We have several updates to provide this week on the capital improvements across the district.
The new solar panel system installed on the Transportation building has officially been connected to the grid and is now generating electricity. This is an exciting step forward in our efforts to improve energy efficiency and reduce long-term utility costs.

Roofing work has begun on the natatorium at Campus High School. Once the roof repairs are complete, installation of the solar panels for this building will begin. Over the next month the Campus staff will have the opportunity to provide input on flooring and tile options for the many hallways throughout the building.
Planning is underway for the installation of new HVAC units scheduled for this summer. The upgrades this summer will take place at Nelson, Rex, Freeman, Oatville, and Campus High School. This work will significantly improve climate control, energy efficiency, and overall comfort for students and staff.

Work continues on the design and planning for the new CTE facility. Our team is working closely with architects and stakeholders to refine the details of this project and ensure it meets the needs of our students and programs.

~ Jeff Hersh, Superintendent

USD 261 Capital Improvements Weekly Update: December 12, 2025
