The district continues to make steady progress on several important capital improvement projects. Solar panels have now been fully installed on the transportation facility, representing a significant step forward in our long-term energy-efficiency efforts. Once Evergy installs the new meter, the system will be connected to the grid and begin generating energy.

The Capital Improvement Committee recently reviewed flooring samples and color options for the main hallways at Campus High School, as well as proposed flooring materials for the upcoming locker room renovations. Once a few preferred options are identified, Mr. Seeley will work with staff to gather input and help determine the final selection.

Planning for the new CTE facility also continues to move forward. Alloy Architecture and Hutton Construction are working together to refine and finalize the many design details associated with the facility. As part of this process, the architect will be meeting with Campus High School staff to gather input on classroom needs, specialized program requirements, and expectations for shared spaces and meeting areas. This collaboration ensures the final design supports high-quality, hands-on learning experiences for students. The project remains on track with the goal of beginning construction in March 2026.
