

IB ESS Year 1 S1 - MHS Subject Group Overview

Unit Name	Unit 1 Foundations of ESS	Unit 2 Intro to Ecosystems	Unit 3 Human Systems and Sustainability	Unit 4 Soil and Food Production	Unit 5 Interconnected Earth
Time Frame	6 Weeks	12 Weeks	8 Weeks	6 weeks	4 weeks
Standards/ IB Topics	<p>Topic 1 Foundations of ESS</p> <p>1.1 – Perspectives 1.2 – Systems 1.3 – Sustainability</p>	<p>Topic 2 Ecology</p> <p>2.1 –Individuals and populations, communities, and ecosystems 2.2- Energy and biomass in ecosystems 2.3- Biogeochemical cycles 2.4- Climate and Biomes 2.5- Zonation, succession and change in ecosystems</p>	<p>Topic 3 Biodiversity and Conservation</p> <p>3.1- Biodiversity and evolution 3.2- Human impact on biodiversity 3.3- Conservation and regeneration</p>	<p>Topic 4 Water</p> <p>4.1- Water systems 4.2- Water access, use and security 4.3- Aquatic food production systems 4.4- Water pollution</p>	<p>Topics 1-4</p> <p>Interconnected Earth: Understanding Ecosystems Through Systems Thinking and Practical Investigation</p>
Content Specific Information	<p>Statement of Inquiry Understanding environmental perspectives, systems, and sustainability fosters holistic thinking and informed decision-making in addressing global environmental challenges.</p> <p>Phenomenon: People around the world respond very differently to the same environmental issues. These varied responses reflect underlying worldviews, value systems, and interpretations of scientific data.</p> <p>Crosscutting Concepts</p> <ul style="list-style-type: none"> • Systems and system models • Cause and effect • Stability and change <p>Scale, proportion, and quantityC</p>	<p>Statement of Inquiry Ecosystems are dynamic systems whose stability depends on energy flow, species interactions, and responses to disturbance.</p> <p>Phenomenon: Coral reefs, once vibrant ecosystems, are increasingly experiencing bleaching events and biodiversity collapse.</p> <p>Crosscutting Concepts</p> <ul style="list-style-type: none"> • Systems and system models • Energy and matter • Stability and change • Structure and function 	<p>Statement of Inquiry The preservation of biodiversity is influenced by ecological, ethical, political, and economic considerations.</p> <p>Phenomenon: Despite protection efforts, the orangutan remains critically endangered due to palm oil expansion.</p> <p>Crosscutting Concepts</p> <ul style="list-style-type: none"> • Patterns • Stability and Change • Cause and Effect • Systems and system models 	<p>Statement of Inquiry Water is a finite resource whose quality and availability are influenced by human management and natural systems.</p> <p>Phenomenon: Despite abundant rainfall, millions globally lack access to clean drinking water.</p> <p>Crosscutting Concepts</p> <ul style="list-style-type: none"> • Systems and system models • Cause and effect • Stability and change 	<p>Statement of Inquiry Understanding ecosystems through systems thinking and investigation reveals the interconnections between humans and the environment.</p> <p>Phenomenon: Environmental change exposes complex system interactions that can be explored through observation and inquiry</p> <p>Crosscutting Concepts:</p> <ul style="list-style-type: none"> • Interdependence of systems • Stability and change

	<p>SEPs</p> <ul style="list-style-type: none"> Asking questions and defining problems Analyzing and interpreting data Engaging in argument from evidence Obtaining, evaluating, and communicating information <p>CORE IDEAS</p> <p>1.1 Perspectives:</p> <ul style="list-style-type: none"> Perspectives are shaped by sociocultural, scientific, religious, and economic factors. Environmental value systems (EVSs) influence behavior and decision-making. Perspectives change over time and context due to events, advocacy, and information. <p>1.2 Systems:</p> <ul style="list-style-type: none"> Systems have storages and flows and can be modeled to understand complexity. Feedback mechanisms influence system behavior. Models are useful but have limitations. <p>1.3 Sustainability:</p> <ul style="list-style-type: none"> Sustainability involves meeting present needs 	<p>SEPs</p> <ul style="list-style-type: none"> Asking Questions and Defining Problems Developing & Using Models Analyzing & interpreting data Use mathematics and computational thinking Constructing Explanations Obtaining, evaluating and communicating information <p>CORE IDEAS</p> <p>2.1 Individuals, Populations, Communities, and Ecosystems</p> <ul style="list-style-type: none"> Populations consist of individuals of the same species living in the same area at the same time. Communities are groups of populations interacting within an ecosystem. Ecosystems include both biotic communities and abiotic components. Abiotic factors (e.g., light, temperature) and biotic factors (e.g., competition, predation) influence distribution. <p>2.2 Species Interactions</p> <ul style="list-style-type: none"> Organisms interact in ways that include predation, competition, 	<p>SEPs</p> <ul style="list-style-type: none"> Asking Questions and Defining Problems Analyzing & interpreting data Constructing Explanations Obtaining, evaluating and communicating information Engage in Argument from Evidence <p>CORE IDEAS</p> <p>3.1 Biodiversity and Evolution</p> <ul style="list-style-type: none"> Biodiversity exists at genetic, species, and habitat levels. Evolution occurs through natural selection acting on variation. Speciation results from isolation and adaptation. Mass extinctions have historically reduced biodiversity. <p>3.2 Threats to Biodiversity</p> <ul style="list-style-type: none"> Biodiversity is threatened by habitat loss, invasive species, pollution, overexploitation, and climate change. IUCN Red List assesses species' extinction risk using criteria like population size and decline. 	<p>SEPs</p> <ul style="list-style-type: none"> Developing & Using Models Analyzing & interpreting data Use mathematics and computational thinking Engage in Argument from Evidence <p>CORE IDEAS</p> <p>4.1 Water Systems</p> <ul style="list-style-type: none"> The hydrological cycle includes processes like evaporation, precipitation, infiltration, and runoff. Ocean currents (e.g., thermohaline circulation) redistribute heat and influence climate. Human activities like damming and deforestation alter the water cycle. <p>4.2 Water Access, Use, and Security</p> <ul style="list-style-type: none"> Access to clean water varies globally and is influenced by social, political, and economic factors. Water is used for 	<p>SEPs</p> <ul style="list-style-type: none"> Asking Questions and Defining Problems Planning and carrying out investigations Analyzing & interpreting data Use mathematics and computational thinking <p>CORE IDEAS</p> <p>Topic 1: Foundations</p> <ul style="list-style-type: none"> Perspectives shape human decision-making around environmental issues. Systems thinking allows for holistic understanding and modeling of environmental issues. Sustainability connects social, economic, and environmental dimensions of human activity. <p>Topic 2: Ecology</p> <ul style="list-style-type: none"> Ecosystems are complex, dynamic systems of biotic

	<p>without compromising future generations.</p> <ul style="list-style-type: none"> Natural capital and ecosystem services are essential. Sustainability indicators and ecological footprints help measure environmental impact. 	<p>mutualism, parasitism, and commensalism.</p> <ul style="list-style-type: none"> A species' ecological niche includes its habitat, role, and interactions. Keystone species play a critical role in maintaining ecosystem structure. <p>2.3 Energy in Ecosystems</p> <ul style="list-style-type: none"> Energy flows through ecosystems from producers to consumers and decomposers. Food chains and food webs show energy transfer. Energy decreases at each trophic level due to loss as heat (10% rule). <p>2.4 Biogeochemical Cycles</p> <ul style="list-style-type: none"> Water, carbon, nitrogen, and phosphorus cycle through ecosystems. Key processes include evaporation, photosynthesis, nitrogen fixation, and decomposition. Human activity (e.g., deforestation, agriculture) disrupts 	<ul style="list-style-type: none"> Human activities influence ecosystem services and species survival. Indigenous and local knowledge contribute to understanding and protecting biodiversity. <p>3.3 Conservation and Regeneration</p> <ul style="list-style-type: none"> Conservation methods include in situ (protected areas) and ex situ (zoos, seed banks) strategies. Biosphere reserves aim to balance conservation and sustainable use. Wildlife corridors help species movement and reduce habitat fragmentation. Conservation success can be measured ecologically, socially, and economically. 	<p>agriculture, industry, and domestic needs.</p> <ul style="list-style-type: none"> Inequitable access leads to water insecurity and conflict. <p>4.3 Water Pollution</p> <ul style="list-style-type: none"> Pollution can be point-source (e.g., factory) or non-point source (e.g., runoff). Common pollutants include nutrients, heavy metals, pathogens, and plastics. Pollution harms aquatic ecosystems, biodiversity, and human health. <p>4.4 Water Quality and Monitoring</p> <ul style="list-style-type: none"> Water quality is assessed using abiotic indicators (e.g., pH, temperature) and biotic indices (e.g., indicator species). Water quality indices (e.g., WQI) combine data to evaluate overall condition. 	<p>and abiotic interactions.</p> <ul style="list-style-type: none"> Energy flows and matter cycles underpin trophic structures and ecosystem productivity. Succession and zonation reveal how ecosystems respond to change over time and space. <p>Topic 3: Biodiversity and Conservation</p> <ul style="list-style-type: none"> Biodiversity ensures ecosystem resilience and stability. Human activities threaten biodiversity, requiring conservation strategies and stakeholder engagement. <p>Topic 4: Water</p> <ul style="list-style-type: none"> Water systems are finite and vulnerable to pollution and overuse. Sustainable water management is
