering shop drawings. The dewatering plan shall be designed by the contractor’s engineer.

G. Pre-Construction Conditions Survey: The Contractor will perform a pre-construction conditions survey of all immediate offsite adjacent structures and surrounding critical site features, the results of which will be made available to the Owner and Design Team upon completion of the survey (include digital copies of photographs). The survey shall consist of photographic and video documentation and shall include a plan detailing the limits of the work and any observed damage.

H. Monitoring: Submit a plan showing location of proposed vertical and horizontal control points. Submit survey readings of the control points within 24 hours of the survey. Plan and survey readings shall be signed and sealed by a Land Surveyor registered in the State of Connecticut.

I. Certification for Examination of Site and Records: Before proceeding with the Work, submit certification in an acceptable form, signed by the Contractor, stating that careful examination has been made of the site, existing structures, records of utility lines, test boring records, test pit records, and subsurface exploration reports by the Owner’s Geotechnical Engineer, the Drawings, and all other Contract Documents.

J. Submit approvals and permits to the General Contractor a minimum of 15 days prior to commencement of construction.

1.5 ENVIRONMENTAL CONSIDERATIONS

A. Install erosion control measures in the sequence shown of the plans or as directed by the Architect or regulatory agencies to protect adjacent properties and water resources from erosion and sediment damage.

B. Owner will register under CTDEEP's General Permit for the Discharge of Stormwater and Dewatering Wastewaters from Construction Activities. Assume responsibility and conform to all permit requirements therein including routine inspections and reporting.

C. Any off-site soil disposal requirement shall be performed in accordance with all applicable Local, State, and Federal regulations governing soil movement and disposal.

D. Dust and Erosion Control:

1. The Contractor shall take all necessary measures and provide equipment and/or materials to minimize dust from rising and blowing across the site and also to control surface water throughout the operation so that it does not run onto paved ways without being filtered. In addition, the Contractor shall control all dust created by construction operation and movement of construction vehicles, both on site and on paved ways. Comply with the 2002 Connecticut Sediment and Erosion Control Guidelines.

1.6 PROJECT CONDITIONS

A. The Contractor, by careful examination, shall inform himself as to the nature and location of the work; the conformation of the ground, the nature of the subsurface conditions; the location of the groundwater table; the character, quality and quantity of the materials to be encountered; the character of the equipment and facilities needed preliminary to and during the execution of the work; the conditions of adjacent structures and utilities and all other matters which can in any way effect the work.

B. The Contractor shall be held to have visited the site and to have familiarized himself with the existing conditions of adjoining utilities and structures.

C. The Contractor shall make his own deductions of the subsurface conditions which may affect the methods or cost of construction of the work hereunder, and he agrees that he will make no claims for damages or compensations, except as are provided under the agreement, should he find conditions during the progress of the work different from those as calculated and/or anticipated by him. Additional borings and other exploratory operations may be performed by Contractor, at the Contractor's option and following the Owner's approval. No change in the Contract Sum will be authorized for such additional exploration undertaken by the Contractor.

D. The Contractor shall investigate the conditions of public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affecting transportation to, ingress and egress of the site of the work. The Contractor shall conform to all Town, State, and Federal regulations concerning the transportation of materials to and from and at the job site and shall secure in advance such permits as may be required.

1.7 PRE-CONSTRUCTION CONDITION SURVEY

A. The Contractor shall perform a pre-construction conditions survey of the structures and critical site features immediately adjacent to the work area, prior to the start of work and shall include the results of this survey with their shop drawings submittal to the Owner and Design Team before commencement of said work.

1.8 PROTECTION

B. Protection of Adjacent Structures, Utilities and Pavements

1. Prior to commencement of any work, consult the records for existing utilities, and note all conditions and limitations, which might affect the work required under this section.
2. The Contractor shall become acquainted with the existence and location of all surface and subsurface structures and utilities within the project area. Contractor shall not damage any of those that are to remain and shall leave them accessible.
3. The work shall be executed so that no damage or injury will occur to existing public and adjoining or adjacent structures, streets, paving, sewers, gas, water, electric or any other pipes. Should any damage or injury caused by the contractor, or anyone in Contractor's employ, or by the work under this Contract occur, the Contractor shall, at his own expense, make good such damage and assume all responsibility for such injury.
4. Provide barricades and warning lights, barriers, etc., to prevent accidents, to avoid all necessary hazards and protect the public, the work, and property at all times, including Saturdays, Sundays, and holidays.
5. The above shall also include the protection of all existing utilities to remain in use within and adjacent to the area affected by the work of this project.
6. Monuments, bench marks and other reference features on streets bounding this project, shall be protected. Should these be disturbed in any manner, the Contractor shall have them replaced at own expense.
7. Excavation work shall be restricted to hours indicated in the Contract Documents.
8. The Contractor's surveyor shall install control points on the adjacent structures and pavement for vertical and horizontal monitoring (to the nearest 0.005 ft.). Control points shall be monitored weekly during excavation and foundation construction work.

C. Protection of Excavation Bottoms

1. Facilities and materials needed to prevent earth at bottom of excavation from becoming frozen or unsuitable to receive the foundations shall be furnished.
2. The excavation shall not be carried to final grades during freezing weather without providing complete protection against freezing of the subgrades as specified hereinafter. Complete protection against freezing shall also be provided if freezing weather sets in after completion of the excavation to final subgrade. This protection shall include adequate heating and coverage of the area to maintain temperatures above freezing until foundations have been concreted and backfilled.
3. The excavation shall be maintained dry following preparation and approval by the owner's Geotechnical Engineer and until concrete foundations and slabs have adequately cured. Protection shall include covering, sloping, pumping, trenching, etc. until foundations and slabs have been concreted and backfilled.
4. Where excavations have been brought to the bottom elevations called for on the drawings, and the bottom of these excavations become unsuitable in the opinion of the Owner's Geotechnical Engineer because of inadequate protection by the Contractor, these excavations shall be carried to lower depths sufficient to provide stable bearing as determined by the Owner's Geotechnical Engineer.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Imported Material: Imported fill should consist of a relatively well-graded mixture of sand and gravel. Suitable imported fill should be free of organics, clay, excessive silt, other deleterious or compressible materials, cinders, frozen material, trash, masonry, rubble, and other deleterious materials. In addition, any approved imported fill should be free of all hazardous substances. Grain-size distribution and modified Proctor compaction tests (ASTM D1557) should be made on representative samples of the imported fill proposed.

1. Imported clean fill shall be "Clean Fill" as defined in the Solid Waste Regulations found at Section 22a-209-1 of the Regulations of Connecticut State Agencies: "Clean fill" means (1) natural soil (2) rock, brick, ceramics, concrete, and asphalt paving fragments which are virtually inert and pose neither a pollution threat to ground or surface waters nor a fire hazard and (3) polluted soil as defined in

subdivision (45) of subsection (a) of section 22a-133k-1 of the Regulations of Connecticut State Agencies which soil has been treated to reduce the concentration of pollutants to levels which do not exceed the applicable pollutant mobility criteria and direct exposure criteria established in sections 22a-133k-1 through 22a-133k-3 of the Regulations of Connecticut State Agencies and which soil is reused in accordance with R.C.S.A. subdivision (3) of subsection (h) of section 22a-133k-2 of such regulations. Documentation, including, but not limited to laboratory analytical reports and source location, shall be provided for review and approval by owner or owner's Licensed Environmental Professional prior to the importation of clean fill materials.

B. Engineered Fill/Structural Fill: Well-graded sand and gravel having no more than 10% by dry weight passing the No. 200 sieve, free of organic material, clay, excessive silt, other deleterious or compressible materials, cinders, frozen material, trash, masonry or rubble and free of particle having dimensions greater than 3-inches in all directions. See geotechnical report for additional comments relative to re-use of on-site fill or the natural sand. Structural fill shall be used as backfilling material within 4 feet laterally of any structure, including footings, slabs, below-grade walls, utilities, manholes, catch basins, in areas greater than 2 feet below pavement subgrade, if acceptable with the project Civil Engineer.

C. Crushed Stone/Crushed Gravel/Drainage Aggregate: Free draining, natural clean, crushed, washed durable stone free of deleterious materials and conforming to the gradation requirements commercially known as ¾-inch clean crushed durable stone (AASHTO No. 57 or approved alternative). Recycled concrete aggregate shall not be acceptable.

D. Processed Aggregate: Coarse and fine aggregates mixed to conform to the gradation requirements of M.05.01 material as defined on Connecticut DOT Form 818.

E. The use of recycled concrete aggregate (RCA) is not permitted as a drainage backfill material against structures.

F. Filter Fabric: Mirafi 140N manufactured by TC Mirafi or approved equivalent woven geotextile filter fabric where specified.

G. The use of mole rock is not permitted.

PART 3 - EXECUTION

3.1 CODES, PERMITS AND REGULATIONS

A. Comply with all applicable permits, laws, rules, ordinances and regulations of the Town, State, and Federal Government, and all other Authorities Having Jurisdiction.

B. Obtain and pay for all permits and licenses required to execute and complete the work unless noted othwerwise.

C. In case of conflict between regulations and specifications, the Contractor shall comply with the most stringent applicable codes, regulations or specifications.

3.2 PUMPING AND DEWATERING

A. Provide adequate pumps, or other equipment, appurtenances, power, drains, materials and labor necessary to excavation continuously dry during excavation, foundation construction, and backfilling and at such other times as the progress of the work may demand or as necessary to insure safety to the structure shall be provided.

B. All pumping both inside and outside the areas of the building shall be performed, continued and maintained as required for the completion of all work, including the work of the mechanical trades, throughout the period of the contract.

C. Contractor shall manage runoff to limit impact on construction.

D. The dewatering system or systems shall be installed and operated in such a manner as to avoid the movement of fines or loss of ground from below the bearing level and shall not influence the stability of surrounding areas. The facilities needed to eliminate loss of ground shall be included.

E. The Contractor shall not use any portion of the building foundation units or any part thereof as a sump for drainage resulting from pumping in any other area. The Contractor shall not conduct water to privately owned properties.

F. Any pumped groundwater which will require off-site disposal shall comply with all Local, State, and Federal environmental regulations.

3.3 EXCAVATION

A. Removal and Replacement

1. The existing fill and estuarine deposit material within the limits of the proposed building are not suitable for foundation or slab support in their current state. In areas where the depths of unsuitable material, as documented in the geotechnical report referenced herein, are relatively shallow, the contractor shall perform a removal and replacement program.
2. In areas of the removal and replacement program, the Contractor shall removal all unsuitable material to the top of natural stratified sand, weathered rock, or bedrock material within the footprint in this area and beyond (i.e. exterior edge) a horizontal distance equal to the depth of the over-excavation below the proposed footing elevation. The contractor shall minimize disturbance of the natural material using appropriate techniques (i.e., flat plate welded across bucket of backhoe). Contractor shall backfill accordingly to proposed grades with structural fill as defined herein.
3. Contractor shall coordinate all removal/replacement work with the architectural, structural, and site drawings.
4. The base or bottom of the excavation shall be as-built and overlain upon the foundation (within the building) or site plan (throughout the site). The contractor's licensed professional surveyor shall provide this information to the Geotechnical and Structural Engineer.
5. In lieu of structural fill, the contractor may use drainage fill (stone) to assist with backfilling operations in proximity to the dewatered level of the groundwater. Drainage fill shall be placed in maximum 12-inch thick lifts and compacted with appropriate equipment to achieve densification. A properly designed geosynthetic filter fabric (Mirafi 140N or equivalent) shall be placed on the top and sides of the drainage fill to serve as a means of preventing migration of overlying soil fill into the drainage fill layer.
6. The contractor shall proofroll the bottom of the excavation prior to placement of structural fill or drainage stone or excavate in a manner so as to obtain a firm and unyielding condition of the surface of the sand and gravel with excavation techniques which minimize disturbance. The excavation subgrade shall be observed and approved by the Owner's Geotechnical Engineer prior to the placement of any structural fill or drainage fill material. The excavation shall be maintained in a dewatered condition such that observation of the surface of the excavation and subsequent backfilling can be accomplished in a relatively dry condition. Should soft or yielding conditions be observed, the contractor shall remove and replace this material with approved suitable compacted material. If alternative drainage fill material is to be utilized by the contractor based on particular circumstances, the proposed material shall be submitted to the Owner's Geotechnical Engineer for review and approval.

B. General

1. Excavation work shall include removal and disposal of all materials encountered regardless of the nature of the materials and shall be understood to include but not limited to rock, boulders, earth, hardpan, fill, structures, utilities, pavements, curbs, piping and debris, and others. Re-use of existing fill material shall only be permitted if the material meets the requirements for structural fill.
2. All excavation shall extend to the dimensions and elevations required for the installation of the work described herein and as indicated on the Drawings. Excavation shall be made to a depth that will allow installation of full depth of concrete slabs, and sub-base as shown on the Drawings and within a 1 inch tolerance. Excavation lines shall provide sufficient clearance for the proper execution of all concrete work, including allowances for form work, shoring and inspection.
3. Materials that in the opinion of the Owner's Geotechnical Engineer are not suitable for fill and any surplus earth shall be removed from the site and legally disposed off-site.
4. Existing utility lines to be retained that are shown on the drawings or the locations of which are made known to the Contractor prior to excavation operations, shall be protected from damage during excavation and backfilling, and if damaged, shall be repaired by the Contractor, at own expense.

C. Excavation for Foundations

1. Foundation subgrades shall be inspected and approved by the Owner’s Geotechnical Engineer before proceeding with the construction of foundations. Bottoms of footings shall be founded on the natural sand material or structural fill as approved by the Owner’s Geotechnical Engineer.
2. Subgrade of foundations shall be level and free of loose soil, debris, standing water and frost prior to acceptance for placing concrete. A Geotechnical Engineer shall inspect and approve the foundation subgrade to verify that the subgrade material is adequate to provide the recommended allowable bearing pressure.
3. Unauthorized Excavation: When suitable bearing material is encountered at subgrade elevations shown on Drawings and excavation is made to greater depth, the foundations and foundation walls shall be extended to the lower elevation with concrete of the same strength used for the foundations, at no additional cost to the Owner.

D. Subgrade Preparation

1. Natural undisturbed material shall be graded and compacted to attain a uniform surface. These areas shall be determined by the Owner’s Geotechnical Engineer.
2. Prior to constructing foundations, slabs, utilities, utility structures, fields, and paved/hardscape areas, the subgrade shall be proofrolled in the presence of the Owner’s Geotechnical Engineer for the following conditions:

    a. Subgrades shall be proofrolled with a minimum of six passes of a 10-ton roller. For all other subgrades, proofrolling shall be accomplished with a minimum of six passes of a 5-ton walk-behind vibratory roller.
    b. Foundation elements shall not be placed until the subgrade is approved by the Owner’s Geotechnical Engineer. All structural fill footing subgrades shall be tested to confirm the top lift of the footing subgrade is compacted to the project specified requirement for structural fill material.
    c. Soft Areas during Compaction: If any areas show pumping, noticeable weaving, or which are otherwise unsatisfactory, undercut material to competent material within the limits and extent suggested by the Owner’s Geotechnical Engineer. These areas shall be replaced with either concrete of the same strength used for the foundation or structural fill, compacted to 95% of maximum dry density by ASTM D1557. The appropriate water content at the time of compaction should be plus or minus 2 percentage points of optimum moisture content as determined by the laboratory compaction test aforementioned, unless otherwise directed by the Engineer of

Record. If structural fill is utilized, the excavation shall be oversized to include the zone of influence (1H:1V) beneath and beyond the footing and footing level.

d. Subgrades should be excavated level and if any cobbles or boulders are encountered at the footing subgrade level such that a relatively level subgrade is not achieved, the cobbles or boulders should be removed and replaced with compacted structural fill or compacted crushed stone.

e. Consideration should be given to protecting the natural sand and gravel subgrades after excavation utilizing either clean, crushed, durable, compacted ¾ inch stone, or a mud mat.

E. Excavation for General Grading:

1. Excavations made below the elevations shown or specified, unless authorized by Change Order, shall be filled and compacted as hereinafter specified, at no additional cost.

F. Trench Excavation:

1. Unless otherwise shown or specified, make trenches for piping and utilities not less than 16 inches or more than 24 inches wider than the outside width of the piping or utilities. Accurately grade bottoms of trenches with bell holes scooped out to provide uniform bearing and support of pipe and utilities on undisturbed soil throughout its entire length, except where other means of supporting pipe are indicated.
2. Trenches for underground conduit and piping, where necessary, shall be excavated to the required depth and bell holes shall be provided where necessary to insure uniform bearing. Trench excavation lines shall provide sufficient clearance for the proper execution of underground mechanical work.
3. Trenches shall be by open cut from the surface. No tunneling will be allowed except by consent of the Owner's Geotechnical Engineer. Irregularities at bottom of trench, or where excavation is below required depth, shall be refilled to required grade with compacted granular fill.
4. Pipe trenches shall be excavated and minimum cover shall be provided to required depths as per the Connecticut State Building Code. Excavated materials adjacent to trench as directed shall be neatly banked.
5. Where trenches are in wet or soft ground that in the opinion of the Owner's Geotechnical Engineer is unsuitable for supporting the piping, concrete cradles or approved equivalent shall be installed.
6. Where necessary, the sides of trenches and excavations shall be supported by adequate sheeting and bracing and conform with applicable OSHA regulations to insure proper construction and safety of the workers. The Contractor will be held responsible for the sufficiency of sheeting and bracing and for all damages to property or injury to persons resulting from improper quality, strength, placing, maintaining and removing of same.
7. Prior to utility installation, soil subgrades in the utility trenches should be proofrolled as specified herein. Pipe bedding should be placed and compacted in accordance with the pipe manufacturer's requirements or as indicated in the Drawings, whichever is more stringent.
8. Immediately after piping has been installed, tested, inspected, and accepted, piping shall be filled around with special care to solidly fill voids without causing injury to piping. Up to two feet above the pipe's crown, the utility excavation shall be backfilled using structural fill placed in 4-inch thick loose lifts. For the remainder of trench backfill, the excavation shall be backfilled using structural fill placed in 12-inch thick loose lifts. Each layer shall be compacted before placing the next layer. Backfill shall be in such a manner so as to prevent future settlement.

3.4 FILLING AND COMPACTING

A. General

1. Do not commence filling and backfilling operations until construction below finish grade has been approved, underground utilities and mechanical items inspected and tested, forms removed, waterproofing or damproofing and other improvements installed, trash and debris removed, and temporary and permanent bracing installed.
2. Do not commence backfilling, filling and grading until existing subgrade has been compacted to 95% of the material's maximum dry density as determined by the Modified Proctor Compaction Test (ASTM D1557).
3. Fill all excavations, backfill against all walls, and do all filling and grading necessary to bring the surfaces to the level required.
4. No fill material shall be placed on areas where free water is standing, or frozen subsoil area, or on surface which have not been approved for fill placement by the Owner's Geotechnical Engineer.
5. Do not backfill against concrete elements until the concrete has obtained its specified compressive strength.
6. Perform backfilling around foundation walls when the first floor provides sufficient bracing to withstand the backfill pressure. All other fill, backfill, and rolling to approximately finished grades shall then be completed.
7. Take particular care when rolling over areas where trenches or other excavations have been made and backfilled.
8. Grade bottoms of pavements and area way bottoms toward sediment pits or catch basins to maintain uniform thickness of the slabs.

B. Grading

1. Prior to placing fill or backfill in any area, grading is to be performed as required to provide for drainage. Ditching or filling around the area will be performed to intercept or divert all surface water. Within the area the ground which fill is to be placed will be graded so as to provide for unobstructed drainage from every point to a sump or other disposal point.
2. On completion of grading as specified above, closely examine to determine whether excessive wetness, springs, or other seepage of water can be observed at any point. If such conditions exist, positive drainage in suitable form, such as trench drains or tilling, must be provided before placement of fill is undertaken.

C. Placement and Compaction of Controlled Fill and Backfill

1. Placement

a. Begin fill and backfilling in the lowest section of the area. Spread material evenly by mechanical equipment or by manual means above the approved compacted subgrade in lifts not exceeding 10 to 12 inches for material compacted by heavy machinery and 4 inches for material compacted by hand tamping. Build layers as horizontally as practical to prevent thickness of lift from exceeding that specified but provide with sufficient longitudinal and transverse slope to provide for runoff of surface water from every point.

b. Moisture Control: The moisture-density curve for the fill use shall be supplied to the Contractor as a guide in controlling moisture to achieve the required degree of compaction. If, in the opinion of the Owner's Geotechnical Engineer, fill material becomes too wet for the required compaction, the fill shall be dried by a method approved by the Owner's Geotechnical Engineer prior to commencing or continuing compaction operations. Likewise, if, in the opinion of the Owner's Geotechnical Engineer, the fill material becomes too dry for the required compaction, the fill shall be moistened by a method approved by the Owner's Geotechnical Engineer prior to commencing or continuing compaction operations. The water content at the time of compaction should be within 2% points of the optimum water content.

2. Compaction: Compact each lift to 95% of the maximum dry laboratory density by ASTM D1557. The degree of compaction shall be checked by the Owner's Geotechnical Engineer and each successive lift shall not be placed or compacted until the previous lift is inspected and approved by the Owner's Geotechnical Engineer. Compact the fill and backfill to elevations and limits shown on Drawings and is subject to final inspection and approval by the Owner's Geotechnical Engineer.
3. Drainage During Fill Operation: At all times, maintain and operate proper and adequate surface and subsurface drainage to the satisfaction of the Owner's Geotechnical Engineer in order to keep the construction site dry and in such condition that placement and compaction of fill may proceed unhindered by saturation of the area.
4. Frost: Do not place fill materials when either the fill materials or the previous lift (or subgrade) on which it is placed is frozen. In the event that any fill which has already been placed on the surface shall become frozen, it shall be scarified and re-compacted, or removed, to the approval of the Owner's Geotechnical Engineer before the next lift is placed. Remove or re-compact any soft spots resulting from frost to the satisfaction of the Engineer before new fill is placed.

3.5 MAINTENANCE

A. Protection of Graded Areas: Protect newly graded areas from traffic and erosion. Keep free of trash and debris.

B. Repair and re-establish grades in settled, eroded, and rutted areas to specified tolerances.

C. Reconditioning Compacted Areas: Where completed compacted areas are disturbed by subsequent construction operations or adverse weather, scarify surface, reshape, and compact to required density prior to further construction.

D. Settling: Where settling is measurable or observable at excavated areas, remove surface (pavement, lawn, or other finish), add backfill material, compact, and replace surface treatment. Restore appearance, quality, and condition of surface or finish to match adjacent work, and eliminate evidence of restoration to greatest extent possible.

3.6 QUALITY CONTROL AND INSPECTION

A. The Owner will employ, at their own expense, a Geotechnical Engineer to review all laboratory test results and submitted reports specified in this Section.

B. The Owner's Geotechnical Engineer will interpret the tests, state in each report whether or not the test specimens and results comply with all requirements of the Contract Documents and note any deviations.

C. The Owner's Geotechnical Engineer will identify when and where samples are to be obtained. Contractor shall collect samples and forward them to the Owner's Testing Laboratory for testing. Testing Laboratory will submit the following laboratory test reports to the Owner's Geotechnical Engineer:

1. Laboratory results conducted on each type of borrow and fill material:

    a. Gradation Analysis ASTM D422.
    b. Atterberg limits ASTM D 4318.
    c. Modified Moisture-density curve determination ASTM D1557.

2. Owner's Geotechnical Engineer will determine the conformance of materials to be used for fills.

D. Field Inspection:

1. Foundation Subgrades: Foundation subgrades shall be inspected by Owner's Geotechnical Engineer to verify the design bearing capacities. The bottom of excavation prior to placement of structural fill shall be observed and approved by the Owner's Geotechnical Engineer prior to placement of structural fill. No foundation shall be constructed unless the Owner's Geotechnical Engineer approves the subgrade.
2. Proofrolling: Proofrolling where required shall be inspected by Owner's Geotechnical Engineer.
3. Paved Area and Building Slab Subgrades: Owner's Geotechnical Engineer shall inspect subgrades for paved areas and building slabs. No pavement or slab shall be constructed unless the subgrade approved by the Owner's Geotechnical Engineer.
4. Backfilling and Compaction: Backfilling and compaction below paved areas, building slabs, behind the foundation walls, and any other backfilling and compaction work shall be inspected by the Owner's Geotechnical Engineer. No fill shall be placed unless the previous lift is approved by the Owner's Geotechnical Engineer. Owner's Geotechnical Engineer will take field density tests of the subgrade for every 2,500 sq- ft. but not less than 3 tests in each compacted fill layer. All footing subgrades within structural fill shall have field density tests. Perform field density tests in accordance with ASTM D6938.

E. Contractor shall cooperate with the Owner's Geotechnical Engineer in the performance of the required tests.

3.7 DISPOSAL OF EXCAVATED MATERIALS

A. Legally dispose the excavated material to an off-site disposal facility, in accordance with all Local, State, and Federal Environmental regulations.

3.8 ERRORS IN DEPTH

A. In the event that any part of the excavation is carried, through error, beyond the depth and the dimensions indicated on the drawings of called for in the specifications, then the Contractor, at his own expense, shall furnish and install gravel or stone with which to fill to the required level, in all locations except beneath footings and piers. At these locations, Contractor shall be required to fill to level of bottom footing with concrete mixed in the proportion of the foundations bearing on them. Where established bottoms as shown on drawings have not been maintained or have been disturbed by operations under this contract, they shall be cleaned out and filled with concrete mixed in the proportion of the footings bearing upon them, without additional cost to the Owner.

END OF SECTION 310800

SECTION 310913 - MONITORING OF EXISTING STRUCTURES AND UTILITIES

PART 1 - GENERAL

1.1 DESCRIPTION

A. Work Included: The Work of this Section includes, but is not limited to the following:

1. Contractor required to perform construction and demolition work such that they do not cause damage (or additional damage) to the existing structure to remain.

2. All labor, equipment, and materials to execute the work of this Section as specified herein during renovation, earthwork, and foundation construction activities.

3. Collection, cataloging, and compilation of the observed conditions of the existing school building and above-grade site features within 200 feet of the proposed work.

4. Furnish and install optical survey targets, surveying marks, benchmarks and settlement monitoring points as required and as outlined herein.

5. Furnish all equipment and labor to provide continuous vibration monitoring within existing school and structures.

6. Provide all surveying services required for performing optical survey monitoring as outlined herein.

7. Provide all labor necessary for the periodic measurement of any installed crack gauges installed under this Section.

8. Compilation, interpretation, and transmittal of monitoring data to the Construction Manager, Owner and others during construction.

1.2 RELATED SECTIONS

A. Section 310800 – Earthwork

B. Section 312316 – Excavation, Backfill, and Subgrade Preparation

C. Section 312333 – Trench Excavation and Backfill for Utilities

D. Construction Drawings & Documents

1.3 QUALITY CONTROL

A. The Contractor shall retain the services of a Land Surveyor, licensed in the State of Connecticut, to perform all survey monitoring during construction. The Contractor’s surveyor shall have at least three years of professional experience or as approved by the Owner’s Engineer.

B. The Contractor shall retain a Professional Engineer, licensed in the State of Connecticut, to perform all other monitoring including measurement of vibration and movement of structures and the ground. The Contractor’s Professional Engineer shall have at least five years of professional experience working under similar circumstances, or as approved by the Owner’s Engineer.

1.4 SUBMITTALS

A. Unless otherwise indicated, transmit all submittals to the Construction Manager for review by the Owner's Engineers before proceeding with ordering, fabricating, or any other work of this Section.

B. Submit method statement describing the type of equipment to be implemented for optical surveying, crack gauges, and any other instrumentation proposed. Describe installation, location, operation, and maintenance of equipment, as necessary.

C. Submit work plan detailing the installation, operation, and maintenance of all equipment.

D. Submit product cut-sheets and calibration data and identify the allowable tolerances of all proposed equipment.

E. The Contractor shall submit resumes for all personnel performing the work of this Section.

F. Submit example weekly monitoring report and data sheets showing typical presentation of seismograph and crack gauge monitoring data.

G. Submit sample survey monitoring report.

H. The Contractor shall submit the results of a Pre-Construction Documentation Report to the Construction Manager for distribution to the Owner, Owner's Architect and Engineers, and all other agencies having jurisdiction. Documentation shall include applicable plans, sketches, notes, and photographs logging the interior and exterior conditions of structures/thoroughfares located within 200 feet of above grade work limits.

I. Submit plan showing location of all instruments installed to document movement during construction activities.

J. Monitoring Plans:

1. The Contractor shall submit drawings showing the plan and vertical locations of all proposed monitoring points. The plan shall graphically identify the type of monitoring point (i.e. optical survey, surface points, seismographs, crack gages, borehole instruments, benchmarks, etc), with each monitoring point bearing a unique identification number. Where required, provide section drawings (i.e. excavation faces, building facades, etc) and identify the elevations (NAVD88 datum) at which monitoring points have been or will be installed.

2. The drawings shall be updated and resubmitted in the event that monitoring points are abandoned, relocated or additional monitoring points are added.

3. The Contractor shall submit a plan, and associated action levels, to monitor existing on-site utilities to remain throughout construction.

K. Submit all monitoring data directly to the Construction Manager for distribution to the Owner's Architect and Engineers. Measurement data shall be submitted within 24 hours of taking each reading. All data shall be transmitted in electronic format suitable to the Owner's Architect and Engineers. Transmitted data shall show all cumulative measurements recorded as a function of time. Requisite notes shall be included to document construction activities performed during the monitoring increment. The Contractor shall clearly identify any exceedances or trends that could lead to an exceedance, as soon as one is identified.

L. Submit weekly summary report to the Construction Manager for distribution to the Owner's Architect, Engineers, and others as required.

M. The Contractor shall submit the results of a Post-Construction Documentation Report to the Construction Manager for distribution to the Owner, Owner's Architect and Engineers, and all other agencies having jurisdiction. Documentation shall include applicable plans, sketches, notes, and photographs logging the interior and exterior conditions of structures/thoroughfares located within 200 feet of above grade work limits.

1.5 SCHEDULING OF WORK

A. Obtain all necessary permits and access agreements necessary prior to performance of the work.

B. Pre-Construction Conditions Documentation of the existing structures to remain and structures/thoroughfares located within 200 feet of above grade work limits shall be completed at least 10 days, but no more than 60 days, prior to commencing renovation work, earthwork and foundation construction, including but not limited to general earthwork or underpinning installation.

C. Locations for crack gauges shall be determined during performance of the Pre-Construction Condition Documentation. Crack gauges shall be installed as required to catalog and record the conditions of existing cracks.

D. Seismographs shall be installed following the performance of the Pre-Construction Conditions Documentation. Seismographs shall be installed to allow for sufficient time (minimum one week) to evaluate background vibration levels resulting from ambient activities prior to construction.

E. Additional crack gauges or seismographs shall be installed as required by renovation, earthwork, underpinning, or foundation construction activities.

F. Survey targets, benchmarks, and settlement monitoring points shall be installed at least 10 days prior to commencing earthwork and foundation construction, including but not limited to renovation, general earthwork, or underpinning installation.

G. Additional monitoring points shall be established as required during construction.

1.6 MONITORING

A. Monitoring shall include but not limited to measurement of construction induced vibrations, vertical and lateral deflections of structures and utilities, inclination, soil/ground movement, and crack movement. Monitoring shall be performed prior to and during earthwork, installation of underpinning, and foundation construction to evaluate the performance of the Contractor's activities.

B. The field locations of all monitoring devices shall be coordinated with the Owner and the Owner's Engineers, and all agencies having jurisdiction.

C. The Contractor shall be responsible for all maintenance of equipment as required to maintain monitoring on a continuous basis throughout the duration of construction activities on-site.

1.7 SURVEY MONITORING

A. Survey monitoring shall include installation of survey monitoring points and periodic measurement of horizontal and vertical movements at existing structures within and adjacent to the project site.

1.8 ADDITIONS

A. The Contractor may elect to provide additional types of monitoring not specifically outlined herein, but shall at a minimum conform to the requirements of this Section. Where additional types of monitoring are proposed, the Contractor shall inform the Construction Manager in writing, and shall provide all information as requested by the Construction Manager and the Owner's Architect and Engineers, and all other agencies having jurisdiction.

B. The Contractor shall be solely responsible for all means and methods not specifically addressed herein.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Contractor shall submit all details and other supporting data for materials proposed for use in performing the work of this Section.

1. Optical Survey Targets: Survey targets shall consist of self-adhesive reflective sheet targets suitable for adherence to wood, steel, brick, concrete, etc.

2. Surface Marker 1 (SM1): A ¼-inch by 2-inch PK nails set in paved streets or sidewalks with a 1-½" diameter hub identification tag (or approved equal).

3. Surface Marker 2 (SM 2): Scribe surface of monitoring point as required to maintain permanent demarcation of the location. Scribed locations shall be identified on all drawings.

4. Crack Gauges: Grid crack gauges shall be as manufactured by Avongard Products Ltd (or approved equal) shall be permanently affixed to monitoring surfaces using bolts or adhesive.

2.2 EQUIPMENT

A. Seismographs: Blastmate Series III portable seismograph as manufactured by Instatel Inc. or approved equal. Seismographs shall include a cellular modem (i.e., Verizon, AT&T) or other means to allow for continuous real-time monitoring and alert via email and internet. Geophones and cases shall be affixed to walls or other structures by means of concrete anchor bolts as manufactured by Hilti, Redhead, or equal. Portable units, mounted directly on the grounds, shall be installed in accordance with manufacturer's requirements.

B. Crack Gages: Grid crack cages shall be as manufactured by Avongard Products (USA) Ltd., or approved equal. Anchors, bolts, screws and quick setting epoxy shall be as provided by Avongard Products or approved equal. A minimum of 20 gauges shall be procured prior to execution of Preconstruction Conditions Documentation.

C. Optical Survey Equipment: Optical surveying equipment shall be suitable for achieving the following accuracies and repeatability:

1. Vertical: at least plus or minus 0.005 ft

2. Horizontal: at least plus or minus 0.005 ft

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION

A. Install monitoring systems prior to commencing renovation, earthwork and foundation construction, including but not limited to general earthwork and underpinning installation. Where employed, monitoring websites for data transmittal and alarm notifications must be active a minimum of one week prior to construction.

B. Install all equipment in accordance with manufacturer's recommendations.

C. Submit drawings showing the as-built locations for all monitoring points installed, listing unique identifiers for each point and the type of monitoring.

D. Install additional monitoring points as required as the work progresses. Replace all locations, lost, damaged or vandalized.

3.2 INSTALLATION OF CRACK GAUGES

A. Install crack gauges prior to commencing construction activities.

B. Installation shall be in accordance with the manufacturer's recommendations.

C. Cracks shall be photographed and mapped prior to installation of crack gauges. The location of crack gauges shall be made in consultation with the Owner's Engineer and all other agencies having jurisdiction.

D. Write ID # on gauge with permanent marker.

E. After completion of installation, check that gauge parts are free to move over each other by passing a feeler gauge or thin plastic card between the two sections.

F. After completion of installation, the as-built location and initial movement (if any) shall be recorded.

G. Photograph crack gauge following installation and all subsequent readings.

3.3 SEISMOGRAPHS

A. Installation shall be in accordance with the manufacturer's recommendations.

B. Seismographs shall be firmly mounted to the ground surface or structures. Where seismographs are placed on undisturbed soil, geophones shall be set with spikes as supplied by the manufacturer and shall be ballasted with sand bags having a minimum weight of 30 pounds.

3.4 MONITORING LOCATIONS

A. The number and location of monitoring points shall be determined at the on-set of construction.

3.5 BASELINE MEASUREMENTS

A. Baseline measurements for all monitoring shall be established a minimum of one week prior to execution of construction activities on-site.

B. Establishment of trigger values for vibration monitoring shall consider background vibration levels. Background levels shall be recorded prior to commencing construction activities to determine ambient levels of vibration resulting from rail operations. Trigger values for seismographs shall be maintained at 0.2 inches per sec above that of the peak background levels recorded or 0.5 inches per second (whichever is lower).

3.6 FREQUENCY OF MONITORING

A. At a minimum, survey monitoring of structures shall be performed once per week. The frequency of monitoring shall be increased or decreased as directed by the Construction Manager and the Owner's Consultants pending the results of recorded monitoring data trends. Survey monitoring shall be performed on structures before and during the earthwork and foundation construction, including but not limited to general earthwork and underpinning installation. Survey monitoring shall cease after the earthwork and foundation construction, including but not limited to renovation, general earthwork or underpinning installation is complete.

B. At a minimum, crack gauges shall be measured once per week. The frequency of monitoring shall be increased as directed by the Construction Manager, the Owner's Consultants or Owner. Crack gauges shall be measured on structures before and during the earthwork and foundation construction, including but not limited to renovation, general earthwork or underpinning installation. Crack gauges shall remain in place (and not monitored) until the overall construction of the proposed development is completed. One final measurement shall be collected before removing the crack gauges.

C. Vibration Monitoring shall be performed on a continuous basis (24/7). The Contractor shall be responsible for evaluating and reporting exceedances of this data in real-time. Vibration monitoring shall be performed on structures before and during the earthwork and foundation construction, including but not limited to renovation, general earthwork, or underpinning installation. Vibration monitoring shall cease after the earthwork and foundation construction, including but not limited to renovation, general earthwork, or underpinning installation is complete.

3.7 MONITORING REPORT, DATA FORMAT AND TRANSMITTAL

A. Weekly monitoring reports shall be prepared and submitted to the Construction Manager, Owner and Owner's Architect and Engineers, and all other agencies having jurisdiction that includes a summary of the measurements for that week, cumulative total movements, observed trends, changes in the monitoring program and any monitoring points that exceeded the trigger levels. The report shall correlate any observed trends in movement or trigger levels with weather and construction activities.

B. Data shall be transmitted in an electronic format (MS Excel) and shall include all cumulative readings taken. Data shall include baseline values, offset measurements. Provide coordinates for readings. Include movement trend plots identifying any exceedances or trends that could lead to exceedances. Include the following information for all readings:

1. Instrument Type
2. Date and time of readings
3. Name of observer
4. Monitoring Point ID #
5. Readings, both total and cumulative where appropriate
6. Weather condition and temperature
7. Remark of any visual observations of conditions, construction activities
8. Work performed on-site

C. Transmit all data to the Construction Manager for distribution to the Owner's Architect and Engineers, and all other agencies having jurisdiction within 24 hours of taking measurements.

D. The Contractor shall alert Construction Manager and the Owner's Architect and Engineers, and all other agencies having jurisdiction immediately in the event that values exceed review levels specified herein. Such notification shall be made by email and in writing.

E. Additional reports shall be prepared as directed by the Owner's Engineers in the event that exceedances occur.

3.8 REVIEW AND LIMIT VALUES

A. The following criteria shall be used to evaluate the necessity for modifying or ceasing construction activities. Where a work stoppage is required, construction activities shall not continue until adequate measures are in place to ensure stability of adjacent structures, excavation support, or utilities. Where movements in excess of the Review level are detected, the frequency of data collection shall be increased to once daily, or as directed by the Construction Manager, Owners Consultants, or all other agencies having jurisdiction. The criteria provided shall not relieve the Contractor of any responsibility with respect to damage incurred by any structures or utilities.

1. Vibration Monitoring: Peak particle velocities

   a. Review Level – 0.5-inches per second (ips) or 0.2 ips + background level.

   b. Limit Level – 1.0 inches per second

2. Crack Gauge Monitoring: Cumulative movement in any direction

   a. Review Level – 1/16th inch in any direction

   b. Limit Level – 1/8th inch in any direction

3. Survey Monitoring:

   a. Review Level:

      i) Vertical movement of buildings or other structures: 3/8-inch total movement or 3/16-inch between two consecutive readings.

      ii) Horizontal movement of building or other surface structures: 3/16-inch total movement or 1/8-inch between two consecutive readings

   b. Limit Level:

      i) Vertical movement of buildings or other structures: ½-inch total movement or ¼ -inch between two consecutive readings

      ii) Horizontal movement of building or other surface structures: ¼-inch total movement, or 3/16-inch between two consecutive readings

3.9 ACTION ITEMS

A. Any movement exceeding the criteria outlined above shall be reported immediately to the Construction Manager, the Owner, the Owner's Consultants, and all other agencies having jurisdiction. Work in the immediate area shall be suspended, unless directed otherwise by the

Owner's Engineers. Corrective measures to ensure integrity and stability of adjacent structures shall be the responsibility of the Contractor.

B. In the event that a Review Level is reached the following shall be required:

1. Contractor shall meet with the Owner and Owner's Consultants, and all other agencies having jurisdiction to discuss the need for a response to mitigate the potential for readings exceeding the Review Level.

2. Where required, submit a detailed plan of action to mitigate the potential for additional movement or vibration.

3. Install additional instruments as required evaluate the need for any action necessary to prevent reaching the Limit Level.

C. In the event of a Limit Level is reached the following shall be required:

1. General earthwork activities, foundation construction, or underpinning installation, shall be suspended and the structures shall be inspected by the Owner, Owner's Consultants, the Contractor's Engineer, and all other agencies having jurisdiction.

2. The Contractor shall take all actions necessary to protect structures and utilities and maintain integrity and stability of said structures and utilities. The Contractor shall be solely responsible for providing all necessary services in conjunction with developing and applying remedial measures including any required engineering design.

3. Should vibration levels exceed the Limit Level, construction activities shall be suspended. The adjacent structures shall be visually inspected, and construction methods modified as necessary to maintain vibrations within acceptable levels.

3.10 DECOMMISSIONING

A. Upon notice from the Owner or Construction Manager, the Contractor shall remove all instruments installed and shall repair any resulting damage.

END OF SECTION

SECTION 311100 – CLEARING AND GRUBBING

PART 1 – GENERAL

1.1 RELATED SECTIONS AND DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. The applicable provisions of the Connecticut Edition of the International Building Code, latest edition or as enforced by the local agency.

C. Architectural and Structural Plans and Specifications where the architectural and structural requirements are more stringent than the requirements outlined herein.

D. Section 02 01 00 – Protection of Existing Utilities

E. Section 31 25 00 – Soil Erosion and Sediment Control

F. Section 31 08 00 – Earthwork

1.2 SCOPE OF WORK

A. Clearing Site of debris, grass, trees, and other plant life in preparation for Site or building earthwork.

B. Protection of existing structures, trees, or vegetation indicated in contract documents to remain.

C. Removal of existing sidewalks, drives, curbs, etc.

D. Removal of asphalt pavement and athletic courts where indicated on contract documents and as specified herein.

E. Stripping topsoil, if necessary, from areas that are to be incorporated into limits of project.

F. Disposal of cleared, grubbed, and stripped materials in accordance with all applicable codes and ordinances.

1.3 REFERENCE STANDARDS

The Connecticut Department of Energy & Environmental Protection’s (CTDEEP) Guidelines for Soil Erosion and Sediment Control, latest edition.

1.4 ENVIRONMENTAL REQUIREMENTS

A. Construct temporary erosion control systems to protect adjacent properties and water resources from erosion and sedimentation.

B. Contractor shall be totally responsible for conducting soil erosion and sediment control and the storm water management practices in accordance with all applicable permits and for enforcement action taken or imposed by federal or state agencies, including cost of fines, construction delays, and remedial actions resulting from contractor's failure to comply with all provisions of the applicable permits.

1.5 PROJECT CONDITIONS

A. Contractor to provide a thorough inspection of the site prior to bidding and accept the site as is.

B. Variations to conditions or discrepancy in actual or described as proposed conditions as they apply to site preparation operations are to be brought to the attention of the Owner prior to commencement of sitework.

PART 2 - PRODUCTS

2.1 MATERIALS

Off-site materials shall be transported to project using well maintained and operating vehicles. Once on site, transporting vehicles shall stay on designated haul roads and shall at no time endanger improvements by rutting, overloading, or pumping.

PART 3 - EXECUTION

3.1 PREPARATION

Verify existing plant life that is to remain and any clearing limits are clearly tagged, identified, and fenced in such manner as to insure their safety throughout construction operations.

3.2 PROTECTION

A. Locate and identify existing utilities that are to remain and protect from damage.

B. Protect trees, plant growth, and features not designated for removal.

C. Conduct operations with minimum interference to public or private accesses and facilities. Maintain ingress and egress at all times and clean or sweep roadways daily as required by the governing authority. Dust control shall be provided with sprinkling systems or equipment provided by contractor.

D. Protect benchmarks, property corners, and other survey monuments from damage or displacement. If marker needs to be removed it shall be referenced by a licensed land surveyor and replaced, as necessary, by same at contractor’s cost.

E. Provide traffic control as required, in accordance with the U.S. Department of Transportation's "Manual on Uniform Traffic Control Devices”, Connecticut Department of Transportation and local requirements.

3.3 CLEARING, GRUBBING AND STRIPPING

A. The Contractor shall clear areas required for execution of work.

B. Unless otherwise indicated on Construction Drawings, the contractor shall remove trees, shrubs, grass, other vegetation, improvements, or obstructions interfering with installation of new construction. Removal includes digging out stumps and roots. Depressions caused by clearing and grubbing operations are to be filled to subgrade elevation to avoid collecting water to form ponds. Satisfactory fill material shall be placed in accordance with Section 31 08 00.

C. Remove grass, trees, plant life, stumps, and other construction debris from site to dump site that is suitable for handling such material according to state laws and regulations.

D. The Contractor shall strip all asphalt within the building footprint area and 10 ft beyond, and from any other areas to receive new fill. Removed asphalt can be milled by the Contractor and asphalt millings can be reused as subbase material beneath new pavements. Asphalt to be used as recycled material shall be milled to form a well-graded material having a maximum particle size of 2 inches. The Contractor shall provide dust control measures during any milling process. Excess asphalt materials shall be properly disposed of in accordance with all applicable codes and ordinances.

3.4 TOPSOIL EXCAVATION

A. Satisfactory topsoil is reasonably free of subsoil, clay lumps, stones, weeds, roots, and other objectionable material.

B. Cut heavy growths of grass from areas before stripping and remove cuttings with remainder of cleared vegetative material.

C. Strip topsoil from areas that are to be filled, excavated, landscaped, or re-graded to such depth that it prevents intermingling with underlying subsoil or questionable material.

D. Stockpile topsoil in storage piles in areas acceptable to the Owner. Construct storage piles to freely drain surface water. Cover storage piles in compliance with the erosion and sedimentation control specifications to prevent windblown dust and waterborne erosion. Dispose of unsuitable topsoil as specified for waste material, unless otherwise specified by Owner. Excess topsoil shall be removed from site by Contractor unless specifically noted otherwise on Construction Drawings.

E. Stockpiled topsoil shall be reused as general fill in landscaped areas as permitted by Owner’s geotechnical engineer and as specified in specifications.

END OF SECTION 311100

SECTION 312113 - RADON MITIGATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes systems for the following:

1. Radon system.
2. Sub-slab ventilation system.

1.3 DEFINITIONS

A. ABS: Acrylonitrile-butadiene-styrene plastic.

B. HDPE: High-density polyethylene plastic.

C. PE: Polyethylene plastic.

D. PP: Polypropylene plastic.

E. PS: Polystyrene plastic.

F. PVC: Polyvinyl chloride plastic.

1.4 SUBMITTALS

A. Product Data: For the following:

1. Perforated-wall pipe and fittings.
2. Solid-wall pipe and fittings.
3. Vapor barriers.

B. Approval of waterproofing manufacturer's service agent for use of drainage panels against and for waterproofing membrane protection.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one (1) of the manufacturers specified below:

1. Fantech
2. RadonAway Inc.
3. Tjernlund Products, Inc.

2.2 PIPING MATERIALS

A. Refer to the "Piping Applications" Article in Part 3 for applications of pipe, tube, fitting, and joining materials.

2.3 PIPES AND FITTINGS

A. Perforated PVC Sewer Pipe and Fittings: ASTM D 2729, bell-and-spigot ends, for loose joints.

1. Gaskets: ASTM C 443, rubber.

B. Solid-Wall PVC Pipe: ASTM D 2665, drain, waste and vent.

1. PVC Socket Fittings: ASTM D 2665, socket type, made to ASTM D 3311, drain, waste, and vent patterns.

C. CPVC PIPING

1. CPVC, Chlorinated Polyvinyl Chloride Plastic, Schedule 80 Pipe: ASTM F 441.
2. CPVC Schedule 80 Fittings: ASTM F 439, socket type or ASTM F 437, threaded type.

2.4 SPECIAL PIPE COUPLINGS

A. Comply with ASTM C 1173, elastomeric, sleeve-type, reducing or transition coupling, for joining underground non-pressure piping. Include ends of same sizes as piping to be joined and corrosion-resistant metal tension band and tightening mechanism on each end.

1. Sleeve Materials:

a. For Plastic Pipes: ASTM F 477, elastomeric seal or ASTM D 5926, PVC.

2. Unshielded Flexible Couplings: Elastomeric sleeve with stainless-steel shear ring and corrosion-resistant metal tension band and tightening mechanism on each end.
3. Shielded Flexible Couplings: ASTM C 1460, elastomeric or rubber sleeve with full-length, corrosion-resistant outer shield and corrosion-resistant metal tension band and tightening mechanism on each end.

2.5 SOIL MATERIALS

A. Backfill, drainage course, impervious fill and satisfactory soil materials are specified in Section 312000 “Earth Moving”.

B. Sub-base shall conform to State of Connecticut DOT Form 816, Section M.03, Article M.0301, paragraph 2, DOT #6 or better with gas-permeable geotextile beneath and vapor barrier above.

2.6 GEOTEXTILE FILTER FABRICS

A. Description: Fabric of PP or polyester fibers or combination of both, with flow rate range from 110 to 330 gpm/sq. ft. when tested according to ASTM D 4491.

1. Structure Type: Nonwoven, needle-punched continuous filament or woven, monofilament or multifilament.
2. Style(s): Flat and sock.

2.7 RADON EXHAUST FAN

A. Description: In-line type, variable speed, mounted in radon stack on roof.

1. Ratings: 375 CFM at 0” external static pressure (when tested with 6-inch inlet and 6-inch discharge piping).
2. Operation: Fan shall run continuously, through local disconnect switch.
3. Electrical Requirements: 95-139 watts; 115 volts; 1-phase; coordinate power wiring and one (l) local disconnect switch provision by the Electrical Contractor.
4. Basis of Design: Radonaway **Model RP265**

2.8 RADON SYSTEM PRESSURE MONITOR

A. Description: Pressure switch/alarm, with warning signal relay, mounted in radon riser in chase. Provide fire-rated chase access door to service pressure switch/alarm device.

1. Operation: Pressure switch/alarm shall activate at 0.25” w.c.
2. Alarm Requirements: Coordinate wiring of “Loss of Negative Pressure” alarm into the Building Management System. Refer to Section 230900 “Instrumentation and Control for HVAC”.
3. Basis of Design: Radonaway **Checkpoint IIA**

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine surfaces and areas for suitable conditions where radon and sub-slab ventilation systems are to be installed.

B. Coordinate installations of this Section with all other trades, particularly structural and concrete work.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 EARTHWORK

A. Excavating, trenching, and backfilling are specified in Section 312000 “Earth Moving”.

3.3 PIPING APPLICATIONS

A. Under-Slab Radon and Sub-Slab Ventilation Piping (Within the Radon Suction Pit):

1. Pipe in subparagraph (2) below is available in NPS 4 (DN 100) only.
2. Perforated PVC sewer pipe and fittings and loose, bell-and-spigot joints.
3. Transition to 6-inch solid wall PVC sewer pipe at point where radon and sub-slab ventilation pipe leaves the radon collection pit.

B. Below Grade Piping Outside the Radon Collection Pit and Above-Grade Piping:

1. Solid-wall PVC sewer pipe and fittings and loose, bell-and-spigot joints.

3.4 RADON AND SUBSLAB VENTILATION PIPING

A. Place impervious fill material on subgrade adjacent to bottom of slab after concrete footing forms have been removed. Place and compact impervious fill to dimensions indicated, but not less than 6 inches deep and 12 inches wide.

B. Place impervious fill on subgrade adjacent to bottom of slab and compact to dimensions indicated, but not less than 6 inches deep and 12 inches wide after concrete footing forms have been removed.

C. Lay flat-style geotextile filter fabric in trench and overlap trench sides.

D. Place supporting layer of drainage course over compacted subgrade and geotextile filter fabric, to depth of not less than 4 inches. (Do not compact drainage layer).

E. Install piping as indicated in Part 3 "Piping Installation" Article for radon and subslab ventilation piping.

F. After satisfactory testing, cover piping to width of at least 6 inches on side away from footing and above top of pipe to within 12 inches of finish grade.

G. Install drainage course and wrap top of drainage course with flat-style geotextile filter fabric.

H. Place layer of flat-style geotextile filter fabric over top of drainage course, overlapping edges at least 4 inches.

3.5 RADON AND SUBSLAB VENTILATION PIPING INSTALLATION

A. Excavate for underslab drainage system after subgrade material has been compacted but before drainage course has been placed. Include horizontal distance of at least 6 inches between drainage pipe and trench walls. Grade bottom of trench excavations to required slope, and compact to firm, solid bed for drainage system.

B. Lay flat-style geotextile filter fabric in trench and overlap trench sides.

C. Place supporting layer of drainage course over compacted subgrade and geotextile filter fabric, to compacted depth of not less than 4 inches.

D. Encase pipe with sock-style geotextile filter fabric before installing pipe. Connect sock sections with adhesive or tape.

E. Install drainage piping as indicated in Part 3 "Piping Installation" Article for underslab subdrainage.

F. Add drainage course to width of at least 6 inches on side away from wall and to top of pipe to perform tests.

G. After satisfactory testing, cover piping with drainage course to elevation of bottom of slab, and compact and wrap top of course with flat-style geotextile filter fabric.

H. Install horizontal drainage panels as follows:

1. Coordinate placement with other drainage materials.
2. Lay perforated drainage pipe at inside edge of footings.

3. Place drainage panel over drainage pipe with core side up. Peel back fabric and wrap fabric around pipe. Locate top of core at bottom elevation of floor slab.
4. Butt additional panels against other installed panels. If panels have plastic flanges, overlap installed panel with flange.

I. All potential radon entry points sealed with polyurethane or equal (tooled-in). Typical locations include slab/wall joints, M/E/P penetrations and radon vent pipe penetrations in slabs/walls, etc.

3.6 PIPING INSTALLATION

A. Install piping beginning at points of system, true to grades and alignment indicated, with unbroken continuity of invert. Bed piping with full bearing in filtering material. Install gaskets, seals, sleeves, and couplings according to manufacturer's written instructions and other requirements indicated.

1. Lay perforated pipe with perforations down.

B. Use increasers, reducers and couplings made for different sizes or materials of pipes and fittings being connected. Reduction of pipe size in direction of flow is prohibited.

C. Install PVC piping according to ASTM D 2321.

D. PVC piping shall not be installed in plenum ceiling areas. Use plenum rated CPVC piping for those areas.

E. Vent pipes shall be labeled, minimum 4” diameter.

F. Vent pipe shall be routed through conditioned spaces or insulated.

G. Vent pipe discharge point shall be a minimum of 25 feet from air intake locations.

H. Isolate radon vent pipe from all building components to reduce vibration and noise transmission.

3.7 PIPE JOINT CONSTRUCTION

A. Join PVC pipe and fittings according to ASTM D 3034 with elastomeric seal gaskets according to ASTM D 2321.

B. Join perforated PVC pipe and fittings according to ASTM D 2729, with loose bell-and-spigot joints.

3.8 RADON EXHAUST FAN AND PRESSSURE SENSOR/ALARM SWITCH INSTALLATION

A. Install pressure sensor/alarm switch according to manufacturer’s best recommendations.

B. Do not install provide radon exhaust fans under Base Bid. If post-construction testing indicates fan or fans are required, fans will be provided through the contract change order process.

3.9 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

3.10 IDENTIFICATION

A. Materials and their installation are specified in Section 312000 “Earth Moving”. Arrange for installation of green warning tapes directly over piping.

1. Install PE warning tape or detectable warning tape over ferrous piping.
2. Install detectable warning tape over nonferrous piping and over edges of underground structures.

B. Provide identification for pressure switch alarm.

3.11 FIELD QUALITY CONTROL

A. Testing: After installing drainage course to top of piping, test drain piping with water to ensure free flow before backfilling. Remove obstructions, replace damaged components, and repeat test until results are satisfactory.

B. After completion of Radon Mitigation system installation, test for negative pressures and radon levels as described in Radon Subslab Depressurization Detail on Plumbing Drawings. Advise Owner, Architect, Engineer, and Construction Manager of test results. Use the services of a DEP-approved radon testing firm. A list of approved firms can be obtained on the State of Connecticut DEP website.

3.12 CLEANING

A. Clear interior of installed piping and structures of dirt and other superfluous material as work progresses. Maintain swab or drag in piping and pull past each joint as it is completed. Place plugs in ends of uncompleted pipe at end of each day or when work stops.

3.13 FAN INSTALLATION

A. Radon fans shall be installed before occupancy when the new building’s required radon tests produce results indicating unacceptable radon concentrations.

1. When radon test results are acceptable, it is not necessary to install a radon fan.
2. The fan shall be turned over to the Owner.

B. Vent stack pipe shall be supported above and below the place where the fan will be installed. The vent stack pipe shall support the fan.

C. A straight length of vent stack pipe, at least ten (10) pipe diameters long, should be directly below fan.

3.14 ELECTRICAL CONNECTION

A. Installation of wiring, conduit, and outlet are specified in Section 260519 “Low-Voltage Electrical Power Conductors and Cables”, Section 260533 “Raceways and Boxes for Electrical Systems”, and Section 262726 “Wiring Devices”.

B. An electrical junction box, with a receptacle, shall be installed within the range of a radon fan with a 6-foot long, typical, plugged cord.

3.15 FIELD QUALITY TESTING

A. Required radon tests, including initial tests, confirmatory initial radon tests, and post-mitigation tests shall be provided by an independent certified or licensed, or both, third party tester using test devices that meet U.S. EPA requirements and are listed by a recognized proficiency program.

B. Post-mitigation radon tests which are performed only on complete and operating radon systems, shall be initiated no sooner than 24 hours after the radon system began operation.

C. Building commissioning agent approval. Provide written notification to the GC and CxA that the following work has been completed in accordance with the contract documents, and that the equipment, systems, and sub-systems are operating as required.

1. Radon fans.

END OF SECTION 312113

SECTION 312316 - EXCAVATION, BACKFILL, AND SUBGRADE PREPARATION FOR PAVEMENT

PART 1 - GENERAL

1.1 RELATED SECTIONS AND DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 320000 – General Requirements

C. Section 312500 – Soil Erosion and Sediment Control

D. Section 310000 – Earthwork

E. Section 321216 – Asphaltic Concrete Paving

F. Section 321313 – Portland Cement Concrete Paving

G. Section 321613 – Curbs and Sidewalks

H. Contract Drawings and Documents

I. Geotechnical Engineering Investigation by Langan Engineering

1.2 SCOPE OF WORK

A. Excavation and backfilling to line, grade and configuration as shown in the Contract Documents and as described in these specifications for proposed asphaltic concrete, porous asphaltic concrete and Portland cement concrete pavement

B. Removal of unsuitable material beneath proposed paved areas.

C. Compacting fill materials in acceptable manner as specified herein.

1.3 REFERENCE STANDARDS

A. American Society for Testing and Materials (ASTM) - latest edition

1. D 422 Method for Particle Size Analysis of Soils
2. D 1557 Test for Moisture-Density Relations of Soils Using 10-lb (4.5 Kg) Hammer and 18-inch (457 mm) Drop (Modified Proctor)
3. D 2216 Laboratory Determination of Moisture content of Soil
4. D 2487 Classification of Soils for Engineering Purposes
5. D 2922 Tests for Density of Soil and Soil- Aggregate in Place by Nuclear Methods (Shallow Depth)
6. D 3017 Test for Moisture Content of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth)
7. D 4318 Test for Plastic Limit, Liquid Limit, and Plasticity Index of Soils

B. American Association of State Highway and Transportation Officials (AASHTO) - latest edition T 88 Mechanical Analysis of Soils

C. All applicable OSHA Regulations

D. Geotechnical Engineering Study, prepared by Langan.

1.4 QUALITY ASSURANCE

A. An Engineer, familiar with the requirements of the Subsurface Investigation and Contract Documents, selected and paid by the Owner (herein referenced to as “Owner’s Engineer”), may be retained to perform construction testing on filling operations and subgrade preparation as specified in section 31 00 00 and described herein. This inspection will not relieve the Contractor from his responsibility to complete the work in accordance with the plans and specifications.

1.5 SUBMITTALS

A. Submit gradation and certification of aggregate material that is to be used for review at least one week prior to use on-site.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Fill material from on-site as specified in Section 310800 of these Specifications and approved by the Owner’s Engineer.

B. Fill material from off-site as specified in Section 310800 of these specifications and approved by the Owner’s Engineer.

2.2 EQUIPMENT

A. Off-site materials shall be transported to project using well maintained and operating vehicles. Once on-site, transporting vehicles shall at no time endanger improvements by rutting, overloading, or pumping.

B. Excavation is to be performed using capable, well maintained equipment and methods acceptable to the Owner and the Contract Document requirements and schedule.

C. Compaction shall be performed using a 5-ton static drum weight, vibratory, smooth drum roller or as specified in the Geotechnical Report.

D. Smaller compaction equipment, together with thinner lifts may be required at areas of limited access or maneuverability. In such a case, the compaction equipment shall be a double drum walk-behind roller and shall be subject to the Owner’s Engineer approval.

PART 3 - EXECUTION

3.1 PREPARATION

A. Identify lines, elevations, and grades necessary to construct pavements, curb, sidewalk, and roadways as shown on Contract Documents.

B. Protect benchmarks, property corners, and other survey monuments from damage or displacement. If marker needs to be removed it shall be referenced by licensed land surveyor and replaced, as necessary, by same.

C. Locate and identify site utilities that have previously been installed and protect from damage.

D. Locate and identify existing utilities that are to remain and protect from damage.

E. Overexcavate and properly prepare areas of subgrade that are not capable of supporting proposed systems. These areas shall be stabilized by using aggregate material placed and compacted as specified.

3.2 EXCAVATION

A. Excavate roadways and pavement areas to line and grade as shown on the Contract Documents.

B. Areas of existing curb islands, sidewalks and existing pavement failure shall be excavated to competent soil to the satisfaction of the Owner's Engineer. Excavation of soft soils will be required in both fill and overlay areas to the satisfaction of the Owner's Engineer.

C. Perform excavation using capable, well maintained equipment and methods acceptable to Owner and local governing agencies.

D. Where existing grades are above proposed subgrade elevation, excavate materials in the pavement areas to the subgrade elevations necessary based on the finished pavement lines and grades as shown in the Contract Documents being careful not to overexcavate beyond the elevations needed. Replacement of fill in areas overexcavated by the Contractor without approval of the Owner's Engineer shall be replaced as compacted fill in accordance with these Specifications at no additional cost to the Owner.

E. Excavated on-site soils that meet the requirements of Section 31 00 00 of these Specifications and approved by the Owner's Engineer may be used as fill on-site.

F. Excavated on-site soils that are unsuitable for fill may be used in landscaped areas if approved by the Owner's Engineer. Otherwise this material shall be legally disposed of off-site at no additional cost to the Owner.

G. Unsuitable material, such as wood and any other deleterious materials determined to be unsuitable by the Owner's Engineer for use as on-site fill shall be legally disposed of off-site at no additional cost to the Owner.

3.3 SUBGRADE PREPARATION

A. Existing grades below areas of proposed pavement shall be leveled prior to fill placement or paving. The Contractor shall remove existing trees, roots, stumps, organic wetland soils, and top soil in these areas prior to placement of any fill and legally dispose of this material off-site at no additional cost to Owner.

B. The Contractor shall drain any standing or puddled water in low lying areas.

C. All existing grades below areas of proposed pavement shall be proofrolled and compacted with a minimum of 6 overlapping passes using the vibratory drum roller specified in part 2.02 of this Section prior to placement of pavement subbase. Existing areas which exhibit "pumping" or "rutting" under the action of the roller shall be removed and replaced with suitable fill material as specified in Section 310000 of these Specifications, or as directed by the Owner's Engineer.

D. Excavated on-site soils that are unsuitable for pavement subgrade below paved areas may be used in landscaped areas if approved by the Owner's Engineer. Otherwise this material shall be legally disposed of off-site at no additional cost to the Owner.

E. Unsuitable material, such as wood and any other deleterious materials determined to be unsuitable by the Owner's Engineer for use as on-site fill shall be legally disposed of off-site at no additional cost to the Owner.

3.4 SUBGRADE FILL PLACEMENT AND COMPACTION

A. Fill material shall not be placed in areas of standing water, in areas of frozen or thawing ground, or in areas that have not been approved by the Owner's Engineer.

B. Fill materials shall not be placed during unfavorable weather conditions. When work is interrupted by heavy rains, fill operations shall not be resumed until all saturated surficial soils are returned to a satisfactory moisture content as determined by the Owner's Engineer.

C. Maintain optimum moisture content of fill materials as specified herein to attain required compaction density.

D. Materials shall be tested in accordance with Section 310800.

E. If compaction requirements are not complied with at any time during construction process, remove and recompact deficient areas until proper compaction is obtained at no additional expense to Owner.

F. Fill lift surfaces shall be made smooth and free from ruts or indentations at the end of any work day when significant precipitation is forecast to prevent saturation of surficial fill material. Fill surfaces shall be graded to drain and sealed with a smooth drum roller at the completion of each work day.

G. Subgrade fill in paved areas shall be placed in uniform loose lifts and compacted in accordance with the Specifications.

H. Wet, saturated material shall be removed and replaced or scarified and air dried as necessary to achieve the field densities specified in this Section. Drying may be assisted by discing, harrowing, or pulverizing until moisture content is reduced.

I. Prior to paving, the subgrade shall be proofrolled with a minimum of 6 overlapping passes using a 5-ton static drum weight vibratory roller.

J. Remove areas of finished subgrade found to have insufficient compaction density of depth necessary and replace with suitable compacted fill as approved by the Owner or Owner's Engineer. Surface of subgrade after compaction shall be hard, uniform, smooth, stable, and true to grade and cross-section.

3.5 MAINTENANCE OF APPROVED SUBGRADE SURFACES

A. Finished subgrades shall be verified to ensure proper elevation and conditions for construction above subgrade.

B. Protect subgrade and binder course from excessive wheel loading during construction including concrete trucks, dump trucks, and other construction equipment.

C. Remove areas of finished subgrade found to have insufficient compaction density to depth necessary and replace in manner that will comply with compaction requirements by use of material that has been approved by the Owner's Engineer. Surface of subgrade after compaction shall be hard, uniform, smooth, stable, and true to grade and cross-section.

3.6 FINISH GRADING

A. Finish grading shall be in accordance with Section 310800.

3.7 QUALITY CONTROL

A. Compaction tests shall be performed by the Owner's Engineer as specified in Section 310800 together with the following for areas of proposed pavement:
   1. In cut areas, not less than one compaction test for every 15,000 square feet.
   2. In fill areas, one test for every 15,000 square feet for each lift.

B. Prior to paving, the finished subgrades shall be verified by the Contractor to ensure proper elevation and conditions for construction above subgrade.

C. Tolerances of 0.10 feet will be permitted. Any deviation from the design grades shall not result in changes in drainage areas or ponding. The Contractor shall provide engineering and field staking necessary for verification of lines, grades, and elevations.

END OF SECTION 312316

SECTION 312319 - DEWATERING

PART 1 – GENERAL

1.1 RELATED SECTIONS AND DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Comply with water disposal requirements of authorities having jurisdiction.

C. Section 31 08 00 – Earthwork

D. Section 31 23 33 – Trench Excavation and Backfill for Utilities

E. Geotechnical Engineering Study prepared by Langan.

1.2 SCOPE OF WORK

A. Construction dewatering.

B. Erosion and Sediment Control

1.3 PERFORMANCE CRITERIA

Design, provide, test, operate, monitor, and maintain a dewatering system of sufficient scope, size, and capacity to control ground-water flow into excavations and permit construction to proceed on dry, stable subgrade.

PART 2 - PRODUCTS

2.1 PRODUCTS

All pumps, hoses, electricity, erosion control measures needed.

PART 3 - EXECUTION

3.1 PREPARATION

A. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by earthwork operations.

B. Prevent surface water and subsurface or ground water from entering excavations, from ponding on prepared subgrades, and from flooding surrounding area.

C. Protect subgrade and foundation soils from softening and damage by rain or water accumulation.

D. Install dewatering system to ensure minimum interference with roads, streets, walks, and other adjacent occupied and used facilities.

E. Accomplish dewatering without damaging existing buildings adjacent to excavation.

3.2 DEWATERING

A. Install dewatering system using wells, well points, or similar methods complete with pump equipment, standby power and pumps, filter material gradation, valves, appurtenances, water disposal, and surface-water controls.

B. Before excavation below ground-water level, place system into operation to lower water to specified levels and then operate it continuously until drains, sewers, and structures have been constructed and fill materials have been placed, or until dewatering is no longer required.

C. Dispose of water removed from excavations in a manner to avoid endangering public health, property, and portions of work under construction or completed. Dispose of water in a manner to avoid inconvenience to others.

D. Utilize Best Management Practices to prevent the discharge of turbid water to receiving water systems. Provide sumps, sedimentation tanks, filtration, or other methods to control turbidity and prevent the discharge of sediment. Provide additional measures to control turbidity if required by the Engineer or by authorities having jurisdiction.

E. Promptly repair damages to adjacent facilities caused by dewatering operations.

END OF SECTION 312319

SECTION 312323 – EPS GEOFOAM FILL

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Expanded Polystyrene (EPS) Geofoam Fill and Soil Stabilization Material and accessories.

1.2 RELATED SECTIONS

A. Section 31 20 00 - Earth Moving.

B. Section 31 23 00 - Excavation and Fill.

1.3 REFERENCE STANDARDS

A. American Society for Testing and Materials – ASTM International (ASTM):

1. ASTM D6817/D6817M - Standard Specification for Rigid Cellular Polystyrene Geofoam.

2. ASTM D7180 - Standard Guide for Use of Expanded Polystyrene (EPS) Geofoam in Geotechnical Projects

3. ASTM C203 - Standard Test Methods for Breaking Load and Flexural Properties of Block-Type Thermal Insulation.

4. ASTM C303 - Standard Test Method for Dimensions and Density of Preformed Block and Board–Type Thermal Insulation.

5. ASTM C1338 - Standard Test Method for Determining Fungi Resistance of Insulation Materials and Facings.
    1. ASTM D1621 - Standard Test Method for Compressive Properties of Rigid Cellular Plastics.
    2. ASTM D1622 - Standard Test Method for Apparent Density of Rigid Cellular Plastics.
    3. ASTM D2863 - Standard Test Method for Measuring the Minimum Oxygen Concentration to Support Candle-Like Combustion of Plastics (Oxygen Index).
    4. ASTM D7557 - Standard Practice for Sampling of Expanded Polystyrene Geofoam Specimens.

1.4 SUBMITTALS

A. Submit under provisions of Section 01 30 00 – Administrative Requirements.

B. Product Data: Submit data on product characteristics, performance criteria, and product limitations.

C. Shop Drawings: Submit drawings with a profile and section view of proposed project, including individual layers of geofoam blocks in multiple-layer projects, indicating size, type, location, and orientation of geofoam blocks and related accessories.

D. Submit Manufacturer's Safety Data Sheet (SDS)

E. Test and Evaluation Reports: Submit independent third-party inspection agency's Evaluation Report(s) indicating compliance with ASTM D6817/D6817M and building codes for Geofoam.

F. Sustainable Design – Recycled Content and Regional Materials: Submit documentation of recycled content and manufacturing plant location relative to project location.

G. Qualification Data: Manufacturer's and Installer's Qualification Statements.

H. CT High Performance Building Requirements

1. Products containing materials with recycled content will be documented in accordance with the procedure outlined in the Project Documents.
2. Products containing materials manufactured and extracted, harvested or recovered within five hundred (500) miles will be documented in accordance with the procedure outlined in the Project Documents.
3. Metal fabrications (and/or steel/metal deck, steel tubing, framing, metal stairs, etc.) shall contain a minimum of thirty-five percent (35%) (combined) pre-consumer/post-consumer recycled content.

1.5 QUALITY ASSURANCE

A. Manufacturer Qualifications:
1. Company specializing in manufacturing products specified in this section, with not less than ten years documented experience.
2. Company maintains a current, third-party certified quality management system and environmental management system.

B. Installer Qualifications: Company specializing in performing work of the type and scope specified and with at least three years of documented experience.

C. Geofoam Block Qualifications:
1. Provide samples of Geofoam blocks upon initial project delivery in accordance with ASTM D7557 and test for compliance with Compressive Resistance minimum value at 1 percent deformation in accordance with ASTM D6817/D6817M requirements.
2. Mark Geofoam blocks to include individual block identifier, manufacturing date, and Type in compliance with ASTM D6817/D6817M.
3. Manufacturer shall maintain records of its quality assurance test results.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials with identification labels intact. The installer shall coordinate with the manufacturer's lead time requirements to prevent construction delays.

B. Provide temporary ballast or other restraint prior to and during installation. Geofoam is highly buoyant when submerged in water and adequate drainage and/or ballast shall be provided to resist potential uplift forces. Higher wind can also dislocate Geofoam blocks.

C. Comply with manufacturer's Safety Data Sheet (SDS), especially regarding:

1. Combustibility: Do not expose Geofoam to sparks, open flames, or any other sources of ignition nor to excessive heat of more than 75 degrees C (167 degrees F). Only store and use Geofoam in well-ventilated areas to prevent the build-up of flammable vapours. Prevent inhalation of any smoke, fumes, or dust from any burning or fabrication activities.

D. Incompatibility: Keep Geofoam protected from hydrocarbons (e.g. fuels, oils, tar, asphaltic mastic compounds), organic solvents (e.g. acetone/ketones, benzene, paint thinner, concrete curing compounds), ethers, esters, aldehydes and amines. Installer shall test Geofoam compatibility with mastics and other materials prior to use.

E. Ultra-Violet (UV) Light Exposure: Avoid prolonged exposure to UV light or direct sunlight that causes a layer of yellow dust to form on the surface of Geofoam. If required for adhesion or friction between blocks, remove the layer of yellow dust from the surface of any EPS Geofoam product as necessary, e.g. with broom or pressure washer.

F. Restrict equipment traffic that can impose contact pressures exceeding the allowable design stress of Geofoam. Protective materials such as sheathing or planks may be placed on the material to allow light rubber-tired equipment use.

G. Handling: Geofoam may be cut, drilled, sawn, rasped and otherwise handled similar to other construction materials, such as wood.

1.7 WARRANTY

A. Manufacturer shall provide a warranty that the products comply with their published specifications and are free from manufacturing defects.

PART 2 - PRODUCT

2.1 MANUFACTURERS

A. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
1. Airfoam Industries Ltd., located at 19402 56 Avenue, Surrey, British Columbia V3S 6K4, Canada; Phone: 800.663.8162 or 1.604.534.8626; Website: www.airfoam.com.
2. Insulfoam Manufacturing Facility, 2000 Summit View Drive, Smithfield, PA 15478, Phone: 855-207-0087, Fax: 855-246-9936

2.2 MATERIALS – EPS GEOFOAM

A. Provide Geofoam in locations and configurations as shown on the drawings, and to meet the following properties:

B. Type EPS15 per ASTM D6817:
1. Compressive resistance at 1% strain: 3.6 psi minimum; ASTM D1621.
2. Flexural strength: 25 ps] minimum; ASTM C203.
3. Density: 0.9 lb/ft3 minimum; ASTM D1622.
4. Buoyancy Force: 61.5 lbf/ft3 maximum.

2.3 MATERIALS - ADDITIONAL PROPERTIES FOR ALL EPS GEOFOAM TYPES

A. Limiting Oxygen Index: minimum 24% per ASTM D2863. Geofoam shall contain a polymeric (non-HBCD) fire retardant modifier

B. Surface Burning Characteristics per ASTM E84 (UL 723):
   1. Flame Spread Index ≤ 25.
   2. Smoke-Developed Index ≤450 up to 6" thick.

C. Combustibility: Geofoam is combustible. GHS Classification: Non-Hazardous

D. Maximum service temperature:
   1. Long-term exposure: 167°F.
   2. Intermittent exposure: 176°F.

E. EPS Geofoam does not contain Formaldehyde, CFCs, HCFCs, nor HFCs

F. Poisson's ratio v≈0.12 within the elastic range (approximate).

G. Coefficient of friction: μ≈0.5-0.7 along clean faces.

H. Coefficient of thermal expansion: 5•10-5/K to 7•10-5/K

I. Capillarity: none

J. Mold and Fungi: Geofoam does not promote mold and fungi growth per ASTM C1338.

K. Geofoam has no nutritional value for insects. To protect against insects/termites and water-vapor, place adequate physical barriers such as membranes around below-grade EPS. Where needed use adequate drainage to limit water absorption and buoyancy.

2.4 PERFORMANCE REQUIREMENTS

A. Exact dimensions of EPS Geofoam products to suit site conditions are determined by the installer in collaboration with the manufacturer and shall be approved by the engineer or architect of record.

B. EPS Geofoam standard blocks are 48" x 48" x 96"; full-size maxima are 48½" x 48½" x 194" within tolerances per ASTM D6817. Use of half blocks, smaller end pieces and thinner sheets may be used as needed to offset joints and complete the project per plans.

C. Geofoam blocks are factory-trimmed as necessary so surfaces are within tolerances of ASTM D6817; additional field cutting or trimming may be required and shall be completed on site by the installer with a saw or hot wire cutter.

D. Installer to correct damage to Geofoam as follows:
   1. Slight Damage: Less than 0.12 ft3 with no linear dimension greater than 1 ft [0.31 m] may be left in place.
   2. Moderate Damage: Less than 0.35 ft3 with no linear dimension greater than 3.3 ft3 shall be filled with sand.
   3. Geofoam blocks with excessive damage, such as exceeding the "Moderate Damage" category, shall be replaced with blocks that comply with dimensional requirements.

4. Geofoam blocks not in compliance with damage criteria may be cut to remove the excessive damage and the remaining undamaged portion of the block may be used within the fill, provided the undamaged portion of the block meets other requirements.

2.5 DESIGN CRITERIA

A. Select Geofoam for compressive resistance performance at 1 percent strain as required to resist live and dead load forces anticipated throughout the life of the structure.

B. Geofoam is thermal insulation that isolates the adjoining material from normal ground temperatures; consider freeze conditions and provide sufficient mass over Geofoam to avoid black ice conditions or other surface freeze events of supported structures.

C. Consider Geofoam's buoyancy forces and provide sufficient ballast on and/or drainage of Geofoam installations to prevent excessive uplift throughout the life of the structure.

D. Offset subsequent layers of Geofoam blocks 90 degrees in direction from previous layer, or stagger with sufficient overlaps, for increased fill-system stability.

E. For design and construction of highway embankments, refer to NCHRP Report 529 for additional information, http://www.trb.org/Publications/Blurbs/155003.aspx

F. For design of slope stability projects, refer to NCHRP Digest 380 for additional information, http://www.trb.org/Publications/Blurbs/168692.aspx

2.6 ACCESSORIES

A. Supply any materials, equipment, or other accessories required for the installation of Geofoam products.

B. Follow respective manufacturer's instructions for accessories and other items to be used in conjunction with Geofoam products.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine and measure installation areas and subgrade conditions to receive Geofoam.

B. If subgrade or substrate preparation are not within specifications and the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

C. Submit all site measurements and project documentation pertaining to the Geofoam installation to the manufacturer for preparation of shop drawings. Notify the manufacturer of any changes in site conditions which may affect the layout or amount of Geofoam required.

D. Verify manufacturer's shop drawings and dimensions of all Geofoam and related products. Submit final shop drawings to the engineer of record for approval.

3.2 PREPARATION

A. Excavate and prepare installation site in accordance with design and project documentation as well as the shop drawings. Clear debris and dewater site as needed.

B. Grade according to elevations shown on plans; the finish grade shall be smooth and free from holes or protrusions to be adequately level for the Geofoam installation.

C. Cover graded area to receive Geofoam blocks with sand or other drainage layer as specified on drawings and level within tolerances per the engineer of record.

D. Ensure that the site has adequate access and space to receive and unload shipments of Geofoam products, safely store Geofoam products, maneuver EPS Geofoam products to the installation area, and perform any site fabrication activities if required.

3.3 INSTALLATION

A. Install Geofoam blocks according to drawings and tolerances approved by the engineer of record.

B. Provide necessary space to accommodate utilities, drainage and structural systems and their installation.

C. Cut and fit geofoam tightly around projections and penetrations. Complete additional fabrication for the installation of Geofoam products as required.

D. If specified, install accessories (membranes, connector plates, etc.), ballast and related components as required.

3.4 PROTECTION

A. Protect Geofoam blocks from: (1) Organic solvents such as acetone, benzene, and paint thinner; (2) Petroleum based solvents such as gasoline and diesel fuel; (3) Open flames.

B. Protect installed products and surface finishes from damage during construction.

C. Properly secure Geofoam blocks as needed to prevent dislocation from water, wind, backfilling or other site activities.

D. Remove and legally dispose of construction debris from project site. Return unused Geofoam material to the manufacturer for recycling, if it is clean, dry, and not mixed with any other materials.

END OF SECTION 312323

SECTION 312333 - TRENCH EXCAVATION AND BACKFILL FOR UTILTIES

PART 1- GENERAL

1.1 RELATED SECTIONS AND DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 310800 – Earthwork

C. Section 312319 – Dewatering

D. Section 331116 – Site Water

E. Section 333000 – Site Sanitary Sewers

F. Section 334100 – Storm Sewer Systems

G. Section 337100 – Utilities

H. Construction Documents and Drawings

I. Local Utility Company Requirements

J. Geotechnical Engineering Study, prepared by Langan.

1.2 SCOPE OF WORK

A. Excavating trenches for the installation of utilities.

B. Backfilling trench with bedding material as specified and finish filling trenches with suitable material to proposed subgrade.

C. Compacting subgrade, bedding, and backfill materials in an acceptable manner.

D. Compliance with all environmental and health and safety regulations.

1.3 REFERENCE STANDARDS

A. American Society for Testing and Materials (ASTM) Latest Edition

1. D 422 Method for Particle Size Analysis
2. D 698 Test of Moisture Density Relations of Soils - Standard Proctor Method
3. D 1557 Test for Moisture-Density Relations of Soils Using 10-lb. (4.5 Kg)
4. Hammer and 18-inch (457 mm) Drop (Modified Proctor)
5. D 2216 Laboratory Determination of Moisture Content of Soil
6. D 2487 Classification of Soils for Engineering Purposes
7. D 2922 Tests for Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth)
8. D 3017 Test for Moisture Content of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth)
9. D 4318 Test for Plastic Limit, Liquid Limit, & Plasticity Index of Soils

B. American Association of State Highway and Transportation Officials (AASHTO) latest edition

1. T 88 Mechanical Analysis of Soils

1.4 QUALITY ASSURANCE

A. A Geotechnical Engineer, selected and paid by owner, may be retained to perform construction inspection and testing on backfilling operations. This inspection will not relieve the Contractor from his responsibility to complete the work in accordance with the plans and specifications.

1.5 SUBMITTALS

A. The Contractor shall contact all utility companies and identify any requirements. Contractor shall provide written confirmation of the status of all utility construction to the Owner at the time of the preconstruction conference or no later than 30 days following the project possession date.

B. Submit gradation and origin for each type of offsite fill and/or bedding material that is to be used in backfilling.

1.6 PROJECT RECORD DOCUMENTS

A. Accurately record actual locations of all subsurface utilities, structures and obstructions encountered.

B. Accurately record any as-built variation from the construction plans and specifications. The Contractor shall provide as-built drawings within 30 days of project completion.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Bedding Material: AASHTO No. 67 processed sand and gravel free from debris, clay lumps, organic, or other deleterious material, and complying with following gradation requirements:

1. U. S. Sieve: Size Percent Passing (by weight)

a. 1 Inch: 100
b. 3/4 Inch: 90-100
c. 3/8 Inch: 20-55
d. No. 4: 0-10
e. No. 8: 0-5

B. Backfill material as approved by the owner and/or the Geotechnical Engineer and utility provider.

PART 3 - EXECUTION

3.1 PREPARATION

A. Set all lines, elevations, and grades for utility and drainage system work and maintain for the duration of work. Provide careful maintenance of benchmarks, property corners, monuments, or other reference points.

B. Protect and maintain in operating condition, existing utilities encountered during utility installation. Repair any damage to surface or subsurface improvements shown on Drawings.

C. Verify location, size, elevation, and other pertinent data required to make connections between existing utilities and drainage systems, and proposed construction indicated on Drawings. Coordinate all building utility connection locations and elevations with architectural plans. Contractor shall comply with all local codes and regulations.

D. Install dewatering systems that will be required to construct the proposed utilities to the design elevations and using the methods described herein. Water pumped out of excavations shall be disposed of on-site, and will not be discharged directly to the city storm drainage system.

E. Over-excavate and properly prepare areas of subgrade that are not capable of supporting the proposed systems. These areas are to be stabilized by using acceptable backfill materials and/or additional bedding material placed and compacted as specified to the satisfaction of the Geotechnical Engineer.

3.2 EXCAVATION

A. Contact local utility companies before excavation begins. Dig trenches at proper width and depth for laying pipe, conduit, or cable and in accordance with utility company requirements. Cut trench banks for safety and remove stones as necessary to avoid point-bearing.

B. All trench excavation side walls shall be sloped, shored, sheeted, braced or otherwise supported by means of sufficient strength to protect the workmen within them in accordance with the applicable rules and regulations established for construction by the Department of Labor, Occupational Safety and Health Administration (OSHA), and by local ordinances. Lateral travel distance to an exit ladder or steps shall not be greater than 25 feet in trenches 4 feet or deeper.

C. Trench width requirements below the top of the pipe shall not be less than 12 inches nor more than 24 inches wider than the outside surface of any pipe or conduit that is to be installed. All other trench width requirements for pipe, conduit, or cable shall be the minimum practical width that will allow for proper compaction of trench backfill and satisfy safety and utility company regulations.

D. Accurately grade trench bottom to an elevation 6 inches below the pipe, as per bedding details in construction drawings. Provide uniform bearing and support for each section of pipe on bedding material at every point along the entire length, except where necessary to excavate for bell holes, pipe joints, or other required connections. Dig bell holes and depressions for joints after trench bottom has been graded. Dig no deeper, longer, or wider than needed to make the joint connection properly.

E. During excavation, stockpile excavated material suitable for backfilling in an orderly manner far enough from the trench to avoid overloading, slides, or cave-ins.

F. Remove excavated materials from the site which are not suitable for backfill.

G. Any abandoned structures, utilities or debris discovered during excavation shall be removed and disposed of.

H. Utility alignments have been designed to avoid expected obstructions wherever possible. If unanticipated significant obstructions are encountered during utility installation work immediately notify the Owner and Engineer.

I. Prevent surface water from flowing into trenches or other excavations by temporary grading or other methods, as required. Remove accumulated water in trenches or other excavations by pumping or other acceptable methods.

J. Utility installation shall meet the following minimum pipe installation depths, or applicable codes and ordinances, measured from finished grade or the paved surface.

1. Water Mains: 54-inch minimum to top of pipe barrel, or as required by the local utility company, whichever is deeper.
2. Sanitary Sewer: Elevations, and grades as indicated on Drawings.
3. Storm Sewer: Elevations, and grades as shown on Drawings.
4. Electrical Conduits: 30-inch minimum to top of secondary service conduits, 36" minimum to the top of primary service conduits, or as required by NEC 300-5, NEC 710-36 codes, or the local utility company requirements, whichever is deeper.
5. Telephone Conduits: 18-inch minimum to top of conduit, or as required by the local utility company, whichever is deeper.
6. Gas Mains and Service: 30-inch minimum to top of pipe, or as required by the local utility company, whichever is deeper.

3.3 LATERALS

A. All utilities intended to connect to services within any building will be extended to within 5 feet of the exterior face of building in the direction and elevation to connect at those geometrical locations indicated or inferred on the drawings. All utility ends will be plugged and marked by a 2" x 4" piece of wood extending from the utility invert to 4 feet above final grade.

3.4 PIPE BEDDING

A. Accurately cut trenches for pipe or conduit to designated line and grade 6 inches below the bottom of the pipe, to width as specified previously. Compact trench bottoms a minimum of 95% of the maximum dry density as determined by ASTM D1557, Modified Proctor Test.

B. Over-excavate wet or unstable soil, if encountered, from trench bottom as necessary to provide a suitable base for continuous and uniform bedding.

C. Place bedding material and compact in 6 inch loose lifts to obtain at least 95% of the maximum dry density. Accurately shape bedding material to conform to lower portion of pipe barrel. After pipe installation, place and compact bedding material as specified above in maximum 6 inch loose layers to the springline of the pipe.

3.5 BACKFILLING

A. After pipe or conduit has been installed, bedded and tested as necessary, backfill trench to finish grade in 8 inch thick loose lifts of approved fill soils, compacting and testing each lift as specified above.

B. Systematically backfill to allow maximum time for natural settlement. Do not backfill over porous, wet, frozen or spongy subgrade surfaces. Should these conditions exist, the areas should be removed, replaced and recompacted.

3.6 COMPACTION

A. Exercise proper caution when compacting immediately over top of pipes or conduits.

B. Maintain optimum moisture content of fill materials to attain required compaction density.

END OF SECTION 312333

SECTION 312500 - SOIL EROSION AND SEDIMENT CONTROL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 310000 - Earthwork

C. Contract Drawings and Documents

1.2 SCOPE OF WORK

A. Temporary and permanent soil erosion control systems.

1.3 REFERENCE STANDARDS

A. The Connecticut Department of Energy & Environmental Protection's (CTDEEP) Guidelines for Soil Erosion and Sediment Control, latest edition

1.4 QUALITY ASSURANCE

A. The Contractor shall carefully adhere to the construction sequence that is shown on the Contract Drawings.

B. The Contractor shall follow Soil Erosion and Sediment Control Notes that are shown on the Contract Drawings.

C. The Contractor shall make frequent inspection of temporary soil erosion controls and maintain them in working order until permanent soil erosion controls are established.

1.5 ENVIRONMENTAL REQUIREMENTS

A. The Contractor shall protect adjacent properties and water resources from soil erosion and sediment damage throughout construction.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Quick-growing grasses such as wheat, rye or oats in accordance with Contract Drawings.

B. Fencing for siltation control as specified on the Contract Drawings.

C. Fibrous blankets by North American Green SC150BN, biodegradable, or approved Equal.

D. Temporary mulches such as loose hay, straw, netting, wood, cellulose or agricultural silage.

E. Filter fabric as specified on the Contract Drawings, or approved equal.

F. Haybales free from invasive species

PART 3 - EXECUTION

3.1 PREPARATION

A. Review site conditions and sediment control plans.

B. Review the soil erosion and sediment control plans as they apply to current conditions. Any proposed deviation from the plans must be submitted to the Owner's Engineer in writing 72 hours prior to commencing that work.

3.2 SOIL EROSION CONTROL AND SLOPE PROTECTION IMPLEMENTATION

A. Place soil erosion control systems in accordance with the Contract Documents prior to any earthwork construction.

B. Limit the surface area of erodible earth material exposed by clearing and grubbing, excavation, borrow and embankment operations by following the construction phasing on the Soil Erosion and Sediment Control Plan.

C. The Contractor will be required to incorporate all permanent soil erosion control features into the project at the earliest practical time to minimize the need for temporary controls. Cut slopes shall be permanently seeded and mulched as the excavation proceeds to the extent considered desirable and practical. Equip catch basins with filter fabric inlet protection immediately upon construction.

D. The temporary soil erosion control systems installed by the Contractor shall be maintained as directed by the Owner's Engineer to control siltation at all times during the life of the contract. The Contractor must respond to any maintenance or additional work ordered by the Owner's Engineer within a 48 hour period.

E. Slopes that erode easily shall be temporarily seeded as the work progresses with quick growing grass grains of wheat, rye or oats unless otherwise specified in the Landscape Specifications. In areas where seeding is ineffective, as determined by the Owner's Engineer or other governing authorities, the Contractor shall provide fibrous netting as shown on Contract Drawings at no additional cost to the Owner.

F. All soil erosion control measures shall be maintained until all permanent improvements to the site are complete unless otherwise directed by the Owner's Engineer.

END OF SECTION 312500

SECTION 321216 – ASPHALTIC CONCRETE PAVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 312316 - Excavation, Backfill, and Subgrade Preparation for Pavement

C. Section 321613 - Curbs and Sidewalks

D. Section 321723 - Pavement Markings

E. Connecticut Department of Transportation Standard Specifications.

F. Contract Drawings and Documents

1.2 SCOPE OF WORK

A. Preparation and placement of asphaltic concrete binder course.

B. Preparation and placement of asphaltic concrete surface course.

1.3 REFERENCE STANDARDS

A. The Asphalt Institute (AI) latest edition

1. MS 2 Mix Design Methods for Asphaltic Concrete and Other Hot Mix Types
2. MS 3 Asphalt Plant Manual
3. MS 19 Basic Asphalt Emulsion Manual

3. D 1559 Resistance to Plastic Flow of Bituminous Mixtures Using Marshall Apparatus

D. American Association of State Highway and Transportation Officials (AASHTO) latest edition

1. M 117 Mineral Filler "Bitumen-Saturated Cotton Fabrics Used in Roofing and Waterproofing"
2. M 140 Tack Coat "Emulsified Asphalt"
3. M 208 Tack Coat "Cationic Emulsified Asphalt"
4. M 226 Viscosity Graded Asphalt Cement
5. T 245 Marshall Mix Design

E. Connecticut Department of Transportation Standard Specifications, latest edition.

F. Town of Enfield Standards

1.4 QUALITY ASSURANCE

A. At the discretion of the Owner, an Engineer, selected and paid by Owner (herein referenced to as “Owner’s Engineer”, may be retained to perform construction testing of in-place asphaltic concrete courses for compliance with requirements for thickness, compaction, and surface smoothness. Asphaltic surface and base courses shall be randomly cored at minimum rate of 1 core per 20,000 sq. ft of paving. However, no less than 3 cores in light duty areas and 3 cores in heavy duty areas shall be obtained. Coring holes shall be immediately filled with full-depth asphaltic concrete. Asphaltic concrete pavement samples shall be tested for conformance with mix design.

B. Establish and maintain required lines and elevations.

C. In-place compacted thickness shall not be less than thickness specified on Contract Documents. Areas of deficient paving thickness shall receive tack coat and minimum 1-in. overlay; or shall be removed and replaced to proper thickness, at discretion of Owner; until specified thickness of course is met or exceeded at no additional expense to Owner.

D. Testing shall be performed on finished surface of each asphalt concrete course for smoothness, using 10-ft straightedge applied parallel with, and at right angles to centerline of paved area. Results of tests shall be made available to Owner upon request. Surfaces will not be acceptable if the following 10-ft straightedge tolerances for smoothness are exceeded:

1. Base Course Surface: 1/4-inch
2. Wearing Course Surface: 3/16-inch

E. Check surface areas at intervals necessary to eliminate ponding areas. Remove and replace unacceptable paving as directed by Owner.

F. Field density test for in-place materials shall be performed by examination of field cores in accordance with one of following standards:

1. Bulk specific gravity of paraffin-coated specimens: ASTM D 1188.
2. Bulk specific gravity using saturated surface-dry specimens: ASTM D 2726.

G. Rate of testing shall be 1 core per 20,000 sq. ft of pavement, with minimum of 3 cores. Cores shall be cut from areas representative of project. Areas of insufficient compaction shall be delineated, removed, and replaced in compliance with Specifications at no additional expense to Owner.

1.5 SUBMITTALS

A. Design Mix: Before any asphaltic concrete paving is constructed, submit actual design mix to the Owner’s Engineer for review and/or approval. Design mix submittal shall follow the format as indicated in the Asphalt Institute manual MS-2, Marshall Stability Method; and shall include the type/name of the mix, gradation analysis, grade of asphalt cement used, Marshall Stability (lbs.), flow, effective asphalt content (percent), and direct references to the Standard Specifications sections for each material. The design shall be for a mixture listed in the current edition of the Standard Specifications. Mix design over three (3) years old will not be accepted by the Owner’s Engineer.

B. Material Certificates: Submit materials certificate to the Owner's Engineer which is signed by material producer and Contractor, certifying that materials comply with, or exceed, the requirements herein.

C. Testing Results: Results of concrete, steel and paving tests performed by Contractor's testing laboratory shall be submitted to Owner's Engineer in a timely manner.

D. The results of Marshall Tests for the day of installation shall be submitted to the Field Engineer with the first truck delivery each day of asphalt placement.

1.6 PROJECT CONDITIONS

A. Weather Limitations:

1. Apply prime and tack coats when ambient temperature is above 40 degrees Fahrenheit, and when temperature has been above 35 degrees Fahrenheit for 12 hours immediately prior to application. Do not apply when base is wet, contains excess moisture, or during rain.
2. Construct asphaltic concrete paving when atmospheric temperature is above 40 degrees Fahrenheit.

B. Maintain access for vehicular and pedestrian traffic as required for other construction activities. Utilize temporary striping, flagmen, barricades, warning signs, and warning lights as required.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Provide asphalt-aggregate mixture to meet Connecticut Department of Transportation standards.

B. Asphalt Cement: Comply with AASHTO M 226; Table 2 AC-10, AC-20, or AC-30, viscosity grade, depending on local mean annual air temperature. See chart below:

1. Temperature Condition: Asphalt Grades

a. Cold, mean annual air temperature at 45 degrees Fahrenheit or lower: AC-10, 85/100 pen.
b. Warm, mean annual air temperature between 45 degrees Fahrenheit and 75 degrees Fahrenheit: AC-20, 60/70 pen.
c. Hot, mean annual air temperature at 75 degrees Fahrenheit or higher: AC-30

C. Tack Coat: Emulsified asphalt; AASHTO M 140 or AASHTO M 208, SS-1h, CSS-1, or CSS-1h, diluted with 1 part water to 1 part emulsified asphalt.

D. Mineral Filler: Rock or slag dust, hydraulic cement, or other inert material complying with AASHTO M 117, if recommended by state highway department specifications.

E. Asphalt-Aggregate Mixture: Unless otherwise noted on Contract Documents, Design Mix shall have minimum stability based on 50-blow Marshall complying with ASTM D 1559 of 1000 lb with flow between 8 and 16. The Design Mix shall be within sieve analysis and bitumen ranges specified below unless approved otherwise by Owner prior to placement.

1. Sieve Analysis of Mix

   a. Square Sieve: Total Percent Passing

      1/2": 100%
      3/8": 80 - 100%
      #4: 50 - 75%
      #8: 30 - 60%
      #16: 20 - 45%
      #30: 15 - 35%
      #50: 10 - 30%
      #200: 4 - 10%

   b. Percent bitumen by weight of total mix: 5.0 - 8.5 percent
   c. Air voids: 3 - 6 percent
   d. Aggregate voids filled with asphalt cement: 70 - 82 percent
   e. Allowable variance of bitumen by weight of total mix = 0.4 percent

2.2 EQUIPMENT

F. Maintain equipment in satisfactory operating condition and correct breakdowns in manner that will not delay or be detrimental to progress of paving operations.

PART 3 - EXECUTION

3.1 PREPARATION

A. Proof roll prepared base material surface to check for unstable areas. Paving work shall begin only after unsuitable areas have been corrected and are ready to receive paving.

B. Remove loose material from compacted base material surface immediately before applying prime coat.

3.2 APPLICATIONS

C. Tack Coat:

1. Apply to contact surfaces of previously constructed asphaltic concrete base courses or Portland cement concrete and surfaces abutting or projecting into asphaltic concrete or into asphaltic concrete pavement.
2. Apply tack coat to asphaltic concrete base course. Apply emulsified asphalt tack coat between each lift or layer of full depth asphaltic concrete bases and on surface of bases where asphaltic concrete paving will be constructed.
3. Apply emulsified asphalt tack coat in accordance with Connecticut Department of Transportation Standard Specifications.
4. Apply at minimum rate of 0.05 gal per sq. yd of surface.
5. Allow to dry until at proper condition to receive paving.

3.3 ASPHALTIC CONCRETE PLACEMENT

D. Place asphaltic concrete mixture on completed compacted subgrade surface, spread, and strike off. Spread mixture at following minimum temperatures:

1. Ambient temperature between 40 degrees Fahrenheit and 50 degrees Fahrenheit, mixture temp. = 285 degrees Fahrenheit
2. Ambient temperature between 50 degrees Fahrenheit and 60 degrees Fahrenheit, mixture temp. = 280 degrees Fahrenheit
3. Ambient temperature higher than 60 degrees Fahrenheit, mixture temp. = 275 degrees Fahrenheit

E. Whenever possible, pavement shall be spread by finishing machine; however, inaccessible or irregular areas may be placed by hand methods. Hot mixture shall be spread uniformly to required depth with hot shovels and rakes. After spreading, hot mixture shall be carefully smoothed to remove segregated course aggregate and rake marks. Rakes and lutes used for hand spreading shall be type designed for use on asphalt mixtures. Loads shall not be dumped faster that they can be properly spread. Workers shall not stand on loose mixture while spreading.

F. Paving Machine Placement: Apply successive lifts of asphaltic concrete in transverse directions with surface course placed parallel to flow of traffic. Place in typical strips not less than 10-ft wide.

G. Joints: Make joints between old and new pavements, or between successive days and work in manner that will provide continuous bond between adjoining work. Construction joints shall have same texture, density, and smoothness as other sections of asphaltic concrete course. Clean contact surfaces of joints and apply tack coat.

3.4 ROLLING AND COMPACTION

H. Mixture, after being spread, shall be thoroughly compacted by rolling as soon as it will bear the weight of rollers without undue displacement. Number, weight, types of rollers, and sequences of rolling operations shall be such that required density and surface are consistently attained while mixture is in workable condition.

I. The bituminous concrete pavement shall have a minimum thickness as specified on the Contract Documents and should be compacted to a minimum of 96% of the maximum unit weight as determined by the Marshall Mix Design Procedures in accordance with ASTM D-1559.

J. Compact mixture with hot hand tampers or vibrating plate compactors in areas inaccessible to rollers.

K. Breakdown Rolling: Accomplish breakdown or initial rolling immediately following rolling of joints and outside edge. Check surface after breakdown rolling and repair displaced areas by loosening and filling with hot material.

L. Second Rolling: Follow breakdown rolling as soon as possible, while mixture is hot. Continue second rolling until mixture has been thoroughly compacted.

M. Finish Rolling: Perform finish rolling while mixture is still warm enough for removal of roller marks. Continue rolling until roller marks are eliminated and course has attained maximum density.

N. Patching: Remove and replace paving areas mixed with foreign materials and defective areas. Cut out such areas and fill with fresh, hot asphaltic concrete. Compact by rolling to maximum surface density and smoothness.

O. Protection: After final rolling, do not permit vehicular traffic on pavement until it has cooled and hardened. Erect barricades to protect paving from traffic until mixture has cooled enough not to become marked.

P. Scheduling: After complete placement of the base course the contractor may be required to re-mobilize for the placement of the top course. This schedule requirement will be based on the building progress, and fully at the discretion of the Owner's Engineer.

END OF SECTION 321216

SECTION 321313 – PORTLAND CEMENT CONCRETE PAVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 310000 - Earthwork

C. Section 312316 - Excavation, Backfill, and Subgrade Preparation for Pavement

D. Connecticut Department of Transportation Standard Specifications, latest edition.

E. Contract Drawings and Documents

1.2 SCOPE OF WORK

A. Preparation and placement of Portland cement concrete sidewalk, pad areas, and other concrete areas identified on Contract Documents

1.3 REFERENCE STANDARDS

A. American Concrete Institute (ACI) latest edition

1. 301 Specifications for Structural Concrete for Buildings
2. 304R Guide for Measuring Mixing, Transporting and Placing Concrete
3. 308 Standard Practice for Curing Concrete

B. American Society for Testing and Materials (ASTM) latest edition

1. A 185 Steel Welded Wire Fabric, Plain for Concrete Reinforcement
2. C497 Steel Welded Wire Fabric, Deformed, for Concrete Reinforcement
3. A615 Deformed and Plain Billet-Steel for Concrete Reinforcement
4. C33 Concrete Aggregates
5. C 94 Ready-Mixed Concrete
6. C 150 Portland Cement
7. C 260 Air-Entraining Admixtures for Concrete
8. D 309 Liquid Membrane-Forming Compounds for Curing Concrete
9. C494 Chemical Admixtures for Concrete
10. C1751 Performed Expansion Joint Fillers for Concrete Paving and Structural Construction (Nonextruding and Resilient Bituminous Types)
11. FS TT C 800 - Curing Compound, Concrete, for New and Existing Surfaces.

C. Connecticut Department of Transportation Standard Specification, latest edition.

1.4 QUALITY ASSURANCE

A. The Contractor shall pay for the services of a test laboratory, approved by the Engineer, for concrete inspection. The test laboratory shall have at least one Professional Engineer on staff and shall submit proof that any concrete inspectors used on the project shall have successfully completed the ACI course in Concrete Inspection within the past year.

B. Establish and maintain required lines and elevations.

C. Check surface areas at intervals necessary to eliminate ponding areas. Remove and replace unacceptable work as directed by Owner's Engineer.

D. Sweep concrete pavement and wash free of stains, discolorations, dirt, and other foreign material just prior to final inspection.

E. Protect concrete from damage until acceptance of work. Exclude traffic from pavement for at least 14 days after placement. When construction traffic is permitted, maintain pavement as clean as possible by removing surface stains and spillage of material.

1.5 SUBMITTALS

A. Submit materials certificate to the Owner's Engineer, which is signed by materials producer and Contractor, certifying that materials comply with, or exceed, requirements specified herein.

B. The Contractor shall retain an independent testing agency to perform the required tests. The Contractor shall provide any necessary assistance to the testing agency and provide the testing agency with the intended construction schedule at least one week prior to the start of construction.

C. Submit concrete mix design to the Owner's Engineer for review at least 14 days prior to use.

D. Testing results of concrete, steel and paving tests performed by Contractor's testing laboratory shall be submitted to Owner's Engineer in a timely manner.

1.6 PROJECT CONDITIONS

A. Maintain access for vehicular and pedestrian traffic as required for other construction activities. Utilize temporary striping, flagmen, barricades, warning signs, and warning lights as required.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Forms: Steel, wood, or other suitable material of size and strength to resist movement during concrete placement and to retain horizontal and vertical alignment until removal. Use straight forms, free of distortion and defects. Use flexible spring steel forms or laminated boards to form radius bends as required. Forms shall be of depth equal to depth of curbing or sidewalk, and so designed as to permit secure fastening together at tops. Coat forms with nonstaining type of coating that will not discolor or deface surface of concrete.

B. Welded Wire Mesh: Welded plain cold-drawn steel wire fabric, ASTM A 185.

C. Reinforcing Bars: Deformed steel bars, ASTM A 615, Grade 60.

D. Concrete materials: Comply with applicable requirements for concrete materials, admixtures, bonding materials, curing materials and others as required. Concrete shall have a minimum 28-day compressive strength of 4000 psi.

E. Joint Sealers: Resilient premolded bituminous impregnated fiberboard units complying with ASTM D 1751 FS HH-F-341, Type II, Class A.

F. Welded wire fabric as indicated on Contract Documents.

2.2 MIX DESIGN AND TESTING

A. Concrete mix design and testing shall comply with requirements of ACI.

B. Design mix to produce normal weight concrete consisting of Portland cement, aggregate, water reducing admixture, air entraining admixture, and water to produce following properties:
1. Compressive Strength: 4,500 psi, minimum at 28 days, unless otherwise indicated on Contract Documents.
2. Slump Range: 4-inches +/- 1-inch at time of placement
3. Air Entrainment: 5 to 7 percent

PART 3 - EXECUTION

3.1 PREPARATION

A. Proof-roll prepared base material surface to check for unstable areas. Paving work shall begin only after unsuitable areas have been corrected and are ready to receive paving. Compaction testing for the base material shall be completed prior to the placement of the paving.

B. Remove loose material from compacted base material surface to produce firm, smooth surface immediately before placing concrete.

3.2 INSTALLATION

A. Form Construction

1. Set forms to require grades and lines, rigidly braced and secured.
2. Install sufficient quantity of forms to allow continuance of work and so that forms remain in place minimum of 24 hours after concrete placement.
3. Check completed formwork for grade and alignment to following tolerances:
   a. Top of forms not more than 1/8-inch in 10-ft
   b. Vertical face on longitudinal axis, not more than
   c. 1/4-inch in 10 ft
4. Clean forms after each use and coat with form release agent as often as required to ensure separation from concrete without damage.
5. Install 6-inch x 6-inch welded wire fabric as indicated on Contract Documents. Support wire on metal wire chairs to ensure that wire stays mid-depth of sidewalk section during concrete pour.

B. Reinforcement: Locate, place and support reinforcement in accordance with Contract Documents and ACI.

3.3 CONCRETE PLACEMENT

A. Place concrete in accordance with requirements of Connecticut Department of Transportation Standard Specifications and ACI requirements.

B. Do not place concrete until base material and forms have been checked for line and grade. Moisten base material if required to provide uniform dampened condition at time concrete is placed. Concrete shall not be placed around manholes or other structures until they are at required finish elevation and alignment.

C. Deposit and spread concrete in continuous operation between transverse joints, as far as possible. If interrupted for more than 1/2 hour, place construction joint. Automatic machine may be used for curb and gutter placement at Contractor's option. Machine placement must produce curbs and gutters to required cross-section, lines, grades, finish and jointing as specified for formed concrete. If results are not acceptable, replace with formed concrete as specified.

D. Concrete placement in poor weather conditions shall be subject to limitation of ACI.

E. Joint Construction: Construct expansion, weakened-plane control or contraction, and construction joints straight with face perpendicular to concrete surface. Construct traverse joints perpendicular to centerline, unless otherwise detailed.
   1. Weakened-Plane Control or Contraction Joints: Provide joints per the drawings. Construct control joints for depth equal to at least 1/4 concrete thickness, as follows:
   2. Form tooled joints in fresh concrete by grooving top with recommended tool and finishing edge with jointer.
   3. Form sawed joints using powered saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut joints into hardened concrete as soon as surface will not be torn, abraded, or otherwise damaged by cutting action.
   4. Construction Joints: Place concrete joints at end of placements and at locations where placement operations are stopped for period of more than 1/2 hour, except where such placements terminate at expansion joints. Construct joints using standard metal keyway-section forms.
   5. Expansion Joints: Locate expansion joints per the drawings. Provide premolded joint filler for expansion joints abutting concrete curbs, catch basins, manholes, inlets, structures, sidewalks, and other fixed objects.

F. Joint Fillers: Extend joint fillers full width and depth of joint, and not less than 1/2-inch or more than 1-inch below finished surface where joint sealer is indicated. Furnish joint fillers in one-piece lengths for full width being placed, wherever possible. Where more than one length is required, lace or clip joint filler sections together.

3.4 CONCRETING FINISHING

A. After striking off and consolidating concrete, smooth surface by screening and floating. Adjust floating to compact surface and produce uniform texture. After floating, test surface for trueness with 10-ft straightedge. Distribute concrete as required to remove surface irregularities, and refloat repaired areas to provide continuous smooth finish.

B. Work edges of sidewalks, gutters, back top edge of curb, and formed joints with edging tool, rounding edge to 1/2-inch radius. After completion of floating and trowelling, when excess moisture or surface sheen has disappeared, complete surface finishing, as follows:

C. Paving: provide course, nonslip finish by scoring surface with stiff-bristled broom perpendicular to flow of traffic.

D. Curbs and sidewalks: Broom finish by drawing fine haired broom across surface perpendicular to line of traffic. Repeat operation as necessary to produce a fine line texture.

E. After form removal, clean ends of joints and point up minor honeycombed areas. Remove and replace areas or sections with major defects, as directed by Owner's Engineer.

F. Protect and cure finished concrete paving using acceptable moist curing methods, more particularly described in "water curing" section of ACI 308.

3.5 BACKFILL

A. After the concrete has set sufficiently, the spaces in front and back of the curb or sidewalk shall be refilled to the required elevation with suitable material in accordance with Section 310000, which shall be compacted until firm and solid and neatly graded.

3.6 CLEANING AND ADJUSTING

A. Sweep concrete pavement and wash free of stains, discolorations, dirt, and other foreign material just prior to final inspection.

B. Protect concrete from damage until acceptance of work. Exclude traffic from pavement for at least 14 days after placement. When construction traffic is permitted, maintain pavement as clean as possible by removing surface stains and spillage of materials.

END OF SECTION 321313

SECTION 321613 – CONCRETE CURB AND SIDEWALKS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 310800 - Earthwork.

C. Section 312316 - Excavation, Backfill and Subgrade Preparation for Pavement.

D. Section 321313 - Portland Cement Concrete Paving

E. Connecticut Department of Transportation Standard Specifications, Latest Edition.

F. Contract Drawing and Documents

1.2 SCOPE OF WORK

A. Preparation and Placement of Concrete Sidewalk

B. Preparation and Placement of Concrete Curb

1.3 REFERENCE STANDARDS

A. American Concrete Institute (ACI) latest edition

1. 301 Specifications for Structural Concrete for Buildings
2. 304R Guide for Measuring Mixing, Transporting and Placing Concrete
3. 308 Standard Practice for Curing Concrete

B. American Society for Testing and Materials (ASTM) latest edition

1. A 185 Steel Welded Wire Fabric, Plain for Concrete Reinforcement
2. C497 Steel Welded Wire Fabric, Deformed, for Concrete Reinforcement
3. A615 Deformed and Plain Billet-Steel for Concrete Reinforcement
4. C33 Concrete Aggregates
5. C 94 Ready-Mixed Concrete
6. C 150 Portland Cement
7. C 260 Air-Entraining Admixtures for Concrete
8. D 309 Liquid Membrane-Forming Compounds for Curing Concrete
9. C494 Chemical Admixtures for Concrete
10. C1751 Performed Expansion Joint Fillers for Concrete Paving and Structural Construction (Nonextruding and Resilient Bituminous Types)
11. FS TT C 800 - Curing Compound, Concrete, for New and Existing Surfaces.

C. Connecticut Department of Transportation Standard Specifications, latest edition.

D. Town of Enfield Standard Requirements

1.4 QUALITY ASSURANCE

A. The Contractor shall warrant that concrete curb and base is 4,500 psi unless otherwise noted on the Construction Documents.

B. Establish and maintain required lines and elevations.

C. Check surface areas at intervals necessary to eliminate ponding areas. Remove and replace unacceptable work as directed by Owner.

D. Sweep concrete pavement and wash free of stains, discolorations, dirt, and other foreign material just prior to final inspection.

E. Protect concrete from damage until acceptance of work. Exclude traffic from pavement for at least 30 days after placement. When construction traffic is permitted, maintain pavement as clean as possible by removing surface stains and spillage of material.

1.5 SUBMITTALS

A. Submit concrete mix design to the Owner's Engineer for review at least 14 days prior to use.

1.6 PROJECT CONDITIONS

A. Contractor shall maintain access for vehicular and pedestrian traffic as required for other construction activities. Utilize temporary striping, flagmen, barricades, warning signs, and warning lights as required.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Forms: Steel, wood, or other suitable material of size and strength to resist movement during concrete placement and to retain horizontal and vertical alignment until removal. Use straight forms, free of distortion and defects. Use flexible spring steel forms or laminated boards to form radius bends as required. The forms shall be of a depth equal to the depth of curbing or sidewalk, and so designed as to permit secure fastening together at the tops. Coat forms with non-staining type coating that will not discolor or deface surface of concrete.

B. Concrete Materials: Comply with requirements of Connecticut Department of Transportation Standard Specifications and applicable Section 321613 for concrete materials, admixtures, bonding materials, curing materials and others as required. Concrete shall have a minimum 28-day compressive strength of 4,500 psi.

C. Joint Fillers: Resilient pre-molded bituminous impregnated fiberboard units complying with AASHTO M 213.

D. Welded wire fabric as indicated on Contract Documents.

2.2 MIX DESIGN AND TESTING

A. Concrete mix design and testing shall comply with requirements of ACI.

B. Design mix to produce normal weight concrete consisting of Portland cement, aggregate, water-reducing admixture, air-entraining admixture, and water to produce the following properties:

1. Compressive Strength: 4,500 psi, minimum at 28 days, unless otherwise indicated on the Contract Drawings.
2. Slump Range: 3-inches +/- 1-inch at time of placement
3. Air Entrainment: 5 to 7 percent

PART 3 - EXECUTION

3.1 PREPARATION

A. Proof-roll prepared base material surface to check for unstable areas. The paving work shall begin after any unsuitable areas have been corrected and are ready to receive paving. Compaction testing for the base material shall be completed prior to the placement of the paving.

B. Surface Preparation: Remove loose material from compacted base material surface to produce a firm, smooth surface immediately before placing concrete.

3.2 INSTALLATION

A. Form Construction

1. Set forms to required grades and lines, rigidly braced and secured.
2. Install sufficient quantity of forms to allow continuance of work and so that forms remain in place a minimum of 24 hours after concrete placement.
3. Check completed formwork for grade and alignment to following tolerances:
4. Top of forms not more than 1/8-inch in 10-ft.
5. Vertical face on longitude axis, not more than 1/4-inch in 10-ft.
6. Clean forms after each use, and coat with form release agent as often as required to ensure separation from concrete without damage.
7. Install 6-inch x 6-inch welded wire fabric as indicated on Contract Documents. Support wire on metal wire chairs to ensure that wire stays mid-depth of sidewalk section during concrete pour.

B. Concrete Placement

1. Comply with applicable requirements of ACI and Architectural Specifications.
2. Do not place concrete until base material and forms have been checked for line and grade. Moisten base material if required to provide uniform dampened condition at time concrete is placed. Concrete shall not be placed around manholes or other structures until they are at the required finish elevation and alignment.
3. Place concrete using methods which prevent segregation of mix. Consolidate concrete along face of forms and adjacent to transverse joints with internal vibrator. Keep vibrator away from joint assemblies, reinforcement, or side forms. Consolidate with care to prevent dislocation of dowels, and joint devices.
4. Deposit and spread concrete in continuous operation between transverse joints, as far as possible. If interrupted for more than 2 hours, place construction joint. Automatic machine may be used for curb and gutter placement at Contractor's option. Machine placement must produce curbs and gutters to required cross section, lines, grades, finish, and jointing as specified for formed concrete. If results are not acceptable, replace with formed concrete as specified.
5. Concrete placement shall be conducted in accordance with related ACI recommended procedures.

C. Joint Construction

1. Transverse Expansion Joints: Transverse expansion joint in sidewalk shall have the filler cut to the exact cross section of the sidewalk. The joints shall be similar to the type of expansion joint used in the adjacent pavement. Joint spacing as specified on the plans.
2. Joint Fillers: Extend joint fillers full-width and depth of joint, and not less than 1-inch or more than 2-inches below finished surface where joint sealer is indicated. Furnish joint fillers in one-piece lengths for full width being placed, wherever possible. Where more than one length is required, lace or clip joint filler sections together.
3. Joint Sealants: All joints shall be sealed with approved exterior pavement joint sealants and shall be installed per manufacturer's recommendations.

D. Concrete Finishing

1. After striking off and consolidating concrete, smooth surface by screening and floating. Adjust floating to compact surface and produce uniform texture. After floating, test surface for trueness with 10-ft straightedge. Distribute concrete as required to remove surface irregularities, and refloat repaired areas to provide continuous smooth finish.
2. Work edges of sidewalks, back top edge of integral curb, and formed joints with an edging took, and round to 2-inch radius. Eliminate tool marks on concrete surface. After completion of floating and troweling when excess moisture or surface sheen has disappeared, complete surface finishing as follows:
3. Inclined Slab Surfaces: Provide coarse, non-slip finish by scoring surface with stiff-bristled broom perpendicular to line of traffic.
4. Curbs, gutters, and sidewalks: Broom Finish by drawing fine-hair broom across surface perpendicular to line of traffic. Repeat operation as necessary to produce a fine line texture.

E. Do not remove forms for 24 hours after concrete has been placed. After form removal, clean ends of joints and point up any minor honeycombed areas. Remove and replace areas or sections with major defects, as directed.

F. Protect and cure finished concrete paving using acceptable moist-curing methods, more particularly described in the "water-curing" section of ACI 308-81.

3.3 BACKFILL

A. After the concrete has set sufficiently, the spaces in front and back of the curb and gutter or sidewalk shall be refilled to the required elevation with suitable material in accordance with Section 31 00 00, which shall be compacted until firm and solid and neatly graded.

3.4 CLEANING AND ADJUSTING

A. Sweep concrete pavement and wash free of stains, discolorations, dirt, and other foreign material just prior to final inspection.

B. Protect concrete from damage until acceptance of work. Exclude traffic from pavement for at least 14 days after placement. When construction traffic is permitted, maintain pavement as clean as possible by removing surface stains and spillage of materials.

END OF SECTION 321613

SECTION 321723 – PAVEMENT MARKINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Contract Drawings and Documents

1.2 SCOPE OF WORK

A. Preparation and application of painted pavement markings.

1.3 REFERENCE STANDARDS

A. Connecticut Department of Transportation Standard Specifications, latest edition.

B. Manual on Uniform Traffic Control Devices, latest edition.

1.4 PROJECT CONDITIONS

A. Maintain access for vehicular and pedestrian traffic as required for other construction activities. Utilize flagmen, barricades, warning signs, and warning lights as required.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Paint shall be non bleeding, quick drying, alkyd petroleum base paint suitable for traffic bearing surface and shall be mixed in accordance with manufacturer's instructions before application.

B. Provide ready-mixed one component waterborne traffic line paint. Materials shall be Sherwin-Williams “Setfast” paint or approved equal.

1. Colors:
   Yellow: TM2161
   White: TM2160
   Blue: TM2133
   Black: TM2135

C. Preformed pavement markings shall be Stamark Intersection Grade Tape Series A420 as manufactured by 3M Traffic Control Materials Division, or approved equal.

PART 3 - EXECUTION

3.1 PREPARATION

A. Sweep and clean surface to eliminate loose material and dust.

B. Where existing pavement markings are indicated on Contract Documents to be removed or would interfere with adhesion of new paint, motorized abrasive device shall be used to remove markings. Equipment employed shall not damage existing paving or create surface hazardous to vehicle or pedestrian traffic. Within public rights-of-way, method of marking removal shall be approved by appropriate governing authority.

3.2 APPLICATION

A. Apply two (2) coats of paint, without addition of thinner, with maximum of 100 sq. ft per gal. Apply the first coat less than 5 days after the placing of bituminous pavement. Apply the second coat just prior to school opening. Apply with mechanical equipment to produce uniform straight edges. At sidewalk curbs and crosswalks, use straightedge to ensure uniform, clean, and straight stripe.

B. Install preformed pavement markings according to manufacturers recommended procedures for the specified material.

C. Following items shall be painted with colors noted below:

1. Pedestrian Crosswalks: White
2. Light Pole Bases, and Bollards: Yellow, or as specified in Contract Drawings.
3. On-Site Sign Bases: Black, or as specified in Contract Drawings.
4. Fire Lanes: as shown on Contract Documents.
5. Lane Striping where separating traffic moving in opposite directions: Yellow
6. Lane Striping where separating traffic moving in the same direction: White
7. Handicap Symbols: Blue or per local code and as shown on Contract Documents.
8. Parking Stall Striping: White, or as shown on Contract Documents.

D. The Minimum Required total Dry Film Thickness (DFT): The DFT shall be the minimum required dry film thickness as measured in mils. or as required by sections 2.1 of this specification as well as part of the referenced standard in section 1.2 of the same.

E. System Coverage Requirements:

1. 1st Coat - 3.0 mils DFT
2. 2nd Coat - 6.0 mils DFT

F. Exterior Paint Systems: Provide the following paint systems as indicated:

1. Parking stall, division and limit lines shall be 4" in width, true and straight. Color: White – DFT 6.0 mils.
2. Stop legends shall be as detailed on Drawing. Color: White - DFT 6.0 mils.
3. Wheelchair legends shall be as detailed on Drawing. Color: Blue. Parking stall striping shall be Blue at Handicapped stalls only - DFT 6.0 mils.
4. Diagonal striping Handicapped. Color: Blue - DFT 6.0 mils.
5. Diagonal striping Loading Zone. Color: White - DFT 6.0 mils.
6. Directional signage shall be as detailed on Drawing. Color: White - DFT 6.0 mils.
7. Centerline striping shall be 4" in width as detailed on Drawings. Color: White - DFT 6.0 mils.

END OF SECTION 321723

SECTION 323100 – CHAINLINK FENCES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 321313 – Portland Cement Concrete

C. Construction Documents

D. Manufacturer's technical data and installation requirements

1.2 SCOPE OF WORK

A. Provide chain link fence, framework, and accessories.

B. Excavation for post bases: concrete foundation for posts.

C. Manufacturer's technical data and installation requirements.

1.3 REFERENCE STANDARDS

A. ASTM A116 Zinc-coated (Galvanized) Steel Woven Wire fence Fabric.

B. ASTM A120 Pipe, Steel, Black and Hot-Dipped Zinc Coated (Galvanized) Welded and seamless, for Ordinary Uses.

C. ASTM A121 Zinc-Coated (Galvanized) Steel Barbed Wire.

D. ANSI/ASTM A123 Zinc (Hot Dip Galvanized) Coatings on iron and steel products.

E. ASTM A153 Zinc Coating (Hot-Dip) on Iron and Steel Hardware.

F. ASTM A392 Zinc Coated Steel Chain-Link Fence Fabric.

G. ANSI A428 Weight of Coating on Aluminum-Coated Iron or Steel Articles.

H. ASTM A446 Steel Sheet, Zinc-Coated (Galvanized) by the Hot-Dip Process, Structural (Physical) Quality.

I. ASTM A491 Aluminum-Coated Steel Chain Link Fence fabric.

J. ASTM A569 Steel, Carbon (0.15 Maximum Percent), Hot-Rolled Sheet and Strip Commercial Quality.

K. ASTM A585 Aluminum Coated Steel Barbed Wire.

L. ASTM C94 Ready-mixed Concrete.

M. ASTM F567 Installation of Chain-Link Fence.

N. ASTM F573 Residential Zinc-Coated Steel Chain Link fence fabric.

O. ASTM F668 Poly (Vinyl Chloride) (PVC) Coated Steel Chain Link Fence Fabric.

P. ASTM F669 Strength Requirements of Metal Posts and Rails for Industrial Chain Link Fence.

Q. ASTM F1083 Pipe, Steel, Hot-Dipped Zinc-Coated.

R. Chain Link Fence Manufacturers Institute (CLFMI)-Product Manual.

1.4 QUALITY ASSURANCE

A. Perform work in accordance with Manufacturer's instructions.

B. Perform work in accordance with ASTM F567.

1.5 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.6 SUBMITTALS

A. Submittals for review - the following submittals are intended for review and acceptability.

1. Section 320000 General Requirements for submittals.
2. Product Data: Provide data on fabric, posts, accessories, fittings and hardware.
3. Shop Drawings: Indicate plan layout, spacing of components, post foundation dimensions, hardware anchorage, and schedule of components.
4. Samples: Submit one sample of fence fabric, 12 inch X 12 inches in size Illustrating construction and finish.

B. Submittals for Information

1. Manufacturer's Installation Instructions: Indicate installation requirements, post foundation anchor bolt, templates, and any other data required.

C. Submittals for Closeout

1. Data: Provide Warranties and Bonds.
2. Project Record Documents: Accurately record actual locations of property perimeter posts relative to property lines and easements.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Fabric and boards:

1. No. 9 ga. finished size galvanized steel wires, 2-inch mesh, with top salvage knuckled and bottom selvage twisted and barbed.
2. Attached Wire Mesh shall be coated with Black PVC or approved equal.

B. End, Corner, and Pull Posts: Galvanized steel, minimum sizes and weights as follows:

1. Up to 6'-0" fabric Height: 2.375" OD pipe, 3.65 lbs./1 in.ft., or 3.5"x 3.5" roll-formed sections, 4.85 lbs./1 in.ft.
2. Over 6'-0" Fabric Height: 2.875" OD pipe, 5.79 lbs./1 in.ft., or 3.5"x 3.5" roll-formed sections, 4.85 lbs./1 in.ft.

C. Line Posts: Galvanized steel, minimum sizes and weights as follows:

1. Up to 6'-0"Fabric Height: 1.90"OD steel pipe, 2.70 lbs./1 in.ft. Or 1.875'x 1.625" C-sections, 2.28 lbs./1 in.ft.
2. 6'-0" to 8'-0"Fabric Height: 2.375"OD steel pipe, 3.65 lbs./1 in.ft. or 2.25" x 1.875" H-sections, 2.64 lbs./1 in.ft.
3. Over 8'-0"Fabric Height: 2.875"OD steel pipe, 5.79 lbs./1 in.ft. or 2.25"x 1.875" H-sections, 3.26 lbs./1 in.ft.

D. Top Rails: Rails: 1.66"OD pipe, 2.27 lbs./ft. or 1.625" x 1.25" roll-formed sections, 1.35 lbs./ft.; galvanized steel, manufacturer's longest lengths.

E. Couplings: Expansion type, approximately 6" long, for each joint.

F. Attaching Devices: Provide means for attaching top rail securely to each gate corner, pull and end post.

G. Sleeves: Galvanized steel pipe not less than 6" long and with inside diameter not less than ½"greater than outside diameter of pipe. Provide steep plate closure welded to bottom of sleeve of width and length not less than 1"greater than outside diameter of sleeve.

H. Tension Wire: 7 gage galvanized steel, coated coil spring wire, located at bottom of fabric.

I. Wire Ties: 11 ga. galvanized steel

J. Post Brace Assembly: Manufacturer's standard adjustable brace at end of gate posts and at both sides of corner and pull posts, with horizontal brace located at mid-height of fabric. Use same material as top rail for brace, and truss to line posts with 0.375" diameter rod and adjustable tightener.

K. Post tops: Galvanized steel, weather-tight closure cap for each tubular post. Furnish caps with openings to permit passage of top rail.

L. Stretcher Bars: Galvanized steel, one piece lengths equal to full height of fabric, with minimum cross-section of 3/16"x 3/4". Provide one stretch bar for each gate and end post, and two for each corner and pull post.

M. Stretch Bar Bands: Manufacturer's standard.

N. Portland Cement: ASTM C 150.

O. Aggregates: ASTM C 33.

P. Water: Potable.

Q. Non-shrink, Non-metallic Grout: Premixed, factory-packaged, noncorrosive, non-staining, nongaseous, exterior grout complying with CE CRD-C621.

PART 3 - EXECUTION

3.1 GATE FABRICATION

A. Fabricate swing gate perimeter frames of 1.90"OD pipe, galvanized steel. Provide horizontal and vertical members to ensure proper gate operation and for attachment of fabric, hardware, and accessories. Space frame members a maximum of 8'-0"apart.

B. Assemble gate frames by welding or special fittings and rivets for rigid connections. Install same fabric as for fence with stretcher bars at vertical edges. Install diagonal cross-bracing on gates as required to ensure rigid frame without sag or twist. Bars may be used at top and bottom edges. Attach stretchers to gate frame at 15 inches on center maximum.

C. Attach hardware to provide security against removal or breakage.

3.2 FINISH

A. Fabric Finish: Galvanized, ASTM A 392, Class I, with not less than 1.2 oz zinc/sq.ft. of surface.

B. Framing: Galvanized steel, ASTM A 120 or A 123, with not less than 1.8 oz. zinc/sq.ft. of surface.

C. Hardware and Accessories: Galvanized, ASTM A 153 with zinc weights in accordance with Table 1.

3.3 CONCRETE MIXING

A. Mix materials to obtain concrete with a minimum 28-day compressive strength of 2,500 psi; 1" maximum size aggregate, maximum 3"slump, and 2-4% entrained air.

3.4 INSTALLATION

A. Comply with recommended procedures and instructions of fencing manufacturer. Provide secure, aligned installation with line posts spaced at 10 feet- 0 inches on center maximum.

B. Grade Set Posts: Drill of hand excavate using post hole digger in firm or compacted soil.

C. Excavate hole for each post to minimum diameter recommended by fence manufacturer but not less than four times largest cross-section of post. Excavate hole depths approximately 3" lower than post bottom with bottom of posts set not less than 36" below finish grade surface.

D. Center and align posts in holes 3" above bottom of excavation.

E. Place concrete around posts; vibrate or tamp for consolidation. Check each post for vertical and top alignment. Hold in position during placement and finishing operations. Extend concrete footing 2" above grade. Crown footing to shed water.

F. Top Rails: Run rail continuously, bending to form radius for curve runs. Provide expansion couplings as recommended by manufacturer.

G. Center Rails: Provide center rails where indicated. Install in one piece between posts and flush with post on fabric side, using special offset fittings where necessary.

H. Brace Assemblies: Install braces so posts are plumb when diagonal rod is under proper tension.

I. Tension Wire: Install tension wires through post cap loops before stretching fabric and tie to each post cap with not less than 6 ga. galvanized wire. Fasten fabric to tension wire using 11 ga. galvanized steel hog rings spaced 24 inches on center.

J. Stretcher Bars: Secure at end, corner, pull, and gate posts by threading through or clamping to fabric at 4 inches on center, and secure to posts with metal bands spaced at 15 inches on center.

K. Fasteners: Install nuts for tension bands and hardware bolts on side of fence opposite fabric side. Peen ends of bolts or score treads to prevent removal of nuts.

END OF SECTION 323100

SECTION 329000 - PLANTING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this section.

B. Section 31 2310 – Earthwork

C. Section 32 9100 – Planting Soils

D. Section 32 9200 – Turf and Grasses

E. Section 32 9353 – Landscape Maintenance

1.2 SUMMARY

A. This Section includes the following:

1. Tree, shrub, groundcover, perennial and bulb installation.
2. Fertilizing, mulching, trimming, guying, wrapping and edging.
3. Maintenance of installed plant material.
4. Warranty.
5. Tree staking

1.3 REFERENCES

A. American Joint Committee on Horticultural Nomenclature Publication: Standardized Plant Names.

B. ANSI Z60.1 - American Standard for Nursery Stock.

C. FS 0-F-241 - Fertilizers, Mixed, Commercial.

1.4 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.5 SUBMITTALS

A. General: Submit each item in this Article according to the Conditions of the Contract and Division 1 Specification Sections.

B. Submit complete list of plant material nursery sources within four weeks of notice to proceed and prior to digging of plants. List is to include names of individuals to contact, phone numbers, addresses and latest possible date for completion of tagging.

C. Contractor to cover cost of Landscape Architect's plant tagging.

D. Submit waterproof tags prior to tagging trip. Tags to contain following information:

1. Contractor's name.
2. Plant genus, species and cultivar/variety.
3. Plant common name.
4. Name of nursery.
5. Size of plant.
6. Quantity of plant (i.e. 2 of 10)

E. Submit proposed planting schedule, indicating dates for each type of landscape work during normal seasons for such work in area of site. Correlate with specified maintenance periods to provide maintenance from date of substantial completion. Once accepted, revise dates only as approved in writing, after documentation of reasons of delay.

F. Submit schedule of arrival of "specimen plant material".

G. Submit instructions for continuing Owner maintenance. Include pruning and trimming methods and types, application frequency and recommended coverage of fertilizer; and water requirements for year-round care of installed plants. Document is to be in bound 8 ½" x 11" format. Submit prior to expiration of required maintenance period(s).

H. Submit for approval a proposed maintenance procedure and schedule of the storage of plant materials. Trees, shrubs, groundcover and perennials stored on and off site shall be maintained by watering, fertilizing, mulching, and spraying for infestation and disease to maintain these plants in a healthy condition. Plants stored off site shall be available for inspection by the Landscape Architect.

I. Samples of each of the following:

1. 5 lb (2 kg) of mulch for each type required for the Project, in labeled plastic bags.
2. Edging materials and accessories to verify color selected.

J. Qualification data for firms and persons specified in the "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of Landscape Architects and Owners, and other information specified.

1.6 QUALITY ASSURANCE

A. Prior to being approved, the successful bidder will be required to submit to the Landscape Architect a statement of qualifications listing the names of contact references for at least three jobs of similar scope that have been completed in the last five years. Attention is called to the fact that the installation will not be awarded to a firm that does not possess the required technical expertise and construction organization.

B. Allow Landscape Architect option of traveling to nursery to select trees from available stock. (See 1.4 C)

C. Allow for receipt of stamped nursery source list, to tag trees. (See 1.4 B)

D. Trees dug prior to tagging by Landscape Architect are subject to rejection.

E. Landscape Architect will confirm the trees satisfy the requirements of ANSI Z60.1 and all special conditions stated in project manual and drawings.

F. Measure trees and shrubs according to ANSI Z60.1 with branches and trunks or canes in their normal position. Do not prune to obtain required sizes. Take caliper measurements 6 inches (150mm) above ground for trees up to 4-inch (100-mm) caliper size, and 12 inches (300-mm) above ground for larger sizes. Measure main body of tree or shrub for height and spread; do not measure branches or roots tip-to-tip.

G. Unacceptable trees will not be tagged and a different Grower will be selected by Contractor at no expense to Owner. A second tagging trip will then be scheduled.

H. Decision by Landscape Architect to forego tagging trip does not release Contractor from responsibility of obtaining plant material which meets standards and conditions stated in project manual and drawings.

I. Minimum three years experience installing plant material of this type required of Installer.

J. Minimum five years' experience specializing in growing and cultivating the specified material is required by of Grower.

1.7 REGULATORY REQUIRMENTS

A. Comply with regulatory requirements for fertilizer and herbicide composition.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Plant material is to be COVERED with tarpaulin during transport.

B. Deliver soil conditioners and fertilizer in unopened waterproof bags showing weight, chemical analysis, and name of manufacturer. Keep materials in dry storage away from contaminants.

C. Provide freshly dug trees and shrubs. Do not prune prior to delivery unless otherwise approved by Landscape Architect. Do not bend or bind tie trees or shrubs in such a manner as to damage bark, break branches, or destroy natural shape. Do not drop balled and burlapped stock during delivery. Protect plants until planted to prevent damage to root balls or desiccation of leaves.

D. Deliver trees and shrubs after preparations for planting have been completed and plant immediately. If planting is delayed more than six hours after delivery, set trees and shrubs in shade, protect from weather and mechanical damage, and keep roots moist by covering with mulch, burlap or other acceptable means of retaining moisture.

E. Provide water to staged material as required to keep root balls moist.

F. Do not remove container-grown stock from containers until planting time.

1.9 ENVIRONMENTAL REQUIREMENTS

A. Do not install plant life when ambient temperatures may drop below 30 degrees F or above 90 degrees F.

B. Do not install plants when wind velocity exceeds 30 mph.

C. Planting shall be done when the ground is not frozen, snow covered, or in an otherwise unsuitable condition for planting.

D. Conduct planting operations during recommended planting seasons. Preferable planting season is March 15 to May 30 and October 15 to December 1, inclusive.

E. At the Subcontractor's option and full responsibility, planting operations may be conducted under unseasonable conditions without additional compensation.

1.10 JOB CONDITIONS

A. Locate above grade and underground utilities and perform Work in manner which will avoid damage. Hand excavate, as required.

B. Maintain grade stakes until removal is mutually agreed upon by concerned parties.

C. Notify Landscape Architect, before proceeding, when conditions detrimental to plant growth are encountered, such as rubble fill or adverse drainage conditions.

D. Install plants after final grades are established and prior to establishment of lawns, unless otherwise approved by Landscape Architect. If planting occurs in undisturbed lawn areas or after lawn work, protect lawn areas and promptly repair damage to lawns resulting from planting operations. PROJECT CONDITIONS

1.11 SEQUENCING AND SCHEDULING

A. Coordinate the Work of this Section with installation of underground utilities, sodding and remainder of Work associated with this Project.

B. Proceed with and complete landscape work as rapidly as portions of site become available, working within seasonal limitations.

1.12 MAINTENANCE

A. Contractor shall maintain plant material until completion of 18-month guarantee period and Final Acceptance of work, as described in Part 3 of this Section

1.13 GUARANTEE

A. Plants shall be guaranteed for a period of 18-months after the date of Acceptance by the Owner.

1. When the work is accepted in parts, the guarantee periods shall extend from each of the partial acceptances to the terminal date of the last guarantee period. Thus, all guarantee periods terminate at one time.

B. Plants shall be healthy, free of pests and disease, and in flourishing condition at the end of the guarantee period. Plants shall be free of dead and dying branches and branch tips, and shall bear foliage of normal density, size and color.

C. Replace dead plants and all plants not in vigorous, thriving condition, as determined by the Architect during and at the end of the guarantee period, without cost to the Owner as soon as weather conditions permit and within the specified planting window.

1. Replacements shall closely match adjacent specimens of the same species. Replacements shall be subject to all requirements stated in this Specification.
2. Make all necessary repairs due to plant replacements. Such repairs shall be done at no extra cost to the Owner.
3. The guarantee of all replacement plants shall extend for an additional 18-month period from the date of their acceptance after replacement. In the event that a replacement plant is not acceptable during or at the end of the said extended guarantee period, the Owner may elect one more replacement or credit for each item.

D. At the end of the guarantee period, and no less than five days prior to final inspection, staking and guying materials, and tree wrap and ties shall be removed from the site.

1.14 FINAL INSPECTION AND FINAL ACCEPTANCE

A. At the end of the 18-month guarantee period, the Architect will, upon written notice offend of guarantee period inspect the work for Final Acceptance. Requests shall be received at least ten calendar days before the anticipated date for Final Inspection.

B. Upon completion and reinspection of full repairs or replacements necessary in the judgment of the Architect at that time, the Architect will recommend to the Owner that Final Acceptance of the Work of this Section be given.

PART 2 - PRODUCTS

2.1 TREES, SHRUBS, GROUND COVER AND BEDDING PLANTS

A. Plant material to be nursery grown stock conforming to ANSI Z60.1.

B. Publication for Standardized Plant Names will govern nomenclature issues.

C. Plans will supersede planting material schedule where a discrepancy in quantity occurs.

D. Provide plant material which is well branched and formed, sound, vigorous, healthy, and free from disease, sun-scald, windburn, abrasion, and harmful insects, eggs, larvae and such defects as knots sun scald, injuries, abrasions and disfigurement, and shall have healthy, normal, and unbroken root systems.

E. Provide symmetrically developed plant material, of uniform habit with straight boles and free from objectionable disfigurements. Tree leader shoots shall not be cut or broken.

F. Where formal arrangements or consecutive order of trees or shrubs are shown, select stock for uniform height and spread, and label with number to assure symmetry in planting.

G. Provide vigorous ground covers and vines with number and length of runners and clump size specified and proper age for the grade of plants specified. Use only vines and ground cover plants well established in removable containers, integral containers, or formed homogeneous soil sections.

H. Plants shall have been grown in the same or colder climatic zone of this project.

I. Provide plants according to measurements indicated. Measure sizes before pruning and with branches in normal position. Plants larger in size than specified may be used as approved.

J. Spray plants, budding into leaf or having soft growth, with an anti-desiccant at the nursery or collecting field before digging.

2.2 PLANTING AMENDMENT MATERIALS

A. Shrub and Tree Fertilizer: Tightly compressed, slow release planting tablets. Provide 50% of Nitrogen as water insoluble. The following or equal is acceptable:

1. AGRIFORM Planting Tablets by:

The Scott's Company

1-800-492-8255

B. Ground Cover Fertilizer: FS-0-F-241, Type 1, Class 1 with fifty percent of the elements derived from organic sources. Use fertilizer with N.P.K. ratio of 1:2:1 for Ground Cover Beds and 2:1:1 for Bedding Plant Beds.

C. Topsoil: Topsoil for backfill shall be as specified in Section 329100 - Landscape Grading.

D. Compost: Well-composted, stable, and weed-free organic matter, pH range of 5.5 to 8; moisture content 35 to 55 percent by weight; 100 percent passing through 1-inch sieve; soluble salt content of 5 to 10 decisiemens/m; not exceeding 0.5 percent inert contaminants and free of substances toxic to plantings; and as follows:

E. Organic Matter Content: 50 to 60 percent of dry weight.

F. Water: Clean, fresh and free of substances or matter which could inhibit vigorous growth of plants.

G. Herbicide: Comply with all applicable State and Federal Laws.

H. Pesticide: Comply with all applicable State and Federal Laws.

2.3 MULCH MATERIALS

A. Mulching Material: Double shredded, composted hardwood bark mulch free of growth or germination inhibiting ingredients.

B. Mineral Mulch: Hard durable stone, washed free of loam, sand, clay and other foreign substances, of following type, size range and color:

1. Type: Rounded, natural tan/beige color.

a. Size Range: 1”-2”

2.4 MISCELLANEOUS MATERIALS

A. Filter Fabric: Filter fabric shall be Trevira 1115, or equal approved by Landscape Architect. Trevira is manufactured by Hoechst Fibers Industries, P.O. Box 5887, Spartanburg, SC 29304 (1-800-845-7597 or 1-800-579-5479).

B. Anti-Desiccant: Emulsion type, film-forming agent, designed to permit transpiration but retard excessive loss of moisture from plants. Deliver in manufacturer’s fully identified containers and mix in accordance with manufacturer’s instructions.Setting Blocks: Elastomeric material with a Shore, Type A durometer hardness of 85, plus or minus 5.

C. Erosion Control Blanket: The following products or approved equal are acceptable:

1. S75 as manufactured by North American Green for 3:1 slopes.
2. C125 as manufactured by North American Green for 2:1 slopes or steeper.

D. Aluminum Edging: Edging shall be 3/16" x 4" aluminum painted black . Edging shall be installed according to manufacturer’s instructions.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify site is ready to accept Work of this section

B. Test drainage of plant beds and pits by filling with water twice in succession. Notify Landscape Architect of conditions permitting the retention of water in planting beds for more than twenty-four (24) hours.

C. Prior to the excavation of planting pits, or placing tree stakes, the Contractor shall ascertain the location of utility lines, electric cables and conduits, so that proper precautions may be taken not to disturb or damage subsurface improvements. Should obstructions be found, the Contractor shall promptly notify the Landscape Architect.

D. Beginning of installation means acceptance of existing conditions.

3.2 PREPARATION OF PLANT PITS AND BEDS

A. Plant Pits: Dig to produce vertical sides and flat, undisturbed bottoms. Scarify glazed side surfaces of pits. Size plant pits as shown on drawings.

B. Shrub masses, hedges, groundcover and perennial beds shall be entirely excavated edge to edge and backfilled with specified backfill mixture; they shall not be treated as individual planting pits.

C. Remove all sticks, stones, roots and other objectionable materials during tilling operations larger than one inch in diameter.

D. Damage to paving, sidewalks or other materials shall be removed and replaced at the Contractor’s expense and to the satisfaction of the Landscape Architect.

3.3 LAYOUT

A. Stake tree and shrub locations with 3/4" x 2" x 18" wood stakes driven into the soil at center points of plants. Paint tops of stakes representing tree locations a color different from the stakes locating shrubs. Contractor may stake continuous uninterrupted straight runs of shrubs at each end. Outline ground cover beds.

B. Mark all underground utilities.

C. Notify Owner's Representative, in writing, of portions of plant material which have been staked. Allow one week for Landscape Architect to review and adjust stake locations.

D. Plants which are planted prior to contractor receiving Landscape Architect's approval of staking and bed outlines are subject to being relocated at no cost to Owner.

3.4 PLANTING

A. Setting Plants: Handle balled and burlapped and container-grown plants by ball or container. Set plants and hold in plumb position until sufficient soil has been firmly placed around roots or ball. Set plants in relation to surrounding grade so that they are even with depth at which they were grown in nursery, collecting field, or container.

B. Place fertilizer prior to backfilling and in accordance with the manufacturer's recommendations. Ground cover plants may be planted after mulch is in place. Take care to avoid contaminating mulch with planting soil.

C. Backfill excavations for balled and burlapped stock with planting soil mixture to approximately half the depth of the ball and then tamp and water. Carefully remove, open or fold back burlap and tying materials. Completely remove plastic wrap before the placement of backfill. Finish backfilling and tamp. Form earth saucers around isolated plants of size ample enough to hold at least 2-1/2 gallons for shrubs or 5 gallons for trees. Do not use planting stock if ball is cracked or broken before or during planting operation.

D. Bulbs shall be planted in the locations and at the spacing indicated on the Drawings. Plant bulbs at the depths and orientation recommended by the Supplier. Do not remove the leaves until after they have lost their green color. Remove leaves by cutting.

3.5 FERTILIZATION, WATERING, EDGING, AND MULCHING

A. Trees, Shrubs and perennials: Fertilize according to manufacturer's recommendations.

B. Ground Cover Beds: Topdress beds with .12 lbs of actual phosphoric acid per cubic yard of Planting Bed Mix.

C. Watering: Provide uniform coverage which will not cause erosion or damage to the finished surface. Water sufficiently to penetrate the planting bed to a depth of 4 inches.

D. Uniformly edge beds or individual plants using a sharp tool to provide a clear cut division line between the planted area and the adjacent lawn. Refer to drawings for bed shape. Provide plant pits circular in shape for individual pits.

E. Mulch within 24 hours after planting. Spread to uniform thickness of 3 inches.

3.6 PRUNING AND REPAIR

A. Plants shall be neatly pruned and or clipped to preserve the natural character of the plants (with exception to clipped shrub hedges); in a manner appropriate to the particular requirements of each plant and to the satisfaction of the Landscape Architect. Unless otherwise directed by Landscape Architect, do not cut tree leaders; remove only injured or dead branches.

B. Remove broken or badly bruised branches with a clean cut. All pruning shall be done with sharp tools in accordance with instructions of the Owner. Accidental damage to trees occurring during the course of planting operations which is not so great as to necessitate removal of a branch or replacement of a plant shall promptly be treated as required in accordance with recognized horticultural practices.

3.7 CLEANING

A. Keep worksite in clean and orderly condition as Work progresses. Leave worksite "broom clean" at end of Work.

3.8 MAINTENANCE

A. See Section 329353 Landscape Maintenance

END OF SECTION 329000

SECTION 329100 – PLANTING SOILS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. The Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this section.

B. Section 31 0800 – Earthwork

C. Section 32 9000 – Planting

D. Section 32 9200 – Lawns and Grasses

1.2 RELATED SECTIONS

A. Testing off-site borrow soil, existing topsoil and amendment materials for approved use in planting soil mixes. Verification testing of on-site sub-soils.

B. Furnishing material from approved off-site source(s) as a base component for planting soil mixes and furnishing other soil amendment materials.

C. Amending, preparing, and mixing planting soils for plant areas.

D. Placing, spreading, and fine grading pre-mixed planting soil material of the type(s) indicated for plant areas.

E. Protecting all plant mix installations with snow fencing, filter fabric, or other approved means, over the surface area plant bed installations, until substantial completion.

F. Protection of finished paving, light poles utility or other finished work by means of wooden protection boards, or other approved means, over the area of construction concurrent with any and all construction operations.

1.3 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to

these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.4 SUBMITTALS

A. Refer to and comply with General Requirements, for procedures and additional submittal criteria.

B. Product Data: Submit technical descriptive data for each manufactured or packaged product of this Section. Include manufacturer's product testing and analysis and installation instructions for manufactured or processed items and materials.

C. Locations: Submit locations of material sources. Submit location of mixing sites.

D. Certificates:

1. Submit certified analysis for each soil treatment, amendment, and fertilizer material specified and as used. Include guaranteed analysis and weight for packaged materials.

E. Test Reports: Submit written reports of each sample tested. Each report shall include the following as a minimum and such other information required specific to material tested:

1. Date issued.
2. Project Title and names of Contractor and supplier.
3. Testing laboratory name, address and telephone number, and name(s), as applicable, of each field and laboratory inspector.
4. Date, place, and time of sampling or test, with record of temperature and weather conditions.
5. Location of material source.
6. Type of test.
7. Results of tests including identification of deviations from acceptable ranges. Identify any toxic substance(s) harmful to plant growth or life.

F. Statement(s) of Qualifications: Submit within 45 days of notice to proceed to confirm qualifications as specified in Article 1.04, herein.

G. Schedule and Protection Plan: Submit a detailed plan for scheduling and sequencing of all contract work and for protection of soil mixes and other completed work including coordination with contractors requiring access through the site. Indicate with schedules and plans the utilization of soil mix and subsoil protection measures (filter fabric and snow fencing) over the surface area of plant bed installations, until substantial completion. Indicate with schedules and plans the utilization of finished work protection measures (wooden protection boards or other approved methods) over the work area of construction operations concurrent with all construction operations until substantial completion.

1.5 QUALITY ASSURANCE

A. Qualifications:

1. Installation and maintenance foreman on the job shall be competent English-speaking supervisor(s), experienced in landscape installation and maintenance. Perform work with personnel totally familiar with planting soil preparation and planting installations under the supervision of a foreman experienced with landscape work.
2. Agricultural Chemist: Experienced person or persons employed by public or private soils testing laboratory, qualified and capable of performing tests, making soil recommendations, and issuing reports as specified. Testing Laboratory and Agricultural Chemist shall be as approved by the Owner's Identified Agent.

B. References:

1. Association of Official Agricultural Chemists.
2. American Society for Testing and Materials (ASTM) using test criteria as specified or required by other references.

C. Pre-installation Conferences: Person(s) responsible for soil preparation and mixes of this Section shall attend Pre-installation Conference(s) to coordinate with work of other sections.

D. Inspections and Testing

1. Soil, compost, and other material testing required in this Section or additionally required by Owner's Representative shall be furnished and paid for by Contractor.
2. Contractor is to test installed soil in-place after installation to confirm material is as submitted. One sample should be taken per every 250sf of installed area.
3. Owner's Identified Agent reserves the right to take and analyze at any time such additional samples of materials as deemed necessary for verification of conformance to specification requirements. Contractor shall furnish samples for this purpose upon request and shall perform testing as requested.
4. If at any time, test results indicate that any soil delivered to the site does not comply with these specifications, the contractor shall immediately remove the non-compliant soils from site at the contractor's expense.

1.6 REQUIREMENTS

A. Comply with all rules, regulations, laws and ordinances of local, state, and federal authorities having jurisdiction. Provide labor, materials, equipment and services necessary to make work comply with such requirements without additional cost to Owner.

B. Procure and pay for permits and licenses required for work of this section. Comply with the requirement of any Remedial Action Work Plan that may apply to the project.

1.7 SITE CONDITIONS

A. Acquaintance with Existing Site Conditions

1. Through study of all Contract Documents and by careful examination of the site, become informed as to the nature and location of the Work, the nature of surface and subsurface soil conditions, the character, quality and quantity of the materials to be encountered, the character of equipment and facilities needed preliminary to and during the prosecution of the Work, the general and local conditions, and all other matters which can in any way affect the Work.
2. Investigate the conditions of public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affecting transportation to, ingress and egress of this work site. Conform to all governmental regulations in regard to the transportation of materials to, from, and at the job site, and secure in advance such permits as may be necessary.
3. Should the Contractor, in the course of Work, find any discrepancies between Contract Drawings and physical conditions or any omissions or errors in Drawings, or in layout as furnished by the Owner, it will be Contractor's duty to inform the Owner's Identified Agent immediately in writing for clarification. Work done after such discovery, unless authorized by the Owner's Identified Agent, shall be done at the Contractor's risk.
4. Contractor shall be familiar with any Remedial Action Work Plan for the project and be experienced in working on sites with historic fill.

B. Environmental Requirements:

1. Perform both off-site mixing and on-site soil work only during suitable weather conditions. Do not disc, rototill, or work soil when frozen, excessively wet, or in otherwise unsatisfactory condition.
2. Soil mixes shall not be handled, hauled, or placed during rain or wet weather or when wet near or above field capacity.

C. Sequencing and Scheduling: Adjust, relate together, and otherwise coordinate work of this Section with work of Project and all other Sections of Project Specifications.

1.8 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Product Data: Packaged Materials: Deliver packaged materials to the location where soils are to be mixed, in unopened bags or containers, each bearing the name, guarantee, and trademark of the producer, material composition, manufacturers' certified analysis, and the weight of the materials Retain packages for the Construction Manager or Owner's Representative.

B. Soil or amendment materials stored on site temporarily in stockpiles prior to placement shall be protected from intrusion of contaminants and erosion. All temporary storage means and methods shall be approved by Owner's Representative.

C. After mixing, soil materials shall be covered with a tarpaulin until time of actual use.

PART 2 - PRODUCTS

2.1 PLANT MIX MATERIALS

A. All soil material to be imported to the site shall be tested every 500 CY to ensure soils meet applicable remediation standards for clean soils. Proof of compliance shall be provided by contractor prior to delivery of soils to site.

B. General:

1. All plant mix materials shall fulfill the requirements for new plant mixes as specified.
2. Samples of blended plant mixes shall be submitted by the Contractor for testing and analysis to the approved testing laboratory. Include verification testing of on-site sub-soils. Comply with specific material requirements specified.

    a. As necessary to conform to the requirements of these specifications, make any and all soil mix amendments, retest and resubmit reports indicating results until approved.

3. Owner's Representative may request additional testing by Contractor for confirmation of mix quality at any time until completion.

C. Base Component Material

1. Base Component Material shall be a sandy loam. Base Component Materials shall not be site salvaged unless approved by Owner's Identified Agent and CT DEEP.
2. Before base component material is used for mixing with amendments, handle and pile Base Component Material in the following manner:

    a. Homogenize to make a uniform mix, free of subsoil lenses and other irregularities.
    b. Aerate the base material to make a friable planting medium.
    c. Separate out and remove all clay lumps, stones, stocks, roots, and other debris.

D. Organic Matter

1. Leaf Mold: Shredded leaf litter, composted for a minimum of one year (12 months) and confirming to the following characteristics:

    a. The leaf mold must be free of debris such as plastic fragments, glass, and metal fragments.
    b. The leaf mold must be free of stones larger than 1/2", large branches, and large roots.
    c. Woodchips over 1" in length or diameter should be removed by screening.

2.2 SOIL AMENDMENT MATERIAL

A. Ground Limestone: Ground Limestone as a soil amendment material will only be used pending results of analysis.

1. Provide a Ground Agricultural Limestone with a minimum of 88% of calcium and magnesium carbonates.
2. Ground Limestone material shall have a total 100% passing the 10 mesh sieve, minimum of 90% passing the 20 mesh sieve, and a minimum of 60% passing the 100 mesh sieve.

2.3 HERBICIDES

A. Herbicides: May be required for use if there is seed germination after sub-grade placement and prior to 2planting mix installation or after subsequent plant mix installation. Under no circumstances are materials to be applied without specific instruction from the Owner's Identified Agent.

1. Herbicides shall be approved before use for type and rate of application by the Owner's Identified Agent and by local and state agencies with jurisdiction.
2. Post emergent herbicide shall be Roundup, as manufactured by Monsanto Agricultural Products Company, C3NJ, St. Louis, MO 63166, or an approved equal.

2.4 PLANTING SOIL MIXES

A. General: Adequate quantities of mixed planting soil materials shall be provided, to supplement topsoil stockpiled from site, to attain, after compaction and natural settlement, all design finish grades. Verify quantities for placement as specified in Planting and Turf and Grasses specifications and to suit conditions.

B. Uniformly mix ingredients as specified (Base Component Material, leaf mold, and other ingredients deemed to be necessary as a result of testing) by wind rowing/tilling on an approved hard surface area. Organic matter shall be maintained moist, not wet, during mixing.

C. Testing of Plant Mixes:

1. Perform initial soil mix tests to confirm compliance with specifications. In conjunction with the requirements of the specifications, these test results, when approved, will establish the standard to which all other test results must conform.
2. Follow-up Testing: Have one (1) composite sample tested prior to delivery and upon arrival to the site from each 500 c.y. of material or as required by Owner's Representative intended for use in each type of lawn and plant mix to include the following:

a. Soil Texture / Physical Analysis: Use the hydrometer method and classify the soil.
b. Nutrient Analysis:

1) Have nutrient levels (nitrate, nitrogen, phosphate, potassium, magnesium, calcium, ammonium, iron, and manganese) tested, and request testing laboratory recommendations for additional fertilizer requirements at both lawn and all plant areas if nutrient levels are below average.
2) Nutrient deficiencies in soils of plant areas shall be corrected at time of installation.
3) Nutrient deficiencies in soils of lawn areas shall be corrected both at time of lawn installations and during maintenance period as specified.

c. Test organic matter, pH, soluble salts, and percolation.

D. Soil Mix Types: Provide the following planting soil mix at the locations indicated. Percentages of components, unless otherwise noted, will be established upon completion of test results of the various mixes. The controlling factor will be the percent (%) organic matter as specified for each mix. Note that percent (%) by volume of components will be, in large part, determined by the leaf mold. Specifically the bulk density reading of the leaf mold will directly impact the organic matter readings which have been specified for each mix.

1. Topsoil / Horticultural Soil Mix shall be used for planting areas on natural subsoils.

    a. Test results must be submitted for per-cent (%) retained as well as for per-cent (%) passing for all sieve sizes. Failure to include any of the aforementioned criteria will be cause for rejection of the test report.

2. Soil Texture/ Physical Analysis (Sandy Loam)

    a. Sand – 50-70%
    b. Silt – 20-30%
    c. Clay – 10-20%
    d. Gravel content should not exceed 3% and soil should be free of glass, plastic and other foreign materials
    e. Chemical Analysis:

        1) Organic matter: 6.0 to 10.0%
        2) Soil reaction (pH): 6.0 to 7.0
        3) Soluble salt content (conductivity): The soluble salts measurement (Electric Conductivity) should not exceed 0.5 mmhos/cm measured as a 1: 5 dilute.

    f. Heavy metal content not to exceed the following amounts:

Element	Acetate Extract	HCL Extract
Iron	0.5 ppm	3.1 ppm
Manganese	0.5 ppm	15.4 ppm
Molybdenum	0.4 ppm	0.8 ppm
Zinc	0.2 ppm	4.4 ppm
Aluminum	0.2 ppm	1.2 ppm
Boron	1.1 ppm	1.7 ppm
Copper	None	0.01 ppm
Lead	01 ppm	0.4 ppm
Selenium	None	0.4 ppm
Mercury	None	None
Chromium	None	None
Cadmium	None	0.02 ppm
Nickel	None	0.04 ppm
Cobalt	None	0.05 ppm

None = none detected = below detection limits of 0.01 ppm.

    g. Percolation: 60% passing in 2 minutes, 40% retained. Soil should be saturated prior to conducting test.
    h. Other Amendments as required by test results and as approved.
    i. All imported topsoil must meet pollution standards for residential areas.

3. Bioretention Soil Mix

a. Bioretention soil mix is to be used in all detention basins and rain gardens.
b. Mix to consist of 60% coarse sand, 40% submitted Topsoil/Horticultural Soil Mix
c. Topsoil/Horticultural Soil Mix: Refer to specifications listed in section above
d. Coarse Sand

1) Particle Size Analysis

Sieve	Percent passing
3/8 inch (9.5 mm)	100
No 4 (4.75 mm)	95-100
No 8 (2.36 mm)	80-100
No 16 (1.18 mm)	50-85
No 30 (.60 mm)	25-60
No 50 (.30 mm)	10-30
No 100 (.15 mm)	2-10
No 200 (0.75 mm	2-5

2) Chemical Analysis
pH: lower than 7.0
Toxic substance analysis

e. Final Bioretention Mix

1) Particle Size Analysis

a) Sand – 80-85%
b) Silt – 8-15%
c) Clay – 2-8%

2) Chemical Analysis

a) pH – 5.5-6.5
b) Soluble salts: less than 2 mmho/cm

3) Contractor to submit toxic substance analysis and material drainage rate in addition to information listed above. Drainage rate of material to exceed 1 inch/hour

E. Stockpiling and Plant Mixes

1. General: Stockpiling and Plant Mixes utilized for planting soil on-site, off-site and at source should be restricted to no more than the needs of what can be used in a 24-hr. period. Stockpiles should be no more than 6 feet in height to prevent anaerobic conditions within the pile(s). Stockpiles shall be sheltered from weather to prevent excessive water absorption and blowing by winds as approved by Owner's Representative.

2.5 VERIFICATIONS

A. Prior to construction and soil placement operations at planting areas, ascertain the location of all electric cables, conduits, underdrainage systems and utility lines.

B. Take proper precautions so as not to disturb or damage sub-surface elements. Contractor failing to take these precautions shall be responsible for making requisite repairs to damaged utilities at Contractor's own expense.

C. Verify that required underground utilities are available, in proper location, and ready for use. Coordinate with other trades.

D. Verify that all work requiring access through or adjacent to areas where plant mixes are to be placed has been completed and no further access will be required. In the event that access will be required, this must be coordinated with the Owner's Representative.

2.6 PREPARATION OF SUBGRADE

A. Prior to depositing and spreading clean fill, sand and/or plant mix soils, the Contractor shall furnish and install grade stakes on a 10 foot grid in open areas and sufficiently spaced in other areas to insure correct line and grade of subgrade and finished grade.

1. Verify as constructed or existing subgrade elevations and do whatever additional grading is necessary to bring the subgrade to a true, smooth, slope parallel to the finish grade at all areas to receive planting soil for lawns.
2. Clean up subgrade and dispose of all debris and garbage prior to inspection.
3. Scarify compacted subgrades to permit drainage through soil layers. Scarification to occur minimum 6" in planting beds, 12" in rain garden or infiltration basins.

B. Remove all vegetation on subgrade or wherever additional soil is to be added to meet grade.

C. Any soils polluted by gasoline, oil, plaster, construction debris, unacceptable soils, or other substances which would render subgrade unsuitable for a proper lawn or plant growth, shall be removed from the premises whether or not such pollution occurs or exists prior to or during the Contract period. In the event that such material is placed, this material shall be removed and replaced with approved material. All remedial operations associated with soil mixes and controlled fill shall be reviewed and approved by the Owner's Representative responsible for remediation, when applicable.

2.7 PLACING PLANTING SOIL

A. Remove all large clods, lumps, brush, roots, stumps, litter, and other foreign material and stones one-half inch (1/2") in diameter or larger. Dispose of removed material legally off-site.

B. Do not place a muddy or wet soil mix.

C. Place and spread planting soil mix of the type specified over approved subgrade to a depth sufficiently greater than the depth required for planting areas so that after natural settlement, misting and/or light rolling, as previously approved by Owner's Identified Agent, the completed work will conform to the lines, grades, and elevations shown or otherwise indicated.

D. Topsoil/ Planting Soil Mix shall be placed at the following minimum depths, or as otherwise directed by the plans in all areas over natural subsoils.

1. Lawn Areas – 6” minimum
2. Planting Beds – 18” minimum
3. Tree Pits – 36” minimum

E. Grading Tolerances: Lawn and Planting areas shall be fine graded within ±1/10 (0.10) feet of grades indicated on drawings. Maintain all “flat” areas and slopes to allow free flow of surface drainage without ponding.

END OF SECTION 329100

SECTION 329200 – LAWNS AND GRASSES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 32 9000 – Planting

C. Section 32 9100 – Planting Soils

1.2 SCOPE OF WORK

A. Provide lawns, meadow mixes, and sod (if selected by owner) in accordance with the contract documents.

B. Provide stakes and rope for protection of seed during establishment.

1.3 REFERENCES

A. Hortus III - 1976 Edition, Bailey Horatorium, Cornell University.

B. Technical Association of the Pulp and Paper Industry for Wood Cellulose.

C. Contract Drawings and Documents

1.4 EXAMINATION OF SITE AND DOCUMENTS

A. By submitting a bid the Contractor affirms that he has carefully examined the site and all conditions affecting work under this Section. No claim for additional costs will be allowed because of lack of full knowledge of existing conditions.

B. Plans, specifications, surveys, measurements, other documents and dimensions under which the work is to be performed are believed to be correct; but the Contractor shall have examined them for himself during the Bidding period, as no additional compensation will be made for errors for inaccuracies that may be found therein.

1.5 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to

these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.6 SUBMITTALS TO LANDSCAPE ARCHITECT

A. Watering or irrigation plan and schedule, including source of water and methods for encouraging drought tolerance, prior to installation.

B. Maintenance plan through final acceptance, prior to installation.

C. Biweekly reports monitoring performance and corrective actions, after installation.

D. Product Data: Manufacturer's current catalog cuts and specifications of the following:

1. Fertilizer
2. Mulch

E. Certificates:

1. Certificates of inspection as required by law for transportation of each shipment of seed along with invoice.
2. Seed mix certificate including fertilizer and rate of application.
3. Sod mix certificate (if selected by owner).
4. Product certificates for soil amendments and fertilizer, from manufacturer.

1.7 FIELD QUALITY CONTROL

A. Tests: Samples of materials may be taken and tested for conformity to Specifications at any time.

B. Rejected Materials: Remove rejected materials immediately from the site at contractor's expense. Pay cost of testing of materials not meeting Specifications.

1.8 DELIVERY, STORAGE AND HANDLING

A. Seed:

1. Delivery: Furnish standard seed in unopened manufacturer's standard containers bearing quantity, analysis and name of manufacturer
2. Storage: Store seed with protection from weather, rodents or other conditions, which would damage or impair the effectiveness of the product.

B. Sod (if selected by owner):

1. Harvest, deliver, store, and handle sod according to requirements in "Specifications for Turfgrass Sod Materials" and "Specifications for Turfgrass Sod Transplanting and Installation" in TPI's "Guideline Specifications to Turfgrass Sodding." Deliver sod in time for planting within 24 hours of harvesting. Protect sod from breakage and drying.

C. Mulch:

1. Labeling: Each package of the cellulose fiber shall be marked by the manufacturer to show the air dry weight content.
2. Storage: Store seed with protection from weather, rodents or other conditions, which would damage or impair the effectiveness of the product.

1.9 PROJECT/SITE CONDITIONS

A. Existing Conditions: For protection of existing plants to remain, refer to Spec Section 32 90 00 – Planting

1.10 SEQUENCING AND SCHEDULING

A. Period of Application of Hydroseeding:

1. Within fourteen (14) calendar days after the completion of finish grading in any area.

B. Scheduling:

1. Hydroseeding: Perform on a section-by-section basis, upon approval of Landscape Architect, and immediately after finish grading and irrigation installation except for seasonal Limitations.

a. Season: Plant in Fall or Spring.

1) Allow sufficient time for full germination and 2 mowings before preliminary acceptance.

2. Embankment and Slopes: Complete in a continuous manner.
3. Acceptable Planting Window:

a. Place grass seed or sod only at seasonal times within appropriate temperature range and wind conditions for plant development as approved by Landscape Architect:
b. Acceptable Seeding Seasons/Times:

1) Spring: April 1st - June 15th
2) Fall: September 1st - October 15th

c. Seeding or sodding at any time other than within the above seasons shall be allowed only when the Contractor submits a written request for permission to do so and permission is granted in writing by the Owner. Newly seeded or sodded areas, if installed out of season, must be continuously watered according to best recommended and Landscape Architect approved practice. Contractor shall be responsible for providing an acceptable stand of grass as specified.

1.11 WARRANTY

A. The 90 day maintenance period begins with the Landscape Architects certification of substantial completion. The warranty period begins after the final acceptance of the maintenance period. The final acceptance occurs upon satisfactory completion of all work, included in the 90 day maintenance period, but exclusive of replacement of materials under the Warranty Period.

B. Time Period: Warrant that meadows shall be in a healthy and flourishing condition of active growth 18-months from date. Lawn to be in a healthy and flourishing condition of active growth 90-days from growth.

C. Appearance During Warranty: Lawns and sod shall be free of dead or dying patches, and all areas shall show foliage of a normal density, size and color.

D. Delays: Delays caused by the Contractor in completing planting operations, which extend the planting into more than one planting season, shall extend the Warranty Period correspondingly.

E. Coverage: Warrant growth and coverage of hydroseeded planting to the effect that a minimum of 95% shall be covered with specified planting after one growing season with no bare spots.

F. Exceptions: Contractor shall not be held responsible for failures due to neglect by owner, vandalism, etc., during Warranty Period. Report such conditions in writing.

PART 2 - PRODUCTS

2.1 MANUFACTURERS/GROWERS

A. Hydro Mulch and Soil Stabilizer: Obtain mulch and soil stabilizer from a certified source within proximity of the project site.

B. Turfgrass Sod: Certified complying with "Specifications for Turfgrass Sod Materials" in TPI's "Guideline Specifications to Turfgrass Sodding." Furnish viable sod of uniform density, color, and texture, strongly rooted, and capable of vigorous growth and development when planted.

C. Fertilizer:

1. Regular Type: Nitrogen content derived from organic sources; bearing manufacturer's statement of analysis. Minimum requirements: 12% nitrogen, 4% phosphoric acid, 8% potash.
2. Slow-release Type: 50% of nitrogen is in slow-release form. Content derived from organic or inorganic sources; bearing manufacturer's statement of analysis. Minimum requirements: 12% nitrogen, 4% phosphoric acid, 8% potash.
3. Commercial Mixed Type: Nitrogen content derived from organic or inorganic sources, bearing manufacturer's statement of analysis. Minimum requirements: 10% nitrogen, 10% phosphoric acid, 10% potash.

D. Lime: Ground limestone containing not less than 85% carbonates; 50% passing 100 mesh sieve and 90% passing 20 mesh sieve.

E. Seed: Shall be of a mix as specified on the plans furnished in un-opened containers and providing percentage of seed varieties and inert matter. All non-turf seeds shall be purchased and applied at a Pure Live Seed (PLS) rate as indicated on the plans. This may require the contractor to purchase/apply seed at a high rate as measured by bulk weight.

F. Straw Bales: Clean bales of straw of hay, wheat, rye, oats or barley.

G. Hydromulch: Wood cellulose fiber containing no germination inhibiting or growth inhibiting agents. Characteristics shall be as follows:

1. Percent moisture content: 9.0% (+3.0%)
2. Percent organic matter: 99.2% (+0.8).
3. Percent ash content: 0.8% (+0.2%).
4. pH: 4.8 (+0.5).
5. Water Holding Capacity: 1150 grams water/100 grams fiber, minimum.

H. Mulch: Clean, seed free straw of hay, wheat, rye, oats or barley.

I. Staking Pegs: 3/4" diameter by 8" long softwood.

J. Water: Clean, potable.

2.2 ACCESSORIES

A. Mulch: Shall be Product: "Silva Fiber", "X-100 Spra-mulch", or "Conwed".

1. Composition: Green-colored, fibrous, 100% virgin wood fibre mulch containing no growth or germination-inhibiting factors.
2. Weight: Weight specifications of this material from suppliers, and for all applications, shall refer only to air dry weight of the fiber material. Absolute air dry weight is based on the normal standards for wood cellulose and is considered equivalent to 10% moisture.
3. Dispersion in Slurry: Mulch shall be manufactured in such manner that after addition to and agitation in slurry tanks with fertilizer, seed, water and other approved additives, fibers in the material will become uniformly suspended to form a homogeneous slurry.
4. Absorption Capacity: When hydraulically sprayed on the ground, the material will form a blotter-like groundcover impregnated uniformly with seed, which will allow absorption of moisture and allow rainfall to percolate to the underlying soil.

2.3 HYDROSEED EQUIPMENT (if required)

A. Type: Commercial type hydro-seeder for the application of slurry. Equipment shall have a built-in agitation system with an operating capacity sufficient to agitate, suspend and homogeneously mix slurry.

B. Distribution Lines: Large enough to prevent stoppage and to provide even distribution of the slurry over the ground.

C. Pump Capacity: 150 psi at the nozzle.

D. Slurry-Tank: Minimum capacity of 1,000 gallons and shall be mounted on a traveling unit which will place the slurry tank and spray nozzles within sufficient proximity to the areas to be seeded.

2.4 MIXES

A. Hydroseeding Mix per (1,000 Sq. Ft.)

1. Lawn Areas:

a. 30 lbs. - Mulch
b. 7 lbs. - Lawn Seed
c. 10 lbs. - Fertilizer

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of Conditions:

1. Stones, Weeds, Debris: Verify that all areas to receive hydroseeding are clear of stones larger than 1/2 in. diameter, weeds, debris and other extraneous materials.
2. Grades: Verify that grades are within 1 in. plus or minus of the required finished grades. Verify that fertilization have been installed in another section. Report all variations in writing.

3.2 PREPARATION

A. Soil Moisture:

1. Excessive Moisture: Do not commence work of this section when soil moisture content is so great that excessive compaction will occur, nor when it is so dry that dust will form in air or that clods will not break readily.
2. Inadequate Moisture: Apply water, as necessary, to bring soil moisture content to an acceptable level.

3.3 SEEDING

A. Unless indicated otherwise, all "lawn" areas shall be seeded or sodded.

B. Provide soil preparation, seeding, sodding, weeding, watering, and otherwise all labor and materials necessary to secure the establishment of acceptable turf and meadows.

C. After planting soil has been placed, grading is complete, surface soils have been allowed to settle a minimum fourteen (14) days, remedial work is complete, and soil amendments have been applied as specified in this Section, water the planting soil seed bed twelve to twenty-four (12-24) hours prior to seed or sod installation to a depth making the planting soil evenly moist but not overly moist or slippery.

D. Water all seeded areas immediately following seed installation so that the seed bed surface is thoroughly soaked. Cut and maintain established grass in accordance with the requirements specified herein. Perform maintenance on completed areas as installation continues in other areas.

E. Seeding shall not be performed in windy weather.

F. Seeding shall be done in two (2) directions at right angles to each other.

G. Lawn areas shall be seeded by sowing evenly with an approved mechanical seeder at the rate indicated on the Construction Drawings. Culti-packer or approved similar equipment may be used to cover the seed and to form the seed bed in one operation. In areas inaccessible to culti-packer, the seeded ground shall be lightly raked with flexible rakes and rolled with a water ballast roller. After rolling, seeded areas are to be tightly mulched with wheat straw.

H. If the project completion date prohibits in-season planting, the Contractor shall prepare himself for out-of- season seeding so that all lawns shall be completed and ready for acceptance at time of project completion, without additional cost to the Owner. Lawn maintenance shall be the same as for other planting.

I. Lawns shall be maintained by the Contractor for at least 60 days after seeding, or as long as is necessary to establish a uniform stand of the specified grasses, or until substantial completion of the project or until acceptance of lawns, whichever is later.

J. In the event that lawn operations are completed too late in the Fall for adequate germination and/or growth, maintenance shall continue into the following growing season or until a uniform stand of the specified grasses has been established.

K. Water seeded areas twice the first week to a minimum depth of six inches (6") with a fine spray and once per week thereafter as necessary to supplement natural rain to the equivalent of one-inch (1") or to a six inch (6") depth.

L. The surface layer of soil for seeded areas must be kept moist during the germination period. After first cutting, water as specified above.

M. Make weekly inspections to determine the moisture content of the soil and adjust the watering schedule established by the irrigation system installer to fit conditions.

N. After grass growth has started, all areas or parts of areas, which fail to show a uniform stand of grass for any reason whatsoever shall be reseeded in accordance with the plans, and as specified herein. Such areas and parts of areas shall be reseeded repeatedly until all areas are covered with a satisfactory growth of grass at no additional cost to the Owner.

O. Watering shall be done in such a manner and as frequently as is deemed necessary by the Landscape Architect to assure continued growth of healthy grass. All areas of the site shall be watered in such a way as to prevent erosion due to excessive quantities applied over small areas and to avoid damage to the finished surface due to the watering equipment.

P. Water for the execution and maintenance of this work shall be provided by the Owner at no expense to the Contractor. The Contractor shall, however, furnish his own portable tanks, pumps, hose, pipe, connections, nozzles, and any other equipment required to transport the water from the available outlets and apply it to the seeded areas in an approved manner.

Q. Mowing of the seeded areas shall be initiated when the grass has attained a height of two and one-half to three inches (1-1/2" to 2"). Grass height shall be maintained between two and two and one-half inches (2" to 2-1/2") at subsequent cuttings depending on the time of year. Not more than one third (1/3) of the grass leaf shall be removed at any cutting and cutting shall not occur closer than ten (10) days apart.

R. When the amount of grass is heavy, it shall be removed to prevent destruction of the underlying turf. If weeds or other undesirable vegetation threaten to smother the planted species, such vegetation shall be mowed or, in the case of rank growths, shall be uprooted, raked and removed from the area by methods approved by the Landscape Architect.

S. Protect seeded area against trespassing while the grass is germinating. Furnish and install fences, signs, barriers or any other necessary temporary protective devices. Damage resulting from trespass, erosion, washout settlement or other causes shall be repaired by the Contractor at his expense.

T. Remove all fences, signs, barriers or other temporary protective devices after final acceptance.

3.4 HYDROSEEDING

A. Roughen surface to break-up large clods and surface crust, to scarify and remove irregularities that will hold water.

B. Mix specified seed, fertilizer and fiber mulch in water using clean, washed equipment specifically designed for hydroseed application. Continue mixing until uniformly blended into a homogenous slurry suitable for hydraulic application.

C. Apply slurry uniformly to all areas to be seeded in a two-step process.

D. Apply first slurry uniformly at a minimum rate of 500 lbs/acre dry weight but no less than a rate required to obtain the recommended seed-sowing rate of the seed mix supplier.

E. Apply second slurry cover coat of fiber mulch at rate of 1000 lbs/acre.

3.5 SODDING

A. Lay sod within 24 hours of harvesting. Do not lay sod if dormant or if ground is frozen or muddy.

B. Lay sod to form a solid mass with tightly fitted joints. Butt ends and sides of sod; do not stretch or overlap. Stagger sod strips or pads to offset joints in adjacent courses. Avoid damage to subgrade or sod during installation. Tamp and roll lightly to ensure contact with subgrade, eliminate air pockets, and form a smooth surface. Work sifted soil or fine sand into minor cracks between pieces of sod; remove excess to avoid smothering sod and adjacent grass.

C. Lay sod across angle of slopes exceeding 1:3.

D. Retain subparagraph below if required. Steel staple anchors are commonly used.

E. Anchor sod on slopes exceeding 1:6 with wood pegs spaced as recommended by sod manufacturer but not less than 2 anchors per sod strip to prevent slippage.

F. Saturate sod with fine water spray within two hours of planting. During first week after planting, water daily or more frequently as necessary to maintain moist soil to a minimum depth of 1-1/2 inches below sod.

3.6 SEEDING MEADOW AREAS

A. Do not use wet seed or seed which is moldy or otherwise damaged, in transit or storage.

B. Sow seed using a spreader, seeding machine or hydroseeder. Do not seed when wind velocity exceeds 5 mi. per hr. Distribute seed evenly over entire area by sowing equal quantity in 2 directions at right angles to each other. Under no circumstances shall wildflower seeds be mixed with to nurse crop seeds or warm season grass seed in the same spreader or mechanical seeder. Variations in seed size, shape a weight will contribute to uneven application and undesirable results.

C. If spreader is utilized for wildflower seeding, mix sufficient quantity of slightly moist sand with seed to ensure even application of seed. After seeding, rake seed lightly into top 1/8” of soil, roll lightly, and water with a fine spray.

D. If cultipacker or seed drill is used to apply seeds, equipment should be set to install seed at a maximum of ¼” depth followed by firming of the soil to maximize seed/soil contact.

E. Sow not less than the quantity of seed specified or scheduled. If utilizing spreader or seeding machine, protect seeded area against erosion by spreading straw type mulch after completion of seeding operation. If seeds are applied using a hydroseeder, 5-10% of the mulching fiber should be applied with the seeds, the balance should be applied separately a second step for optimal seedling germination. Spread uniformly to form a continuous blanket not less than 1½" thick, loose measurement over seeded areas.

1. If wind is a problem, then anchor mulch by spraying with tactifier at the rate of 10 to 13 gallons per 1000 sq. ft. Take precautions to prevent damage or staining of construction or other plantings adjacent to mulched areas.
2. If a hydroseeder is employed to apply seed, the proper procedures should be followed to minimize the amount of time that seed is circulated through pumps and paddles prior to application. Over circulation may damage the seed.

F. For areas to be seeded before 26 April

1. Areas to be seeded/planted are to be shallow tilled to a depth of 6" to remove existing turf type grasses and weeds, to expose dormant weed seeds and to remove large stones over 1½" in any dimension and sticks, roots, rubbish and other extraneous matter. Limit preparation to areas, which will be planted after preparation. Hand cultivation only will be permitted within the canopy areas of existing trees.
2. Soil amendments, as determined by soil tests, are to be spread and incorporated into topsoil to a minimum depth of 6".
3. Fine grade lawn and wildflower areas to smooth, even surface with loose, uniformly fine texture. Roll, rake and drag meadow areas, remove ridges and fill depressions, as required to meet finish grades.
4. Moisten prepared meadow planting areas to settle soil and amendments. Do not create a muddy soil condition.
5. Approximately two weeks following initial tilling, areas to be seeded/planted are to be treated with a non-selective, glyphosate based herbicide to kill any newly germinated grasses and weeds.

G. For areas to be seeded after 26 April

1. Following the first flush of spring growth on existing turf areas, areas to be seeded/planted are to be mowed to a height of 4" with all debris raked off and disposed of off-site. Areas to be seeded/planted are then to be sprayed with a non-selective glyphosate based herbicide to kill all grasses and forbs.
2. Approximately four weeks after initial spraying, Contractor is to inspect sprayed areas with Architect to determine success of vegetation removal. Follow up spot treatments may be required and shall be applied at that time. Soil amendments, as determined by soil tests, are to be applied to areas to be seeded/planted.

H. Preparation of Unchanged Grades: Where lawns or meadows are to be planted in areas that have not been altered or disturbed by excavating, grading, or stripping operations, prepare soil for lawn planting as follows: Till to a depth of not less than 6"; apply soil amendments and initial fertilizers as specified; remove high areas and fill in depressions; till soil to a homogenous mixture of fine texture, free of lumps, clods, stones, roots, and other extraneous matter. Hand cultivation only will be permitted within the canopy of areas of existing trees.

1. Note: Some limited tree protection areas may require removal of mulch, debris, stumps, herbaceous material, etc. before lawn can he installed.
2. Prior to preparation of unchanged areas, herbicidally treat or physically remove existing grass, vegetation and turf. Dispose of such material properly outside Owner's property; do not turn over into soil being prepared for lawns.

3.7 MAINTENANCE OF MEADOW AREAS

A. General Maintenance Requirements:

1. Maintenance work shall include but not be limited to watering; remedial work such as repair of eroded areas, reseeding, and keeping the area clean. All other work as deemed by the Contractor required in support of his guarantee, or as may be pointed out to the Contractor by the Landscape Architect during the guarantee period shall be provided.

B. In early spring before growth begins, mow to a height of 4 to 6 inches and leave the residue on the ground as a reservoir of viable seed.

1. Refer to plans for additional maintenance notes.
2. For grassy annual weed control, apply post-emergent herbicides such as “Acclaim” or approved equal, as per manufacturer’s recommendations and with written approval of Landscape Architect. Apply twice during first growing season.
3. Selectively apply broadleaf weed control spot spray as required with a broadleaf selective herbicide as recommended by manufacturer twice during first growing season.
4. Apply overseed to wildflower areas original wildflower seed mix at 50% original rate.

3.8 CLEANING

A. Hydroseed Overspray: Immediately after application, thoroughly wash off any plant materials, planting areas, or paved areas not intended to receive slurry mix.

1. Erosion: Immediately restore eroded areas. Keep all adjacent paved surfaces cleaned of dirt, mud or stains and organic debris.

END OF SECTION 329200

SECTION 329353 – LANDSCAPE MAINTENANCE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this section.

B. Section 32 9000 – Planting

C. Section 32 9200 – Lawns and Grasses

1.2 SUMMARY

A. Provide labor, materials, equipment, services and transportation to complete work.

1. Plant and turf maintenance including pruning, watering, drainage, irrigation, fertilizing, weed and pest control, adjusting tree guys, and mulching two times per year during 18-month warranty period.
2. Guaranty and replacement of unacceptable plants.
3. Fall Leaf Cleanup in fall every two weeks prior to acceptance
4. Providing Owner with Maintenance Manual.

1.3 REFERENCES

A. Comply with applicable requirements of:

1. State of Connecticut Department of Transportation (ConnDOT) Standard Specifications for Roads, Bridges and Incidental Construction, Latest addition
2. American Association of Nurserymen, American Standards for Nursery Stock, (ANSI Z60.1), latest edition, published by the American Association of Nurserymen, 1250 I Street, N.W., Suite 500 Washington, D.C. 20005.

1.4 DEFINITIONS

A. Maintenance: consists of keeping turf , woody, perennial and annual plants in healthy growing condition including watering, weeding, cultivating, remulching twice during 18-month warranty period, removal and replacement of dead plant material, resetting plants to proper grades or upright positions and maintaining saucer.

1.5 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to

these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.6 SUBMITTALS

A. Submittals: in accordance with Section 013300 – Submittal Procedures

B. Materials List: provide list of materials to be used in maintenance; materials shall be the same as approved in related sections:

1. Fertilizers, soil amendments, testing see Section 329113 – Planting Soils.
2. Plant materials, mulch, and related materials, see Section 329000 - Planting.

C. Pest and Disease Treatment

1. Submit plan for pest and disease treatment; identify proposed materials and methods.
2. Explain why a problem does or may exist.

D. Maintenance Manual

1. Provide a maintenance manual to Owner describing operations for on-going upkeep of the installed plants. The manual shall address itself to specified types and uses of plants installed, and provide information for care of both newly installed plants and long-term maintenance.
2. Provide specific information on the following items:

    a. Watering: Watering season; diagnosis of watering need; frequency of watering; amount; time of day; methods and equipment; equipment maintenance.
    b. Fertilization: Fertilizing seasons; analysis for fertilizer selection; application rates and methods; preparation and conditions; application times; application equipment; post-application operations and care; precautions for fertilizer use.
    c. Liming: Liming season; analysis for liming; application rate; method and equipment for application.
    d. Pruning: Pruning goals and purposes; methods and techniques (relate to species); equipment; season; cleanup and disposal; precautions.
    e. Mulching of beds: Depths of mulch; refreshment and replacement of mulch.
    f. Miscellaneous plant maintenance: Weeding and weed control; pest and disease control; leaf and litter removal (required every two weeks during the fall if maintenance period is not complete before fall clean-up); bed edging; professional assistance for plant care; and plant replacement as necessary.

3. Include a month-by-month calendar of maintenance procedures, indicating operations listed above.
4. Include a developed Record Keeping document to be completed by the maintenance staff and submitted weekly to the Owner’s Representative during active maintenance period.

5. Submit a copy of maintenance manual to Owner's Representative for approval. Submit prior to planting completion. Owner's Representative may request revisions to manual to meet intent of project design.
6. Submit three copies of manual to Owner at acceptance meeting for planting work. Acceptance shall not be granted until manual has been submitted and approved.

1.7 QUALITY ASSURANCE

A. Qualifications: contractor shall have minimum five years' experience in landscape maintenance.

B. Regulatory Requirements

1. Secure permits, licenses, and pay fees including traffic control.
2. Comply with laws, regulations, and quarantines for agricultural and horticultural products.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Packing and Shipping: deliver materials in unopened containers bearing the manufacturer's name. Transport materials without damage. Protect finishes from abrasion, dirt, oils, grease, and chemicals. Pack materials to protect from weather.

B. Acceptance at Site: verify in writing that delivered materials conform to specifications and approved submittals.

C. Storage and Protection:

1. The owner will not provide areas of storage for the maintenance contractor.
2. Store materials in dry place, on pallets, off the ground; protect from sun.
3. Protect materials from theft, damage, weather, dirt, oils, grease, and construction.

1.9 PROJECT/SITE CONDITIONS

A. Environmental Requirements: do not work soils when dry, wet, or frozen.

1. Field Test

a. Form soil in palm of hand, if soil retains shape and crumbles upon touching, the soil may be worked.
b. If soil will not retain shape it is too dry and should not be worked.
c. If soil retains shape and will not crumble, it is too wet and should not be worked.

B. Planting Seasons: see Section 329000 – Planting

1.10 COMPLETION

A. Upon completion of planting, request Owner's Representative's review to determine if work is substantially complete. If work is complete, Owner's Representative will issue a Letter of Substantial Completion that establishes the effective date of the start of the 18-Month Maintenance Period for plantings and turf.

1. If work is not substantially complete, Owner's Representative will make a list of outstanding work to be done on a timely schedule agreed upon by Contractor and Owner's Representative.

2. Contractor shall notify Owner's Representative when outstanding work is accomplished and ready for review. When outstanding work is complete, in the judgment of Owner's Representative, a Letter of Substantial Completion will be issued.

1.11 PRELIMINARY ACCEPTANCE

A. After the Letter of Substantial Completeness the work will be reviewed for completeness and of Preliminary Acceptance

B. Plantings and turf shall be in thriving and vigorous condition at the time of review for Preliminary Acceptance. If plantings and turf are acceptable, Owner's Representative will issue a Letter of Preliminary Acceptance establishing the effective date of the 18-Month Guaranty Period.

1. If plantings are not thriving, in the judgment of Owner's Representative, remedial actions by Contractor will be required to repair or replace plantings.
2. Remedial work shall be done immediately and in accordance with related work of other sections.
3. At the conclusion of remedial work, Owner's Representative will review work and extend the Guaranty Period to incorporate new plantings.

1.12 FINAL ACCEPTANCE

A. After the 18-month Maintenance and Guaranty Period, plantings and turf will be reviewed.

B. Plantings and turf shall be in thriving and vigorous condition at the time of review for Final Acceptance. If plantings and turf are acceptable, Owner's Representative will issue a Letter of Final Acceptance.

1. If plantings and turf are not thriving, in the judgment of Owner's Representative, remedial actions by Contractor will be required to replace plantings.
2. Remedial work shall be done immediately and in accordance with related work of other sections.
3. At the conclusion of remedial work, Owner's Representative will review work and extend the Maintenance and Guaranty Period until plantings are deemed acceptable.

PART 2 - MATERIALS

2.1 MATERIALS

A. Materials utilized during the maintenance period shall be the same specified in the work of the related sections:

1. Fertilizers, soil amendments, testing, see Section 329113 – Planting Soils.
2. Seed, sod and related materials, see Section 329200 – Turf and Grasses
3. Plants, mulch, and related materials, see Section 329300 - Planting.

2.2 BIOLOGICAL, HORTICULTURAL, HERBICIDAL AND OTHER PEST CONTROL

A. Material Specification: shall be by a licensed pest control operator, with authority to purchase, utilize, and specify agricultural chemicals and agricultural products.

B. Use the least hazardous, least intrusive materials and methods.

2.3 EQUIPMENT

A. Vehicles: in good working order so oil and grease does not stain pavements and poison plantings. Signs identifying the vehicles shall be clearly displayed.

B. Machinery: in good working order so oil and grease does not stain pavements and poison plantings.

2.4 WATER

A. Water: Furnished by Contractor, suitable for irrigation and free from ingredients harmful to plant life.

B. Hoses and other watering equipment to be furnished by Contractor.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of Conditions: in the event field conditions are not as shown on Drawings and outlined in the Specifications, notify Owner's Representative in writing.

3.2 PREPARATION

A. Protection:

1. Agricultural Chemicals: protect site improvements from contact with agricultural chemicals, soil amendments, and fertilizers.

3.3 PRUNING

A. Pruning: prune with approval of Owner's Representative.

1. Remove dead branches, rubbing branches, and branches growing towards plant center.

3.4 DRAINAGE

A. Observe drainage in plant pits with hand soil augur.

B. Verify plant pits are draining; plant pits not draining shall be identified on the plan and brought to the attention of Owner's Representative.

3.5 PLANTS

A. Maintain plants in vigorous condition throughout the Maintenance and Guaranty Periods.

B. Replace plants that are missing, dead, not true to name or size as specified, or not in satisfactory growth, as determined by Owner's Representative. Replace plants found unacceptable within one month or in first month of next growing season, whichever comes first.

C. Plants must show a minimum of 75% healthy head with obvious growth since planting. Signs of disease, injury, or damage shall have been successfully treated or plant shall be rejected as determined by Owner's Representative.

D. Replacements plants shall be same kind and size as specified in plant list. Furnish and plant. Cost of replacement borne by Contractor except where it can be shown loss resulted from vandalism, fire, theft, or other causes beyond Contractor's control. Restore areas damaged or disturbed by replacement operations to their original condition.

3.6 WATERING

A. Water at a rate of one inch of water every five to seven days. Apply water such that it penetrates the soil to a depth of 6”.

B. Trees require a minimum of ten gallons each and shrubs a minimum of five gallons each per week.

C. If spring or fall months experience below average rainfall, periodic watering could be extended as part of this contract and at no additional charge as requested by Owner’s Representative.

D. If natural rainfall provides water to meet watering requirements, weekly watering could be reduced but only at the request of Owner’s Representative.

3.7 BASINS

A. Keep foot tamped and shaped earth dikes around plantings.

3.8 MULCH

A. Maintain mulch at 2” depth in planting areas with the exception of at stems and trunks of plants where mulch to be placed to a 0” depth and increasing to a depth of 2” at edge of rootballs and beyond.

B. Mulching is required two times per year during maintenance period, remove existing mulch as needed to maintain maximum 2” cover.

C. Maintain finish grades around plantings, at pavement edges, and at irrigation fixtures.

3.9 TREATMENT OF PEST AND DISEASES

A. Spray for both insect pests and diseases during maintenance period with notification and permission of Owner’s Representative. Apply herbicides, insecticides and fungicides as prescribed by their manufacturer and in accordance with State laws. Contractor shall possess from the State of Connecticut the proper registrations and permits for application of materials or have applications made by approved, qualified firm holding registrations and permits. Furnish copies of permits in connection with materials to Owner’s Representative. Spraying to be considered only after full consideration has been given to alternative pest control strategies. The least toxic approach to pest control shall be used.

3.10 ADJUSTING

A. Re-set settled plants to proper grade and position.

B. Restore planting saucer and adjacent material.

3.11 CLEANING

A. Clean up, remove and dispose off-site excess planting mixture, soil and debris generated under work of this section.

B. Wash and sweep clean site improvements and building surfaces. Clean spills and oversprays immediately.

C. Repair damage caused by maintenance operations.

3.12 PROTECTION

A. Protect work of this section until Final Acceptance.

B. Protect planted areas and soils from compaction by construction traffic and from contamination by construction materials.

END OF SECTION 329353

SECTION 329400 - ARBORICULTURE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specifications, apply to this section.

B. Section 024113 – Site Demolition

C. Section 311100 – Clearing and Grubbing

D. Section 310000 - Earthwork

E. Section 312333 – Trench Excavation for Utilities

F. Section 334100 – Storm Sewer

G. Section 329200 – Lawns and Grasses

H. Section 329300 – Landscape Planting

1.2 SCOPE OF WORK

A. This Work Included: Provide labor and materials as indication on Drawings and specified to implement basic arboricultural activities for existing trees, as well as construction observation of activities within the Tree Preservation Areas. Scope to include but not limited to

1. Pruning
2. Shade Tree Inventories
3. Diagnosis and Treatment Recommendations
4. Pre Planting Site Analysis, Plant Recommendations
5. Root Pruning
6. Integrated Pest Management
7. Monitor Excavation & Construction within Tree Preservation Area (Section 02200-Earthwork).
8. Disposal and Cleanup

B. Coordinate Work with that of other trades affecting or affected by Work of this Section and cooperate to assure the steady progress of Work.

1.3 REFERENCE STANDARDS

A. National Arborist Association (N.A.A.) Standards

B. American Society of Consulting Arborists

C. American National Standard for Tree Care Operations

1. ANSI Z133.1 – 1994
2. ANSI A300 – 1995

D. American Nurseryman Association Standards

1.4 QUALITY ASSURANCE

A. Arboriculture: comply with all applicable standards of the National Arborist Association (NAA) for pruning, guying, fertilizing and installation of lightning protection systems. Arborist shall have current certification by the International Society of Arboriculture (ISA).

1. All arboricultural work under this section shall be performed by personnel totally familiar with arboricultural work and under the supervision of an experienced foreman and ISA certified arborist.
2. Pruning shall be performed by tree workers who, through a minimum of five years related training and on-the-job experience, are familiar with the techniques and hazards of this work.

B. Analysis and testing of materials required under these specifications shall be in accordance with the current methods of the Association of Official Agricultural Chemists (AOCA) and ASTM.

C. Equipment and Safety

1. Equipment shall be modern and well maintained. Adhere to all applicable state and federal regulations. Contractor shall be responsible for damage to property resulting from equipment, including fluid leakage or damage resulting from equipment failure. Report incidents of this type immediately to Owner's representative.
2. Safety shall be a primary concern while working on the Site. Contractor shall have an established safety program and adhere to NAA, OSHA and ANSI standards applicable to the tree care industry, including electrical and utility requirements as well as personal equipment and safe work procedures.

D. Pesticide Applications

1. Certified Pesticide Applicator shall be responsible for supervision of all applications of fertilizer or pesticides on the site.
2. Pesticides shall be applied in strict compliance with label instructions and all applicable federal, state and local requirements. Material Safety Data sheets shall be available for pesticides in the Contractor's possession while on the site.

E. Arrange a pre-construction meeting between the Landscape Architect, General Contractor and Arboriculture Subcontractor. Such meeting shall seek to review the proposed arboriculture procedures, schedule, consideration of substitutions, and general review of specifications. Note that pruning, fertilization, vertical mulching and mulching activities should be performed prior to the start of construction activities, to improve the vigor of the existing trees to be preserved and to help mitigate the effects of construction stress.

1.5 DEFINITIONS

A. Diameter shall be defined as diameter at breast height (dbh) which is the average tree diameter at 4.5 feet from the ground on the uphill side of the tree.

B. Caliper shall be defined as the diameter of the trunk at 6” above the soil for trees up to 4” in caliper and as the diameter of the trunk at 12” above the soil for trees up to 12” caliper.

C. Root zone shall be defined as 1 (one) foot of radius around trunk for every inch of trunk diameter (at 4.5 feet above the ground level on the uphill side of the tree).

D. Tree Preservation Area shall be defined as all areas outside the limits of construction which contain trees and all areas within the limits of construction which are designated as tree preservation areas on the plans and/or in the field by fencing and signs.

1.6 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project’s environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.7 SUBMITTALS

A. General: Make submittals in accordance with the provisions and procedures of these documents. Render submittals and receive approval prior to delivery or installation. Approval by the Landscape Architect of submitted product data, samples, test reports, and certificates, or material inspected at source of supply, does not constitute final acceptance.

B. Product Data: Submit producers/manufacturers specifications, quality control, product data, and test reports for the following: Include instructions for handling, storage, installation and protection.
   1. All Pesticides, Insecticides, Herbicides, and other chemicals

C. Arboricultural Program: Submit detailed program of Arboriculture work and proposed schedule at the pre-construction meeting.

D. Arborist Qualifications
   1. Include evidence of experience, including project list.
   2. Verification of membership in the National Arborist Association (NAA).

1.8 COORDINATION

A. The work of this Section shall be coordinated with that of other trades affecting, or affected by, this work, as necessary to assure the steady progress of all work of the Contract.

1.9 PERMITS AND CODES

A. All work shall comply with applicable codes, ordinances, rules, regulations, and laws of all local, municipal, and state authorities having jurisdiction. All work necessary to make site preparation comply with such requirements shall be provided without additional cost to Owner.

B. Procure and pay for all permits and licenses required for work under this Section.

1.10 REGULATORY REQUIREMENTS

A. Comply with all rules, regulations, laws and ordinances of local, state and federal authorities having jurisdiction. Provide labor materials, equipment and services necessary to make Work comply with such requirements without additional cost to Owner.

B. Investigate the conditions of public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affecting transportation to and ingress and egress at the site. Conform to all governmental regulations regarding the transportation of materials and secure, in advance, any necessary permits.

C. Procure and pay for permits and licenses required for Work.

1.11 DELIVERY, STORAGE AND HANDLING

A. Packaged Materials: Deliver packaged materials in clearly marked containers showing net weight, guaranteed analysis and name of manufacturer. Specified requirements for packaged materials apply to bulk shipments. Protect materials from deterioration during delivery and during storage at site.

1.12 PROJECT CONDITIONS

A. Existing Conditions

1. Carefully examine the site before submitting a bid. Be informed as to the nature and location of the Work, general and local conditions including climate, adjacent properties and utilities, conformation of the ground, the nature of subsurface conditions, the character of equipment and facilities needed prior to and during execution of the Work. Be aware of and comply with restrictions regarding subsurface utilities and subterranean structures, including excavation and loading parameters.
2. Should the Contractor, in the course of Work, find any discrepancies between Drawings and physical conditions or any omissions or errors in Drawings, or in layout as furnished by the Landscape Architect, it will be his duty to inform the Landscape Architect immediately in writing for clarification. Work done after such discovery unless authorized by the Landscape Architect, shall be done at the Contractor’s risk.

B. Environmental Conditions – Arboriculture

1. Pruning: Pruning shall occur, no later than April 1st, prior to the leafing out of the trees. Pruning shall only occur when weather conditions are favorable; pruning shall not occur when branches are wet with snow or rain or when covered by ice.
2. Fertilization: Spring fertilization shall occur in early spring, before bud break. When leaves have fully expanded, fertilizing can continue until early July Fall fertilization shall occur after October 1st or after the first hard freeze, whichever comes first, when all possibility of top growth in past and before the moisture in the soil freezes casing root activity. Avoid fertilizing between July and September 1.

3. Pest control: Avoid use of herbicides within planting bed. Avoid use of fertilizer/herbicide combinations within the dripline of trees in plant beds.

PART 2 - PRODUCTS

2.1 SOIL AMENDMENT MATERIAL

A. Sand: Natural, medium to coarse grained in texture, free from decomposed organic matter like roots, sticks, leaves, paper and of any other undesirable trash-like glass, plastic or metal fragments, that could interfere with soil drainage and planting operations. Sand shall be salt-free.

B. Ground Limestone: Natural dolomitic limestone containing a minimum of 88% of calcium and magnesium carbonates. Total of 100% passing the 10 mesh sieve; minimum of 90% passing the 20 mesh sieve; minimum of 60% passing the 100 mesh sieve.

C. Water: Potable, clean, fresh and free from harmful materials. Water shall be furnished by the Owner. All hoses and other irrigation equipment required for the Work shall be furnished by the Contractor.

2.2 FERTILIZERS

A. General: As specified below, all fertilizer shall conform to applicable state fertilizer laws. It shall be uniform in composition, free-flowing, and shall be delivered to the site in the original, unopened containers, each bearing the manufacturer’s guaranteed analysis. Any fertilizer which is unsuitable for use will be rejected.

B. Fertilizer: To be determined based on testing.

2.3 MULCH

A. Mulch shall be double shredded hardwood bark.

2.4 PESTICIDES

A. Biological control for trees and shrubs: Bacillus thuringensis, predatory mites, parasitic nematodes, parasitic insects, predatory insects, or other approved biological agents.

B. Miticide for trees: chinomethionate or dicofol.

C. Miticide for trees: chinomethionate or dicofol.

D. Superior oil for trees: horticultural grade, highly refined potassium salts or fatty acids.

E. Insecticides for trees: acephate, cyfluthrin, fluvalinate, chlorpyrifos, bendiocarb, or dimethoate.

PART 3 - EXECUTION

3.1 GENERAL

A. Basic arboriculture shall include all activities as noted in drawings, and shall include other arboriculture activities as described herein. Note that pruning, fertilization, vertical mulching and mulching activities should be performed prior to the start of construction activities, to improve the vigor of the existing trees to be preserved and to help mitigate the effects of construction stress.

B. The Arborist shall monitor excavations and construction within the Tree Preservation Area, including: being on site during all excavations within the Tree Preservation Area to ensure that hand or approved mechanical excavations does not damage existing root systems, and to perform compensatory pruning. The construction that would occur within the Tree Preservation Area would include but not be limited to removal of existing pavements, pavements, and utility trenching.

3.2 PRUNING

A. Pruning – General: Pruning shall conform to ANSI A300 – 2017 standards as specified. Stripping of interior growth on trees is not acceptable. Interior growth may be selectively thinned when appropriate to type of prune. Thinning in general shall be accomplished from the tips of branches by removing diseased, crossing, and/or conflicting branch structure. Target pruning shall be the preferred method of branch removal. Equipment shall be sharp and well maintained. Proper equipment shall be used for all pruning procedures (i.e., handsaw, chainsaw, polesaw, or pole pruner). Employees pruning trees shall have adequate training as to the proper methods and procedures for tree pruning. Refer to ANSI A300 standards for other pruning requirements.

1. On trees known or suspected of being diseased, tools are to be disinfected with methyl alcohol at 70% (denatured wood alcohol diluted appropriately with water) or Clorox solution after each cut and between trees where there is known to be a danger of transmitting the diseased on tools.
2. The presence of any structural weakness, disease conditions, decayed trunk or branches, split crotches or branches, should be reported in writing to the Architect and Owner, and corrective measures recommended.

B. All Trees shall receive a crown cleaning to remove all dead, weak, and conflicting branches 1 (one) inch and larger at the point of attachment. Trees with root zone affected by construction shall receive a slight reduction in the meristematic regions at the branch tips in the crown.

3.3 ROOT PRUNING

A. Root pruning shall be performed in conjunction with Tree Preservation Fencing. Root pruning shall be performed as indicated on Drawings or as required, including: trenching for utilities, excavations for foundations, or wherever grades will be changed within the root zone of the tree to be preserved. Root pruning shall be to the depth of excavation or 24 inches, whichever is less. A trencher or vibratory plow shall be used to prune roots. Roots over 2” in diameter shall have a clean cut made on the surface of the root which is still attached to the tree. This cut shall be made with a hand saw or chain saw as soon as larger root is severed. Where fill is to be placed, root pruning shall be to the depth of top soil.

B. The Arborist must verify exact layout with General Contractor, to ensure root pruning in appropriate location.

C. When root pruning in conjunction with excavation and installation of utilities, the Arborist shall endeavor to work around and preserve the existing tree roots. Make all effort to preserve roots greater than 2" in diameter.

3.4 FERTILIZATION

A. Position Trees shall receive a liquid fertilization. Fertilizer shall be applied at a rate of 1.5 pounds of nitrogen per 1,000 square feet of root zone treated. A root stimulant shall be added for trees with root loss or disturbance or otherwise affected by construction. Fertilizer shall be injected using a soil probe at a depth of six inches. Fertilizer shall be applied in three foot grid pattern evenly distributed throughout the root zone.

3.5 INTEGRATED PEST MANAGEMENT (IPM)

A. Arborist shall provide an IPM technician and equipment to make necessary treatments. Technician shall be trained and licensed to apply necessary controls, and the control methods shall be reviewed and approved by the Arborist.

B. Work shall be completed in accordance with the town of Enfield landscaping standards.

C. IPM technician shall monitor and treat any pests which may inhibit the health or survival of the trees to be preserved. Technician shall make ten monitoring / treatment visits per year. Arborist shall submit a Site Monitoring/Treatment Report following each visit, which describes the pests observed and treatments which were applied, and shall report on other issues observed on Site which may affect survival or the trees.

D. Watering shall be included in IPM program. Water shall be applied to trees during Site Monitoring / Treatment Visits, whenever soil moisture is below 40% of field capacity.

3.6 TREE WOUND CARE

A. Tree wounds shall be treated according to standard practices, by a professional arborist. Wounds shall not be covered with dressings.

3.7 DISPOSAL AND CLEAN UP

A. All refuse and debris from these operations shall be legally disposed of off-site. Material shall be removed or neatly stored at the end of each day's work. Dumping on the site shall not be permitted. Burning of material on the site shall not be permitted.

B. Maintain the site in an orderly condition during the progress of Work. Con tenuously and promptly remove excess and waste materials; keep lawn areas, walks and roads clear. Store materials and equipment where directed. Immediately remove rejected materials from the property. Promptly remove equipment, surplus material, and debris and trash resulting from operations under this Contract upon completion and prior to initial acceptance of Work. Lave the site in a neat, orderly condition, "broom clean".

C. All materials generated by construction activities during this phase of work shall be completely removed at the end of this phase and the site shall be left in a safe and clean conditions.

END OF SECTION 329400

SECTION 331116 – SITE WATER

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 312333 –Trench Excavation and Backfill for Utilities

C. Town of Greenwich Standards and Regulations

1.2 SCOPE OF WORK

A. Work under this Section shall consist of providing all labor, plant facilities, materials, and equipment necessary and required to install all proposed water facilities in accordance with the Contract Documents. This Work shall include but not be limited to:

1. Installation of water mains consisting of pipes, valves, thrust blocks, meter pits, hydrants, and all necessary and required accessory items and operations.

B. Coordination of the connection of building fire service lines to the on-site water mains with the Building Contractor.

C. Sterilization and testing of new water facilities.

1.3 SUBMITTALS

A. Product Data: Provide manufacturer's certificate for castings, pipe and accessories to certify that products meet or exceed specified requirements.

B. Shop drawings of hydrants, valves, and valve boxes.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Ductile Iron Pipe: AWWA C151-91. Thickness Class 54 or better. Push-on joint complying with AWWA C110-90 or C153, rubber gaskets. Cement mortar lining complying with AWWA C104-90 for pipe and fittings minimum 1/16” thick. Note this type of pipe is most preferred and must be used for all lines 4” in diameter or greater.

B. Control Valves:

1. General: Provide valves and flow control devices as indicated.
2. Minimum Working Pressure: 200 psi unless otherwise indicated, or required.
3. Valves shall open left.
4. Gate Valves: Standard shut off valves with maximum working pressure cast into body, outside screw and yoke type complying with AWWA C500.

5. Check Valves: Gravity operated, regular type, iron bodied, bronze fitted with metal to metal rubber faced checks, complying with AWWA C506.
6. Butterfly Valves: Rubber seated, equipped with gear or traveling nut actuator to minimize water hammer, complying with AWWA C504.

C. Valve Boxes: Minimum 5-1/4" diameter cast iron, slide type. Covers shall be non-locking and have the word WATER in the casting.

D. Accessories:

1. General: Provide anchorages for tees, plugs, caps, and bends. After installation, apply a full coat of asphalt or other acceptable corrosion retarding material to surfaces of rods and clamps.
2. Clamps, Straps and Washers: Steel, ANSI/ASTM A506.
3. Rods: Steel, ANSI/ASTM A575.
4. Rod Couplings: Malleable iron, ANSI/ASTM A197.
5. Bolts: Steel, ANSI/ASTM A307.
6. Cast Iron Washers: ANSI/ASTM A126, Class A.
7. Trust Blocks: 2,500 psi concrete. Use at all changes in directions and elsewhere as necessary.
8. Fittings: Fitting should be short body, cast iron or ductile iron, and should conform and be installed per applicable AWWA C110/A21.10-82 or C153/A21.53-84.
9. Water Service Identification: Blue metallic tape reading 'WATER LINE BURIED

E. Joints:

1. Restrained: 1700 series by EBAA Iron or field lock gaskets
2. Retaining Glands: 'Megalug' with a minimum working pressure of 250 psi, or approved equal

F. Hydrants:

1. Per drawings and local utility Specifications.
2. 3-way hydrant with a 5-1/4" valve and mechanical joint connections in accordance with AWWA C502, open left, as manufactured by Mueller or approved equal.

G. Concrete Valve Seats: Concrete for valve seats shall have a minimum compressive strength of 3,000 psi in 28 days.

PART 3 - EXECUTION

3.1 GENERAL

A. The Contractor shall install all water pipe in the locations as shown on the Drawings and/or as approved by the Owner's Representative. Pipe shall be of the type and sizes specified and shall be laid accurately to line and grade. Structures shall be accurately located and properly oriented. Installation should conform with applicable AWWA Standards for the installation of water mains.

3.2 EXCAVATION AND BACKFILL

A. The provisions of Section 312333 entitled "Trench Excavation and Backfill for Utilities" shall govern all work under this Section.

B. The bottom of the trench shall provide a minimum of 4-1/2’ of cover over the crown of the pipe. Stones are not permitted at the bottom of the trench or in contact with the pipe in any location.

C. Sand bedding shall be installed to line and grade as shown on the Contract Drawings. Bedding shall provide continuous and uniform support along the entire length of the pipe.

D. Backfill shall be in accordance with Section 312333, entitled “ Trench Excavation and Backfill for Utilities”

E. Metallic tape reading ‘WATER LINE BURIED BELOW’ shall be placed in trench along entire length of water line.

F. The trench shall be kept free of water throughout pipe installation in accordance with Section 312319, entitled “Dewatering”

G. Contractor shall plug open ends of pipe overnight with an inflatable rubber plug, or approved equal.

3.3 STORAGE AND HANDLING PIPE

A. All pipes shall be protected against impact, shock and free fall, and only equipment of sufficient capacity and proper design shall be used in the handling of the pipe. Storage of pipe on the job shall be in accordance with the pipe manufacturer's recommendations, subject to the approval of the Owner's Representative.

3.4 DAMAGE TO PIPE

A. Pipe which is defective from any cause, including damage caused by handling, and determined by the Owner's Representative as unrepairable, shall be unacceptable for installation and shall be replaced at no cost to the Owner as directed by the Owner's Representative.

B. Pipe that is damaged or disturbed through any cause prior to acceptance of the Work shall be repaired, realigned or replaced as directed by the Owner's Representative, at the Contractor's expense.

3.5 PIPE INSTALLATION

A. The installation of water pipe shall conform to the requirements of AWWA standards and shall be laid to required lines and grades.

B. Laying Pipe - Each length of pipe shall be laid with firm, full and even bearing throughout its entire length, in a trench prepared and maintained in accordance with Section 312333 entitled "Trench Excavation and Backfill for Utilities”. All pipe shall have sufficient cover above the top of the pipe, and must be laid in separate trenches at least ten feet from the sewer pipe. Crossing of other facilities must have 12 inch minimum clearance (18 inches minimum clearance from sanitary).

C. Every length of pipe shall be inspected and cleaned of all dirt and debris before being laid. The interior of the pipe and the jointing seal shall be free from sand, dirt and trash before installing in the line. No pipe is to be trimmed or chipped to fit.

D. No length of pipe shall be laid until the preceding lengths of pipe have been thoroughly embedded in place, so as to prevent movement or disturbance of the pipe.

E. Full Length of Pipe - Full lengths of pipe are to be used whenever possible to minimize the amount of cutting and splicing in the field.

F. Bedding and Backfilling - The type of materials to be used in bedding and backfilling and the method of placement shall conform to the requirements of Section 312333 entitled "Trench Excavation and Backfill for Site Utilities", Section 3.2 above, and as shown on the Details on the Drawings.

G. Protection During Construction - The Contractor shall protect the installation at all times during construction, and movement of construction equipment, vehicles and loads over and adjacent to any pipe shall be performed at the Contractor's risk.

H. At all times when pipe laying is not in progress, all open ends of pipes shall be closed by temporary watertight plugs. If water is in the trench when work is resumed, the plug shall not be removed until the trench has been pumped dry and all danger of water entering the pipe has passed.

3.6 PIPE JOINTS

A. All joints are to be made water-tight and shall be tested in accordance with the requirements of the Water Company.

B. Pipe shall be jointed in strict accordance with the pipe manufacturer's instruction. Jointing of all pipe shall be done entirely in the trench.

C. At all tees, bends, dead ends and hydrant, joint restraint shall be provided on the first two joints on either side of the fitting.

D. Install retaining glands at all mechanical joint locations per manufacturer’s installation method.

3.7 THRUST BLOCKS

A. Thrust blocks shall be constructed at all bends by placing a minimum of one-third cubic yard of concrete for each fitting at the undisturbed side of excavation. The thrust block construction shall be adequate to sustain the imposed load. Placement of thrust blocks shall conform to the details and schedule of the Drawings.

3.8 CONNECTION TO EXISTING FACILITIES

A. General - The Contractor shall make all required connections of the proposed water lines into existing water facilities, where and as shown on the Drawings and/or as approved by the Owner's Representative. Connections shall be performed by a Contractor approved by the local utility company. The Contractor shall perform any investigation measures including, but not limited to, exploratory test pits to confirm the point of tie-in and avoidance of other utilities. All investigation measures should be performed a minimum of two weeks prior to the start of water main installation work. Notify engineer of any conflicts. The Contractor shall be responsible for relocating utilities in conflict.

B. Compliance with Requirements of Owner of Facility - Connections into existing water facilities shall be performed in accordance with the requirements of the Owner of the facility. The Contractor shall be required to comply with all such requirements, including securing of all required permits, and paying the costs thereof. The cost of making the connections in accordance with the requirements of the owner of the existing facility shall be included in the Contract Sum.

3.9 SERVICE LINES

A. General - The Contractor shall terminate the water laterals five feet from the building. Work shall include making the service line connections into the on-site water mains, furnishing and installing all service line pipe from the on-site water main systems to points located five feet outside of the proposed building lines and properly sealing the ends with watertight plugs. Service line extensions from these points into the building will be performed by the Building Contractor.

B. Coordination with Building Contractor - The Contractor shall be required to coordinate his work with the work of the Building Contractor to determine the exact location and elevation of the point of entry into the building. If the Building Contractor has installed his portion of the water service line, work under this Contract shall also include final connection of the water service line five feet outside the building line to the building service line at no additional cost to the Owner. The Contractor shall review the latest architectural/ mechanical plans to verify the location of the service laterals.

C. Connection into On-Site Water System - Water service line connections to the pipe of the on-site water mains shall be made with proper fittings supplied by the pipe manufacturer and as shown on the Drawings in a manner satisfactory to the Owner's Representative.

D. Connection into Off-Site Water System - Water service line connections to the pipe of the off-site water mains shall be made with proper fittings supplied by the pipe manufacturer and as shown on the Drawings in a manner satisfactory to the local authorities.

3.10 STERILIZING

A. All new water lines shall be flushed, sterilized and inspected prior to being put into service and the final connection(s) made to the existing system. Contractor shall sterilize lines in accordance with AWWA C601 or the local utility requirements, whichever is more restrictive.

B. The contractor is responsible for properly disposing of any chlorinated water in accordance with all State and Federal regulations. Any required permits for this work is also the responsibility of the contractor.

3.11 TESTING

A. General: The Contractor shall coordinate and perform all required testing in connection with water line installation. Hydrostatic and leakage tests shall be performed in accordance with the latest edition of AWWA C600 or the local utility requirements, whichever is more restrictive.

B. Scheduling of pressure and leakage tests shall be coordinated with the local water company and performed in the presence of local water company personnel.

C. Contractor shall furnish all necessary items to complete the required tests. Items include, but are not limited to:

Temporary plugs or caps
Pumps
Water meter
Pressure guage

D. Pipes proposed to be encased in concrete shall be tested prior to placing of the concrete.

3.12 FINAL INSPECTION

A. Upon completion of the Work and before final acceptance by the Owner, the entire water system may be subjected to a final inspection in the presence of the Site Engineer and/or Owner's Representative at the Owner's discretion. The Work shall not be considered as complete until all requirements for line, grade, cleanliness, leakage tests and workmanship have been met.

END OF SECTION 331116

SECTION 333000 – SITE SANITARY SEWERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 310000 – Earthwork

C. Section 312333 –Trench Excavation and Backfill for Site Utilities

D. Town of Greenwich Standards and Regulations

1.2 SCOPE OF WORK

A. This Work under this section of the specifications shall consist of providing all labor, plant facilities, materials and equipment necessary to install all of the sanitary sewer facilities. This work shall include but not be limited to:

1. Installation of sanitary sewers consisting of manholes, pipe, cleanouts, laterals, wye connections, and all necessary and required accessory items and operations as shown on the Details and Drawings.
2. Connection to existing sanitary sewer facilities.

B. All necessary coordination with governing sewerage authority including local sewerage authority and local health department.

C. Testing of sanitary sewer system.

D. Abandonment and removal of existing sanitary sewer pipes and manholes.

1.3 SUBMITTALS

A. Product Data: Provide manufacturer's certificate for castings, pipe and accessories to certify that products meet or exceed specified requirements.

B. Submit shop drawings of the precast structures to the Owner’s Engineer for review prior to fabrication. Shop drawings shall include dimensions, reinforcing, joint treatment, invert elevations and invert locations.

C. Submit shop drawings of structure tops including frames and covers.

D. Anti-buoyancy calculations, if necessary

PART 2 - PRODUCTS

2.1 MATERIALS

A. The Contractor shall install materials based on this specification or per local specifications, whichever is more restrictive.

B. Polyvinyl Chloride (PVC) Pipe: ASTM D3034-93 for pipe and fittings, minimum wall thickness of SCH-40 or SDR-35 as indicated on drawings. Provide minimum three feet of pipe cover in pavement areas.

C. Precast Concrete Manholes: AASHTO M199-93/ASTM C478-90b, rated for H20 loading, with concrete strength of 4,000 psi.

D. Manhole Frames and Covers: Gray iron casting, AASHTO M105-93/ASTM A48, Class 30B. Pattern number as specified by the local authority or approved equal. All openings to comply to OSHA confined space access diameter. The word sewer is to be on the cover or as specified by the local sewage authority.

E. Manhole Steps: Aluminum alloy 6016T6 steps, manufactured by Alco or approved equal.

F. Cleanouts: Iron body type with extra heavy bronze plugs. Cover shall consist of Neenah Foundary Company Pattern No. R-1914 with locking cover, or approved equal.

G. Pipe joint: Rubber compression gaskets meeting ASTM D 3212.

PART 3 - EXECUTION

3.1 GENERAL

A. The Contractor shall install all sanitary sewer structures and pipe in the locations as shown on the Drawings and/or as approved by the Owner's Representative. Pipe shall be of the type and sizes specified and shall be laid accurately to line and grade. Structures shall be accurately located and properly oriented.

3.2 EXCAVATION AND BACKFILL

A. The provisions of Section 312333 entitled “Trench Excavation and Backfill for Utilities” shall govern all Work under this Section.

3.3 STORAGE AND HANDLING OF PIPE

A. All pipe shall be protected against impact, shock and free fall, and only equipment of sufficient capacity and proper design shall be used in the handling of the pipe. Storage of pipe on the job shall be in accordance with the pipe manufacturer's recommendations, subject to the approval of the Owner's Representative.

3.4 DAMAGE TO PIPE

A. Pipe which is defective from any cause, including damage caused by handling, and determined by the Owner's Representative as unrepairable, shall be unacceptable for installation and shall be replaced at no cost to the Owner as directed by the Owner's Representative. Damaged pipe shall be immediately marked with white paint and separated from usable pipe on site.

B. Pipe that is damaged or disturbed through any cause prior to acceptance of the Work shall be repaired, realigned or replaced as directed by the Owner's Representative, at the Contractor's expense.

3.5 PIPE INSTALLATION

A. Laying Pipe - Each length of pipe shall be laid with firm, full and even bearing throughout its entire length, in a trench prepared and maintained in accordance with Section 312333 entitled “Trench Excavation and Backfill for Utilities”. Pipe will be laid with bells upgrade.

B. Every length of pipe shall be inspected and cleaned of all dirt and debris before being laid. The interior of the pipe and the jointing seal shall be free from sand, dirt and trash before installing in the line. Extreme care must be taken to keep the bells of the pipe free from dirt and rocks so that joints may be properly assembled without over stressing the bells. No pipe is to be trimmed or chipped to fit.

C. No length of pipe shall be laid until the preceding lengths of pipe have been thoroughly embedded in place, so as to prevent movement or disturbance of the pipe.

D. Full Lengths of Pipe - Only full lengths of pipe are to be used in the installation except that partial lengths of pipe may be used at the entrance to structures where necessary to obtain a proper connection to the structure.

E. Pipe Entrances to Structures - All pipe entering structures shall be cut flush with the inside face of the structure, and the cut ends of the pipe surface of the structure shall be properly rounded and finished so that there will be no protrusion, ragged edges or imperfections that will impede the flow of water or affect the hydraulic characteristics of the installation.

F. Bedding and Backfilling - The type of materials to be used in bedding and backfilling and the method of placement shall conform to the requirements Section 312333 entitled “Trench Excavation and Backfill for Utilities” and as shown on the Details of the Drawings.

G. Protection During Construction - The Contractor shall protect the installation at all times during construction, and movement of construction equipment, vehicles and loads over and adjacent to any pipe shall be performed at the Contractor's risk.

H. At all times when pipe laying is not in progress, all open ends of pipes shall be closed by temporary water tight plugs. If water is in the trench when work is resumed, the plug shall not be removed until the trench has been pumped dry and all danger of water entering the pipe has passed.

I. Tolerance - Pipe shall be laid accurately to the line and grade as shown on the Drawings and/or as approved by the Owner's Representative. Allowable tolerances shall be 1/4 inch in grade and 1/2 inch in line in any section of pipe between manholes. No adverse grades shall be allowed. Deviations from these tolerances shall be grounds for rejection of the line of pipe by the Owner's Representative. Any line which has been rejected shall be rebuilt to the correct line and grade by the Contractor at his own expense.

J. Do not lay the sanitary sewer line closer than ten feet horizontally or 1.5 feet vertically to a water main or service line. Where sanitary sewer lines pass above water lines, encase the sewer in six inches of concrete for a distance of ten feet on each side of the crossing or substitute rubber-gasketed pressure pipe for the pipe being used for the same distance if approved by the appropriate sewerage authority.

3.6 PIPE JOINTS

A. All joints are to be made watertight in accordance with the requirements specified herein.

B. Pipe shall be jointed in strict accordance with the pipe manufacturer's instructions. Jointing of all pipe shall be done entirely in the trench.

C. Where sanitary sewer lines pass below water lines, lay pipe so that no joint in the sewer line will be closer than 3 feet horizontally to the water line.

D. Where sanitary sewer lines pass less than 18 inches below the water line, provide concrete encasement. The length of encasement is to be increased to the nearest joint beyond the specified horizontal offset distance.

E. Make joints between ductile-iron pipe and other types of pipe with standard manufactured ductile-iron adapters and fittings or as directed by the local sewerage authority. Install ductile-iron piping and fittings in accordance with the recommendations of the pipe manufacturer.

3.7 MANHOLES AND OTHER PRECAST STRUCTURES

A. General Requirements - All manholes shall be built in accordance with the Details and in the locations shown on the Drawings and as specified herein.

B. Structures shall be constructed of precast concrete. Precast structures will require Shop Drawing approval by the Owner's Representative and/or the Site Engineer.

C. No concrete shall be poured when the temperature is below 40 degrees Fahrenheit, or when indications are for lower temperatures within 24 hours, unless protection of concrete is approved by the Owner's Representative.

D. Manholes are to be constructed as soon as the pipe-laying reaches the location of the manhole. Should the Contractor continue his pipe-laying without making provision for completion of the manhole, the Owner's Representative shall have the authority to stop the pipe-laying operations until the manhole is completed.

E. Any manhole which is mislocated or oriented improperly shall be removed and rebuilt in its proper location, alignment and orientation at the Contractor's expense.

F. Foundations - All foundations shall rest on firm ground of uniform bearing.

G. Inverts - Smooth concrete invert channels shall be constructed in all manholes to insure a smooth flow of water through the structure.

H. The invert channels shall be carried up to the elevations shown on the Drawings and/or as approved by the Owner's Representative. Channels shall slope smoothly and evenly from the entrance pipe to the outlet pipe.

I. Frames, Covers and Gratings - Frames, covers and/or grating for manholes shall be of the type and size indicated on the Drawings or as required by the local authority. Frames shall be well bedded in mortar and shall be set accurately to the correct alignment and grade.

J. Ladder Rungs - Ladder rungs shall be installed in all manholes, spaced 12 inches on center vertically and staggered. Rungs shall be set securely in place during the construction of the masonry wall.

K. Precast Manhole - Precast manholes shall be installed only after Shop Drawings have been approved. Any manholes required by the appropriate utility shall be fabricated, bedded, located and backfilled in accordance with said utility requirements and recommendations.

L. The top grade of the precast concrete corbel section shall be set sufficiently below finished grade to permit a maximum of four and a minimum of two courses of eight inch brick to be used as risers to adjust the grade of casting. Manhole frames shall be set on a grout pad as specified herein above.

M. Bitumastic coating - The entire exterior surface of all manholes shall be coated with two coats of an approved bitumastic material to produce a dry film thickness of 0.07 inches (7 mils) per coat.

3.8 INTERFACE WITH EXISTING FACILITIES

A. Requirements: The Contractor shall make all required connections of the proposed sanitary sewer facilities into existing sanitary sewer facilities, where and as shown on the Contract Documents and/or as approved by the Owner's Engineer.

B. Compliance with Facility Owner Requirements: Connections made into existing sanitary sewer facilities shall be performed in accordance with the requirements of the Owner of the facility. The Contractor will be required to comply with all such requirements, including securing of all required permits, and paying the costs thereof. The cost of making the connections in accordance with the requirements of the Owner of the existing facility shall be included in the Contract Sum.

3.9 MODIFICATIONS OF EXISTING STRUCTURES

A. General: The Contractor shall alter, reconstruct and/or convert existing structures where and as shown on the Contract Documents, and/or as approved by the Owner's Engineer. In general, alterations shall be performed with the same type of material used in the original construction unless otherwise indicated on the Contract Documents of approved by the Owner's Engineer.

B. Damage to Existing Installations: The Contractor shall exercise extreme care during such alteration, reconstruction and/or conversions so as not to damage any portions of the structure and/or pipe shown to remain. Any Such damage shall be repaired by the Contractor at his own expense and to the satisfaction of the Owner's Engineer and Owner of the damaged structure.

C. All existing sanitary sewer manhole covers, rims, and structures to remain shall be adjusted to proposed grade.

3.10 SERVICE LINES

A. General - The Contractor shall terminate sanitary laterals five feet from the building.

B. Coordination with Building Contractor - The Contractor will be required to coordinate his work with the work of the Building Contractor to determine the exact location and elevation of the point of entry into the building. If the Building Contractor has installed his portion of the sanitary sewer service line, work under this contract shall also include final connection of the sanitary sewer service line five feet outside the building line to the building service line at no additional cost to the Owner. The Contractor shall consult the latest architectural/mechanical drawings to confirm lateral locations.

3.11 INSPECTION AND TESTING

A. General - The Contractor shall test the completed sewers, including manholes and laterals for leakage by low-pressure air test, infiltration and exfiltration tests as specified herein and any other testing required by the local sewer authority. The Contractor shall furnish all necessary equipment, materials and labor for performing the tests as specified. The Contractor shall notify the Owner's Representative and the sewage authority at least 48 hours prior to the start of testing. Sections of pipe tested for infiltration and exfiltration prior to completion of the project shall be subject to additional leakage tests, if warranted in the opinion of the Owner's Representative, and/or the sewage authority prior to acceptance of the project.

B. Infiltration and Exfiltration Testing - The test length intervals for either type of leakage test shall be approved by the Owner's Representative and the sewage authority, but in no event shall they exceed 1000 feet. In the case of sewers laid on steep grades, the length of line to be tested by exfiltration at any one time may be limited by the maximum allowable internal pressure on the pipe and joints at the lower end of the line.

C. The test period, wherein the measurements are taken shall not be less than four hours in either type of test.

D. Leakage Requirements - The total leakage of any section tested shall not exceed the rate of 50 gallons per day per mile per inch of nominal pipe diameter. For purposes of determining the maximum allowable leakage, manholes shall be considered as sections of 48 inch diameter pipe, five feet long, and the equivalent leakage allowance shall be 2.25 gallons per manhole per 24 hours. Depending on field conditions, the following test for leakage shall be employed:

1. Infiltration Test - The test may be used only when groundwater levels are at least four feet above the highest point of the crown of the sewer being tested and after the trench has been backfilled and compacted. The groundwater leakage into the pipe will be measured near the lower end of the section of sewer under test.
2. Exfiltration Test - This test consists of filling the pipe with water to provide a head of at least five feet above the top of the pipe or five feet above groundwater, whichever is higher, at the highest point of the pipe line under test, and measuring the loss of water from the line by the amount which must be added to maintain the original level. In this test, the line must remain filled with water for at lest 24 hours prior to the taking of measurements. Exfiltration shall be measured by the drop of water level in a closed-end standpipe or in one of the sewer manholes available for convenient measuring.When a standpipe and plug arrangement is used in the upper manhole of a line under test, there must be some positive method of releasing entrapped air in the sewer prior to taking measurements.

E. Low Pressure Air Testing - The sewer mains and/or laterals shall be tested for leakage by the use of low-pressure air as specified hereinafter or by the local sewage authority and as approved by the Owner's Representative. The test length shall not exceed one interval of pipe between two manholes. Air test procedures may be dangerous and the Contractor shall take all necessary precautions to prevent blowouts.

F. The proper procedure for air testing of sanitary sewers shall be as described in ASTM C-828, latest edition, entitled "Recommended Practice for Low-Pressure Air Test of Vitrified Clay Pipe Lines (4-12 inches)". Although the title specifies vitrified clay pipe, the same procedure maybe used for any other pipe material.

G. It is important that test plugs be properly installed to prevent blowouts. It is also important to maintain pressure relief devices to prevent system over pressurization.

H. Correction of Defective Work - If leakage exceeds the specified amount, the Contractor shall, at his own expense, make the necessary repairs or replacements required to permanently reduce the leakage to within the specified limit, and the tests shall be repeated until the leakage requirement is met.

I. Any defects found in the system are to be repaired at the expense of the Contractor so as to conform strictly to the Specifications and to the satisfaction of the Owner's Representative. All repairs shown necessary by the tests are to be made, broken or cracked pipe replaced, all deposits removed, and sanitary sewer left true to line and grade and entirely clean, free from lumps of cement, protruding gaskets, bulkheads, etc., and ready for use before final acceptance by the Owner.

J. Compliance with Agency Requirements - In the event of conflict between the leakage test requirements specified herein with the leakage test requirements of agencies having jurisdiction over all or any portion of the sanitary sewers installed under this Contract, the more restrictive requirements shall govern.

3.12 CLEANING AND REPAIR

A. The Contractor will be required to clean the entire sanitary sewer system of all debris and obstructions. This shall include, but not be limited to removal of all formwork from structures, concrete and mortar droppings, construction debris and dirt. The system shall be thoroughly flushed clean and the Contractor shall furnish all necessary hose, pumps, pipe and other equipment that may be required for this purpose. No debris shall be flushed into existing sanitary sewers or streams; all debris shall be removed from the system.

B. After the system has been cleaned, the Contractor shall thoroughly inspect the system and all repairs shown to be necessary shall be promptly performed by the Contractor.

C. All work of cleaning and repair as specified herein shall be performed at the Contractor's expense and to the complete satisfaction of the Owner's Representative.

3.13 FINAL INSPECTION

A. Upon completion of the Work and before final acceptance by the Owner, the entire sanitary sewer system shall be subjected to a final inspection in the presence of the Site Engineer and/or Owner's Representative and local sewerage authority. The Work shall not be considered as complete until all requirements for line, grade, cleanliness, leakage tests and workmanship have been met.

END OF SECTION 333000

F. Section 312500 - Soil Erosion and Sediment Control

G. Section 333100 Sanitary Sewerage System

H. Section 321313 - Portland Cement Concrete Paving

I. Local governing authority and code requirements.

J. All necessary construction permits.

K. Contract Documents

L. Town of Greenwich standard requirements

1.2 SCOPE OF WORK

A. Work under this section shall consist of providing all labor, plant facilities, materials, tools, equipment, shop drawings and supervision necessary and required to install all of the storm drainage facilities as specified in accordance with the Contract Documents. This work shall include but not be limited to:

1. Installation of the drainage system consisting of manholes, catch basins, pipes, yard drains, cleanouts, flared end sections, stormwater management units, water quality units and all necessary and required accessory items and operations.
2. Connections to existing drainage facilities.

1.3 REFERENCE STANDARDS

A. American Society for Testing and Materials (ASTM) latest edition.

1. A706 Type 1R
2. C14 Concrete Sewer, Storm Drain, and Culvert Pipe.
3. C55 Concrete Building Brick.
4. C76 Reinforced Concrete Culvert, Storm Drain, and Sewer Pipe.
5. C443 Joints for Circular Concrete Sewer and Culvert Pipe, Using Rubber Gaskets.

6. C478 Precast Reinforced Concrete Manhole Sections.
7. C923 Resilient Connectors between Reinforced Concrete Manhole Structures and Pipes.
8. D1557 Test Methods for Moisture Density Relations of Soils and Soil Aggregate Mixtures Using 10 lb (4.54 Kg) Rammer and 18 inch (457 mm) Drop.
9. D2922 Test Methods for Density of Soil and Soil Aggregate in Place by Nuclear Methods (Shallow Depth).
10. D3017 Test Methods for Moisture Content of Soil and Soil Aggregate Mixtures.

B. American Association of State Highway and Transportation Officials (AASHTO) - latest edition

C. International Masonry Industry All-Weather Council (IMIAC): Recommended Practices and Guide Specification for Cold Weather Masonry Construction.

1.4 QUALITY ASSURANCE

A. An Engineer, selected and paid by the Owner (herein referenced to as “Owner’s Engineer”), may be retained to perform construction inspection on-site based on measurement, visual observation, and judgment.

B. Visual field confirmation may be performed by the Owner’s Engineer as part of the construction testing requirements.

C. All costs related to reinspection due to failures shall be paid for by the Contractor at no additional expense to Owner. The Owner reserves the right to direct any inspection that is deemed necessary. Contractor shall provide free access to site for inspection activities.

1.5 SUBMITTALS

A. Product Data: Provide manufacturer's certificate for castings, pipe and accessories to certify that products meet or exceed specified requirements.

B. Submit shop drawings of the precast structures to the Owner’s Engineer for review prior to fabrication. Shop drawings shall include dimensions, reinforcing, joint treatment, invert elevations and invert locations.

C. Submit shop drawings of structure tops including frames, covers, and/or grates.

D. Submit shop drawings of the below grade stormwater management system including material, layout, elevations, pipe connection locations, inspection ports, access locations, and backfill requirements.

1.6 PROJECT RECORD DOCUMENTS

A. Accurately record actual locations of pipe runs, connections, catch basins, cleanouts, and invert elevations.

B. Identify and describe unexpected variations to subsoil conditions and location of uncharted utilities.

1.7 COORDINATION

A. Coordinate the Work with termination of storm sewer connection outside building including connection to existing storm sewer system.

PART 2 - PRODUCTS

2.1 SEWER PIPE MATERIALS AND ACCESSORIES

A. Reinforced Concrete Pipe (RCP): Straight and flared end sections complying with requirements of ASTM C 76, Class III unless another class type is indicated on the Contract Documents, installed with flexible plastic (Bitumen) gaskets at all joints. Gaskets shall comply with AASHTO M 198 75I, Type B, and shall be installed in strict accordance with pipe manufacturer's recommendations.

B. Corrugated High Density Polyethylene Pipe (HDPE): Shall conform to AASHTO Designation M294 and M252. Pipe must be installed in accordance with pipe manufacturer’s installation Guidelines for Culvert Storm Drainage Applications. Acceptable manufacturers: Advanced Drainage Systems, Inc. “ADS N-12” and HANCOR, Inc. “Hi-Q” or approved equal.

C. Polyvinyl Chloride Pipe (PVC)

1. On-site pipe and fittings shall comply with ASTM D 3034, rated SDR 35 unless otherwise specified on the Contract Documents or required by the local utility. Pipe shall be continually marked with manufacturer's name, pipe size, cell classification, SDR rating, and ASTM D 3034 classification.
2. Pipe joints shall be integrally molded bell ends per ASTM D 3034, Table 2, with factory supplied elastomeric gaskets and lubricant.

2.2 CATCH BASINS, INLETS, MANHOLES AND COMPONENTS

A. General: All manholes, catch basins and drain inlets shall be built in accordance with, and in the locations shown on the Contract Documents. All structures will require shop drawings approved by the Owner's Engineer and Town Engineer.

B. No concrete or masonry shall be placed when the temperature is below forty (40) degrees Fahrenheit, or when indications are for lower temperatures within twenty-four (24) hours, unless protection of concrete and masonry is approved by the Owner's Engineer. Damage to the structure because of freezing shall be corrected by the Contractor at his own expense, to the satisfaction of the Owner's Engineer.

C. Manholes, catch basins and drain inlets shall be constructed as soon as the pipe laying reaches the location of the structures. Should the Contractor continue his pipe laying without making provisions for completion of the structures, the Owner's Engineer shall have the authority to stop the pipe laying operations until the structure is completed.

D. Any structure which is mislocated or oriented improperly shall be removed and re-built in its proper location, alignment and orientation at the Contractor's expense.

E. Precast Concrete Manholes: AASHTO M199-93/ASTM C478-90b. Manhole diameter shall be selected to accommodate the inflow and outflow pipes.

F. Pour-in-place or Precast Reinforced Concrete Catch Basins (Control Structures): AASHTO M199-93/ASTM C478-90b rated for H20 loading, with minimum concrete strength of 3,000 psi. Inlet size shall be selected to accommodate the inflow and outflow pipes.

1. Manhole Barrel: Reinforced precast concrete in accordance with ASTM C478 with gaskets in accordance with ASTM C923 & C361

   a. Construct manholes of precast concrete sections as required by Contract Documents to size, shape, and depth indicated, but never less than 4-ft inside diameter.

2. Mortar and Grout: Mortar for finishing and sealing shall be Class "C". Honeycombing less than two (2) inches deep shall be repaired using Class "D" mortar.
3. Brick Transition Reinforcement: Formed steel 8-gage wire with galvanized finish.
4. Foundations: All foundations shall rest on firm soil of uniform bearing and stone subbase as shown on Contract Documents.
5. Inverts: Brick or smooth concrete invert channels shall be constructed in all manholes and in all catch basins and drain inlets which do not have sumps, to insure a smooth flow of water through the structure.
6. The invert channel shall be constructed to the elevations shown on the Contract Documents and/or as approved by the Owner's Engineer. Channels shall slope smoothly and evenly from the entrance pipe to the outlet pipe.
7. Frames, Cover, and Gratings: Frames, Covers and/or gratings for manholes, catch basins, and drain inlets shall be of the type and size indicated on the Contract Documents. Frames shall be well bedded in mortar and shall be set accurately to the correct alignment and grade.
8. Ladder Rungs: Forged Aluminum to dimensions shown on Contract Documents to be Alco steps 6061T6 or approved equal.
9. Precast Structures: Precast structures shall be installed only after shop drawings have been approved by Owner’s Engineer and shall meet the requirements of ASTM C478.
10. Grout around pipes which protrude through the walls of the structure and on all joints shall contain "Antihydro", or other approved additive to insure water tightness. Cement grout shall contain two parts cement to one part sand and additive in accordance with manufacturer's recommendations. Mortar shall be applied to the bottom 1/3 of the opening before the pipe is inserted.
11. The top grade of the precast concrete corbel section shall be set sufficiently below finished grade to permit a maximum of seven (7) and a minimum of two (2) courses of 8-inch brick to be used as risers to adjust the grade of the casting. Manhole frames shall be set on a grout pad as specified herein above.
12. Provide precast manhole shaft construction with eccentric cone top section and lipped male/female rubber gasket joints or mortar joints.
13. Brick shall be new units conforming to AASHTO Designation M-91, latest revision, Grade MS.
14. Mortar shall conform to ASTM C270, Type M.
15. Pipe joints for rigid pipes shall be made with mortar, grout, gaskets, or as recommended by the pipe manufacturer.
16. Manholes and Pipe constructed within the Right-of-Way shall be manufactured and installed in accordance with all applicable Standard Specifications and the Contract Documents.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that trench cut and excavation is ready to receive work and excavations, dimensions, and elevations are as indicated on Contract Documents.

3.2 PREPARATION

A. Hand trim excavations to required elevations. Correct over excavation with fine aggregate.

B. Remove large stones or other hard matter which could damage piping or impede consistent backfilling or compaction.

C. Protect benchmarks, property corners, and other survey monuments from damage or displacement. If marker needs to be removed it shall be referenced by licensed land surveyor and replaced, as necessary, by same.

3.3 GENERAL

A. The Contractor shall install all drainage structures and pipe in the locations shown on the Contract Documents and/or as approved by the Owner's Engineer. Pipe shall be of the type and sizes specified and shall be laid accurately to line and grade. Structures shall be accurately located and properly oriented.

B. Excavation and Backfill shall be in accordance with Section 312333 of these specifications.

C. Storage and Handling of Pipe - All pipe shall be protected against impact, shock and free fall, and only equipment of sufficient capacity and proper design shall be used in the handling of the pipe. Storage of pipe on the job shall be in accordance with the pipe manufacturer's recommendations.

D. Damage to Pipe - Pipe which is defective from any cause, including damage caused by handling, and determined by the Owner's Engineer as unrepairable, shall be unacceptable for installation and shall be replaced at no cost to the Owner as directed by the Owner's Engineer.

E. Pipe that is damaged or disturbed through any cause prior to acceptance of the Work, shall be repaired, realigned or replaced as directed by the Owner's Engineer, at the Contractor's expense.

3.4 BEDDING

A. Excavate pipe trench and place bedding material in accordance with Section 31 23 33 for work of this Section.

3.5 INSTALLATION - PIPE

A. Laying Pipe: Each length of pipe shall be laid with firm, full and even bearing throughout the entire length, in a trench prepared and maintained in accordance with Section 31 23 33 of these Specifications and Contract Documents. Pipe shall be laid upgrade unless otherwise approved by the Owner’s Engineer.

B. Concrete pipe over 24-inches in diameter shall be laid with the lift holes on top of the pipe. After the pipe is installed, the lift holes shall be sealed with suitable concrete plugs to the satisfaction of the Owner's Representative. No lift holes will be permitted in pipes 24-inches in diameter and smaller.

C. Bell and spigot pipe shall be laid with the bell end upgrade. The pipe shall be joined so that there will be uniform space around the pipe. Trimming of the pipe shall not be allowed.

D. Every length of pipe shall be inspected and cleaned of all dirt and debris before being laid. Prior to placing a length of pipe, the end of the previously laid length shall be carefully and thoroughly wiped smooth and clean to obtain an even and close fitting joint.

E. No length of pipe shall be laid until the preceding lengths of pipe have been thoroughly embedded in place, so as to prevent movement or disturbance of the pipe.

F. Place pipe on minimum 6-inch thick bed of compacted bedding or as detailed on the Contract Documents.

G. Install pipe, fittings, and accessories in accordance with ASTM C12, ASTM D2321, manufacturer's instructions and/or state or local requirements. Seal joints to be watertight.

H. Lay pipe to slope gradients noted on Contract Documents with maximum variation from true slope of 1/8-inch in 10-ft.

I. Place and compact bedding aggregate at sides and to the springline of the pipe as per these Specifications.

J. Refer to Sections 310000 and 312333 of these Specifications for backfill requirements. Do not displace or damage pipe when compacting.

K. Full Lengths of Pipe: Only full lengths of pipe shall be used in the installation except that partial lengths of pipe may be used at the entrance to structures where necessary to obtain a proper connection to the structure.

L. Pipe Entrances to Structures: All pipe entering structures (e.g.: manholes, catch basins, etc.) shall be cut flush with the inside of the structure, and the cut ends of the pipe and surface of the structure shall be properly rounded and finished so that there will be no protrusion, ragged edges, or imperfections that will impede the flow of water or affect the hydraulic characteristics of the installation.

M. Only full sections of pipe shall be used where entering a structure which will be exposed to view, such as endwalls, headwalls, end sections, etc.

N. Bedding and Backfilling: The type of materials to be used in bedding and backfilling and the method and placement shall conform to the requirements of these Specifications.

O. Protection During Construction: The Contractor shall protect the installation at all times during construction, and movement of construction equipment, vehicles and loads over and or adjacent to any pipe shall be performed at the Contractor's risk.

P. Tolerance: Pipe shall be laid accurately to the line and grade shown on the Contract Documents and/or as approved by the Owner's Engineer. Allowable tolerances shall be 1/2-inch on grade and 1-inch on line in any section of pipe between structures. Deviations from these tolerances shall be a basis for rejection of the line of pipe by the Owner's Engineer. Any line which has been rejected shall be rebuilt to correct line and grade by the Contractor at his own expense.

3.6 INSTALLATION - CATCH BASINS, MANHOLES AND CONTROL STRUCTURES

A. Form bottom of excavation clean and smooth to correct elevation.

B. Form and place cast-in-place concrete base pad, with provision for storm sewer pipe to be placed at proper elevation.

C. Place precast reinforced concrete sections with provision for storm sewer pipe sections at the location and elevation specified on the Contract Documents.

D. Level top surface of each precast concrete shaft sections as assembly progresses.

E. Establish elevations and pipe inverts for inlets and outlets as indicated.

F. Lay brick masonry in running bond with full 3/8-inch mortar joints to receive casting assembly. Level casting frame in grout to receive grated inlet or manhole cover.

3.7 PLACING PRE-CAST MANHOLE BARREL SECTIONS

A. Place base pad to proper elevation and location and trowel top surface level for placement of manhole barrel.

B. Place manhole barrel plumb and level to correct elevations and anchor to base pad.
   1. After completion of slab foundation the first joint of manhole barrel shall be lowered into position, grooved end first, and set level and plumb on concrete base. Align and adjust to proper grade prior to placing and forming invert which shall be poured immediately after setting of first section of manhole barrel.
   2. Prior to setting subsequent manhole barrel sections, apply primer to tongue and groove ends and allow to set in accordance with manufacturer recommendations. Place "Ram-nek", or equivalent, plastic rope on tongue end. Lower next section into position, and remove excess material from interior of structure. Add additional material on exterior of joint, if necessary, for completely watertight joint.

3.8 PIPE JOINTS

A. Mortar Joints (RCP): After each length of RCP is laid, the lower portion of the bell shall be filled with mortar, and the succeeding length shall be laid in place so that the inner surfaces of the abutting lengths are flush. The remainder of the joint shall be completely filled with mortar and sufficient additional mortar used to form a bead around the joint flush with the outside diameter of the bell. The inside of the joint shall be wiped and finished smooth. Joints shall be thoroughly wet before the mortar is placed.

B. Cold Applied Joint Sealer (RCP): Bell and spigot or tongue and groove RCP shall be wiped clean and dry before applying the sealer to the pipe joint. Before the pipes are placed in contact with each other, the spigot end or tongue end of the pope shall be completely covered with an excess of sealer, and then the pipe shall be laid to the established line and grade so that the inside surfaces of abutting pipe are flush.

3.9 INTERFACE WITH EXISTING FACILITIES

A. Requirements: The Contractor shall make all required connections of the proposed drainage facilities into existing drainage facilities, where and as shown on the Contract Documents and/or as approved by the Owner's Engineer.

B. Compliance With Facility Owner Requirements: Connections made into existing drainage facilities shall be performed in accordance with the requirements of the Owner of the facility. The Contractor will be required to comply with all such requirements, including securing of all required permits, and paying the costs thereof. The cost of making the connections in accordance with the requirements of the Owner of the existing facility shall be included in the Contract Sum.

3.10 REMOVAL OF EXISTING UTILITIES

A. The Contractor shall remove and legally dispose of off-site all abandoned utilities encountered during installation of the storm drainage facilities. In particular, all components of the existing combined sewer shall be removed from the site and up to the nearest off-site manhole.

3.11 MODIFICATIONS OF EXISTING STRUCTURES

A. General: The Contractor shall alter, reconstruct and/or convert existing structures where and as shown on the Contract Documents, and/or as approved by the Owner's Engineer. In general, alterations shall be performed with the same type of material used in the original construction unless otherwise indicated on the Contract Documents or approved by the Owner's Engineer.

B. Damage to Existing Installations: The Contractor shall exercise extreme care during such alteration, reconstruction and/or conversions so as not to damage any portions of the structure and/or pipe shown to remain. Any such damage shall be repaired by the Contractor at his own expense and to the satisfaction of the Owner's Engineer and Owner of the damaged structure.

3.12 CLEANING AND REPAIR

A. The Contractor will be required to clean the entire drainage system of all debris and obstructions. This shall include, but not be limited to, removal of all formwork from structures, concrete and mortar droppings, construction debris and dirt. The system shall be thoroughly flushed clean and the Contractor shall furnish all necessary hose, pumps, pipe and other equipment that may be required for this purpose. No debris shall be flushed into existing storm drains or streams; all debris shall be removed from the system and disposed of in accordance with all governing agencies.

B. After the system has been cleaned, the Contractor shall thoroughly inspect the system along with the Owner’s Engineer and all repairs shown to be necessary shall be promptly made by the Contractor.

C. All Work of cleaning and repair as specified herein shall be performed at the Contractor's expense and to the complete satisfaction of the Owner's Engineer.

3.13 FINAL INSPECTION

A. Upon completion of the Work and before final acceptance by the Owner, the entire drainage system shall be subject to a final inspection in the presence of the Owner’s Engineer and Town Engineer. The Work shall not be considered as complete until all requirements for line, grade, cleanliness, and workmanship have been completed to the satisfaction of the Owner's Engineer and the Town Engineer.

END OF SECTION 334100

10 May 2023
Revised 24 May 2023

Re: Geotechnical Engineering Study
Old Greenwich School
Old Greenwich, Connecticut
Langan Project No.: 140265801

Dear David:
This report presents our geotechnical engineering study for the proposed addition to Old Greenwich School at 285 Sound Beach Avenue in Old Greenwich, Connecticut. The purposes of this study were to explore subsurface conditions, evaluate feasible foundation options, and develop geotechnical engineering recommendations. Services were performed in accordance with our authorized proposal (revised 11 January 2023).

Our boring exploration approach was developed considering a sketch showing the proposed building footprint and boring locations by Silver Petrucelli + Associates (SP+A) sent via email on 9 March 2023. We note that a revised building footprint is shown in the drawing set entitled "Scheme D.2" (18 April 2023) by SP+A, which was received after our geotechnical field program. Changes to the design scheme must be reviewed by Langan for effects on our recommendations.

Elevations are referenced from a plan titled "Boundary & Topographic Survey" (01 May 2023) prepared by Langan referencing the North American Vertical Datum of 1988 (NAVD88).

SITE DESCRIPTION

The about 7.3-acre site is located at 285 Sound Beach Avenue in Old Greenwich, Connecticut. The site is bordered by commercial and residential properties to the north, Sound Beach Avenue to the east, residential properties to the south, and wetlands/marsh the west. The site is occupied by the existing Old Greenwich School, which is a three-story brick building at the east part of the site. The existing school has a footprint of about 39,600 square feet (SF) and no below-grade

levels. The finished floor elevation (FFE) varies between about el +11.3 and el +15.4. Associated site features surround the structure, including an asphalt parking lot to the north, asphalt sports courts and a playground area to the southwest, and grass sports fields to the west. Figure 1 shows the site location and surrounding properties.

Existing site grades gently slope down from east to west, from about el +15 to el +7. Site grades within the proposed building addition footprint vary between about el +13 to el +10.

Underground utilities are present throughout the site including stormwater, electric, gas, and sanitary.

PROPOSED DEVELOPMENT

The proposed project consists of renovations within the existing Old Greenwich School and the construction of an addition to the southwest of the existing structure. Interior renovations consist of two new elevator pits and infilling select portions of the building to raise the FFE.

The addition consists of a 1-story, about 7,260 SF footprint structure. The FFE of the proposed classrooms is el +14 and the FFE of the proposed hallways varies between about el +11.5 to +14. Cuts of up to about 5 feet are anticipated to reach the bottom of the proposed elevator pits and fills up 4 feet are expected to reach the FFE of the proposed addition.

Estimated building column and slab loads are currently unavailable. Based on our experience with similar buildings of this type, we estimate column loads of up to 100 kips and slab loads up to about 200 pounds per square foot (psf).

REVIEW OF AVAILABLE INFORMATION

Regional Geology

The 1992 "Surficial Materials Map of Connecticut" (Figure 2) indicates the overburden is predominantly sand and gravel within the proposed renovation and addition footprints, with thin till located along the east and west edges of the site. The 1985 "Bedrock Geological Map of Connecticut" (Figure 3) indicates that bedrock below the site is predominately Harrison gneiss (typically hard rock) with Golden Hill schist is located along the west edge of the site. Both maps were prepared by the Connecticut Geological and Natural Resource Survey.

Federal Emergency Management Agency Flood Map

We reviewed the Flood Insurance Rate Map (FIRM) for the town of Old Greenwich published by the Federal Emergency Management Agency (FEMA), Map Nos. 09001C0512G effective 8 July 2013 and 09001C0514G effective 8 July 2013 (Figure 4). The proposed renovations and addition

footprint are predominately located in Zone AE: shaded, "1% annual chance flood hazard" with a provided base flood elevation of el +13. The southeast corner of the site, and some renovation areas, are located in Zone X: unshaded, "areas of minimal flood hazard" (outside the 500-year floodplain).

SUBSURFACE EXPLORATION

Langan performed a subsurface exploration consisting of 3 borings. The exploration was overseen by a Langan field engineer. An exploration location plan is shown in Figure 5. We note that test pits were also proposed as part of the exploration scope and will be completed at a later date.

Borings

Three borings (LB-01 through LB-03 were drilled by SoilTesting, Inc. on 11 April 2023. The borings were advanced with a CME55 LC track-mounted rig using hollow-stem-auger drilling techniques. Borings were terminated from 25.9 to 27 feet below the existing grades (about el -13.9 to el -17).

Standard Penetration Test (SPT) N-values[1] were documented and soil samples were generally obtained continuously to a depth of about 12 feet and every 5 feet thereafter. Disturbed soil samples were obtained using a standard 2-inch-outer-diameter split-spoon sampler driven by a 140-pound safety hammer in accordance with ASTM D1586, Standard Penetration Test.

Recovered soil samples were visually examined and classified in the field in general accordance with the Unified Soil Classification System (USCS). Soil classifications, N-values, and other field observations were recorded on our field logs provided in Appendix A.

Lab Testing

Selected samples were sent to a testing laboratory to confirm visual classifications and to determine index properties (physical and mechanical). Five moisture-content determinations, three grain-size analyses, two Atterberg limits tests, and one organic content test were performed; the results are provided in Appendix B.

[1] The Standard Penetration Test (SPT) is an in situ testing technique used to infer soil density and consistency. The SPT N-value is defined as the number of blows required to drive a 2-inch-diameter split-barrel sampler 12 inches after an initial penetration of 6-inches using a 140-pound hammer falling freely from 30 inches.

SUBSURFACE CONDITIONS

The subsurface conditions generally consist of a surficial layer of asphalt or topsoil underlain by layers of fill, estuarine deposits, sand, decomposed rock, and bedrock. Bedrock was inferred from about 26 to 27 feet below existing grades (about el -14 to el -16). Groundwater was observed in all borings from about 7.5 to 8 feet below existing grades (between about el +4.5 and el +2). A detailed description of subsurface materials encountered is provided below in order of increasing depth.

Surficial Materials – A 5-inch-thick surficial layer of asphalt pavement was encountered in borings LB-02 and LB-03. A 9-inch-thick layer of topsoil was encountered in boring LB-01. The topsoil consists of brown silty fine to medium sand with vary proportions of gravel, organics, roots, asphalt fragments, and plastic debris.

Fill – An about 1- to- 4-foot-thick layer of fill was encountered below the surficial material in all borings. The fill is generally composed of brown fine to coarse sand, with varying proportions of fine to coarse gravel, silt, organics, roots, asphalt, and plastic debris. SPT N-values within the fill layer vary from about 6 blows per foot (bpf) to 11 bpf. Laboratory testing of one sample reported a fines content of about 23% and measured moisture content of about 9%. The fill layer is generally classified as silty sand with gravel (SM) in accordance with the Unified Soil Classification System (USCS).

Estuarine Deposits – An about 1.4- to- 4.5-foot-thick layer of estuarine (marsh) deposits (top of layer corresponding to about el +7.5 to el +8.5) was encountered below the fill in all borings. The estuarine layer is generally composed of dark brown dark to orangish gray silt or clayey sand with varying proportions of organics, fine to medium sand, silt, clay, gravel, roots, and mottling. SPT N-values within the estuarine layer vary from about 4 to 12 bpf. Laboratory testing of samples reported a liquid limit between about 24 to 34, a plastic limit between about 17 and 23, and a measured moisture content between about 24% to 34%. The measured organic content was about 3.6%. The estuarine layer is generally classified as clayey sand, clay, and clayey silt (SC, CL, and CL-ML) in accordance with the USCS.

Sand – An about 4- to- 21-foot-thick layer of sand (top of layer corresponding to about el +4 to el +6) was encountered below the estuarine layer in all borings. The sand layer is generally composed of light brown or orangish brown fine to coarse sand with varying proportions of gravel, and silt. SPT N-values within the sand layer vary from about 7 bpf to 52 bpf. Laboratory testing of samples reported a fines content of about 8% to 13% and a measured moisture content between about 5% to 19%. The sand layer is generally classified as well graded sand with silt and gravel (SW-SM) in accordance with the USCS.

Decomposed Rock – An about 0.7- to 16-foot-thick layer of decomposed rock (top of layer corresponding to about el -16 to el +2) was encountered below the sand layer in all borings. Lb-03 was terminated in the decomposed rock layer, and therefore thicknesses may be greater than reported herein. The decomposed rock layer is generally composed of brown to gray silty fine to coarse sand with varying amounts of gravel, weathered rock fragments, mica fragments and visible stratification. SPT N-values within the sand layer vary from about 17 bpf to split-spoon refusal (greater than 100 bpf). The decomposed rock displayed the structure of the parent rock but broke apart under the action of the split spoon.

Bedrock – Bedrock was inferred below the decomposed rock layer as evidenced by refusal of the drilling equipment (augers and split spoons) from about 26 to 27 feet below existing grades (top of rock between about el -14 to el -16) in borings LB-01 and LB-02.

Groundwater - Groundwater was first encountered in all borings from about 7.5 to 8 feet below existing grades (about el +2 to el +4.5). Groundwater was measured upon completion of each of the borings from about 9 to 18 feet below existing grades (about el +1 to el -6). We note that the drop in the groundwater measurements at the completion of the boring may be due to the groundwater having insufficient time to recharge through the denser decomposed rock layer. Due to the proximity of the nearby Greenwich Cove, we believe that groundwater levels may be tidally influenced. Groundwater, if encountered, should be expected to fluctuate with seasons, precipitation, construction activities, utility breaks, etc.

GEOTECHNICAL DESIGN RECOMMENDATIONS

The following key geotechnical issues have been identified:

- Loose uncontrolled fills and estuarine (marsh) deposits below the proposed building footprint,
- Fills up to 3 feet within the proposed building footprint over soft estuarine soils,
- Shallow groundwater,
- Proposed structure within FEMA zone AE, and
- The presence of loose sands below the groundwater table.

Additional Exploration

The proposed building addition footprint has been altered following our exploration. Additional borings or test pits should be coordinated with the proposed civil exploration work. We recommend additional exploration be performed within the western part of the building footprint to further understand fill and estuarine deposit thicknesses within the addition footprint, and to understand fill thicknesses adjacent to the existing building. Further exploration may also be

required at the proposed elevator pit locations to understand existing building foundations and pit bearing materials.

Seismic Design

This section presents seismic design recommendation, in accordance with the 2022 Connecticut State Building Code (International Building Code 2021). We have considered the soil conditions encountered in the borings to be consistent and representative of the soil conditions in the top 100 feet of soil at this site.

Table 1. Seismic Design Values

Description	Parameter	Recommended Value
Mapped Spectral Acceleration for short periods:	S_s	0.274
Mapped Spectral Acceleration for 1-sec period:	S_1	0.059
Site Class:	--	**D – Stiff soil profile**
Site Coefficient:	F_a	1.58
Site Coefficient:	F_v	2.4
5% damped design spectral response acceleration at short periods:	**S_{DS}**	**0.281**
5% damped design spectral response acceleration at 1-sec period:	**S_{D1}**	**0.094**
Anticipated Risk Category	--	**III**
Seismic Design Category	**--**	**B**

Based on the above spectral accelerations and the anticipated risk category, we have estimated the Seismic Design Category (SDC). The structural engineer is responsible for confirming the appropriate use group, occupancy category, and final SDC for the proposed structure.

Liquefaction

Due to the presence of loose sands (low N-values) below the groundwater table in LB-03, we evaluated the liquefaction potential of non-cohesive soil below the groundwater table up to 100 feet below the ground surface (as required by the Connecticut Building Code) using the procedure outlined by Youd et al. (2001). Our analysis included all Langan borings within the building footprint that were potentially susceptible to liquefaction. The Youd et al. method is considered to be the state-of-practice recommended by the National Earthquake Hazard Reduction Program. The method presents an empirical relationship between the earthquake demand, represented by the Cyclic Stress Ratio (CSR), and the soil's resistance to dynamic loading, represented by the Cyclic Resistance Ratio (CRR). Field N-values are converted to $N_{1,60,cs}$ by applying corrections for

hammer energy efficiency, soil overburden pressure, borehole diameter, rod length, sampler lining, and fines content.

Our analysis parameters included a peak ground acceleration of 0.161g and mean earthquake magnitude of 5.49 (from the Unified Hazard Tool[2]). Our analysis indicates that all SPT N-values evaluated have a factor of safety against liquefaction greater than one. It is our judgment that liquefaction need not be considered in the design. A plot showing factors of safety versus depth is provided as Figure 6.

Foundations

Removal and Replacement Program

The materials encountered at the anticipated footing elevation (estimated to be between about el +9 to el +11) consist of fill and estuarine deposits. The surficial materials, fill, and estuarine deposits are not suitable for foundation or slab support. A removal and replacement program should be performed to remove the fill and estuarine deposits to the native sands, and be replaced with structural fill to the bottom of proposed foundation elevation. Replacement fill materials should be placed in accordance with the Excavation, Fill Placement, and Compaction Criteria section of this report to support shallow foundation construction. We estimate over-excavations up to about 6 feet will be necessary to reach the native sandy soils. The proposed structure can be supported on shallow foundations bearing on structural fill or natural sands using an allowable bearing pressure of 4,000 psf. Footing subgrades should be prepared in accordance with the Subgrade Preparation section of this report.

Flood Conditions

Foundations should be designed to account for anticipated flooding associated with the design flood elevation (see the Ground Floor Slab and Permanent Groundwater Controls sections below) and ASCE 24 requirements. Foundations should also be designed to account for erosion or local scour where necessary.

General

All exterior footings should be constructed 42 inches or deeper below the lowest adjacent grade for frost protection. Interior footings in heated spaces may be constructed at a convenient depth below the slab; however, all bottoms of footings should be at least 1.5 feet below the finished-floor elevation. Isolated column footings should have a minimum dimension of 3 feet, and strip

[2] Unified Hazard Tool via U.S. Geological Survey – Earthquake Hazards Program

footings should have a minimum width of 2 feet even if smaller dimensions can be justified using the recommended allowable bearing pressure.

Foundations should not be located so that one foundation is within the zone of influence of an adjacent foundation. The zone of influence is taken as a 1H:1V projection extending outward and downward from the edge of the foundation. New foundation elements should match the bottom of footing elevation of the existing foundations for adjacent elements. Excavations to remove unsuitable materials should be sloped from the existing foundations or existing foundations should be underpinned to avoid undermining existing foundations. Additional information is included in the underpinning section below.

Foundation Settlement

Total settlement of the new structure is estimated to be on the order of 3/4 inch or less, provided the bearing pressure recommended here is used and the subgrade preparation work described here is performed. Differential settlements between the existing structure and new foundations are expected to be reach settlement limits of about 3/4 inch. A majority of the settlement is expected to take place during construction.

Ground Floor Slabs

Design Flood Elevation

The FEMA base flood elevation (BFE) of el +13 is above the proposed lowest ground floor FFE for the building addition. The building slab should be designed to account for anticipated flooding associated with the design groundwater elevation from the adjacent water bodies and ASCE 24 requirements.

The ground floor level should consider potential hydrostatic pressures from flood events. The BFE elevation is el +13, and the design flood elevation should be taken as BFE +1 feet for a design flood elevation (DFE) of el +14.

Scheme 1 – Slab-on-Grade

Slab-on-grade construction should consider the DFE and be designed in accordance with ASCE 24 requirements. A slab-on-grade can be constructed bearing on natural soils, structural fill, or compacted existing fill prepared in accordance with the recommendations here. Removal and replacement of estuarine soils should be performed below slab-on-grade areas prior to placement of any raise-in-grade fills to limit settlement of the slabs over time. Subgrades within the building footprint should be prepared in accordance with recommendations in the Subgrade Preparation section of this report prior to placing any additional fill materials. We anticipate that the existing

fill materials can be reused as structural fill provided the fill is placed in compacted lift as outlined herein. We recommend designing slab-on-grade for a modulus of subgrade reaction of 125 pounds per cubic inch.

We recommend a minimum 12-inch-thick layer of ¾-inch clean crushed stone be included beneath the slab to protect the prepared subgrade and to serve as a capillary break. We recommend any slab below the DFE have a waterproofing membrane below the ground-floor slab. The barrier should be coordinated with any environmental requirements for the development. Omission of a barrier can lead to floor-covering problems including delamination and mold.

Scheme 2 – Structural Slab

Slabs that cannot be designed to meet ASCE 24 requirements or resist uplift loads from the DGE should be designed as a structural slab. The structural slab can be designed to withstand hydrostatic pressures from flood conditions. The slab should be designed to account for anticipated flooding associated with the design flood elevation from the adjacent water bodies and ASCE 24 requirements.

Uplift Resistance

The slab should be designed to resist uplift pressures by increasing the dead load, through smaller structural spans, or uplift anchors. If anchors are necessary, we can provide a preliminary design. The anchors should be double corrosion protected to account for the marine environment and use below water.

Permanent Groundwater Controls

Waterproofing

The design groundwater elevation is el +14, and we recommend that all foundations, slabs, and pits below the DGE will be fully waterproofed to protect mechanical equipment and finishes against moisture. We recommend that a membrane-type waterproofing be used such as Preprufe and Bithuthene products by GCP. Bentonite is not recommended. The vertical waterproofing should be protected with a rigid barrier to prevent damage during backfilling. A drainage board can serve as protection as well. After installation of the waterproofing, care must be taken so as to not damage the waterproofing. Waterproofing damaged during construction should be repaired as determined by the manufacturer.

Additional Flood-proofing Measures

We understand existing and proposed portions of the structure lie below the design flood elevation. Additional measures may be necessary at existing building areas, structure entrances, utility penetrations, etc. to maintain dry conditions during high water events.

Below Grade Walls (Pits)

Permanent below-grade walls that are considered to be fixed against rotation should be designed to resist soil, groundwater, and surcharge pressures. Backfill should not be placed against below-grade walls until the wall concrete has reached its 28-day compressive design strength and has been approved by the structural engineer.

We recommend that the below-grade foundation walls (i.e., fixed walls) be designed using a triangular earth-pressure distribution having an equivalent fluid weight 90 lb/ft^2 per foot of depth below the design flood elevation. Above the design flood elevation, below grade foundation walls can be designed using 60 lb/ft^2 per foot of depth presuming that free-draining clean stone as backfill or a manufactured drain is used.

Surcharge loading on the below-grade foundation walls should be included by adding a uniform stress equal to one-half the surcharge load in addition to the soil loading.

Underpinning

We understand that one elevator pit will be added within the existing building footprint. Additionally, if removal and replacement is necessary next to the existing building foundations to construct the proposed addition, localized underpinning may be necessary to perform the removal and replacement program. Additional exploration (see additional exploration section above) or historic information will be necessary to understand the bottom of footing elevations of the existing adjacent foundation elements. Underpinning can be used to support the adjacent foundations and avoid undermining the adjacent foundation elements.

In locations where localized underpinning is necessary, conventional underpinning concrete piers can likely be constructed to transfer the loads to the same elevation of the proposed pit level or over-excavation limit and prevent undermining. Concrete underpinning piers are typically a maximum of 4 feet wide and constructed in sequence below the adjacent building foundations. Piers are typically constructed at a spacing of 12 feet on-center and allowed to set before the next sequence is constructed.

Concrete underpinning piers are permanent design features and should be designed by the site geotechnical engineer as part of the design phase. We can design the underpinning piers and

sequencing after further exploration or understanding of existing building foundations. The contractor should submit shop drawings for review to the design engineer prior to construction.

GEOTECHNICAL CONSTRUCTION RECOMMENDATIONS

Site Preparation

All existing foundations, floor slabs, and utilities should be completely removed within 10 feet of the proposed footprint. Below-grade structures outside of the building footprint can be abandoned in place provided they are removed to at least 3 feet below finished subgrade levels, 2 feet below proposed utilities, and to eliminate conflicts with new utilities or structures. Slabs left in place should be sufficiently broken up to allow water to drain, and so that a geotechnical engineer can observe if voids exist beneath the slab. Existing asphalt pavement and concrete walkways should be completely removed.

Existing utilities within the building footprint should be completely removed. Existing utilities outside of the proposed building footprint should be removed or abandoned in place by completely filling with grout.

Excavations made to remove below-grade elements should be backfilled with approved, compacted fill in accordance with the Excavation, Fill, Placement, and Compaction Criteria section of this report and any environmental requirements.

Clearing and grubbing of trees and vegetation designated for removal (including root systems) should be performed. Buried debris should be completely removed beneath proposed building slab and footing locations. Topsoil should be stripped from the proposed building and pavement areas and should be stockpiled and protected from erosion. Topsoil should be evaluated by a landscape architect for reuse in landscape areas (if permitted by the environmental engineer). All clearing and stripping activities should be performed in strict accordance with the approved soil-erosion and sediment-control plan and the environmental reports prepared for the project.

All demolition and site-clearing work should be performed in accordance with any environmental requirements established for the site, and all local, state, and federal regulations. All debris and trees and other vegetation should be properly disposed of offsite in accordance with applicable regulations. All construction work should be performed so as not to adversely impact the existing school, neighboring buildings, off-site structures or utilities, including the existing utilities and trees that are to remain. Protection of these elements should be provided as necessary. Before beginning grading or placing fill, any miscellaneous trash, debris, or other unsuitable materials should be removed from the site.

Subgrade Preparation

All footing and utility-trench subgrades, except rock subgrades, should be proofrolled with six overlapping coverages of a double-drum 1-ton walk-behind vibratory roller (such as a Bomag BW75 or equivalent). All slab subgrade areas should be proofrolled with six overlapping coverages of a vibratory drum roller having a minimum static drum weight of 5 tons.

Soft areas identified during proofrolling should be excavated and replaced with approved structural fill. The actual extent of necessary excavation and replacement should be determined by a qualified Langan geotechnical engineer. Care should be taken when proofrolling near any existing underground utilities of structures that are to remain.

Soil footing subgrades should be excavated level. If any cobbles or boulders are encountered at the footing subgrade such that a relatively level subgrade is not achieved, they should be removed and replaced with compacted structural fill, compacted ¾-inch crushed stone, or lean concrete. All soil subgrades for footings or slabs should be compacted to the project specified compaction criteria.

If foundations are not poured in a timely manner, the subgrade should be protected with a lean concrete mud mat to protect the footing subgrades.

Steps should be taken by the contractor to control and remove surface-water runoff and precipitation. When soil is wet and subjected to construction traffic, previously acceptable subgrades can soften and become unacceptable. A smooth drum roller should be used to seal the surface and provide for better drainage. We also recommend crowning or sloping the subgrade to provide positive drainage off the subgrades.

Excavation, Fill, Placement, and Compaction Criteria

Excavation through the fill, estuarine deposits and the underlying natural sands can likely be performed using conventional earthmoving equipment (e.g., backhoes, excavators, dozers, etc.). Excavations made for footings and utilities should be conducted to minimize disturbance to the subgrade (i.e., backhoe with a smooth-edge bucket).

All excavations should be properly sloped or braced and conform with applicable OSHA regulations including, but not limited to, temporary shoring, trench boxes, or proper benching.

All excavation and backfilling must be performed in accordance with the project environmental engineer's recommendations.

The following types of fill can be used.

Structural Fill – Structural fill should be well-graded sand and gravel having a maximum particle size of 3 inches and no more than 10% passing the No. 200 sieve. Additionally, the structural fill should be free of organics, clay, roots, concrete, other non-soil constituents, and other deleterious or compressible materials. Any approved imported structural fill should be "certified clean fill" free of hazardous substances and meeting all local, state, federal and the Connecticut Department of Energy and Environmental Protection Soil Waste regulations.

Material Reuse – The contractor may reuse the on-site fill or natural sand as structural fill provided the soil meet the requirements for structural fill outlined above and is approved by the environmental engineer. Note that samples obtained within the fill and natural sand layers have a fines content (material passing the No. 200 sieve) of about 13 to 23%; therefore, the soil may be sensitive to moisture. The overall amount of soil that can be reused will be dependent on the amount of fines present within the soil, the time of year the earthwork is carried out (e.g., potentially inclement weather), and the earthwork contractor's ability to stage, aerate and process the material to facilitate placement and compaction. We do not anticipate the estuarine deposits can be reused on-site.

General Fill – On-site soils not meeting the requirements for structural fill can be used as general fill for site landscape and other nonstructural areas if environmentally suitable for reuse.

Compaction Criteria – All fill should be placed in uniform 12-inch-thick loose lifts and compacted. Fill in landscaped areas should be compacted to 90% of its maximum dry unit weight as determined by ASTM D1557; all other fill should be compacted to at least 95%. In restricted areas where only hand-operated compactors can be used, the maximum lift thickness should be limited to 8 inches. The appropriate water content at the time of compaction should be plus or minus 2% of optimum as determined by the laboratory compaction tests of proposed fill. No backfill should be placed on areas where free water is standing or on frozen subsoil areas.

Temporary Groundwater Control

We anticipate that dewatering will be required during construction. Water infiltration to the foundation excavation and during the removal and replacement program can likely be controlled using gravity-fed sump pumps via gravel trenches or sumps assisted with collector trenches. The final dewatering measures required should be evaluated and designed by the contractor. The dewatering measures implemented should adequately dewater all foundation-related excavations such that compaction of footing subgrades is feasible.

Collection of rainwater runoff will also be needed during the excavation for the removal and replacement program and during the subgrade preparation work. Water runoff is expected to be controlled with the use of gravel-lined collection trenches, pits and submersible pumps. Care should be taken to ensure that drainage is provided during all phases of excavation work. Environmental pretreatment of groundwater, if necessary, is beyond the scope of this study. Collected water should be discharged in accordance with applicable regulations.

Monitoring

We understand that the existing school is to remain, will receive renovations, and is to be tied into the new addition, therefor damage to the existing school is to be avoided as much as possible. As such, we recommend that a monitoring program be developed and incorporated into the Contract Documents during construction. Monitoring should include means to measure vibrations from construction operations and ground movement. The type and locations of specific monitoring equipment, threshold values, and durations should be developed based on review of the anticipated construction means and methods in conjunction with proximity and type of existing structures and utilities. The purpose of performing monitoring is to provide reasonable feedback to the contractor with respect to protecting existing structures and utilities, and to assess any necessary changes to means and methods of construction.

We recommend developing a monitoring plan and project specifications prior to construction. These would detail the methods and equipment required for monitoring vibration and movement, and would provide limits along with requirements for frequency of readings and reporting. The monitoring program would likely include optical surveying, seismographs (vibration monitoring), and crack gauges. We recommend that all monitoring be performed by a third-party consultant independent of the contractor; however, the contractor should reserve the right to perform additional monitoring. Threshold criteria should be developed during deign and coordinated with the structural engineer.

SERVICES DURING DESIGN, CONSTRUCTION DOCUMENTS AND CONSTRUCTION QUALITY ASSURANCE

During final design, Langan should be retained to consult with the design team as geotechnical questions arise. Technical specifications and design drawings should incorporate our recommendations. When authorized, we will assist the design team in preparing specification sections related to geotechnical issues such as earthwork, shallow foundations, backfill, and excavation support. Langan should also, when authorized, review the project plans and contractor submittals relating to materials and construction procedures for geotechnical work to confirm the designs incorporate the intent of our recommendations.

Langan has explored and interpreted the site subsurface conditions and developed the foundation design recommendations contained here and is, therefore, best suited to perform quality-

assurance observation and testing of geotechnical-related work during construction. The work requiring quality-assurance confirmation or special inspections per the Building Code includes, but is not limited to, earthwork, shallow foundations, backfill, and excavation support.

Recognizing that construction observation is the final stage of geotechnical design, quality-assurance observation during construction by Langan is necessary to confirm the design assumptions and design elements, to maintain our continuity of responsibility on this project, and allow us to make changes to our recommendations, as necessary. The foundation system and general geotechnical construction methods recommended herein are predicated upon Langan's assisting with the final design and providing construction observation services for the owner. If Langan is not retained for these services, we cannot assume the role of geotechnical engineer of record, and the entity providing the final design and construction observation services must serve as the engineer of record.

LIMITATIONS

The conclusions and recommendations provided in this report result from our interpretation of the geotechnical conditions existing at the site inferred from a limited number of borings and information provided by the design team. Actual subsurface conditions may vary. Recommendations provided are dependent upon one another and no recommendation should be followed independent of the others.

Any proposed changes in structures or their locations should be brought to Langan's attention as soon as possible so we can determine whether such changes affect our recommendations. Information on subsurface strata and groundwater levels shown on the logs represent conditions encountered only at the locations indicated and at the time of our exploration. If different conditions are encountered during construction, they should immediately be brought to Langan's attention for evaluation because they might affect our recommendations.

This report has been prepared to assist the owner, architect, and structural engineer in the design process and is only applicable to the design of the specific project identified. The information in this report cannot be used or depended on by engineers or contractors involved in evaluations or designs of facilities (including underpinning, grouting, stabilization, etc.) on adjacent properties beyond the limits of that which is the specific subject of this report.

Environmental issues (such as permitting or potentially contaminated soil and groundwater) are outside the scope of this study and should be addressed in a separate evaluation.

CLOSING

We have appreciated being of service on this project, and look forward to working with you to successfully complete this project.

Sincerely,
Langan CT, Inc.

Taylor Dalling, P.E

1.0 INTRODUCTION

Langan CT, Inc. (Langan) prepared this revised limited National Emissions Standards for Hazardous Air Pollutants (NESHAP) Pre-Renovation Hazardous Building Materials (HBM) Survey Report on behalf of the Town of Greenwich and Silver/Petrucelli + Associates to identify hazardous building materials that may exist at Old Greenwich School, 285 Sound Beach Avenue, Greenwich, Connecticut. The school was constructed in 1902 with additions in 1925, 1950, 1957 and 1995. The school is an approximately 68,500 square-foot (SF) three-story structure with classrooms, offices, gymnasium, media center, kitchen, cafeteria, toilet rooms, storage rooms, boiler/mechanical rooms, attic and tunnel/crawl space areas. The objectives of this survey/report is to identify the presence or absence of accessible asbestos-containing materials (ACM), lead-based paint (LBP), suspect assumed Polychlorinated biphenyl (PCB) containing sealant compounds and universal waste so these materials can be properly quantified and assessed in support of planned renovation of the building.

Details pertaining to the building subject to this survey are summarized in the following table.

PROJECT INFORMATION

Client Name:	Silver/Petrucelli + Associates 3190 Whitney Avenue Building 2 Hamden, CT 0518-2340	Property Visit Date:	10 – 13 April 2023 9 and 18 August 2023
Professional's Project #:	140265802	Construction Dates:	Original Building: 1902 Additions: 1925, 1950, 1957 and 1995
Consultant's Project Manager:	Matthew A. Myers	No. Buildings:	One
Phone No.:	203-562-5571	No. of Stories:	Three
Email:	mmyers@langan.com	Bldgs. Gross Footage:	68,500 Square Feet
Property Address:	285 Sound Beach Avenue		
Property Town, State:	Greenwich, Connecticut	Property Use:	Public School

The following sections summarize the HBM findings for the building surveyed.

2.0 ASBESTOS-CONTAINING MATERIALS

Terminology

Suspect Asbestos-Containing Materials

Asbestos was historically used in certain types of construction and building materials. Until a material is examined by using polarized light microscopy (PLM) or a similar technique, the building material is considered as a suspect asbestos-containing material. A few examples of these materials include wall and ceiling plasters, sheetrock/taping compound, flooring materials, ceiling panels, thermal system insulation, fireproofing insulation, adhesives, roofing materials, damp-proofing/waterproofing materials, caulking and glazing compounds, etc. Any suspect ACM and/or building material of unknown asbestos content should be assumed to be an asbestos containing material and handled and disposed of accordingly. Demolition, renovation, maintenance or daily activities should not disturb building materials that are found to contain asbestos, assumed to contain asbestos or that have not been tested for possible asbestos content.

Asbestos–Containing Material

A material with an asbestos concentration greater than 1% by weight is considered an ACM by the United States Environmental Protection Agency (EPA). Thus, a material which contains asbestos in concentrations greater than 1% by weight is considered "positive" while a material that does not contain asbestos or asbestos is detected in concentrations less than 1% by weight is considered "negative". The Connecticut Department of Public Health (CT DPH) revised the definition of an asbestos-containing material to be a concentration equal to or greater than 1% by weight. However, the Occupational Safety and Health Administration (OSHA) considers any amount of asbestos as regulated and some landfills/states consider building materials containing less than 1% asbestos as regulated asbestos-containing waste.

Regulatory Guidelines and Requirements

Federal

In accordance with the Clean Air Act (CAA), the U.S. Environmental Protection Agency established the National Emission Standards for hazardous Air Pollutants to protect the public from exposure to airborne pollutants. Asbestos was one of the air pollutants, which was addressed under the NESHAP 40 Code of Federal Regulations (CFR) Part 61. The purpose of the asbestos NESHAP regulations is to protect the public health by minimizing the release of asbestos when facilities, which contain ACM, are being renovated or demolished. EPA is

responsible for enforcing regulations related to asbestos during renovation and demolition activities, however, the CAA allows the EPA to delegate this authority to state and local agencies. Even after EPA delegates responsibility to a state or local agency, EPA retains the authority to oversee agency performance and to enforce NESHAP regulations as appropriate. OSHA considers any amount of asbestos to be regulated.

State

Asbestos in Connecticut is regulated by the State of Connecticut Department of Public Health, under Standards for Asbestos Abatement – Section 19a-333a-1 through 16 of Regulations of Connecticut State Agencies (RCSA) and Licensing and Training Requirements for Persons Engaged in Asbestos Abatement and Asbestos Consulting Services – Section 20-440-1 through 9 and Section 20-441 of RCSA.

Asbestos Survey

During this survey, suspect ACM were separated into three US EPA categories. These categories are: thermal system insulation (TSI), surfacing materials, and miscellaneous materials. TSI includes all materials used to prevent heat gain or loss or water condensation on mechanical systems. Typical examples of TSI are boiler, duct and tank insulation, pipe and pipe fitting insulation. Surfacing materials are sprayed, troweled or otherwise applied to an existing surface and common uses are fireproofing, decorative and acoustical plaster applications. Miscellaneous materials include all ACM not listed as TSI or surfacing and include: flooring materials, ceiling tiles, adhesives, transite cement board, sink undercoating, gypsum board/taping and joint compounds, cove base materials, caulking and glazing compounds, damp-proofing/tars/mastics, roofing materials and other materials. State of Connecticut DPH licensed asbestos inspectors Matthew Myers (#000041), Willie Thompson (#000673) and Ryan Murphy (#000937) performed the survey.

ACM Results Summary

Bulk sampling results are included as Tables 1 and 2 below. Analytical asbestos laboratory data can be found in Appendix A.

As required by EPA and CT DPH, samples were analyzed by individual layers (e.g. floor tile & the associated mastic were analyzed as two separate samples, rough and finish coat plasters, etc.). Bulk samples of suspect ACM were analyzed using the PLM analytical methodology in accordance with EPA Protocol 600/R-93/116 and possibly by PLM Point Count. Additional analysis

of non-friable organically bound (NOB) materials (e.g. flooring mastics) using NOB and transmission electron microscopy (TEM) was performed. The samples were analyzed by EMSL of Cinnaminson, New Jersey, accredited by the National Voluntary Laboratory Program (NVLAP) and American Industrial Hygiene Association (AIHA).

Utilizing the EPA and CT DPH protocols and criteria, the following materials **were determined to be ACM or assumed to be ACM:**

Table 1 – Summary of Asbestos-Containing Materials

Material	Location	% Asbestos and Sample ID	Estimated Quantity of ACM
1902 Original Building and 1925 Addition			
Pipe and Pipe Fitting Insulation – Thermal System Insulation	Inaccessible – Assumed Behind Walls, Ceilings and Chases and Possibly in Tunnels/Crawl Spaces	Assumed ACM	No Visible Insulation Noted Assume up to 900 Linear Feet Inaccessible Behind Walls, Ceilings and Chases and up to 800 Linear Feet in Possible Inaccessible Tunnels/Crawl Spaces
Interior Window Glazing Compound (White) – Miscellaneous Material	Classrooms 3 and 4 Corridor	ACM 3% Anthophyllite 041381A	Six Window Openings
9"x9" Floor Tiles and Black Mastic – Miscellaneous Materials	Ground Floor Custodial Closet (with Ramp) Adjacent Room 10 and Custodial Office Under Work Shelves Throughout Underneath Millwork, Cabinetry, Other Non-Moveable Objects	ACM 1.5%-8% Chrysotile 0413113A 0413114A 0413115A 080916	180 Square Feet Unknown – Assumed Throughout Each Room

Material	Location	% Asbestos and Sample ID	Estimated Quantity of ACM
White and Pink Sink Undercoating – Miscellaneous Materials	Classrooms 20, 22, 23, 28, 31, 33, 35, 36, 38, 40, 43 and 44	ACM 3% Chrysotile 0413151A 0413152A	12 Sinks
Interior Sink Backsplash Caulking Compound (White) – Miscellaneous Material	Classrooms 20, 22, 23, 25, 28, 31, 33, 35, 36, 38, 40, 43 and 44	ACM 3% Anthophyllite 0413158A	130 Linear Feet
Wall and Ceiling Plaster Finish/Rough Coats – Surfacing Materials	Throughout 1902 Original Building	ACM 1.5%-2.25% Chrysotile 0413191B 0413195A 0413226A And Previous Historical Results	77,000 Square Feet (Quantity Assumes Plaster is Located Above Sheetrock Ceilings Above Suspended Ceiling Tiles and Walls Behind Sheetrock and Other Wall Materials) (Quantity Does Not Include Plaster Located in Attic)
Bulletin Board, "Chalk" Board and Other Wall Adhesives – Miscellaneous Materials (Adjacent Materials/Substrates are Contaminated – Multiple Layers of Boards/Materials Also)	Throughout Original Building and 1925 Addition	Assumed ACM	Unknown – Estimate up to 3,750 Square Feet
Exterior/Interior Window Caulking Compounds – Miscellaneous Material	Exterior	ACM 4% Chrysotile 0413263A	93 Window Openings (Varying Sizes/Windows Per Opening)

Material	Location	% Asbestos and Sample ID	Estimated Quantity of ACM
Exterior/Interior Door and Door/Window Caulking Compounds (Glazing Compound Also at Main Front Entry Door) – Miscellaneous Materials	Exterior	ACM 3%-5% Chrysotile 0413264A 0413265A 0413266A	Eight Door and Door/Window Openings (Varying Sizes Per Opening)
Exterior Wall Expansion Caulking Compound – Miscellaneous Material	Exterior	ACM 4% Chrysotile 0413258A	60 Linear Feet
Exterior Vent Caulking Compound – Miscellaneous Materials	Exterior	ACM 4% Chrysotile 0413260A 0413261A	Seven Vent Openings
1950 Addition			
Pipe and Pipe Fitting Insulation – Thermal System Insulation	Exterior Storage Room Adjacent Classroom 3 Inaccessible – Assumed Behind Walls, Ceilings and Chases	Assumed ACM	40 Linear Feet Visible Assume up to 1,600 Linear Feet Inaccessible Behind Walls, Ceilings and Chases
9"x9" Floor Tiles and Black Mastic – Miscellaneous Materials	Throughout Underneath Millwork, Cabinetry, Other Non-Moveable Objects	ACM 6% Chrysotile 080918	Unknown – Assumed Throughout Each Room
White Sink Undercoating – Miscellaneous Material	Classrooms 1, 2, 12, 41 and 42	ACM 3% Chrysotile 041360A	Five Sinks

Material	Location	% Asbestos and Sample ID	Estimated Quantity of ACM
White Duct Insulation (Residue) – Thermal System Insulation (Substrates Contaminated)	Mechanical Room Above Room 29 (Above Gymnasium) (May Exist In Other Locations and Underneath Fiberglass Duct Insulation Throughout Addition – Checked Accessible Ducts in Several Locations)	ACM 12% Chrysotile 041364A	Unknown – Estimate 4,000 Square Feet above Gymnasium (Temporary Flooring May Need to be Installed Throughout the Attic to Make Abatement Work Safe (May Require Engineer for Additional Weight of Temporary Flooring)
Gray Duct Insulation – Thermal System Insulation (Substrates Contaminated)	Exterior Storage Room Adjacent Classroom 3	ACM 21% Chrysotile 041365A	225 Square Feet
Bulletin Board, "Chalk" Board and Other Wall Adhesives – Miscellaneous Materials (Adjacent Materials/Substrates are Contaminated – Multiple Layers of Boards/Materials Also)	Throughout 1950 Addition	Assumed ACM	Unknown – Estimate up to 1,850 Square Feet
Interior Door Window Glazing Compound (Black) – Miscellaneous Material	Classrooms 41 and 42	ACM 3% Chrysotile 041371A	Two Doors
Interior Window Caulking Compound – Miscellaneous Material	Stairwell Adjacent Classroom 42/29 and Gymnasium	ACM 4%-5% Chrysotile 041374A 041376A	Eight Large Window Openings

Material	Location	% Asbestos and Sample ID	Estimated Quantity of ACM
Interior Door Caulking Compounds – Miscellaneous Materials	Gymnasium Foyer/Lobby, Gymnasium and Boiler Room Corridors and Stairwell Corridor Adjacent Classroom 12	ACM 3%-4% Chrysotile 041377A-C	200 Linear Feet
Interior Door/Window Caulking Compound – Miscellaneous Material	Gymnasium Foyer/Lobby Perimeter Entry/Exit	ACM 3% Chrysotile 041378A	Two Door/Window Openings
Ceramic Wall Tile Adhesive (Dark Brown) – Miscellaneous Material (May be a Replacement Adhesive)	Girls Locker Room Rear Shower Room (May Exist In Other Locations Throughout Addition)	ACM 7% Chrysotile 0413142A	Estimate up to 100 Square Feet
Black Tar/Paper On/Inside Concrete Walls – Miscellaneous Materials	Tunnels/Crawl Spaces	ACM 12%-13% Chrysotile 0413245A 0413246A	Unknown – Should Not Be Affected By Planned Renovations
Exterior/Interior Window Caulking Compounds – Miscellaneous Materials	Exterior	ACM 4%-5% Chrysotile 0413254A 0413255A	85 Window Openings (Varying Sizes/Windows Per Opening)
Exterior/Interior Door and Door/Window Caulking Compounds – Miscellaneous Material	Exterior	ACM 4%-8% Chrysotile 0413256A 0413257A	Ten Door and Door/Window Openings (Varying Sizes Per Opening)

Material	Location	% Asbestos and Sample ID	Estimated Quantity of ACM
Exterior Wall Expansion Caulking Compound – Miscellaneous Material	Exterior	ACM 4% Chrysotile 0413258A	20 Linear Feet
Exterior Vent Caulking Compound – Miscellaneous Materials	Exterior	ACM 4% Chrysotile 0413260A 0413261A	Four Vent Openings
1957 Addition			
Pipe and Pipe Fitting Insulation – Thermal System Insulation	Classroom 6 Inaccessible – Assumed Behind Walls, Ceilings and Chases	Assumed ACM	Ten Linear Feet Visible Assume up to 200 Linear Feet Inaccessible Behind Walls, Ceilings and Chases
9"x9" Floor Tiles and Black Mastic – Miscellaneous Materials	Throughout Underneath Millwork, Cabinetry, Other Non-Moveable Objects	ACM 8% Chrysotile 080920	Unknown – Assumed Throughout Each Room
Bulletin Board, "Chalk" Board and Other Wall Adhesives – Miscellaneous Materials (Adjacent Materials/Substrates are Contaminated – Multiple Layers of Boards/Materials Also)	Throughout 1957 Addition	Assumed ACM	Unknown – Estimate up to 800 Square Feet
Black Damp-proofing Material(s) – Miscellaneous Material (Substrates Contaminated)	Perimeter Walls Throughout Addition	ACM 3% Chrysotile 041348A	5,000 Square Feet

Material	Location	% Asbestos and Sample ID	Estimated Quantity of ACM
Exterior Foundation Damp-proofing Tar Material – Miscellaneous Material (Substrates Contaminated)	Exterior Foundations	ACM 4% Chrysotile 0413249A	Unknown – Estimate up to 1,250 Square Feet
Exterior Vent Caulking Compound – Miscellaneous Material	Exterior	ACM 6% Anthophyllite 2% Chrysotile 0413251A	One Vent Opening
Exterior/Interior Window Caulking Compound – Miscellaneous Material	Exterior	ACM 4% Chrysotile 0413253A	Eight Window Openings (Varying Sizes/Windows Per Opening)
1995 Addition			
Interior Window Sill Caulking Compound – Miscellaneous Material	Classrooms 114 and 115	ACM 3% Anthophyllite 041306A	40 Linear Feet
Roofing Materials			
Copper Flashing/Wall Tar – Miscellaneous Material	Roofs Throughout Except 1995 Addition	ACM 4% - 6% Chrysotile 0413277A 0413298A	Unknown – Should Not Be Affected By Planned Renovations
Chimney Flashing Tar – Miscellaneous Material	Roofs Throughout Except 1995 Addition	ACM 8% Chrysotile 0413292A	450 Square Feet

Material	Location	% Asbestos and Sample ID	Estimated Quantity of ACM
Gutter Seam Flashing Tar – Miscellaneous Material	1950 Addition (May Exist on Other Roofs As Well – Could Not Access All Roofing Areas)	ACM 5% Chrysotile 0413300A	Unknown – Estimate 1,100 Square Feet for 1950 Addition

Utilizing the EPA and CT DPH protocols and criteria, the following materials **were determined to be non-ACM:**

Table 2 – Summary of Non-Asbestos-Containing Materials

Material	Location	Sample ID
1902 Original Building and 1925 Addition		
"Newer" Interior Door Caulking Compound (White) – Miscellaneous Material	Classrooms 3 and 4 Corridor	041379A,B

Sheet Flooring, Adhesive and Gray Cement/Substrate/Leveler – Miscellaneous Materials	Kitchen	041313A,B – 041315A,B 041323A,B
12"x12" Pink, White and Blue Floor Tiles , Yellow Mastic and Floor Leveler – Miscellaneous Materials	Throughout Addition	041316A,B – 041320A,B
Rubber Sheet Flooring and Yellow Adhesive – Miscellaneous Materials	Entry/Exit Foyers	041321A,B 041322A,B
Cove Base and Adhesives (Multiple Colors) – Miscellaneous Materials	Throughout Addition	041324A,B – 041329A,B
Plastic Wall Adhesive – Miscellaneous Material	Kitchen	041330A,B
Wall/Bulletin Boards and Adhesives – Miscellaneous Materials	Throughout Addition	041331A,B – 041334A,B
Ceramic Floor and Wall Tile Mud Beds and Grouts – Miscellaneous Materials	Cafeteria, Corridor and Toilet Rooms	041335A,B – 041338A,B

Material	Location	Sample ID
Exterior Window Sill Caulking Compound – Miscellaneous Material	Exterior Throughout	0413247A,B
Exterior Window, Door, Wall Expansion and Vent Caulking Compound – Miscellaneous Material	Exterior Throughout	0413248A,B
Roofing Materials		
Exterior "Newer" Copper Flashing, Perimeter, Wall Expansion and HVAC Caulking Compounds – Miscellaneous Materials	Roofs Throughout	0413267A,B – 0413270A,B
Top and Bottom Layers Roof Shingles and Black Paper Under Shingles – Miscellaneous Materials	1995 Addition	0413271A,B – 0413273A,B
Roof Walk Mats – Miscellaneous Material	1995 and 1950 Additions	0413318A,B
Perimeter, Penetration and HVAC Flashing Tar and Tar Paper – Miscellaneous Materials	Roofs Throughout	0413274A,B - 0413276A,B 0413287 0413289A,B - 0413291A,B 0413310A,B – 0413317A,B
Copper Flashing Tar Patch – Miscellaneous Material	1995 Addition to 1950 Addition	0413278A,B
Rolled Roofing, Paper Layer and Soft Concrete Deck – Miscellaneous Materials	1995 Addition and 1957 Addition Roofs	0413279A,B - 0413282A,B 0413283 – 0413285 0413288
Bottom Layer Roof Field Tar – Miscellaneous Material	1957 Addition	0413286A,B
Three Layers of Roofing Shingles, Black Paper Under Shingles and Concrete Roof Deck– Miscellaneous Materials	1950 Addition	0413293A-D – 0413297A-C

Material	Location	Sample ID
Gutter Flashing Tar – Miscellaneous Material (Contaminated with Asbestos-Containing Gutter Seam Flashing Tar)	1950 Addition	0413299A,B
Three Layers of Roofing Shingles and Black Paper Under Shingles – Miscellaneous Materials	1902 Building and 1925 Addition	0413301A,B – 0413304A,B
Rolled Roofing, Soft Concrete, Paper Layers, Bottom Layer Tar and Tar on Deck – Miscellaneous Materials	1950 Addition	0413305A,B – 0413309A,B
Roof Field/Flashing Tar – Miscellaneous Material	1950 Addition Over Bay Windows	0413319A,B

NOTE: Materials that contain less than 1% asbestos are regulated by OSHA and some landfills may not accept the waste as clean construction debris. See appendix A for materials that contain less than 1% asbestos.

DISCLAIMERS: Reasonable care was taken to identify all suspect accessible asbestos containing materials through visual inspection and limited destructive sampling techniques. However, it is not feasible to uncover all materials that may exist. Additional materials may need to sampled after the building has been vacated and/or during the selective demolition/renovation process. Some locations/materials were not sampled during this survey due to occupancy, location and damage required to inspect certain materials/areas.

Flooring Materials Remaining (Hidden) – A majority of the flooring materials (tiles) were reported to have been abated throughout the building. Langan checked at least one location in each room and in common areas. Additional asbestos-containing flooring materials may exist and may be discovered during selective demolition and/or building renovation under gypsum board walls, under fixed cabinetry/millwork/non-moveable objects throughout all areas (confirmed to exist), under lockers, under multiple layers of flooring (wood, newer tiles/flooring materials, epoxy, rubber, etc.), under floor leveling compounds and/or soft concrete and underneath other materials. The gymnasium flooring materials were not investigated (currently not part of planned renovations). Suspect asbestos-containing materials could exist underneath the gymnasium flooring (tars, damp-proofing, paper, other materials).

Duct Insulation Residue – The mechanical space above room 29 (above gymnasium) was found to have HVAC duct work and the ducts had a white residue on them that was found to contain asbestos. This material may exist throughout the building in other locations (checked several locations) and may also exist underneath fiberglass duct insulation throughout.

Possible Additional Tunnel/Crawl Space and Inaccessible Areas – Accessible tunnel/crawl space areas were investigated. **Piping was found to be going into solid concrete walls and there may exist tunnel/crawl space areas under the 1902 original building and 1925 additions that are currently not accessible.** Additional asbestos-containing materials (pipe and pipe fitting insulation, etc.) could exist in these locations. The majority of the "higher" original building and 1925 additions roofing materials could not be accessed safely for visual inspection and bulk sampling (inspection and bulk sampling did occur on these roofs adjacent the roof hatch by the 1957 addition). There is a closet hatch door (corridor closet adjacent classroom 42) that could not be accessed due to the amount of stored materials inside the closet. Additional asbestos-containing materials may exist in this area which is currently assumed to be the boiler room exhaust chimney that runs from the ground floor to the second floor. Several areas in the previous locker rooms could also not be accessed due to materials stored in these areas and additional asbestos-containing materials may exist in these areas (pipe and pipe fitting insulation will be assumed inside walls/chases).

Previous Abatement Records – Existing recordkeeping documents stated that asbestos-containing roofing materials were abated. Previous abatement recordkeeping also state that the entire boiler room and tunnels/crawl spaces/mechanical spaces have been abated of several asbestos-containing materials as well as asbestos-containing residue found underneath fiberglass pipe insulation. Langan investigated representative areas and noted the boiler, boiler exhausts, pipe insulation, etc. were "newer" and did not find suspect asbestos-containing insulation materials or other materials abated to be present. Asbestos-containing materials may still exist in some locations, underneath fiberglass pipe insulation throughout as well as throughout the roofs. A window replacement project was reported to have occurred in 2012. The window caulking compounds were found to contain asbestos throughout the majority of the original building and 1925, 1950 and 1957 additions.

Interior Hidden Materials - Interior walls/ceilings/floors/other building materials were opened up/accessed in limited locations to investigate for suspect asbestos-containing materials. Additional suspect asbestos-containing materials may be discovered during selective demolition and/or renovation activities despite the inspectors investigating representative areas during the

survey. Additional asbestos containing materials may be found:

- Interiors of boilers, walk-in freezers, etc. (appear to be "newer" and should not have asbestos containing materials inside them but will need to be sampled prior to demolition);
- Behind water fountains (tar/damp-proofing and pipe insulation);
- Inside HVAC ducts, mechanical systems, chimneys and incinerators (damp-proofing, tars, adhesives, sealants, fire brick and thermal system insulation);
- Adhesives (and other materials) associated with millwork, cabinetry, shelving, window sills, behind gypsum board walls/ceilings, classroom sink walls areas, mirrors and wall materials (checked several locations and sampled limited materials – most bulletin boards and "chalk" boards were not able to be investigated behind), etc.;
- Behind custodian slop sinks (damp-proofing/tar behind);
- Behind ceilings, walls, chases and flooring throughout (duct insulation, pipe insulation, vibration isolation cloth, roofing debris, flooring, etc.) and underneath the stage (checked limited areas). There are multiple layers of wall, ceiling and flooring materials throughout original building and additions with inaccessible areas behind them;
- Vermiculite behind/inside walls, ceilings and chases (checked several areas in attic);
- Roofing materials and/or debris not found during this inspection (checked several locations throughout);
- Paints, cement, brick and masonry (typically not suspect);
- Transite cement board, adhesives, pipe insulation, other materials behind radiators, closets, wall paneling/materials, exterior, ceilings, soffits, etc.);
- HVAC duct adhesives, duct pin adhesive, seam and flange sealants and vibration isolation cloths (checked several locations) throughout;
- Additional fire door/door insulation;
- Behind ceramic walls and floors (damp-proofing/tars/etc.). Checked several locations throughout building. The girls locker room ceramic walls were found to have asbestos-containing adhesive behind the tiles in one location and this material may exist in additional areas in this room as well as other areas (checked several additional areas, including inside the girls locker room and did not find except for one location);
- Asbestos-containing pipe and/or pipe fitting residue/contamination underneath fiberglass insulation (checked several locations);
- Paper backing inside lights and electrical insulation (stage and other locations – stage lighting appeared to be "newer");
- Damp-proofing/tar/paper behind perimeter walls throughout and around perimeter wall window, door, vent openings throughout and

- Materials (adhesives, transite, etc.) behind exterior "stucco" textured walls.

Foundations/Soil and Buried Piping and Mechanical Conduits – Foundation damp-proofing/tars/mastics may exist under the soil on the building foundations (checked 1957 addition). Additional damp-proofing materials that have not been investigated/sampled, may exist in other locations, on the inside of foundation walls and underneath floor slabs throughout. It is not known if other materials are buried in the soil adjacent to the building (ex. transite and/or orangeburg piping, etc.). Asbestos containing damp-proofing/tars/mastics/other materials may also exist on piping and mechanical conduits in the subsurface.

Exterior Hidden Materials – Additional asbestos-containing materials (damp-proofing, etc.) may exist behind wall materials not investigated/in other locations that have not been opened up/sampled to date. Langan could not drill above door or window headers/lintels due to the damage that would occur. "Older" window/door/vent/wall sealant compounds may exist behind newer sealant compounds (checked several locations) and behind blocked/filled in window/other openings. Additional hidden suspect asbestos containing "older" roofing materials may exist that were not found by the limited roof cuts/sampling that has occurred to date.

Hidden Materials Between Original Building and All Building Additions – Additional asbestos-containing materials (damp-proofing, etc.) may exist behind walls, etc. between different ages of the building/additions.

3.0 LEAD-BASED PAINT XRF SCREENING

A limited lead-based paint XRF (X-ray Fluorescence) screening survey was performed throughout the building by Pavel Zayenchik, a CT DPH licensed lead inspector (CT license #002262). LBP was identified exceeding the HUD/EPA action level of equal to or greater than 1.0 mg/cm^2 in the materials listed below. Toxicity Characteristic Leaching Procedure (TCLP) lead waste characterization samples should be taken to classify the building materials for proper waste disposal after the building has been vacated or during the start of renovation activities. See Appendix B for XRF field data sheets.

Table 3 – XRF Lead-Based Paint Screening Results (>1 mg/cm^2)

Sample Number	Component	Substrate	Color	Test Location	Total Lead mg/cm^2	Results
20	Post Handrail	Metal	Blue	1950 Stairwell	1.6	Positive
21	Handrail	Metal	Blue	1950 Stairwell	3.2	Positive

222	Door Casing	Wood	White	Exterior Gym	7.3	Positive

Contractors should be aware that OSHA has not established a level of lead in a material below which 29 CFR 1926.62 does not apply. Contractor shall comply with exposure assessment criteria, interim worker protection and other requirements of the regulation as necessary to protect workers and occupants/residents.

The information in this report does not constitute a comprehensive lead inspection under the Connecticut Department of Public Health Regulations, Section 19a-111-1 to 11. The survey was an XRF lead screening utilizing an XRF and does not satisfy the testing requirements of US EPA's Renovation, Repair and Painting Rule (RRP) under 40 CFR 745.80 through 92. Reliance on this report for determining RRP or CT DPH applicability is not authorized by Langan.

4.0 PCB SEALANT SOURCE MATERIALS

In recent years, the Unites States Environmental Protection Agency (US EPA) has learned that building sealants (e.g. caulking, glazing, expansion joint and other sealant materials) containing potentially harmful PCBs were used in many buildings in the 1950s through the 1980s. PCBs were added to building sealants for durability, resistance to degradation, and as a softener/plasticizer for application.

Connecticut Department of Energy and Environmental Protection (CTDEEP) has a PCB regulatory limit of 1 ppm and EPA has a regulatory limit of 50 ppm for source materials. The following "older" PCB sealant source materials are assumed to have greater than 50 ppm PCB (PCB Bulk Product Waste):

Table 4 – Summary of Assumed PCB Source Sealant Materials	
Material	**Location**
1902 Original Building and 1925 Addition	
Interior Window Caulking, Glazing and Door Caulking Compounds	Classrooms 3 and 4 Corridor (Six Window and Two Door Openings)
Interior Sink Backsplash Caulking Compound	Classrooms 20, 22, 23, 25, 28, 31, 33, 35, 36, 38, 40, 43 and 44 (130 Linear Feet)
Interior Door Window Glazing Compound	Classroom 8 and 7/8 (Two Doors)
Interior Window Glazing Compound (Above Corridor Entry Doors)	Classrooms 20, 22, 23, 25, 28, 31, 32, 33, 38, 39, 40, 43 and 44 (13 Windows)
Exterior/Interior Window Caulking Compounds (Perimeter Walls)	Exterior (93 Window Openings - Varying Sizes/Windows Per Opening)
Exterior/Interior Door and Door/Window Caulking Compounds (Glazing Compound Also at Main Front Entry Door) (Perimeter Walls)	Exterior (Eight Door and Door/Window Openings - Varying Sizes Per Opening)
Exterior Wall Expansion Caulking Compound (Perimeter Walls)	Exterior (60 Linear Feet)
Exterior Vent Caulking Compound (Perimeter Walls)	Exterior (Seven Vent Openings)
1950 Addition	
Interior Door Window Glazing Compound	Classrooms 41 and 42 (Two Doors)
Interior Window Caulking Compound	Stairwell Adjacent Classroom 42/29 and Gymnasium (Eight Large Window Openings)

Material	Location
Interior Door Caulking Compounds	Gymnasium Foyer/Lobby, Gymnasium and Boiler Room Corridors and Stairwell Corridor Adjacent Classroom 12 (200 Linear Feet)
Interior Door/Window Caulking Compound	Gymnasium Foyer/Lobby Perimeter Entry/Exit (Two Door/Window Openings)
Exterior/Interior Window Caulking Compounds (Perimeter Walls)	Exterior (85 Window Openings - Varying Sizes/Windows Per Opening)
Exterior/Interior Door and Door/Window Caulking Compounds (Perimeter Walls)	Exterior (Ten Door and Door/Window Openings- Varying Sizes Per Opening)
Exterior Wall Expansion Caulking Compound (Perimeter Walls)	Exterior (20 Linear Feet)
Exterior Vent Caulking Compound (Perimeter Walls)	Exterior (Four Vent Openings)
1957 Addition	
Interior Window Glazing Compounds (Above Corridor Entry Doors)	Classroom 24 and 37 (Two Window Openings)
Exterior/Interior Window Caulking Compounds (Perimeter Walls)	Exterior (Eight Window Openings - Varying Sizes/Windows Per Opening)
Exterior/Interior Door Caulking Compounds (Perimeter Walls)	Exterior (One Door Opening)
Exterior Vent Caulking Compounds (Perimeter Walls)	Exterior (One Vent Opening)

Sealant compounds throughout the 1995 addition and throughout the roofs were not included in the PCB visual survey due to the age of construction/installation (not typically suspect).

PCBs can also be found in paints, damp-proofing materials, roofing materials, adhesives, glues, floor mastics, etc. Sampling of these materials and sealant compounds was not authorized at the time of the HBM survey.

5.0 UNIVERSAL WASTE ASSESSMENT

Completion of detailed Universal Waste Assessment (identifying the number and location of Universal Waste items) was not conducted as part of this survey. Universal wastes noted during the visual survey include suspect PCB/DEHP (di (2-ethylhexyl) phthalate) ballasts/capacitors associated with light fixtures, air conditioner and refrigerant coolants, rooftop HVAC units, window air conditioning units, mercury-containing florescent and other mixed used high intensity light bulbs, smoke detectors and other alarms/sensors containing suspect radioactive materials, batteries and emergency lighting, exit and other signage, possible mercury-containing thermostats, switches, gauges, electronics, paints, wiring, fire extinguishers, cleaning and other chemicals.

All universal waste that is present in the building that will be impacted by renovation activities, will need to be properly removed, recycled, and/or disposed of at a landfill permitted to accept such waste. The removal, handling, recycling, and disposal must be performed in accordance with applicable Federal, State, and local regulations.

6.0 CONCLUSIONS AND RECOMMENDATIONS

Langan provides the following conclusions and recommendations, based on the findings of this revised limited NESHAP Pre-Renovation Hazardous Building Materials Survey:

Both friable and non-friable ACM were identified/assumed throughout the original building and building additions. Prior to selective demolition/renovation activities, the identified ACM that will be disturbed/impacted by renovation activities must be properly removed and disposed in accordance with applicable Federal, State and Local regulations by a State of Connecticut DPH licensed asbestos abatement contractor. A State of Connecticut licensed Asbestos Designer should create abatement specifications and an Asbestos Project Monitor should perform project oversight and air testing in accordance with the Federal and State regulations. These are all requirements of the CT DPH Standards. Additional sampling/destructive sampling/visual investigation is required for materials that have not been sampled to date and the abatement

contractor will be required to perform selective demolition throughout the interior and exterior of the building.

Building materials identified to contain less than 1% asbestos are regulated by OSHA and some landfills may not accept this waste as clean construction debris. Contractors must comply with all applicable federal and state regulations, including OSHA, when handling/disturbing/disposing of materials that contain less than 1% asbestos.

Contractors completing demolition and/or abatement activities should be aware that OSHA has not established a level of lead in a material below which 29 CFR 1926.62 does not apply. All contractors working on the project are responsible for having adequate training (RRP or greater amount) and performing their own OSHA compliance requirements. Contractor shall comply with exposure assessment criteria, interim worker protection and other requirements of the regulation as necessary to protect workers and occupants/residents. All contractors must comply with all applicable State and Federal regulations, including but not limited to the lead OSHA regulations.

TCLP lead waste characterization sampling should be performed to determine the waste disposal method for painted components to be removed/disposed (normal construction debris versus regulated hazardous waste). Separate TCLP samples should be obtained for each different age of construction (original building and building additions) after the building has been vacated or during the start of renovation activities. Metal materials painted in lead-based paint may be recycled. Langan recommends completion of a lead-based paint awareness specification for the project.

The interior plaster materials and window/door/other interior/exterior components found to contain lead based paint that will be scheduled to be impacted by selective demolition activities in the original building, 1925 and 1950's additions should be demolished under controlled conditions (polyethylene sheeting, negative air machines, etc.) to avoid possibly contaminating building areas and exterior ground surfaces with lead debris and dust and the CT DPH lead regulations may apply if children under the age of six occupy the building.

"Older" caulking, glazing and sealant compounds to be disturbed by selective demolition/ renovation activities are assumed to contain greater than 50 ppm PCB bulk product waste. These materials and other suspect PCB containing materials could be tested at a later date or assumed to contain PCBs (and possibly adjacent building materials and ground surfaces). PCB abatement specification(s) will be required and if sampling is performed, a PCB performance based plan

(does not require EPA approval) or self-implementing plan (requires EPA approval – two to six months is typical for this process) may be required depending upon the sample results. The owner/owners representative and Langan should meet to discuss the testing parameters (what materials is Langan authorized to sample (if any) and when will sampling occur) or what assumptions will be in place to write specifications without sampling (types of source materials to be assumed, extent of adjacent building materials, etc.).

All universal waste that is present in the building that will require removal/replacement due to planned renovation activities, will need to be properly removed, recycled, and/or disposed of at a landfill permitted to accept such waste. The removal, handling, recycling and disposal must be performed in accordance with applicable Federal, State, and local regulations. Langan recommends completion of a universal waste recycling/disposal specification for the project.

7.0 LIMITATIONS

The conclusions and recommendations presented in this report are professional opinions based solely upon Langan's visual observations, laboratory test data, and current regulatory requirements. These conclusions and recommendations are intended exclusively for the purpose stated herein, at the site indicated, and for the project indicated.

It is important to recognize that even the most comprehensive scope of services may fail to detect all hazardous building materials that may be associated with the property. Therefore, Langan cannot act as insurers and cannot "certify" that all hazardous building materials associated with the property have been identified, and no expressed or implied representation or warranty is included or intended in our report, except that our services were performed, within the limits prescribed by our client, with the customary thoroughness and competence of our profession.

Any suspect material that is not listed in this report must be assumed as ACM, PCBs, LBP, etc. until confirmed otherwise via laboratory testing.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This is a summary report; official reports are available on LabConnect or upon request and relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Samples analyzed by EMSL Analytical, Inc. Carle Place, NY NVLAP Lab Code 101048-10, CA ELAP 2339

Shannon Halloran (11)
Sara Poppa (22)

Danny Sandhu, Asbestos Laboratory Manager
or Other Approved Signatory

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 “Interim Method”) but augmented with procedures outlined in the 1993 (”final”) version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Samples analyzed by EMSL Analytical, Inc. Meriden, CT NVLAP Lab Code 200700-0,

RE: In-Situ Waste Classification Soil Sampling
Old Greenwich School
Greenwich, Connecticut
Langan Project No.: 140265801

Dear Paul:

Langan CT, Inc. (Langan) was engaged by the town of Greenwich to collect soil samples from an area at the Old Greenwich School (OGS) at 285 Sound Beach Avenue in Greenwich (the "Site"). The investigation area was within an area of proposed excavation for a proposed building addition. The purpose of the sampling was to complete in-situ waste classification of the soil and groundwater prior to planned construction activities. The following is a summary of the sampling event and analytical results of the soil and groundwater.

Soil Sampling

On September 25, 2023, five soil borings (LB-01 through LB-05) were advanced in the planned excavation area at OGS. The soil borings were advanced using a truck-mounted, direct-push drill rig by Cisco Geotechnical, LLC (Cisco) of Glastonbury, Connecticut. Soil borings were advanced up to 12 feet below ground surface (bgs) and soil cores were collected continuously from the ground surface. Soil samples retrieved from each boring were classified for soil type, grain size, moisture, and texture. Each soil core was screened for volatile organic compounds (VOCs) using a photoionization detector (PID) equipped with a 10.6-electron volt (eV) lamp. Soil cores were evaluated for visual and olfactory indications of environmental impact. Soil boring logs are provided in Attachment A and boring locations are shown on Figure 2.

Four five-point composite soil samples were collected from soil borings LB-01 through LB-05. One of the composite samples was collected from the shallow fill interval (1 to 2 feet bgs), and the other three composite samples were collected from three separate depth intervals in the estuarine soils beneath the fill (3 to 4, 4 to 5, and 5 to 6 feet bgs). The composite samples were composed of five discrete grab samples of soil collected from the

same depth interval from each boring location. The five grab samples were placed in a Ziploc® bag and vigorously mixed to homogenize the sample material into a composite sample representative of the soil profile for the corresponding depth interval. The composite sample material was then transferred into laboratory-supplied containers, labeled, stored in an ice-chilled cooler, and transported under chain of custody to York Analytical Laboratories (York) of Stratford, Connecticut. York is a Connecticut Department of Public Health (CTDPH)-certified laboratory. The samples were submitted to York for analysis of typical soil waste classification parameters:

- VOCs
- Total petroleum hydrocarbons (TPH)
- Semi-volatile organic compounds (SVOCs)
- Pesticides
- Herbicides
- Polychlorinated biphenyls (PCBs)
- Resource Conservation and Recovery Act (RCRA) Metals plus antimony, copper, beryllium, trivalent and hexavalent chromium, nickel, thallium, vanadium, and zinc
- RCRA Toxicity characteristic leaching procedure (TCLP) Metals and Pesticides
- Conductivity
- Ignitability
- pH
- Paint filter test
- Cyanide and sulfide reactivity

Analytical results of the soil samples are discussed below and summarized on Table 1. The soil laboratory reports are provided as Attachment B.

Subsurface soil conditions in area of the proposed building addition generally consisted of 2 to 3 feet of fill consisting of light to dark brown, fine to medium sand with some gravel and trace silt, underlain by 4 to 7 feet of light to tannish gray, silty sand estuarine deposits. Light grayish to tannish brown medium sand was observed below the estuarine deposits. Groundwater was encountered at approximately 8 feet bgs in all five boring locations. Soil boring logs are provided as Attachment A.

Groundwater Sampling

Following advancement of LB-01, Cisco installed a temporary monitoring well in the open borehole. The monitoring well (TMW-01) was installed at a depth of approximately 18 feet and consisted of a 1-inch Schedule 40 polyvinyl chloride (PVC) riser pipe with 10 feet of screen. The annular space around the PVC was filled with No. 2 filter sand. Groundwater

was sampled from the well with a peristaltic pump and dedicated ¼-inch tubing. Using the pump, groundwater was collected directly into laboratory-supplied containers. The groundwater sample was submitted to York under chain of custody for analysis of VOCs, TPH, total metals including copper, lead, mercury, zinc, iron, and cadmium, pH, total nitrogen, total phosphorus, total settleable solids, total suspended solids, total kjeldahl nitrogen (TKN), nitrate as nitrogen, and nitrite as nitrogen.

Soil Analytical Results

Soil analytical results were compared to the town of Manchester Landfill acceptance criteria for Non-Hazardous Contaminated Soils and the RCRA Toxicity Characteristics Maximum Concentrations.

Two VOCs (acetone and 2-butanone (MEK)), TPH (diesel range organics (DRO)), various metals, and the pesticide total DDT were detected in composite samples at concentrations above laboratory reporting limits. SVOCs, TPH (gasoline range organics (GRO)), PCBs, herbicides, and TCLP pesticides were not detected above laboratory reporting limits in composite samples.

Arsenic was detected in composite samples OGS_FILL (1-2) and OGS_EST (5-6) at concentrations of 26.3 and 15.3 milligrams per kilogram (mg/kg), respectively, above the Connecticut Department of Energy and Environmental Protection (CTDEEP) Remediation Standard Regulations (RSRs) for Industrial/Commercial Direct Exposure Criteria (I/CDEC), which Manchester Landfill uses as their acceptance criteria. The sample was run for TCLP metals including arsenic, which were not detected above laboratory reporting limits. TCLP lead was detected in composite sample OGS_EST (4-5) at a concentration of 0.132 milligrams per liter (mg/L), below RCRA Toxicity Characteristics Maximum Concentration for lead of 5 mg/L.

Waste characteristics (conductivity, pH, reactivity, temperature, ignitability, and paint filter test) for the composite samples demonstrated non-hazardous characteristics.

Full soil analytical results are summarized on Table 1. Soil analytical laboratory reports are included as Attachment B.

Groundwater Analytical Results

Groundwater analytical results were compared to the General Permit for the Discharge of Groundwater Remediation Wastewater Appendix A: Discharges to Surface Waters and Appendix B: Discharges to a Publicly Owned Treatment Works (POTW) criteria.

Metals, nitrate as nitrogen, total phosphorus, TKN, and total settleable and suspended solids were detected above laboratory reporting limits. VOCs, nitrite as nitrogen, and TPH were not detected above laboratory reporting limits.

Copper and zinc were detected at concentrations of 136 and 566 micrograms per liter (µg/L), respectively, above the General Permit's criteria for discharge to a surface water at 10 to 1 dilution (48 and 322 mg/L, respectively) but below the criteria for 100 to 1 dilution (480 and 1,000 mg/L). Total suspended solids were detected at a concentration of 1,510 mg/L, above the General Permit's criteria for discharge to a surface water.

Full groundwater analytical results are summarized on Table 2. Groundwater analytical laboratory reports are included as Attachment C.

CONCLUSIONS

Based on the analytical results of in-site waste classification, soils at the Site may be classified as polluted or contaminated for the purposes of disposal. Analytical results for soil compared to a local landfill that accepts non-hazardous contaminated soil demonstrated acceptable characteristics for disposal. Based on the information provided above, Langan recommends development of a Soil Management Plan (SMP) to direct the proper excavation, handling, dewatering, offsite disposal of soils, and development and implementation, as needed, of wastewater treatment for groundwater remediation wastewater generated during redevelopment activities.

Based on groundwater analytical results, if dewatering activities will be necessary for planned construction activities, the Site Contractor should plan for appropriate settlement time and comply with all applicable local, state, and federal regulations and permits.

Sincerely,
Langan CT, Inc.

Hannah Griesbach
Project Engineer

David V. Granucci, LEP
Senior Project Engineer

Report Date: 10/17/2023
Client Project ID: 140265801
York Project (SDG) No.: 23I1597

Langan Engineering & Environmental Services (CT)
Long Wharf Maritime Center, 555 Long Wharf Drive
New Haven CT, 06511-6107
Attention: William Adsit

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on September 25, 2023 and listed below. The project was identified as your project: **140265801**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 23I1597

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Approved By  **Date:** 10/17/2023

Cassie L. Mosher
Laboratory Manager

Sample and Data Qualifiers Relating to This Work Order

S-08	The recovery of this surrogate was outside of QC limits.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data are acceptable.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
PF-01	No Free Liquid
M-CCV1	The recovery for this element in the Continuing Calibration Verification (CCV) exceeded 110% of the expected value. Positive detections may be biased high.
IS-LO	The internal std associated with this target compound did not meet acceptance criteria (area <50% CCV) at the stated dilution due to matrix effects. Sample was rerun to confirm matrix effects.
IGN-01	Non-Ignit.
ICVE	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration verification (recovery exceeded 30% of expected value).
HT-04	NON-COMPLIANT- Client requested analysis be conducted outside of holding times.
EXT-Temp	Extraction temperture slightly exceeded acceptance range.
EXT-COMP	Completed
CCVL	The value reported is estimated due to its behavior during continuing calibration verification (>20% difference for average RF or >20% drift for linear or quadratic fit.) This value may be biased low.
CCVE	The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for average Rf or >20% Drift for quadratic fit).
CAL-E	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration (average Rf>20%)
B	Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants.

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis

Low Bias — Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

High Bias — High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

Non-Dir. — Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Revision Description: This report has been revised to include TCLP Pesticides and TCLP Metals for sample 01,02 and 03.

Attention: William Adsit

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on September 25, 2023 and listed below. The project was identified as your project: **140265801**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

York Sample ID	Client Sample ID	Matrix	Date Collected	Date Received
23I1584-01	TMW01	Ground Water	09/25/2023	09/25/2023
23I1584-02	Trip Blank	Water	09/25/2023	09/25/2023

General Notes for York Project (SDG) No.: 23I1584

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Approved By  **Date:** 10/03/2023

Cassie L. Mosher
Laboratory Manager

Analyte		Result	Reporting Limit	Units	Spike Level	Source* Result	%REC	%REC Limits	Flag	RPD	RPD Limit	Flag
Batch BI31580 - Analysis Preparation												
Blank (BI31580-BLK1)	Blank									Prepared & Analyzed: 09/25/2023		
Total Settleable Solids		ND	0.100	mL/L								
Batch BI31587 - % Solids Prep												
Blank (BI31587-BLK1)	Blank									Prepared & Analyzed: 09/26/2023		
Total Suspended Solids		ND	1.00	mg/L								
Duplicate (BI31587-DUP1)	Duplicate	*Source sample: 23I1553-01 (Duplicate)								Prepared & Analyzed: 09/26/2023		
Total Suspended Solids		ND	2.50	mg/L		ND					15	
Duplicate (BI31587-DUP2)	Duplicate	*Source sample: 23I1555-02 (Duplicate)								Prepared & Analyzed: 09/26/2023		
Total Suspended Solids		ND	2.50	mg/L		ND					15	

Volatile Analysis Sample Containers

Lab ID	Client Sample ID	Volatile Sample Container
23I1584-01	TMW01	40mL Clear Vial (pre-pres.) HCl; Cool to 4° C
23I1584-02	Trip Blank	40mL Clear Vial (pre-pres.) HCl; Cool to 4° C

Sample and Data Qualifiers Relating to This Work Order

QM-07	The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
M-CCV1	The recovery for this element in the Continuing Calibration Verification (CCV) exceeded 110% of the expected value. Positive detections may be biased high.
HT-pH	HOLDING TIME EXCEEDED. Samples for pH must be measured in the field or within 15 minutes of sample collection.
HT-01R	This flag indicates that the sample was initially analyzed within recommended hold time and that a re-run was performed outside of the hold time.
CCVE	The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for average Rf or >20% Drift for quadratic fit).

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Field Chain-of-Custody Record

YORK ANALYTICAL LABORATORIES INC

York Analytical Laboratories, Inc. (YORK)'s Standard Terms & Conditions are listed on the back side of this document.
This document serves as your written authorization for YORK to proceed with the analyses requested below.
Your signature binds you to YORK's Standard Terms & Conditions.

YORK Project No. 23I1584
