IV. O& M Areas with ACBM in need of repair

Based on the findings of the inspection, appropriate response actions must be selected in accordance with AHERA guidelines. If ACBM is in good condition and unlikely to be disturbed, it may be managed in place through an operations and maintenance (O&M) program, including periodic surveillance and worker training. However, if the material is damaged or poses a risk of fiber release, response actions such as repair (e.g., encapsulation or enclosure) or removal may be required. Repairs are typically used when damage is limited, and the material can be stabilized, while removal is often necessary when ACBM is significantly damaged, cannot be effectively repaired, or will be impacted by renovation or demolition activities. All such actions must be performed using accredited personnel and appropriate work practices to prevent asbestos fiber release and protect building occupants. Under 40 CFR 61 Subpart M, projects involving regulated asbestos-containing material (RACM) above threshold amounts (160 sq ft, 260 linear ft, or 35 cubic ft) must follow full NESHAP requirements, regardless of how the waste is packaged.

In the event of a fiber release episode, 40 CFR 763.90 requires prompt action to control the hazard. The affected area must be immediately isolated, appropriate personnel notified, and cleanup performed by trained professionals using HEPA vacuums and wet methods. The damaged ACBM must then be repaired, encapsulated, or removed, followed by a visual inspection and, if necessary, air clearance testing before the space can be safely reoccupied.
