Re: CITADEL Project No. CITADEL PROJECT NO. 2732.1002.0
Perimeter Air Monitoring Baseline Report
Flint Hill Elementary & Middle School Campus
Flint Hill Elementary School, 392 Gold Hill Road, Fort Mill, SC 29715

Dear Mr. Burke:

Citadel Environmental Health and Safety, inc. (Citadel) is pleased to provide the Fort Mill School District (the District) with this Perimeter Air Monitoring Baseline Report for the above-referenced location.

This report was prepared in general accordance with citadel proposal no. 2732.1002.p, dated December 11, 2025, and a mutually agreed upon scope of work. It presents the results of continuous exterior air quality monitoring conducted at the flint hill elementary school campus during the month of February 2026.

The purpose of this baseline monitoring effort was to characterize existing ambient air quality conditions in the vicinity of the school prior to the commencement of full-scale operations at the adjacent Silfab solar manufacturing facility. The data collected during this period will serve as the reference point against which all future monitoring results are compared, supporting the district's ongoing commitment to the health and safety of its students, staff, and community.

If, after your review, you have any questions or require additional information, please do not hesitate to contact me at (818) 246-2707.

Sincerely,

CITADEL EHS

1.0 EXECUTIVE SUMMARY

1.1 Purpose

This report presents the results of the first phase of continuous exterior air quality monitoring conducted at Flint Hill Elementary School in Fort Mill, South Carolina. The Fort Mill School District (the District) retained Citadel Environmental Health and Safety, Inc. (Citadel) to install perimeter air monitoring equipment on the school campus and establish baseline ambient air quality conditions prior to the commencement of full-scale operations at the adjacent Silfab Solar manufacturing facility.

The objective of this effort was to measure and document existing air quality conditions so that any future changes, whether gradual or sudden, can be identified, evaluated, and acted on in a timely manner.

1.2 Context

The Silfab Solar manufacturing facility is located approximately 1,300 feet from the Flint Hill Elementary and Middle School campuses. In response to community concerns about the types of industrial chemicals and gases that may be used at this facility, the District engaged Citadel to provide independent environmental monitoring services, including implementing a monitoring program that represents a proactive, science-based approach to protecting students, staff, and the surrounding community.

The baseline data presented in this report were collected during February 2026. The first day of school was August 4, 2025. As such, the school was in session during baseline air monitoring.

1.3 Key Findings

During the four-week baseline monitoring period (February 2 through February 28, 2026), all measured air quality parameters were within established health-protective standards set by the United States Environmental Protection Agency (U.S. EPA) and the American Industrial Hygiene Association (AIHA). One isolated period of elevated particulate matter readings on February 13 through 14, described in detail within this report, was attributed to a fire in the surrounding neighborhood and was not associated with the Silfab Solar facility.

Overall, the data indicate that ambient air quality in the vicinity of Flint Hill Elementary School during the monitoring period was consistent with conditions typically observed in suburban environments in the southeastern United States, and well within health-protective standards.

2.0 INTRODUCTION

Citadel Environmental Health and Safety, Inc. (Citadel) prepared this Perimeter Air Monitoring Baseline Report for Flint Hill Elementary School, located at 392 Gold Hill Road in the City of Fort Mill, South Carolina (the Site). The Fort Mill School District (the District or Client) retained Citadel in response to community concerns about the presence and handling of industrial chemicals and gases at the nearby Silfab Solar manufacturing facility, located approximately 1,300 feet north from the Flint Hill Elementary and Middle School campuses.

Due to the proximity of the Site to the manufacturing facility, concerns were raised regarding the potential for chemical releases and the associated risks related to prolonged exposure to airborne

contaminants. Citadel was retained to provide environmental consulting services, including the installation and operation of air quality monitoring equipment to characterize existing ambient air conditions in the vicinity of the Site.

Baseline monitoring, which involves measuring air quality before a potential source of emissions begins full operations, establishes a scientifically sound reference point. This “before” snapshot allows future monitoring results to be compared against known pre-operational conditions, making it possible to identify any meaningful changes or trends that may warrant further evaluation.

The monitoring focused on four key air quality indicators: particulate matter (PM_{2.5} and PM₁₀), methane (CH₄), and total volatile organic compounds (TVOCs). These parameters are explained in Section 4.0 of this report.

Companion Document: This report is intended to be read alongside the companion Community Air Monitoring Plan (CAMP), Citadel Project No. 2732.1002.0. The CAMP provides detailed information on monitoring equipment, alert and action thresholds, response protocols, data access, and quality assurance procedures. Readers seeking additional technical detail on any of those topics are encouraged to review the CAMP first.

3.0 BACKGROUND

In July 2025, Citadel developed an Air Quality Monitoring Plan (Citadel Project No. 2732.1001.0) for the District. That plan was based on a thorough review of publicly available documentation related to the Silfab Solar facility, including air permits, the Department of Health and Environmental Control (DHEC) Bureau of Air Quality (BAQ) Statement of Basis, emissions modeling data, chemical inventory records, and process descriptions. Citadel used this information to identify a set of Chemicals of Potential Concern (COPCs), substances that have the potential to be present in the air near the school campus and warrant inclusion in the monitoring program.

The Air Quality Monitoring Plan recommended a two-part monitoring strategy: scheduled indoor and outdoor air sampling for laboratory analysis (conducted on a quarterly basis) and continuous exterior perimeter monitoring. This report addresses the continuous exterior perimeter monitoring component.

The monitoring parameters selected for this study, PM_{2.5}, PM₁₀, methane (CH₄), and TVOCs, serve as reliable indicators of changes in ambient air quality. By tracking these indicators continuously, the system can detect shifts in air conditions that may be associated with the Silfab Solar facility, nearby construction activity, traffic, weather events, or other sources.

At the time monitoring began in February 2026, the Silfab Solar facility remained in the construction phase. A temporary certificate of occupancy had been issued to permit testing of internal systems, including operation of the acid scrubber. To Citadel's knowledge, Silfab Solar had not yet received approval to store or use hazardous gases or chemicals on-site at the time of sampling. Flint Hill Elementary School was in session throughout the monitoring period, having opened for the school year on August 4, 2025.

4.0 SCOPE OF WORK

4.1 Equipment and Installation

Citadel installed two exterior air quality monitoring stations at the Site in February 2026. Each station is equipped with sensor modules for PM_{2.5}, PM₁₀, methane, and TVOCs, along with a dedicated weather station that records wind speed and direction. Wind data are essential for determining whether any detected changes in air quality are coming from the direction of the Silfab Solar facility or from other sources. Complete equipment specifications, including sensor ranges, detection limits, and accuracy data, are provided in the companion Community Air Monitoring Plan (CAMP).

4.2 Monitoring Locations

Two monitoring stations were installed at the boundaries of the school property: one at an upwind location to the southwest and one at a downwind location to the northeast, based on prevailing wind conditions and coordination with the District. This upwind/downwind configuration is standard practice in perimeter air monitoring; comparing data from both stations allows Citadel to evaluate whether changes in air quality are associated with the Silfab Solar facility or other sources. See Figure 1 for a Site Map. Additional details on the monitoring location rationale is provided in the CAMP. In practical terms, the Northeast (NE) monitor captures downwind conditions, air arriving from the direction of the Silfab Solar facility, while the Southwest (SW) monitor captures upwind conditions, representing ambient air as it approaches the campus.

4.3 Monitoring Period and Data Collection

Baseline monitoring was conducted continuously from February 2 through February 28, 2026, providing four weeks of data. Sensors recorded measurements at one-minute intervals. Citadel analyzed the data using both 15-minute rolling averages (for short-term trend analysis and comparison against the New York State Department of Environmental Conservation (NYSDEC) Division of Environmental Remediation (DER) DER-10 Technical Guidance for Site Investigation and Remediation) and 24-hour rolling averages (for comparison against federal National Ambient Air Quality Standards, or NAAQS). The monitoring schedule, data management protocols, and quality assurance procedures are described in the CAMP.

5.0 UNDERSTANDING THE MEASUREMENTS

The following provides a brief overview of each parameter monitored during this baseline period. More detailed descriptions, including sensor specifications and cross-sensitivity information, are provided in the CAMP.

Particulate Matter (PM₁₀ and PM_{2.5}): Fine particles in the air that can be inhaled. PM_{2.5} (2.5 micrometers or smaller) can penetrate deep into the lungs; PM₁₀ (10 micrometers or smaller) can be inhaled. Common sources include dust, vehicle exhaust, construction, and combustion.

Methane (CH₄): A colorless, odorless gas naturally present in outdoor air at low concentrations (~2 ppm). The methane sensor acts as a tracer gas to other combustible gases, making an important early-warning indicator of potentially flammable conditions.

Total Volatile Organic Compounds (TVOCs): A broad category of carbon-based chemicals that evaporate easily. Sources include but are not limited to paints, cleaning products, building materials, vehicle exhaust, and industrial processes.

Wind Speed and Direction: Essential for determining whether detected changes in air quality may be associated with the Silfab Solar manufacturing facility or other sources.

6.0 RESULTS

The tables below summarize the air monitoring and meteorological data collected during the four-week baseline period. Two types of averages are presented for air quality parameters: 15-minute rolling averages (for detailed short-term trend analysis) and 24-hour rolling averages (for comparison against federal National Ambient Air Quality Standards, or NAAQS). This dual-averaging approach ensures that both brief episodes and sustained conditions are captured and evaluated. A summary of the four-week 15-minute rolling average monitoring data for each parameter is provided in Appendix A.

6.1 Meteorological Conditions During Baseline Period

Table one summarizes meteorological conditions recorded by the on-site weather station during the four-week baseline monitoring period on a 24-hour rolling average basis. This data provides context for interpreting the air quality results; for example, wind direction helps determine whether an elevated reading may be coming from the direction of the Silfab Solar manufacturing facility, and temperature and humidity offer insight into temporal fluctuations in particulate matter and gases.

Table 1: Baseline Meteorological Conditions Summary (February 2-28, 2026)

Parameter	Average (24-hour rolling average)
Temperature (°F)	46.4
Relative Humidity (%)	65.5
Prevailing Wind Direction	West Southwest (WSW)
Average Wind Speed (mph)	2.63

Table 2 below presents the four-week average concentrations for each continuously monitored air quality parameter, calculated from the 15-minute rolling averages described above. Each value reflects the arithmetic mean of all 15-minute data points collected over the full baseline monitoring period at each station. Reference levels are provided for context and are identified in the table footnotes.

Table 2: Four-Week Averages (15-Minute Rolling Averages)

Parameter	NE Monitor (Downwind)	SW Monitor (Upwind)	Reference Level
PM _{2.5} (µg/m³)	9.589	10.526	N/A

Parameter	NE Monitor (Downwind)	SW Monitor (Upwind)	Reference Level
PM ₁₀ (µg/m³)	12.624	14.223	100 above background***
Methane / CH ₄ (ppm)	2.275	3.306	<10 (industry standard)
TVOCs (ppm)	0.0029	0.002	0.05–0.5** 5 above background***

*NAAQS 24-hour standard. **AIHA recommended range for typical indoor environments; outdoor levels are generally lower.

***NYSDEC DER-10

Table 3: Four-Week Averages (24-Hour Rolling Averages)

Air Quality Indicator	NE Monitor (Downwind)	SW Monitor (Upwind)	Reference Level
PM _{2.5} (µg/m³)	10.336	10.607	35*
PM ₁₀ (µg/m³)	13.328	14.348	150*
Methane / CH ₄ (ppm)	2.238	1.710	<10 (typical)
TVOCs (ppm)	0.0023	0.003	0.05–0.5**; 5 above background***

*NAAQS 24-hour standard. **AIHA recommended range for typical indoor environments; outdoor levels are generally lower

***NYSDEC DER-10

6.2 Elevated Readings: February 13-14, 2026

During the four-week baseline monitoring period, one isolated event produced PM_{2.5} readings that exceeded both the CAMP notification thresholds and the federal NAAQS 24-hour standard. The event began on the evening of Friday, February 13, and continued overnight into Saturday, February 14. No school was in session during this time.

PM_{2.5} concentrations at the SW (upwind) monitor began rising sharply around 5:00 PM on Friday evening, reaching a peak 15-minute reading of 575.4 µg/m³ at approximately 7:00 PM. Readings remained significantly elevated throughout the overnight hours, with a second sustained period of high concentrations between approximately 12:30 AM and 7:00 AM Saturday morning.

Concentrations gradually returned to baseline levels by late Saturday morning. The NE (downwind) monitor recorded elevated readings during the same period, though at consistently lower concentrations, peaking at 168.6 µg/m³.

Table 4 reiterates the PM_{2.5} notification, alert, and action thresholds established in the CAMP. Table 5 places the February 13–14 readings in context against those thresholds and the four-week baseline averages.

Table 4: PM_{2.5} CAMP PM_{2.5} Notification, Alert, and Action Thresholds

CAMP PM _{2.5} Notification, Alert, and Action Thresholds	
Threshold Level	Value
Notification Level (15-minute rolling average)	~30 µg/m³ at NE (downwind) station
Alert Level (15-minute rolling average)	~60 µg/m³ at either station
Action (24-hour rolling average)	Exceeds 35 µg/m³ at either station

Table 5: PM_{2.5} Readings During February 13–14 Elevated Event

Monitoring Station PM _{2.5} Averages		
	NE Monitor (Downwind)	SW Monitor (Upwind)
Baseline Averages	10.3 (µg/m ³)	10.6 (µg/m ³)
February 13-14 (15-minute average)	31.7 – 168.6 (µg/m³)	32.6 – 575.4 (µg/m³)
Feb. 13-14 (24-hour average)	39.1 (µg/m³)	75.9 (µg/m³)

Bold font indicates exceedance above established thresholds as reiterated in Table 4.

Citadel investigated this spike and identified a brush fire in the residential neighborhood off of Gold Hill Road, nearest to the SW (upwind) monitoring station. As shown in table five above, the elevated readings were highest at the SW or upwind station, meaning the source of the particulates was coming from the direction opposite of the Silfab Solar manufacturing facility. This directional pattern is consistent with a localized brush fire event, not an industrial emission. Importantly, TVOC and methane readings showed no corresponding elevation during this period, further confirming a combustion source unrelated to industrial chemical activity. Aside from this isolated period, all particulate matter readings remained well within federal standards throughout the monitoring period.

7.0 CONCLUSIONS

All measured air quality parameters during the four-week baseline period were consistent with conditions typically observed in suburban environments in the southeastern United States and were within established ambient air quality standards. The one isolated period of elevated particulate matter on February 13–14 was attributed to a neighborhood brush fire and does not appear to indicate any association with the Silfab Solar manufacturing facility.

These baseline values establish the pre-operational reference point against which all future monitoring data will be compared. Any sustained trends or meaningful departures from baseline conditions will prompt further investigation, as described in the companion Community Air Monitoring Plan (CAMP).

For the alert and action thresholds, equipment specifications, response protocols, and quality assurance procedures that govern the ongoing monitoring program, please refer to the CAMP (Citadel Project No. 2732.1002.0), which is designed to be updated independently as additional operational data become available.

8.0 ONGOING MONITORING PROGRAM

The perimeter air monitoring system will continue to operate continuously, recording data at one-minute intervals, 24 hours per day, 7 days per week. Citadel will provide monthly summary reports to the District documenting monitoring activities, data trends, and any observations of note.

In addition to the continuous perimeter monitoring described in this report, the District's broader air quality monitoring program includes quarterly indoor and outdoor air sampling for laboratory analysis at both Flint Hill Elementary School and Flint Hill Middle School. These quarterly sampling events assess a wider range of specific chemicals, including hydrochloric acid (HCl), hydrogen fluoride (HF), ammonia (NH₃), formaldehyde (CH₂O), silane (SiH₄), volatile organic compounds (VOCs), carbon monoxide (CO), and particulate matter (PM). Samples are collected using industry-standard methods and analyzed by independent, third-party laboratories accredited through the American Industrial Hygiene Association (AIHA).

Together, these two complementary layers of monitoring, continuous real-time perimeter data and periodic detailed laboratory analysis, provide a comprehensive picture of air quality conditions at and around the school campuses. Reports will be made available to the community on the Fort Mill School District website to maintain transparency and public access to ongoing results.

10.0 LIMITATIONS

This perimeter air monitoring baseline report was performed in accordance with generally and currently accepted engineering practices and principles. Although the data in this report is indicative of subsurface conditions in areas investigated, no further conclusions regarding the absence or presence of subsurface contamination at the site should be construed or inferred other than those expressly stated in this report. The conclusions made are based on information obtained from field observations, and from relevant Federal, State, regional, and local agencies.
