MAP Testing What It Is & Why It Matters

The Basics

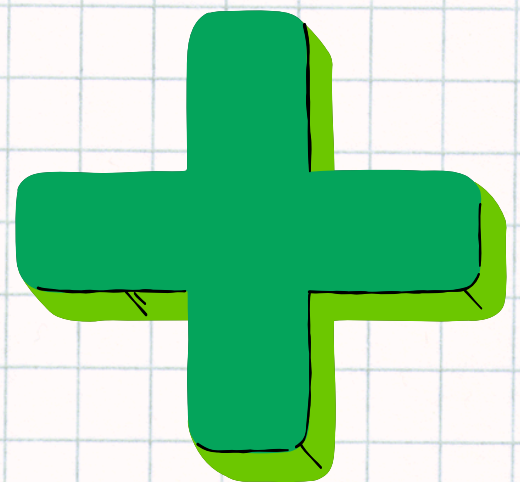

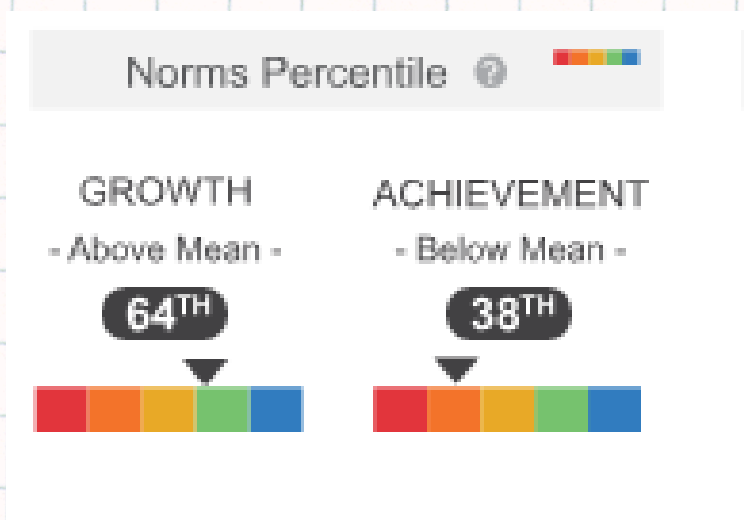

MAP stands for Measures of Academic Progress. It's used in schools across the US and internationally. MAP tests are one of the many tools used by QSI schools to understand student academic progress.

How it works

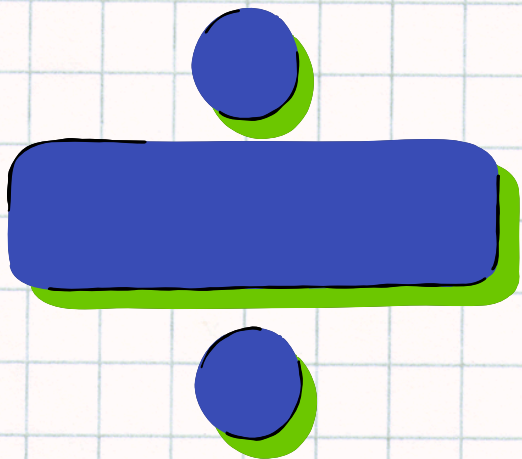

MAP is a dynamic test: it adjusts to each answer a student gives. Questions get harder or easier based on the answer to the previous question. MAP has a common scale that lets teachers track progress clearly across grade levels.

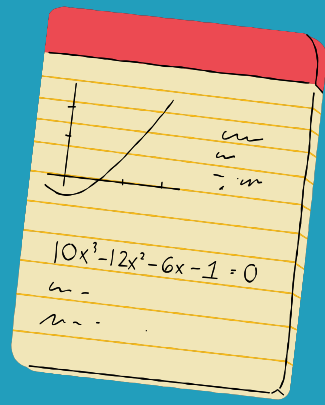

What's tested

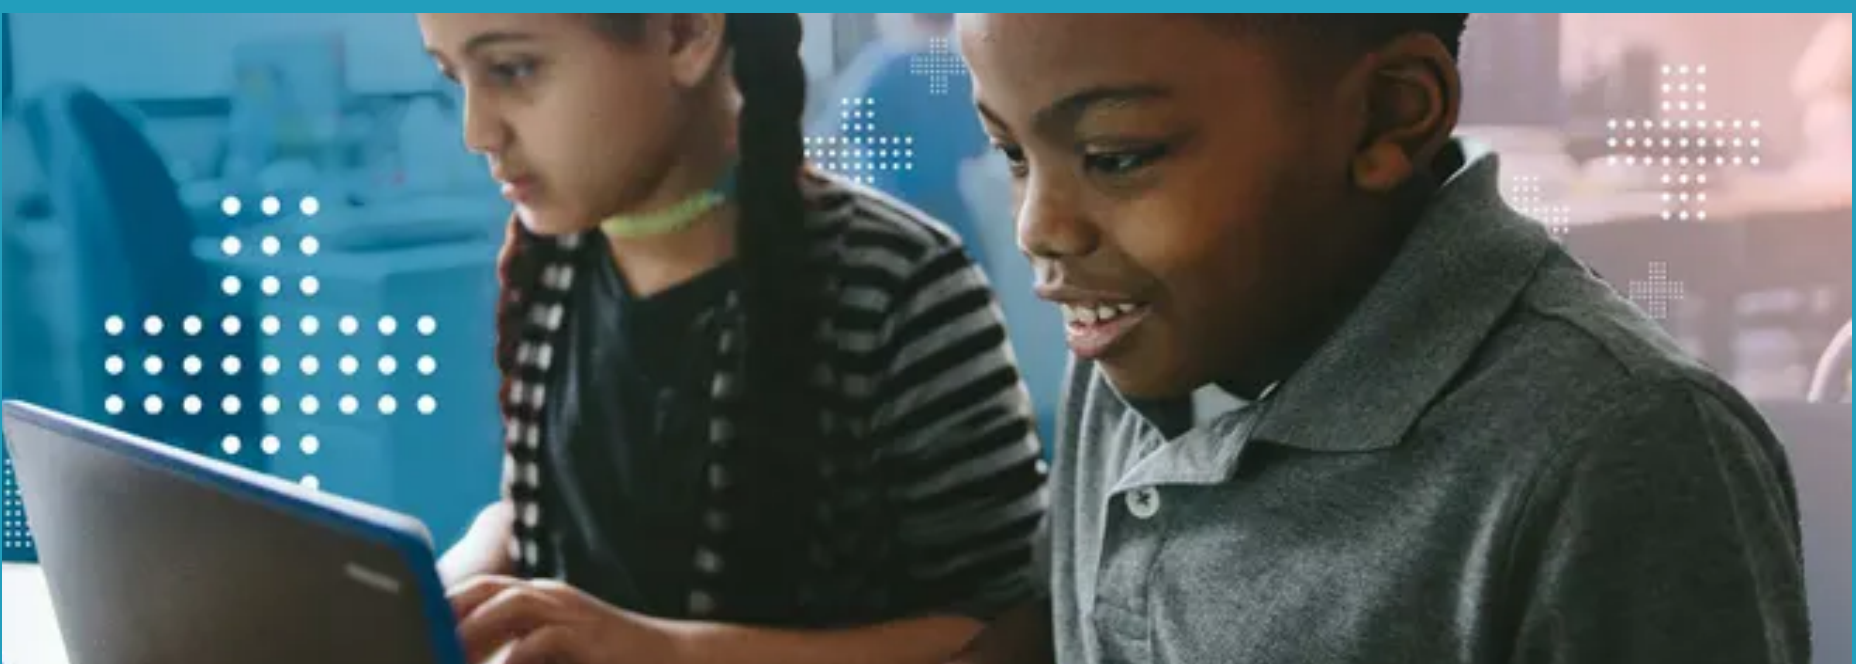

Most students test in reading, language usage, and mathematics. There are different tests for different age levels. Secondary students may also see specialized subject tests in advanced mathematics.

When it happens

Students typically take MAP tests in the fall and spring, so teachers can compare growth over the time. There's no pass or fail, just a clearer picture of how far a student has come.

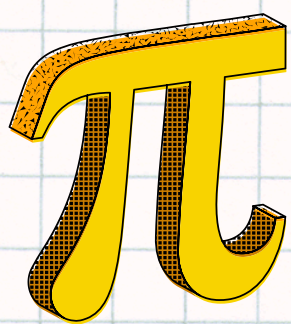

READY

Going in

As the test covers a range of subject matter, it is not a test you can prepare for the night before. Just get good sleep, eat breakfast, and know when your test day is. Go in ready to do your best, since missing some answers is a normal part of how this adaptive test works.

Every QSI school uses MAP the same way, so wherever a student's journey takes them in the QSI network and beyond, their progress travels with them.
